Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Preface

Purpose of the documentation

This documentation provides important information on configuring, installing, wiring and commissioning the ET 200SP distributed I/O system.

Basic knowledge required

A basic knowledge of automation technology is required to understand the documentation.

Validity of the documentation

This documentation applies to the distributed I/O system, ET 200SP.

Definition

In this document, " motor starter" always refers to all variants of the ET 200SP motor starters.

Conventions

Please pay particular attention to notes highlighted as follows:

Note

Notes contain important information on the product, handling the product or on part of the documentation to which you should pay particular attention.

Standards

You can find a dated reference to the relevant standards or EU declaration of conformity on the Internet (https://support.industry.siemens.com).

Special information

WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Proper use of hardware products

This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.

Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.

EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Directive 2006/42/EC.

Note

Important note for maintaining operational safety of your plant

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. Even suppliers are required to observe special measures during product monitoring. For this reason, we inform you in the form of personal notifications about product developments and features that are (or could be) relevant to operation of systems from a safety perspective.

By subscribing to the appropriate notifications, you will ensure that you are always up-to-date and able to make changes to your system, when necessary.

Note

When using F-CPUs in safety mode and fail-safe modules, observe the description of the SIMATIC Industrial Software SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) fail-safe system.

Recycling and disposal

For ecologically sustainable recycling and disposal of your old device, contact a certified disposal service for electronic scrap and dispose of the device in accordance with the regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

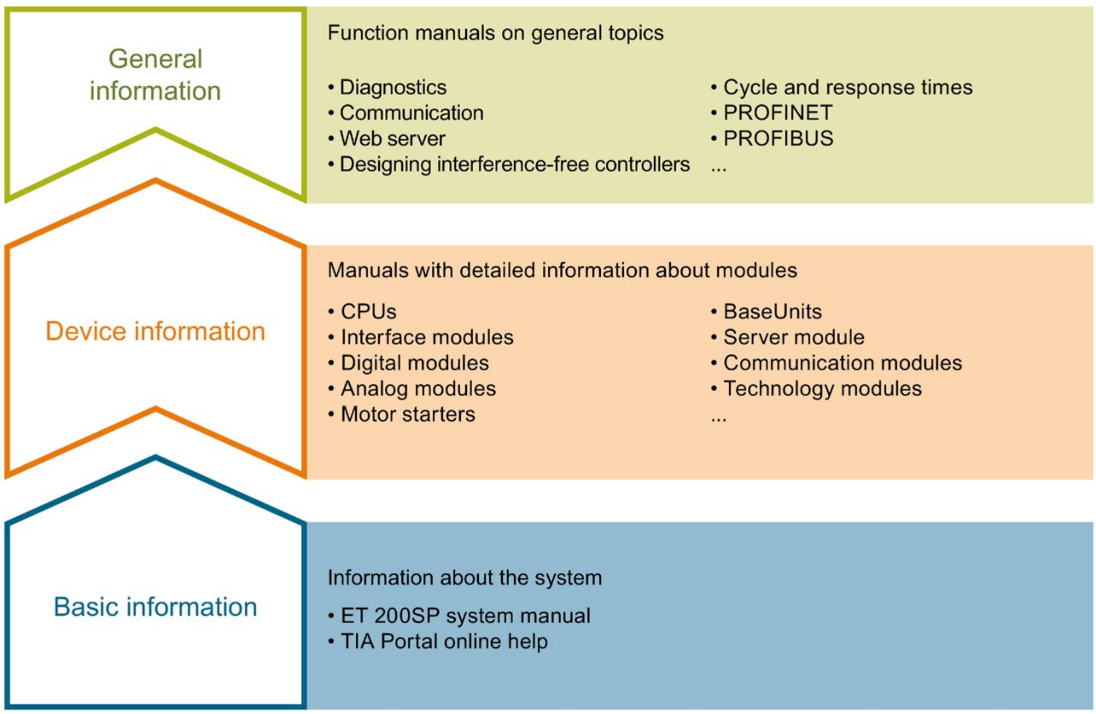
Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

New properties/functions 2

What's new in the system manual ET 200SP, edition 02/2018 compared to edition 12/2016

What's new?		What are the customer benefits?	Where can I find information?
New contents	Potential distributor modules	Potential distributor modules are a space-saving replacement for standard potential distributors or potential distributor terminals. You can set up potential groups much faster, in a more compact design and with fewer components than with standard potential distributor systems. One application is, for example, the design of digital input modules with 16 channels and 3-wire connection. By using the potential distributor modules, you are reserving the unused signal lines of antivalent sensors. Another application is the supply of potentials for external components.	Starting from section System overview (Page 19)
	Password provider	As an alternative to manual password input you can connect a password provider to STEP 7. A password provider offers the following advantages: • Convenient handling of passwords. STEP 7 reads the password automatically for the blocks. This saves you time. • Optimal block protection because the operators do not know the actual password.	Section Know-how protection (Page 166)
	GetSMCinfo instruction	With the help of the GetSMCinfo instruction you can respond to information provided by the memory card in the user program and if required, replace the memory card as a precautionary measure. This makes sense in particular if you write to the card often in your application, for example if you use data logs.	Section SIMATIC memory card - overview (Page 240)

What's new?		What are the customer benefits?	Where can I find information?
	Testing with breakpoints	When testing with breakpoints, you execute a program from one breakpoint to another. Testing with breakpoints provides you with the following advantages: • Testing SCL and STL program code with the help of breakpoints • Localization of logic errors step by step • Simple and quick analysis of complex programs prior to actual commissioning • Recording of current values within individual executed loops • Use of breakpoints for program validation also possible in SCL/STL networks within LAD/FBD blocks	Section Test functions (Page 273)
Changed contents	Reading out the identification and maintenance data using the Get_IM_Data instruction	With the Get_IM_Data instruction you can read out the identification and maintenance data of the modules without much programming work. With the Get_IM_Data instruction, you can access the identification and maintenance data (I&M) of a module in the user program. I&M data is information saved in a module. This allows you to • check the system configurations • react to hardware changes • react to hardware faults in the user program. Finding and elimination of hardware errors is made easier.	Section Reading out and entering I&M data (Page 225)
	Time synchronization	For all applications that need the exact time, you update the CPU time using the NTP process. This also automatically sets the CPU time beyond subnet limits.	Section Time synchronization (Page 234)
	Firmware update via accessible devices	You are given information on fast firmware updates via accessible devices in the network.	Section Firmware update (Page 257)

System overview

3

3.1 What is the SIMATIC ET 200SP distributed I/O system?

SIMATIC ET 200SP

SIMATIC ET 200SP is a scalable and highly flexible distributed I/O system for connecting process signals to a higher-level controller via a fieldbus.

Customer benefits of the system

Compact design

- Small size and high variability thanks to scalability
- Maximum transparency in the most restricted space thanks to the innovative labeling system
- System-integrated load power supply

Easy to use

- Compact modules, permanent wiring with single-conductor or multi-conductor connection
- Time savings through tool-free connection system with push-in terminals
- Configuration adaptation for future expansions through integrated configuration control

Safety Integrated

- Simple integration of fail-safe CPUs and modules
- Setting of all F-parameters via software

Communication standards

- PROFINET IO
- PROFIBUS DP
- ET-Connection
- AS-Interface
- IO-Link
- Point-to-point (RS232, RS485)

High performance

- Isochronous PROFINET IO with PROFIsafe and PROFIenergy profiles

Energy efficiency

- PROFIenergy as integrated function

CPU

- PROFINET interface with 3 ports
- IO controller
- I device
- Optional CM DP module for connecting to PROFIBUS DP

Motor starter

- Simple integration of motor starters with overload and short-circuit protection
- Compact design with a max. switchable motor output of up to 5.5 kW

Powerful technology

- Modules for the functions: counting, positioning, weighing and measuring of electrical quantities

Figure 3-1 SIMATIC ET 200SP distributed I/O system - Customer benefits

Area of application

Thanks to its multifunctionality, the SIMATIC ET 200SP distributed I/O system is suitable for a wide range of applications. Its scalable design allows you to tailor your configuration to local requirements. Different CPUs/interface modules are available for connection to PROFINET IO or PROFIBUS DP.

SIMATIC ET 200SP with CPU allows intelligent pre-processing to relieve the higher-level controller. The CPU can also be used as standalone device.

By using fail-safe CPUs, you can implement applications for safety engineering. Configuration and programming of your safety program takes place the same way as for standard CPUs.

A wide range of I/O modules rounds off the product range.

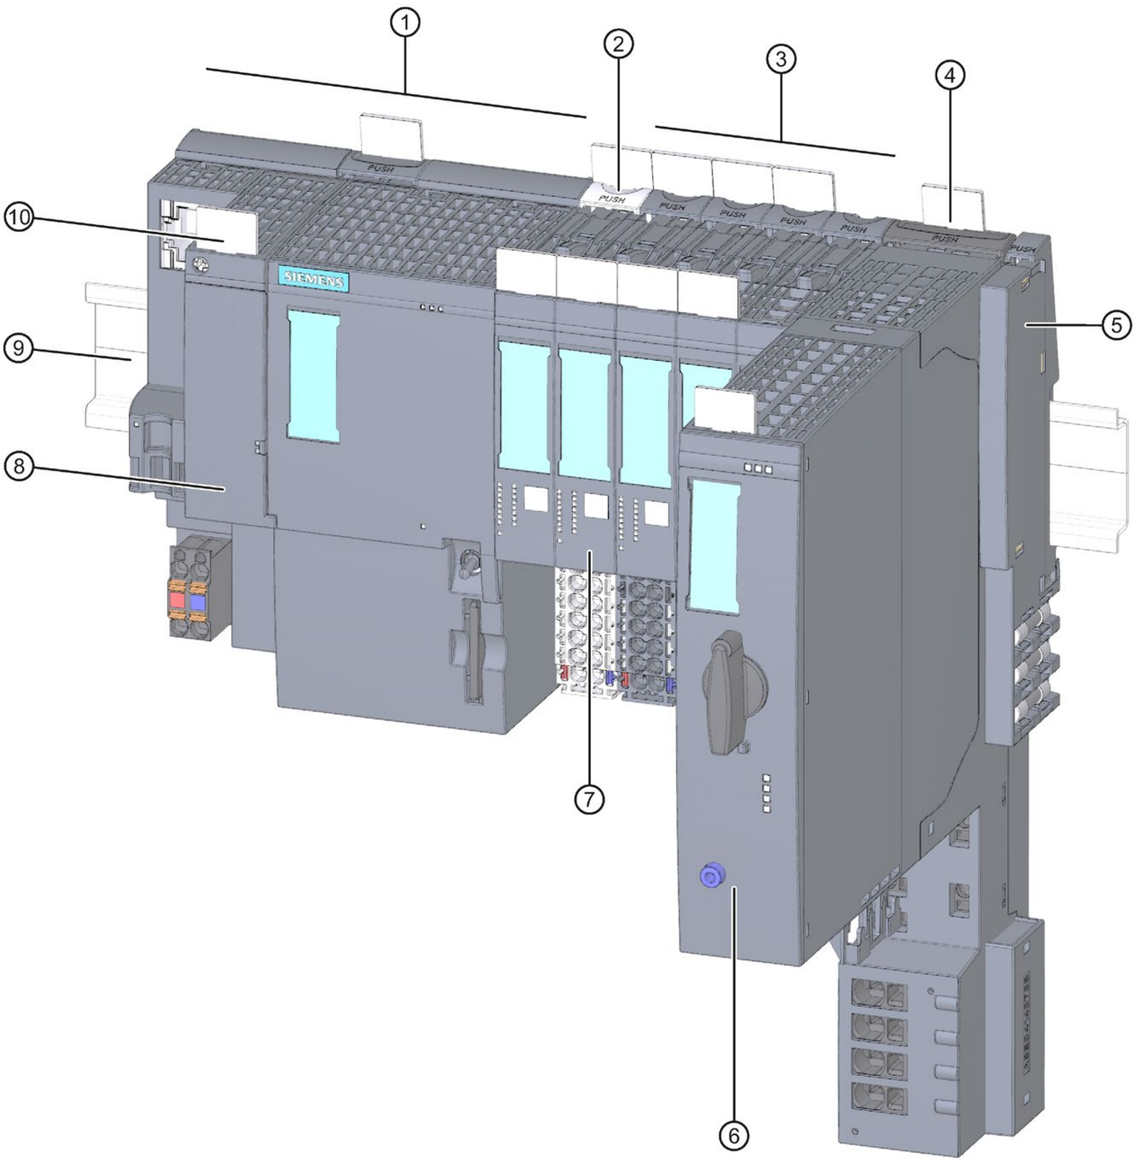
SIMATIC ET 200SP is designed with degree of protection IP20 and is intended for installation in a control cabinet.

Configuration

The SIMATIC ET 200SP distributed I/O system is installed on a mounting rail. It consists of:

- CPU/interface module
- Up to 64 I/O modules, which can be plugged into BaseUnits in any combination
- Up to 31 motor starters
- A server module that completes the configuration of the ET 200SP.

Configuration example



①	CPU/interface module
②	Light-colored BaseUnit BU..D with infeed of supply voltage
③	Dark-colored BaseUnits BU..B for extending the potential group
④	BaseUnit for motor starter
⑤	Server module (included in the scope of delivery of the CPU/interface module)
⑥	ET 200SP motor starter
⑦	I/O module
⑧	BusAdapter
⑨	Mounting rail
⑩	Reference identification label

Figure 3-2 Configuration example of the ET 200SP

3.2 What are fail-safe automation systems and fail-safe modules?

Fail-safe automation systems

Fail-safe automation systems (F-systems) are used in systems with higher safety requirements. F-systems control processes and ensure that they are in a safe state immediately after shutdown. In other words, F-systems control processes in which an immediate shutdown does not endanger persons or the environment.

Safety Integrated

Safety Integrated is the integrated safety concept for automation and drive technology from Siemens.

Proven technologies and systems from automation technology are used for safety systems. Safety Integrated includes the complete safety sequence, ranging from sensor, actuator and fail-safe modules right through to the controller, including safety-related communication via standard fieldbuses. Drives and controllers handle safety tasks in addition to their actual functions.

Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard modules is that they have an internal two-channel design. This means the two integrated processors monitor each other, automatically test the input and output circuits, and switch the fail-safe module to a safe state in the event of a fault.

The F-CPU communicates with a fail-safe module via the safety-related PROFIsafe bus profile.

Fail-safe motor starters

Fail-safe motor starters enable safety-related tripping of motor loads. Fail-safe motor starters are not PROFIsafe nodes. Motor starters operate together with the fail-safe modules of the ET 200SP system.

Area of application of ET 200SP with fail-safe I/O modules

By using the ET 200SP distributed I/O system with fail-safe I/O modules, you are replacing conventional safety engineering configurations. This includes the replacement of switching devices for emergency STOP, protective door monitors, two-hand operation, etc.

3.3 How are SIMATIC Safety F-systems structured with ET 200SP?

SIMATIC Safety F-system with ET 200SP

The figure below shows an example of a configuration for a SIMATIC Safety F-system with ET 200SP distributed I/O system and PROFINET IO. The PROFINET IO lines can be set up with copper cable, fiber-optic cable or WLAN.

Fail-safe I/O modules and non-fail-safe I/O modules can be combined in an ET 200SP configuration.

The fail-safe IO controller (F-CPU) exchanges safety-related and non-safety-related data with fail-safe and non-fail-safe ET 200SP modules.

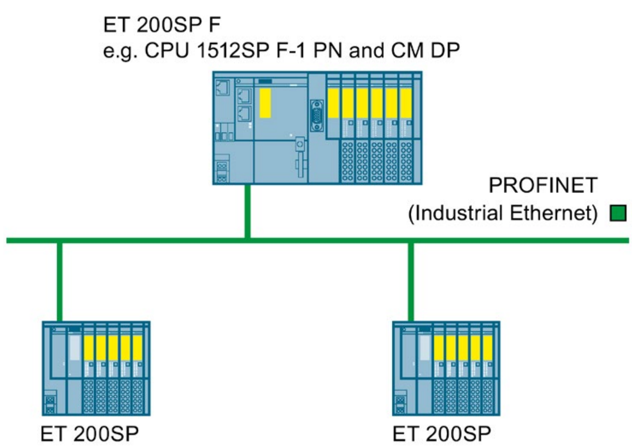


Figure 3-3 Fail-safe SIMATIC Safety automation system (sample configuration)

Fail-safe ET 200SP I/O modules

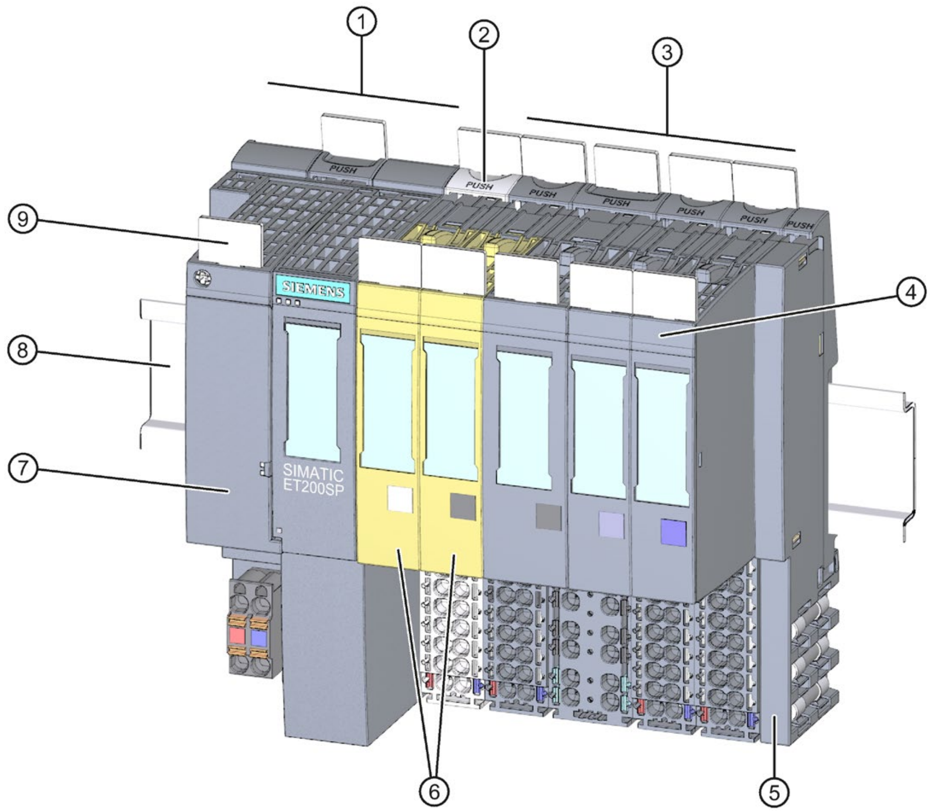
The following fail-safe I/O modules are available for the ET 200SP distributed I/O system:

- Fail-safe power modules are used to supply the potential group load voltage and for the safety-related tripping of the load voltage for non-fail-safe output modules.
- Fail-safe digital input modules detect the signal states of safety-related sensors and send the relevant safety frames to the F-CPU.
- Fail-safe digital output modules are suitable for safety-related shutdown procedures with short circuit and cross-circuit protection up to the actuator.

ET 200SP fail-safe motor starters

Fail-safe motor starters are suitable for safety-related tripping of motor loads.

Example of a configuration with fail-safe I/O modules



① Interface module
② Light-colored BaseUnit BU..D with infeed of supply voltage
③ Dark-colored BaseUnits BU..B for conducting the potential group further
④ I/O module
⑤ Server module (ships with the interface module)
⑥ Fail-safe I/O modules
⑦ BusAdapter
⑧ Mounting rail
⑨ Reference identification label

Figure 3-4 Example of a configuration of the ET 200SP with fail-safe I/O modules

Hardware and software requirements

Fail-safe modules ET 200SP are supported by IM155-6PN ST interface modules as of firmware V1.1.1, IM155-6PN HF as of firmware V2.0, IM155-6PN HS as of firmware V4.0 and IM155-6DP HF as of firmware V1.0.

You require the STEP 7 Safety Advanced option package, V12 or higher including HSP 54, for configuration and programming of the ET 200SP fail-safe modules with the SIMATIC Safety fail-safe system.

You require the F-Configuration Pack V5.5 SP10 or later for configuring and programming the ET 200SP failsafe modules with the Distributed Safety failsafe system.

You require the F-Configuration Pack V5.5 SP12 or later for configuring and programming the ET 200SP failsafe modules with the F/FH Systems failsafe system.

ET 200SP fail-safe motor starters are supported by interface modules IM155-6PN BA, firmware V3.2 or higher, IM155-6PN ST, firmware V3.1 or higher, IM155-6PN HF, firmware V3.1 or higher and IM155-6DP HF firmware V3.0 or higher.

You require SIMATIC Step 7 V14 or higher for configuration and programming of ET 200SP fail-safe motor starters. The F-Configuration Pack is not needed for configuration and programming of the ET 200SP fail-safe motor starter.

Note

Configuration of ET 200SP motor starters, SIMATIC Step 7 V13 or higher, is possible with a GSD file (GSDML).

Use in safety mode only

Safety mode is the F-I/O operating mode that allows safety-related communication using safety frames.

Safety mode of motor starters is characterized by the fail-safe digital input (F-DI) and availability of the 24 V power supply.

You can only use the ET 200SP fail-safe I/O modules in safety mode. They cannot be used in non-fail-safe mode.

Achievable safety classes

The fail-safe modules are equipped with integrated safety functions for safety mode.

You can achieve the safety classes of the table below:

- With the appropriate parameter assignment of the safety functions in STEP 7
- With a specific combination of fail-safe and non-fail-safe I/O modules
- With a special arrangement and wiring of the sensors and actuators

Table 3- 1 Safety classes that can be achieved with ET 200SP in safety mode

Safety class in safety mode		
According to IEC 61508	**In accordance with ISO 13849-1**	
SIL2	Category 3	(PL) Performance Level d
SIL3	Category 3	(PL) Performance Level e
SIL3	Category 4	(PL) Performance Level e

Additional information

You will find the use cases and wiring for the relevant safety class in the manuals of the fail-safe I/Os and the fail-safe motor starters.

3.4 Components

Basic components of the ET 200SP distributed I/O system

Table 3- 2 Basic components of the ET 200SP

Basic component	Function	Figure
Mounting rail in accordance with EN 60715	The mounting rail is the rack of the ET 200SP. The ET 200SP is installed on the mounting rail. The mounting rail is 35 mm high.	
CPU/Fail-safe CPU	The (F) CPU: • Runs the user program. The F-CPU also runs the safety program. • Can be used as an IO controller or I-Device on PROFINET IO or as a standalone CPU • Links the ET 200SP to the IO devices or the IO controller • Exchanges data with the I/O modules via the backplane bus. Additional CPU functions: • Communication via PROFIBUS DP (the CPU can be used as a DP master or DP slave in combination with the CM DP communication module) • Integrated Web server • Integrated technology • Integrated trace functionality • Integrated system diagnostics • Integrated safety • Safety mode (when using fail-safe CPUs)	
<table>
<tr><th>Basic component</th><th>Function</th><th>Figure</th></tr>
<tr><td>Communication module CM DP</td><td>The communication module CM DP
Connects the CPU with PROFIBUS DP
The bus connection is an RS485 interface</td><td></td></tr>
<tr><td>Interface module for PROFINET IO</td><td>The interface module:
Can be used as IO device on PROFINET IO
Links the ET 200SP with the IO controller
Exchanges data with the I/O modules via the backplane bus.</td><td></td></tr>
<tr><td>Interface module for PROFIBUS DP</td><td>The interface module:
Can be used as DP slave on PROFIBUS DP
Links the ET 200SP with the DP master
Exchanges data with the I/O modules via the backplane bus.</td><td></td></tr>
</table>

Basic component	Function	Figure
BusAdapter	The BusAdapters allow free selection of the connection technology for PROFINET IO. The following versions are available for PROFINET CPU/interface modules: • For standard RJ45 connector (BA 2×RJ45) ① • For direct connection of the bus cable (BA 2×FC) ② • For POF/PCF fiber-optic cable (BA 2xSCRJ) ③ • As media converter for POF/PCF fiber-optic cable ⇔ standard RJ45 plug (BA SCRJ/RJ45) ④ • As media converter for POF/PCF fiber-optic cable ⇔ direct connection of the bus cable (BA SCRJ/FC) ⑤ • For glass fiber-optic cable (BA 2xLC) ⑥ • As media converter for glass fiber-optic cable ⇔ standard RJ45 plug (BA LC/RJ45) ⑦ • As media converter for glass fiber-optic cable ⇔ direct connection of the bus cable (BA LC/FC) ⑧		For mixed ET 200SP/ET 200AL configuration, you require the BusAdapter BA-Send 1xFC ① (plugged into the BaseUnit BU-Send). Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1xFC.	
Basic component	Function	Figure
BaseUnit	The BaseUnits provide the electrical and mechanical connection of the ET 200SP modules. Place the I/O modules or the motor starter onto the BaseUnits. Suitable BaseUnits are available in each case for the different requirements. You can find additional information in section Selecting the BaseUnit for I/O modules (Page 40).	
PotDis-BaseUnit potential distributor module	You use the potential distributor module to distribute a variety of potentials (P1, P2). This allows you to implement a multi-cable connection without external terminals with 16-channel digital modules. The assembly has two parts: • If you need additional potential terminals, plug a PotDis-TerminalBlock in the PotDis-BaseUnit. • Alternatively, plug a BU cover (15 mm) on the PotDis-BaseUnit. With potential distributor modules, you may only connect to the PotDis-TB versions BR-W and n.c.-G potential, which exceed the voltage level of SELV/PELV. Other SELV/PELV potential groups should be separated with light-colored PotDis BUs. Suitable PotDis-BaseUnits are available in each case for the different requirements. You can find additional information in section Selecting a PotDis-BaseUnit (Page 45).	PotDis-TerminalBlock	If you need additional potential terminals for a PotDis-BaseUnit, plug a PotDis-TerminalBlock in the PotDis-BaseUnit. Voltages greater than SELV/PELV are only permitted for the PO PotDis-TBs BR (bridged) and NC (not connected). The same applies to PE. Voltages at the terminals of the PotDis modules connected to the P1/P2 rails must not be greater than SELV/PELV. Suitable PotDis-TerminalBlocks are available in each case for the different requirements. You can find additional information in section Selecting a PotDis-TerminalBlock (Page 46).	
Basic component	Function	Figure
Fail-safe power module	The fail-safe power module allows the safety-related shutdown of digital output modules / fail-safe digital output modules.	I/O module / fail-safe I/O module	The I/O module determines the function at the terminals. The controller detects the current process state via the connected sensors and actuators, and triggers the corresponding reactions. I/O modules are divided into the following module types: • Digital input (DI, F-DI) • Digital output (DQ, F-DQ PM, F-DQ PP, F-RQ) • Analog input (AI) • Analog output (AQ) • Technology module (TM) • Communication module (CM)	Motor starter/fail-safe motor starter	The motor starter is a switching and protection device for 1-phase and 3-phase loads. The motor starter is available as a direct-on-line and reversing starter.	

Basic component	Function	Figure
Vale terminal AirLINE SP type 8647 (Bürkert GmbH & Co. KG) [1) 2)]	Basic component: Valve terminal AirLINE SP type 8647 (Bürkert). For more information on the AirLINE SP, type 8647 (e.g. data sheet and operating instructions), please contact Bürkert (https://www.burkert.co.uk/en/type/8647) directly. Function: Valve terminals are common in industrial automation and are used as pilot valves for controlling pneumatic actuators, for example in areas of the food, pharmaceutical and water treatment industries. The ET 200SP in combination with the AirLINE SP, type 8647 from Bürkert provides a universal interface between process and plant control that enables the flexible, modular configuration of pilot valves and I/O modules. The valve terminal can also be fitted to the base of the control cabinet with the help of the AirLINE Quick Adapter. This further reduces the space required in the control cabinet and considerably simplifies installation of the pneumatic system. [1) 2)]	BU cover	Insert the BU cover on the BaseUnits: • Whose slots are not equipped with I/O modules/ motor starters// PotDis-TerminalBlocks. • Whose slots have been reserved for future expansion (as empty slots). You can keep a reference identification label for the planned I/O module inside the BU cover. There are three versions: • For BaseUnits with a width of 15 mm ① • For BaseUnits with a width of 20 mm ② • For BaseUnits of motor starters with a width of 30 mm ③	
Basic component	Function	Figure
Server module	The server module completes the configuration of the ET 200SP. The server module includes holders for 3 spare fuses (5 × 20 mm). The server module ships with the CPU/interface module.	Coding element	The coding element codes the I/O module with the BaseUnit. There are two versions: • Mechanical coding element ①: Ensures the coding • Electronic coding element ②: This version also has an electronic, rewritable memory for module-specific configuration data (such as the F-destination address for fail-safe modules, parameter data for the IO link master).

Accessories of the ET 200SP distributed I/O system

Table 3- 3 Accessories of the ET 200SP

Accessories	Function	Figure
24 V DC connector	Applying the 24 V DC supply at the connector and connection with the CPU/interface module, for example.	Shield connection	The shield connection allows the low-impedance contacting of cable shields with minimum installation times.	Labeling strips	Attach the labeling strips to the modules for system-specific labeling of the ET 200SP. The labeling strips can be printed. The labeling strips can be ordered as accessories (Page 302) on a roll for thermal transfer printers or as DIN A4 format sheets for laser printers.	Reference identification labels	The labels enable the reference identification labeling of the ET 200SP components. The labels can be ordered on a mat for thermal transfer and inkjet printers as accessories (Page 302).	
Color identification labels	The color identification labels are module-specific and can be ordered for the process terminals, AUX terminals and additional terminals as accessories (Page 302).	
Accessories of the SIMATIC ET 200SP motor starters

Table 3- 4 SIMATIC ET 200SP motor starter accessories

Accessories	Function	Figure
3DI/LC module	The optional 3DI/LC module has three digital inputs and one LC input. For reasons of operational safety, input LC is permanently set to manual local mode. By parameterizing the inputs DI1 - DI3 with motor CLOCKWISE or motor COUNTER-CLOCKWISE, you can control the motor in manual local mode. The functions of the 3DI/LC module are not relevant to functional safety. Detailed information on the functions when using a 3DI/LC module can be found in the Manual (https://support.industry.siemens.com/cs/ww/en/view/109479973).	
Mechanical bracket for BaseUnit	Use the mechanical bracket for additional fixing of the motor starter. You can use the mechanical bracket on 7.5 mm and 15 mm mounting rails.	Infeed bus cover	For finger-safe termination of the infeed bus, use the cover.	
Fan	You can use the motor starter at higher ambient temperatures if a fan is installed.	
4 Application planning

Overview

The BaseUnits (BU) are classified according to different types. Every BaseUnit type is distinguished by characteristics that match certain I/O modules and motor starters (see the following table and graphics).

You recognize the BU type for an I/O module by the last two digits of an I/O module's article number.

The BU type onto which you can plug the respective I/O module is printed on the I/O modules. You can therefore read which BU type you need straight from the I/O module (see Factory labels (Page 127) (page 122)).
Example: On the output module DQ 16x24VDC/0.5A ST with article number 6ES7132-6BH01-0B**A0** the information "BU: A0" is printed. This means you can plug this I/O module to a BaseUnit of the BU type "A0", which means on any BaseUnit whose article number ends in "A0". I/O modules that are suitable for two BU types are labeled accordingly, for example "BU: A0, A1".

Note

You will find a complete overview of the possibilities of combining BaseUnits and I/O modules /motor starters in the Product information for documentation of the ET 200SP I/O system (http://support.automation.siemens.com/WW/view/en/73021864).

Additional information

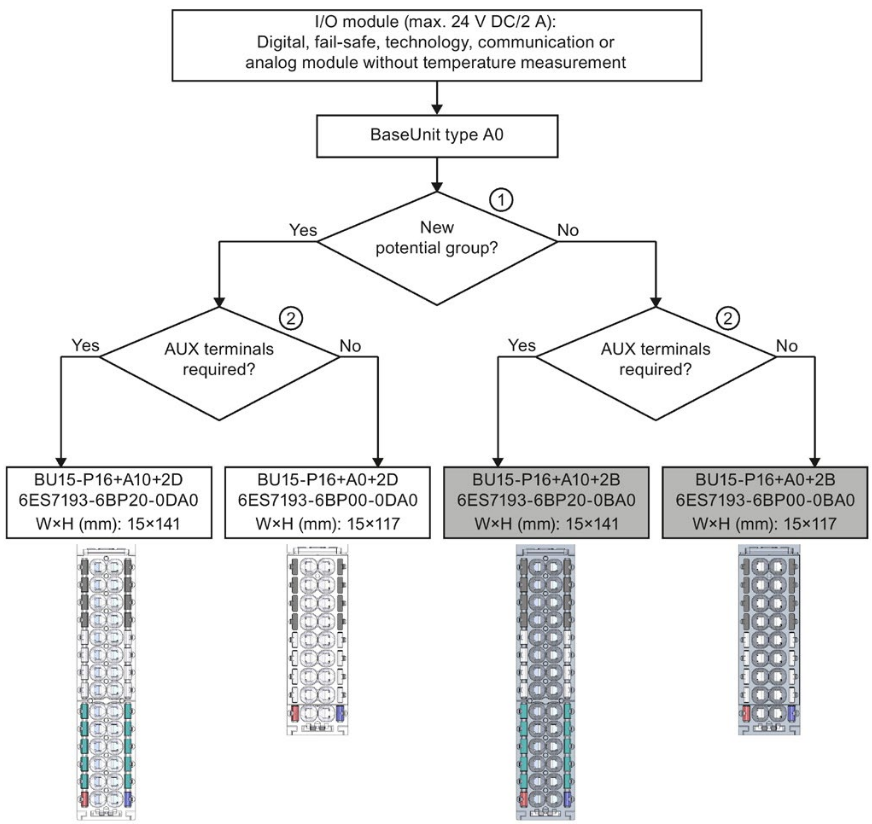
Additional information on the functional assignment of the terminals and on the associated BaseUnits can be found in one of the following manuals:

- Manual for the relevant I/O module (http://support.automation.siemens.com/WW/view/en/55679691/133300)
- Manual BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)
- Motor starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) manual

4.1 Selecting the BaseUnit for I/O modules

4.1.1 Digital, fail-safe, communication, technology or analog modules without temperature measurement

Selection of a suitable BaseUnit



① Light-colored BaseUnit: Configuration of a new potential group, electrical isolation from adjacent module on the left. The first BaseUnit of the ET 200SP is usually a light-colored BaseUnit for feeding the supply voltage L+.
Exception: If you insert an AC I/O module or an AI Energy Meter as the first I/O module, the first BaseUnit in the ET 200SP configuration can be a dark-colored BaseUnit. The requirement is that you use a CPU or IM 155-6 (as of V3.0).

Dark-colored BaseUnit: Conduction of the internal power and AUX buses from the adjacent module on the left.

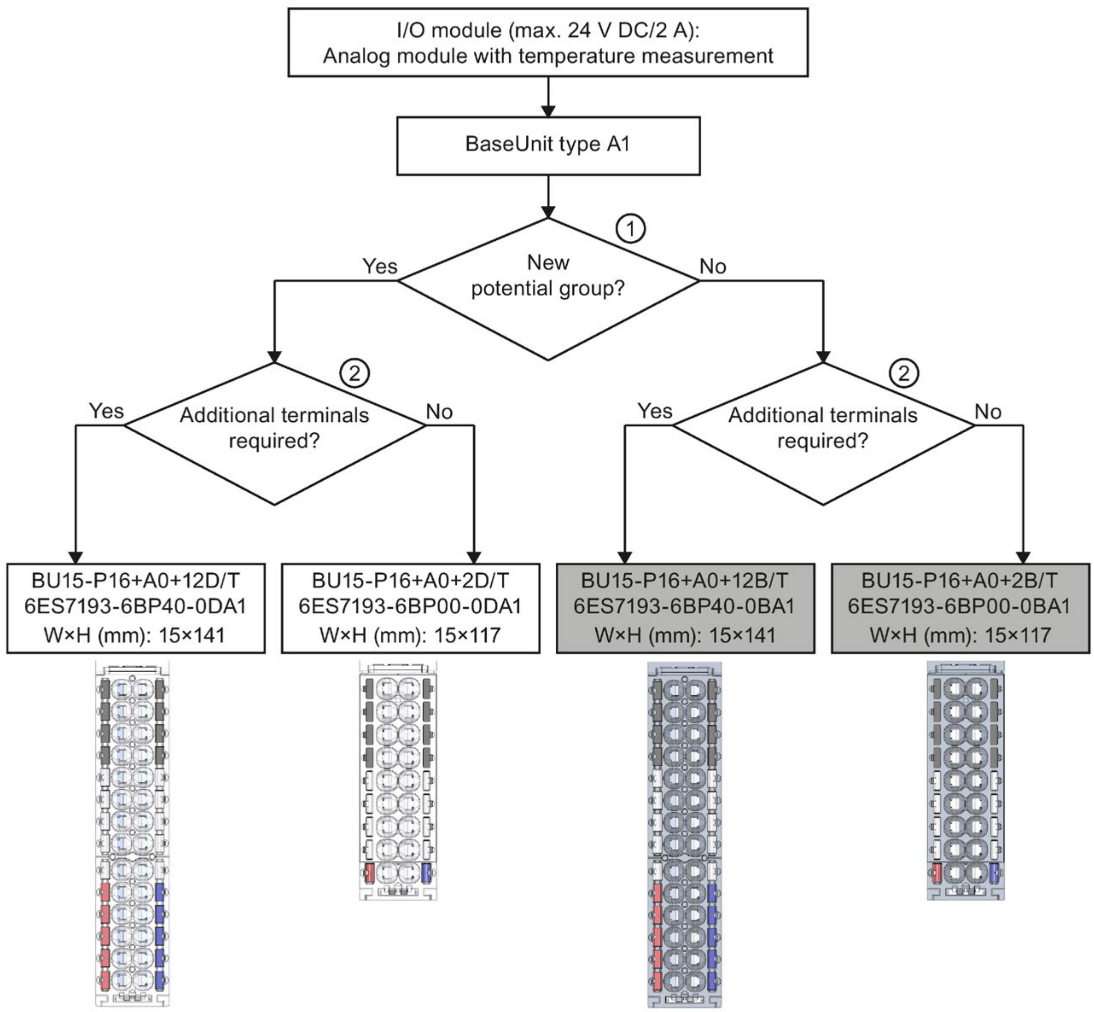
② AUX terminal: 10 internally bridged terminals for individual use up to 24 V DC/10 A or as protective conductors.

Example: Multiple cable connection for DI 8×24VDC ST

Figure 4-1 Digital, fail-safe, communication, technology or analog modules without temperature measurement

4.1.2 Analog modules with temperature measurement

Selection of a suitable BaseUnit



① Light-colored BaseUnit: Configuration of a new potential group, electrical isolation from adjacent module on the left. The first BaseUnit of the ET 200SP is usually a light -colored BaseUnit for feeding the supply voltage L+.
Dark-coloredBaseUnit: Continuation of the internal power and AUX buses from the adjacent module on the left.

② Additional terminals: 2×5 internally bridged terminals for individual use up to 24 V DC/2 A
Example: Sensor supply for AI 4×U/I 2-wire ST

Figure 4-2 Analog modules with temperature measurement

4.2 Selecting motor starters with a suitable BaseUnit

4.2.1 Selecting a BaseUnit for motor starters

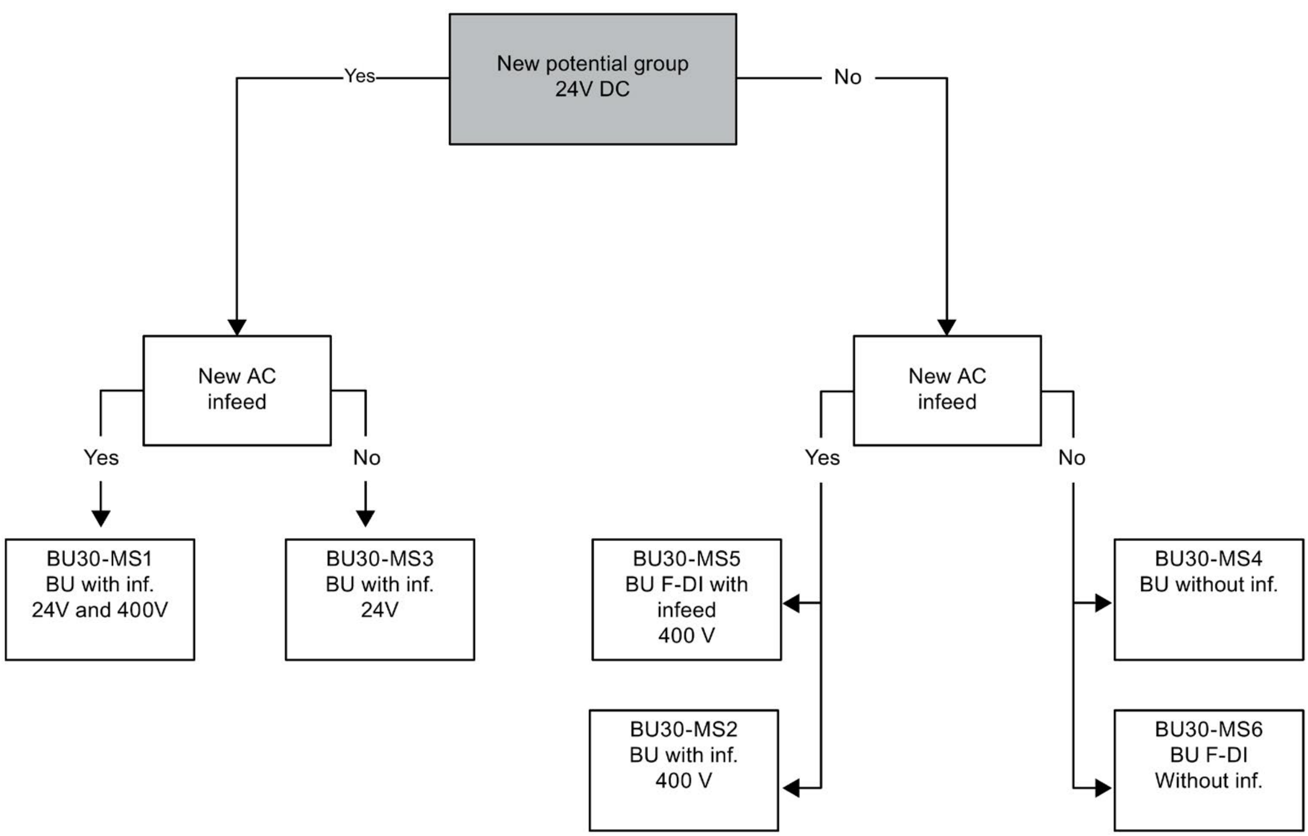
The motor starter BaseUnits "BU30-MS1", "BU30-MS2", "BU30-MS3" and "BU30-MS4" are compatible with all non-fail-safe motor starters. The motor starter BaseUnits "BU30-MS1", "BU30-MS2", "BU30-MS3", "BU30-MS4", "BU30-MS5" and "BU30-MS6" are compatible with all fail-safe motor starters. You will find an overview of available BaseUnits for motor starters here (Page 36). With the different BaseUnits, you can form different potential groups for the 24 V DC electronics supply (L+/M) and for the AC infeed.

Voltage range

The voltage range of the AC infeed is between 48 V AC and 500 V AC.

Selection criteria for the BaseUnit

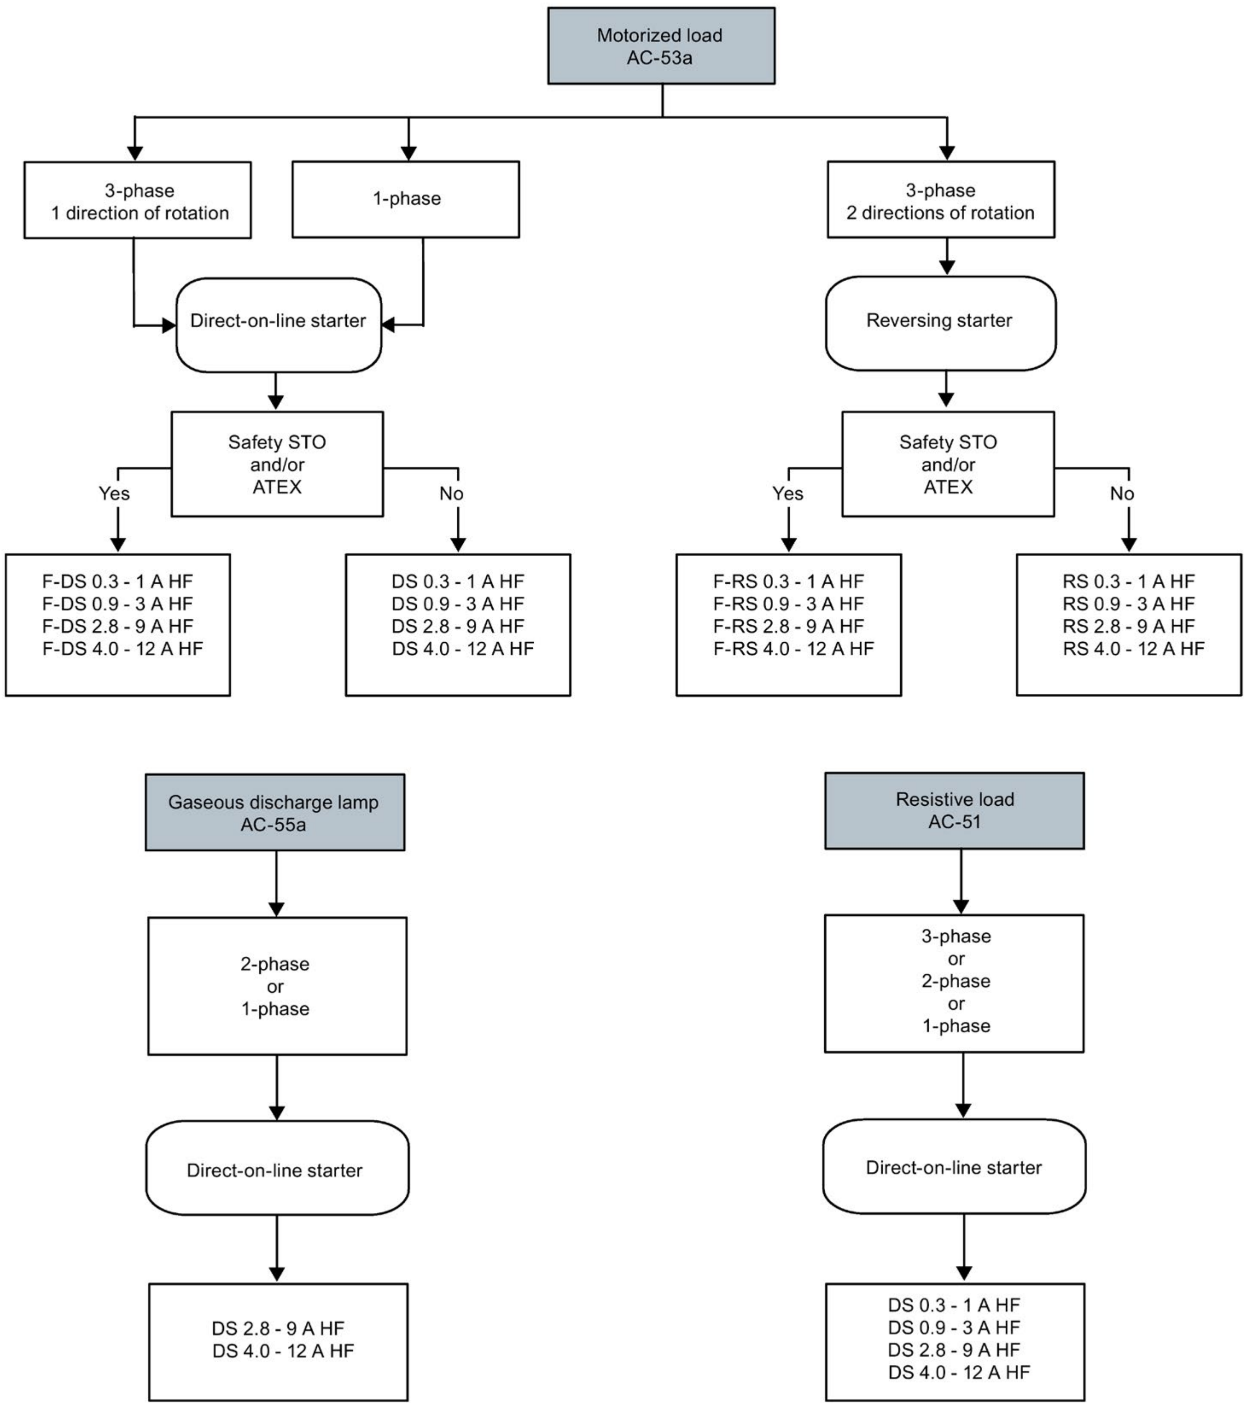
The figure below shows the criteria you use to select the appropriate BaseUnit:



Form separate potential groups on the infeed bus for single-phase (L, N, PE) and three-phase (L1, L2, L3, PE) operation.

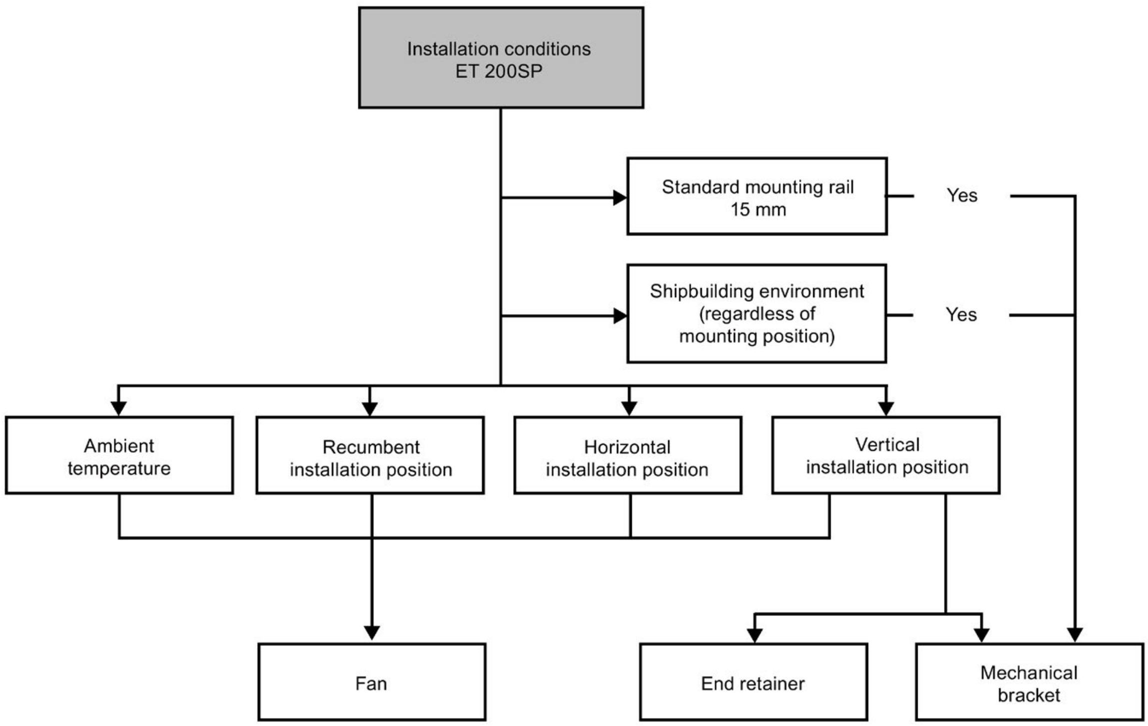
4.2.2 Selecting the motor starter

You select the suitable motor starter using the load type according to the following scheme:



4.2.3 Selecting accessories for motor starters

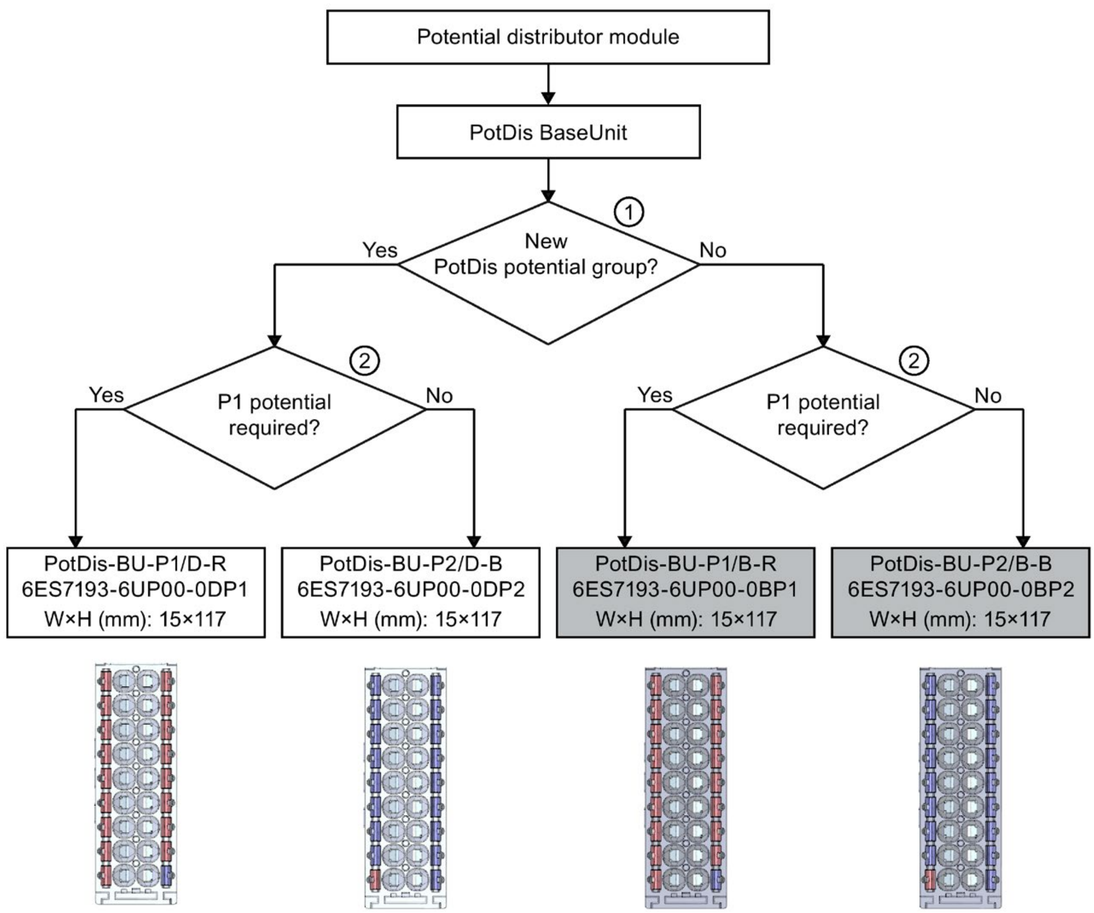
Observe the installation conditions of the station with ET 200SP motor starters. The figure below shows the criteria the station must meet:



4.3 Selecting potential distributor modules

4.3.1 Selecting a PotDis-BaseUnit

Selection of a suitable PotDis-BaseUnit potential distributor module



① Light-colored PotDis-BaseUnit: Configuration of a new potential group, electrical isolation from adjacent module on the left. The first BaseUnit of the ET 200SP is usually a light-colored BaseUnit for the incoming supply voltage.

② P1 terminal: 16 internally bridged terminals for individual use up to 48 V DC/10 A
Example: Multiple cable connection for DI 16×24VDC ST

Figure 4-3 PotDis-BaseUnits

Please note:

- The potential groups opened with a light-colored PotDis-BU must not contain any I/O modules. You can integrate any dark-colored PotDis-BUs into I/O module potential groups provided they are based on an SELV/PELV supply.
- If you do not need the additional terminals of the PotDis-TB in a potential distributor module, replace the PotDis-TB with a BU cover. You may only connect one potential group within a combination of PotDis-BU and PotDis-TB.
- Only SELV/PELV potentials are permitted on PotDis-BUs. Separate different SELV/PELV potential groups using light-colored PotDis-BUs.
- With potential distributor modules, you may only connect to the PotDis-TB versions BR-W and n.c.-G potential, which exceed the voltage level of SELV/PELV.
- PotDis terminals are not directly configurable as PotDis via GSD/GSDML. When configuring with GSD, always use an dummy module; with GSDML, integrate a free space.

Additional information

Additional information on the potential distributor modules (PotDis-BaseUnits and PotDis-TerminalBlocks) is available in the BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521) manual.

4.3.2 Selecting a PotDis-TerminalBlock

Selection of a suitable PotDis-TerminalBlock

With a PotDis-TerminalBlock you are expanding a PotDis-BaseUnit potential distributor module by an additional 18 potential terminals.

You can freely combine PotDis-TerminalBlocks and PotDis-BaseUnits.

The following PotDis-TerminalBlocks are available:

Table 4- 3 Selection of TerminalBlock PotDis-TB

PotDis-TerminalBlocks		
TerminalBlock	**Explanation**	**Application**
PotDis-TB-P1-R	Terminal block with 18 terminals with red spring releases with connection to the supply voltage P1 of the PotDis-BaseUnit with SELV/PELV.	Provision of 18 x P1 potential, e.g. for P1 sensor supply with 3-wire connection for 16-channel digital input modules
PotDis-TB-P2-B	Terminal block with 18 terminals with blue spring releases with connection to ground (P2) of the PotDis-BaseUnit	Provision of 18 x P2 potential, e.g. for ground of the sensor supply with 2-wire connection for 16-channel digital output modules

PotDis-TerminalBlocks		
PotDis-TB-n.c.-G	Terminal block with 18 terminals with gray spring releases without connection to each other or to a voltage bus of the PotDis-BaseUnit	Provision of 18 x n.c. (not connected), for reserving ("parking") unused signals/lines, e.g. for antivalent sensors in the same potential group
PotDis-TB-BR-W	Terminal block with 18 terminals connected to each other with white spring releases without connection to a voltage bus of the PotDis-BaseUnit	Provision of 17 terminals with shared potential (the 18th terminal is used for infeed) for supply of external consumers

Additional information

Additional information on the potential distributor modules (PotDis-BaseUnits and PotDis-TerminalBlocks) is available in the BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521) manual.

4.4 Hardware configuration

Maximum mechanical configuration

As soon as **one** of the following rules applies, the maximum configuration of the ET 200SP has been reached:

Table 4- 4 Maximum mechanical configuration

Properties	Rule
Number of modules	Maximum of 12/30/32/64 I/O modules (depending on the CPU used/the interface module used; see CPU (http://support.automation.siemens.com/WW/view/en/90466439/133300) and interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300) manuals)
	For every 6 F-modules F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0), the maximum configuration is reduced by 1 module.
Number of motor starters	Maximum of 31 motor starters
Backplane bus length of the ET 200SP	maximum 1 m mounting width (without CPU/interface module, including server module)

Electrical maximum configuration for I/O modules

The number of operable I/O modules of a potential group is limited by the following factors:

- Power consumption of the I/O modules
- Power consumption of the components supplied via these I/O modules

The maximum current carrying capacity of the terminals on the BaseUnit L+/M is 10 A. Current carrying capacity refers to the current load via the power bus and the infeed bus of the ET 200SP station. Consider the current carrying capacity when using a motor starter.

Maximum electrical configuration for motor starter power bus (24 V DC)

To determine the current requirement of an individual motor starter via the power bus, take account of the following parameters:

- Current consumption via DC infeed in the ON state
- Current consumption via DC infeed when switching on (40 ms peak load)
- Increased power consumption through fan operation
- Current requirement via encoder supply of the connected DI module

The maximum current carrying capacity of the 24 V potential group is 7 A across the entire permissible temperature range.

Maximum electrical configuration for motor starter infeed bus (500 V AC)

To determine the current requirement of an individual motor starter via the infeed bus, proceed as follows:

Calculate the current requirement via the main current paths of the individual motor starter. In doing so, take into account the parameter I_e (set rated operational current of the motor starter). The permissible overload characteristics of the motor feeder for motors are determined with the thermal motor model. You calculate the current value ($I_{infeed\ bus}$) for the infeed bus of the ET 200SP system according to the following formula:

$I_{infeed\ bus} = \sum_n(I_e * 1.125)$
n = number of motor starters of a potential group on the infeed bus

Refer to the Manual (https://support.industry.siemens.com/cs/ww/en/view/109479973) for details of how to assign the basic rated operational current I_e parameter.

The following values apply for the potential group of the AC infeed:

- The maximum current carrying capacity is 32 A at an ambient temperature of up to 50 °C.
- The maximum current carrying capacity is 27 A at an ambient temperature of up to 60 °C.
- The maximum current carrying capacity for applications according to UL requirements is 24 A at an ambient temperature of up to 60 °C.

Address space

The address space depends on the CPU/interface module (see CPU (http://support.automation.siemens.com/WW/view/en/90466439/133300) Manual) and the interface module used (see Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300) Manual):

- For PROFINET IO: Dependent on the IO controller/IO device used
- For PROFIBUS DP: Dependent on the DP master used

4.5 Forming potential groups

4.5.1 Basics

Introduction

Potential groups for the ET 200SP distributed I/O system are formed by systematically arranging the BaseUnits.

Requirements

For formation of potential groups, the ET 200SP distinguishes between the following BaseUnits:

- BaseUnits BU...D (recognizable by the light-colored terminal box and the light-colored mounting rail release button):
  - Opening of a new potential group (power busbar and AUX bus are interrupted to the left)
  - Infeed of the supply voltage L+ up to an infeed current of 10 A
- BaseUnits BU...B (recognizable by the dark-colored terminal box and the dark-colored mounting rail release button):
  - Conduction of the potential group (power busbar and AUX bus continued)
  - Pick up of the supply voltage L+ for external components or loop-through with a maximum total current of 10 A
- BaseUnits BU30-MSx (BaseUnit for the motor starter only)

  Depending on the version, the BaseUnits in the "BU30-MSx" model series possess the following properties:
  - Opening a new potential group or continuing an existing one
  - Feeding in the supply voltage L+ up to an infeed current of 7 A DC
  - Opening a new load group or continuing an existing one by means of 500 V AC infeed bus
  - Feeding in the line voltage up to an infeed current of 32 A AC

Placement and grouping of I/O modules

Each BaseUnit BU...D that you install in the ET 200SP configuration opens a new potential group and supplies all subsequent I/O modules (on BaseUnits BU...B) with the necessary supply voltage. The first 24 V DC I/O module to the right of the CPU/interface module must be installed on a light-colored BaseUnit BU...D. Exception: If you insert an AC I/O module or an AI Energy Meter as the first I/O module, the first BaseUnit in the ET 200SP configuration can be a dark-colored BaseUnit. The requirement is that you use a CPU or IM 155-6 (as of V3.0).

If you want to place another BaseUnit BU...B after a BaseUnit BU...D, disconnect the power and AUX buses and open a new potential group at the same time. This allows individual grouping of the supply voltages.

Note

All BaseUnits placed in a load group must match the infeed potential of the corresponding light-colored BaseUnits.

Do not connect any BaseUnit of the "BU...B" type on the right of a motor starter's BaseUnit (BU30-MSxx).

Placing and connecting potential distributor modules

Potential distributor modules provide potential distributors integrated into the system that you can use to configure a rapid, space-saving customized replacement for standard potential distribution systems.

You can place potential distributor modules at any location within the ET 200SP distributed I/O system. To do so, you must observe the same design rules as for placing and connecting I/O modules. Potential distributor modules are only suitable for SELV/PELV.

A potential distributor module consists of a potential distributor BaseUnit (PotDis-BU) and (if necessary) a potential distributor TerminalBlock (PotDis-TB) plugged onto it. If you do not need the additional terminals of the PotDis-TB, install a BU cover (15 mm) on the PotDis-BaseUnit.

You must not place a BaseUnit for I/O modules in a PotDis potential group formed with a light-colored PotDis-BaseUnit.

Note

Identical voltages with potential distributor modules

You can only connect identical (supplied) voltages with to the terminals of a potential distributor module or PotDis potential group. Example: You only connect 24 V DC.

Placement and grouping of I/O modules and motor starters

For the potential group (L+/M), the following slot rules apply within the motor starter modules and other I/O modules of the ET 200SP:

- An unassembled BaseUnit (BaseUnit with BU cover) must be inserted between the CPU, an interface module or an I/O module and the motor starter. This is not necessary between the motor starters.
- The empty slot can take on the potential (24 V DC) of the potential group on the left of it (L+, M), i.e. I/O modules and motor starters can be operated in the same potential group.
- If you would like to insert an I/O module on the right of a motor starter, then use only one BaseUnit of the BU...D Typ A0 type (light terminal box).
- The BaseUnits BU30-MS2, BU30-MS4, BU30-MS5 and BU30-MS6 can take on the potential groups of other BaseUnit types.
  However, pay attention to the following exceptions:
  - Only a BaseUnit of type BU30-MS1 or BU30-MS3 may follow an AS-i module (AS-i potential group).
  - Only BaseUnits with fail-safe motor starters can be connected together in the same potential group of an F-PM-E.

WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Hazardous electrical voltage can cause electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

AUX bus (AUX(iliary) bus)

BaseUnits with additional AUX terminals (e.g. BU15-P16+**A10**+2D) enable the additional connection of a potential (up to the maximum supply voltage of the module), which is applied via the AUX bus.

In the case of light-colored BaseUnits, the AUX bus is interrupted to the left. In the case of BaseUnits of motor starters, the AUX bus is interrupted to the left.

The AUX bus can be used individually:

- You can plug a maximum of 8 I/O modules into the corresponding potential group as a PE bar.
- For additionally required voltage

NOTICE
AUX bus as PE bar If you use an AUX bus as a protective conductor bar, attach the yellow-green color identification labels to the AUX terminals, and establish a functional connection to the central protective conductor connection. If you stop using the AUX bus as a protective conductor bar, make sure you remove the yellow-green color identification labels and remove the connection to the central protective conductor connection again.

The AUX bus is designed as follows:

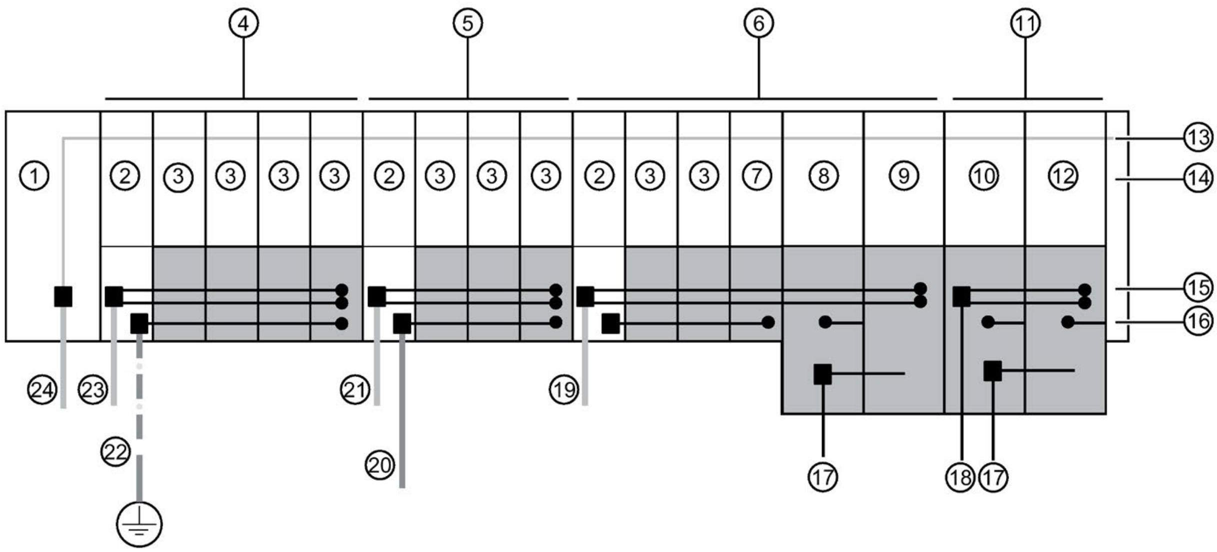
- Maximum current carrying capacity (at 60 °C ambient air temperature): 10 A
- Permissible voltage: Depending on the BaseUnit type (see BaseUnit manual (http://support.automation.siemens.com/WW/view/en/59753521))

Self-assembling voltage buses

You must feed in the supply voltage L+ via the BaseUnit BU...D, BU30-MS1 or BU30-MS3 .

Each BaseUnit BU...B allows access to the supply voltage L+ via terminals (red/blue). The motor starter BaseUnits "BU30-MS1", "BU30-MS2", "BU30-MS3", "BU30-MS4", "BU30-MS5" and "BU30-MS6" do not have this access.

Operating principle



1	CPU/interface module	14	Server module
2	BaseUnit BU...D	15	Self-assembling voltage buses P1/P2
3	BaseUnit BU...B	16	AUX bus

Figure 4-4 Placing the BaseUnits

Connecting different potentials to the power or AUX bus

Note

If you apply different potentials to the power or AUX bus within an ET 200SP station, you need to separate the potential groups with a BaseUnit BU...D.

4.5.2 Forming potential groups with BaseUnit type B1

Introduction

The AC I/O modules of the ET 200SP are required to connect sensors/actuators with alternating voltage 24 to 230 V AC.

Requirements

BaseUnits BU20-P12+A0+4B (BU type B1) and

- DI 4x120..230VAC ST digital input module
- DQ 4x24..230VAC/2A ST digital output module

Operating principle

Connect the required alternating voltage for the AC I/O modules directly at the BaseUnits BU20-P12+A0+4B (terminals 1L, 2L/1N, 2N). Insert the AC I/O modules on the BaseUnits.

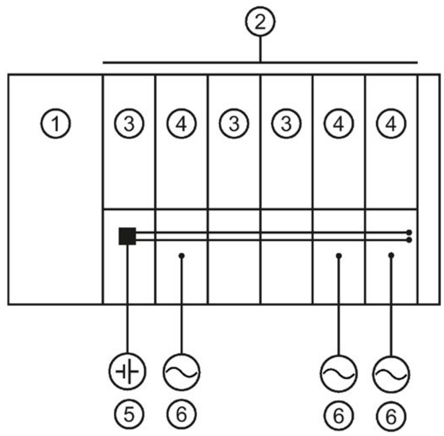
Note

Placing the BaseUnits for AC I/O modules

If you insert an AC I/O module as the first I/O module, a BaseUnit BU20-P12+A0+4B can be the first BaseUnit to the right of the CPU/interface module in the ET 200SP configuration.

The requirement is that you use a CPU as of V3.0 or IM 155-6 (as of V3.0).

- The BaseUnits BU20-P12+A0+4B do not monitor the connected alternating voltage. Please note the information on limiting the overvoltage and power rating in the AC I/O module manuals.
- Remember to take the BaseUnit type into account during configuration.



① CPU/interface module
② 24 V DC potential group
③ BaseUnits with DC I/O modules
④ BaseUnits BU 20-P12+A0+4B with AC I/O modules
⑤ Direct voltage
⑥ Alternating voltage

Figure 4-5 Placing the BaseUnits for the AC I/O modules

4.5.3 Forming potential groups with fail-safe modules

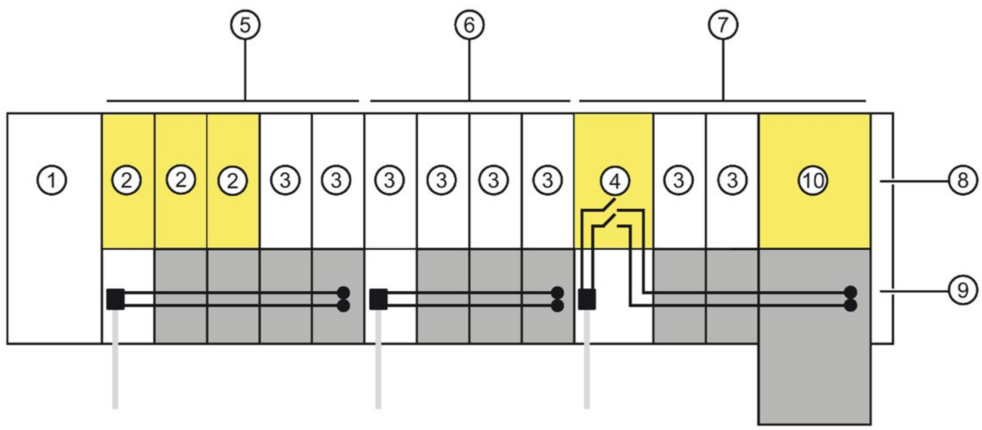
Introduction

ET 200SP distributed I/O systems can be configured using fail-safe and non-fail-safe modules. This chapter provides an example of a mixed configuration comprising fail-safe and non-fail-safe modules.

Example of an ET 200SP configuration with fail-safe and non-fail-safe modules

In principle, it is not necessary to operate fail-safe and non-fail-safe modules in separate potential groups. You can divide the modules into fail-safe and non-fail-safe potential groups and install them.

The figure below shows an example of a configuration with fail-safe and non-fail-safe modules within a single ET 200SP distributed I/O system.



① IM 155-6 PN HF interface module
② F-module
③ Non-fail-safe module
④ Power module F-PM-E 24VDC/8A PPM ST
⑤ Mixed fail-safe and non-fail-safe potential group with BaseUnits BU15..D and BU15..B.
You achieve SIL3/Cat. 4/PLe for the fail-safe modules. No safety category can be achieved with the non-fail-safe motor starter.
⑥ Non-fail-safe potential group with BaseUnits BU15..D and BU15..B
⑦ Fail-safe potential group with BaseUnits BU20..D, BU15..B and BU30-MSx.
Up to SIL2/Cat. 3/PLd is possible if you disconnect the self-assembling voltage bus and thus the non-failsafe modules.
⑧ Server module
⑨ Self-assembling voltage buses P1/P2
⑩ Fail-safe motor starter F-DS HF

Figure 4-6 ET 200SP - example of a configuration with fail-safe modules

4.5.4 Forming potential groups with motor starters

Properties of the 500 V AC infeed bus

The infeed bus has the following properties:

- The infeed bus is assembled by lining up the motor starter BaseUnits "BU30-MSx".
- The infeed bus distributes the energy to the SIMATIC ET 200SP motor starter within one load group.
- You can open load groups by inserting a 500 V infeed BaseUnit (BU30-MS1, BU30-MS2 or BU30-MS5). With the BaseUnits BU30-MS3, BU30-MS4 or BU30-MS6, you can take over the infeed bus from the left-hand BaseUnit.
- Via the infeed bus, you have the option of supplying three-phase load groups via L1, L2 and L3 or with single-phase load groups via L and N.
- The permissible voltage range is between 48 and 500 V AC.
- The maximum current carrying capacity is up 32 A (3-phase) at 50 °C and 500 V. Pay attention to the derating values depending on the configuration.

Properties of the self-assembling voltage bus (L+)

Self-assembling voltage buses have the following properties:

- Maximum current: 7 A
- Rated voltage: 24 V

Pay attention to the derating values depending on the configuration.

The AUX1 bus is not supported in the BaseUnits of the SIMATIC ET 200SP motor starters.

WARNING
Electric shock when operating the infeed bus without touch protection cover
There is a risk of electric shock when touching the infeed bus if you have not fitted a touch protection cover on the infeed bus on the right.
Always fit a touch protection cover on the infeed bus on the right (article number: 3RK1908-1DA00-2BP0).

WARNING
Electric shock when operating a BaseUnit without an inserted motor starter
If you fit a BaseUnit for motor starters without cover (e.g. option handling), there is a risk of an electric shock when touching the BaseUnit.
Always fit a cover on the BaseUnit (article number: 3RK1908-1CA00-0BP0).

Requirements

Use the following devices to form potential groups with motor starters:

- BaseUnits BU30-MSx
- 3RK1308-0xx00-0CP0 motor starters

Operating principle

Feed in the supply voltage L+ via the BaseUnit BU30-MS1 and BU30-MS3 at the 24V DC and M terminals.

You can operate the motor starter on a single-phase (L1, N, PE) or a three-phase (L1, L2, L3, PE) AC voltage system. You connect the required AC voltage directly to the BaseUnits BU30-MSx (terminals L1, L2(N), L3, PE). You plug the motor starter onto the BaseUnits.

Note

The motor starters' AC power supply is not connected to the AC power supply for the AC I/O modules (see Chapter "Forming potential groups with BaseUnit type B1 (Page 55)").

4.6 Configuration examples for potential groups

4.6.1 Configuration examples with BaseUnits

Table 4- 5 Configuration examples with BaseUnits

BaseUnits	Configuration
BU15-P16+A0+2D BU15-P16+A0+2B	BU15-P16+A0+2D BU15-P16+A0+2B BU20-P12+A0+0B	
BaseUnits	Configuration
BU15-P16+A10+2D BU15-P16+A10+2B	
4.6.2 Configuration examples with potential distributor modules

3-wire connection

The potential distributor modules allow for a space-saving design. For a 3-wire connection, you can, for example, replace two digital input modules with 8 channels on a 141 mm long BaseUnit with a digital input module with 16 channels and a potential distributor module, each of which is only 117 mm long.

Note

You must not place a BaseUnit for I/O modules in a PotDis potential group formed with a light-colored PotDis-BaseUnit.

The figure below shows a configuration example with a DI 16×24VDC ST digital input module on a BU15-P16+A0+2B BaseUnit and a PotDis-TerminalBlock PotDis-TB-P1-R on a PotDis-BaseUnit PotDis-BU-P2/B-B.

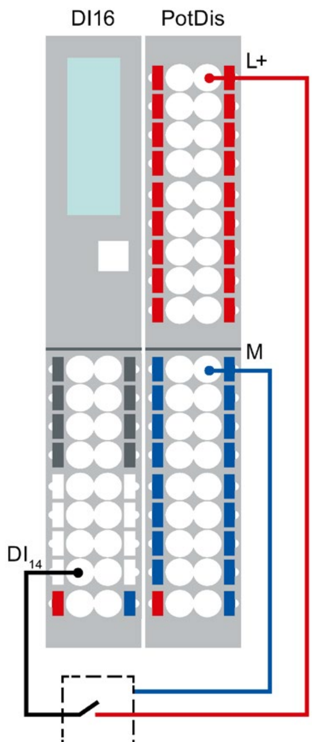

Figure 4-7 **Example: 3-wire connection**

Supply of external components

Another application of the potential distributor modules is the supply of potentials for external components. Potential distributor modules enable simple, compact, integrated and clear design.

Observe the current carrying capacity of each terminal: max. 10 A.

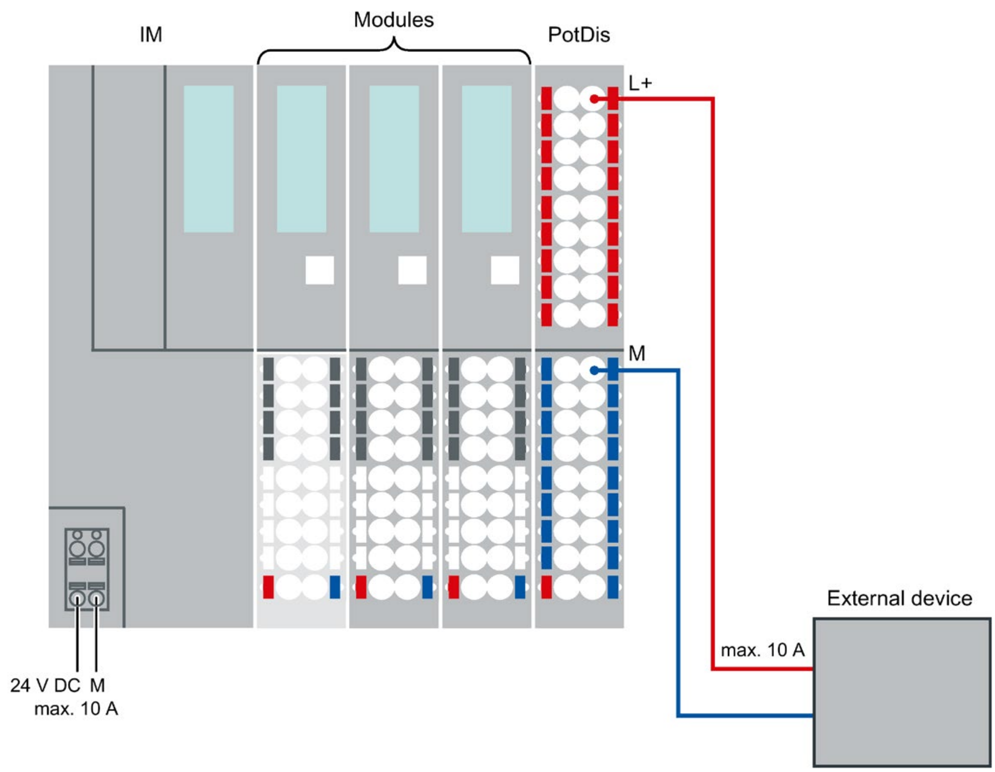

Figure 4-8 **Example: Supply of external components**

5 Installation

5.1 Basics

Introduction

All modules of the ET 200SP distributed I/O system are open equipment. This means you may only set up the distributed I/O system ET 200SP in enclosures, cabinets or electrical equipment rooms and in a dry environment (IP20 degree of protection). The housings, cabinets and electrical operating rooms must guarantee protection against electric shock and spread of fire. The requirements regarding mechanical strength must also be observed. The housings, cabinets, and electrical operating rooms must not be accessible without a key or tool. Access must only be possible for personnel instructed or authorized to work with such equipment.

Installation location

Install the ET 200SP distributed I/O system into a suitable housing/control cabinet with sufficient mechanical strength, fire protection and at least IP54 degree of protection according to EN 60529, and take into consideration the ambient conditions for operating the devices.

Installation position

You can mount the ET 200SP distributed I/O system in any position. The preferred mounting position is horizontal mounting on a vertical wall.

The ambient temperature may be restricted in certain installation positions. You will find more information in the section Mechanical and climatic environmental conditions (Page 296).

Pay attention to chapter "Installation conditions for motor starters (Page 68)" when using motor starters.

Mounting rail

Mount the ET 200SP distributed I/O system on a mounting rail in accordance with EN 60715 (35 × 7.5 mm or 35 × 15 mm).

You need to ground the mounting rail separately in the control cabinet. Exception: If you install the rail on grounded, zinc-plated mounting plates, there is no need to ground the rail separately.

Note

If the ET 200SP distributed I/O system is exposed to vibration and shock loads, both ends of the ET 200SP system assembly must be mechanically fixed to the mounting rail (e.g using 8WA1010-1PH01 ground terminals). This measure prevents the ET 200SP distributed I/O system from shifting to the side.

Note

If the ET 200SP distributed IO system is exposed to increased vibrations and shock, we recommend that you screw the mounting rail to the mounting surface at intervals of approx. 200 mm.

The following are suitable surfaces for the mounting rails:

- Steel strip in accordance with Appendix A of EN 60715 or
- Tinned steel strip. We recommend these in conjunction with the mounting rails in the section Accessories/spare parts (Page 302).

  Note

  If you use mounting rails from other manufacturers, make sure that they have the required properties for your ambient climatic conditions.

Minimum clearances

The figure below shows the minimum clearances you must observe when installing or dismantling the ET 200SP distributed I/O system.

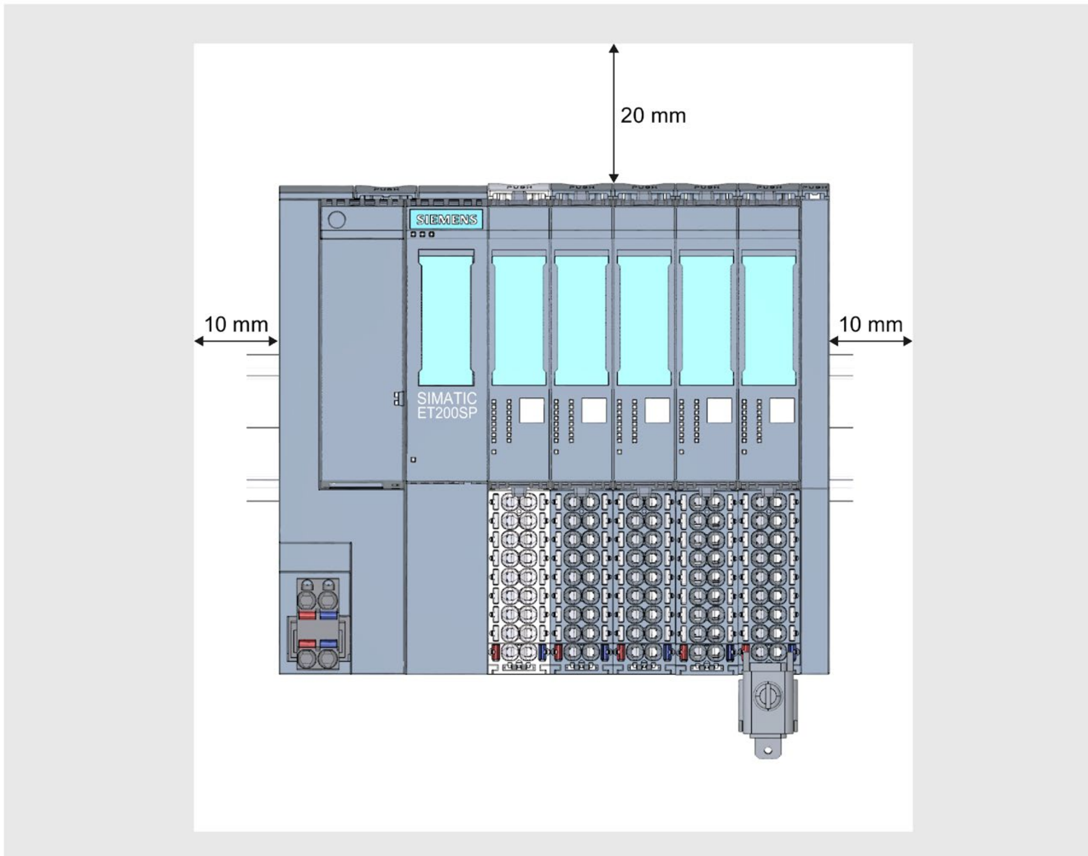

Figure 5-1 Minimum clearances

General rules for installation

WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Hazardous electrical voltage can cause electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

Observe the following rules:

- Installation starts on the left-hand side with the CPU/interface module.
- A light-colored BaseUnit BU..D0, BU30-MS1 or BU30-MS3 with infeed of the supply voltage L+ follows the CPU/the interface module or is placed at the start of each potential group.
  If you fit an AC I/O module or an AI Energy Meter as the first I/O module, then the first BaseUnit in the structure of the distributed I/O system ET 200SP may be a dark-colored BaseUnit. The requirement is that you use a CPU or IM 155-6 (as of V3.0).
- This is followed by BaseUnits BU..B, BU30-MS2 or BU30-MS4 (with a dark-colored terminal box).
- The matching I/O modules / motor starters can be plugged onto the BaseUnits. You will find matching combinations of BaseUnits and I/O modules / motor starters in Application planning (Page 36).
- The server module completes the configuration of the ET 200SP distributed I/O system.

Note

Mount the ET 200SP distributed I/O system only with disconnected supply voltage.

WARNING

Protection from conductive contamination

Taking into account the environmental conditions, the devices must be protected from conductive contamination.
This can be achieved, for example, by installing the devices in a control cabinet with the appropriate degree of protection.

5.2 Installation conditions for motor starters

Observe the following installation conditions when using an ET 200SP motor starter:

- Installation position

  You can fit the motor starter vertically or horizontally. The mounting position refers to the alignment of the mounting rail The maximum permissible ambient temperature range depends on the mounting position:

  – Up to 60° C: Horizontal mounting position

  – Up to 50° C: Vertical installation position

  You also need to consider the current carrying capacity of the ET 200SP components.

  In the case of a vertical mounting position, use end retainers "8WA1808" at both ends of the ET 200SP station:

- Mounting rail

  Use one of the following mounting rails:

  – 35x15 mm DIN rail in accordance with DIN EN 60715

  – 35x7.5 mm DIN rail in accordance with DIN EN 60715

  – SIMATIC S7 mounting rail

- Current carrying capacity of the ET 200SP station
  Current carrying capacity refers to the current load via the power bus and the infeed bus of the ET 200SP station.

Depending on the ambient conditions and mounting position, you have to take account of the fan unit or additional mechanical fixings.

Mechanical brackets

Use the mechanical brackets in the following situations:

- When using a 15 mm mounting rail
- With a vertical mounting position
- For applications according to shipbuilding standards in all mounting positions with 7.5 mm and 15 mm mounting rails

Designing interference-free motor starters

For interference-free operation of the ET 200SP station in accordance with standard IEC 60947-4-2, use a dummy module before the first motor starter. No dummy module is required to the right of the motor starter.

Note the following mounting rules:

Use the following dummy module on the standard mounting rail between the previous module and the SIMATIC ET 200SP motor starter:

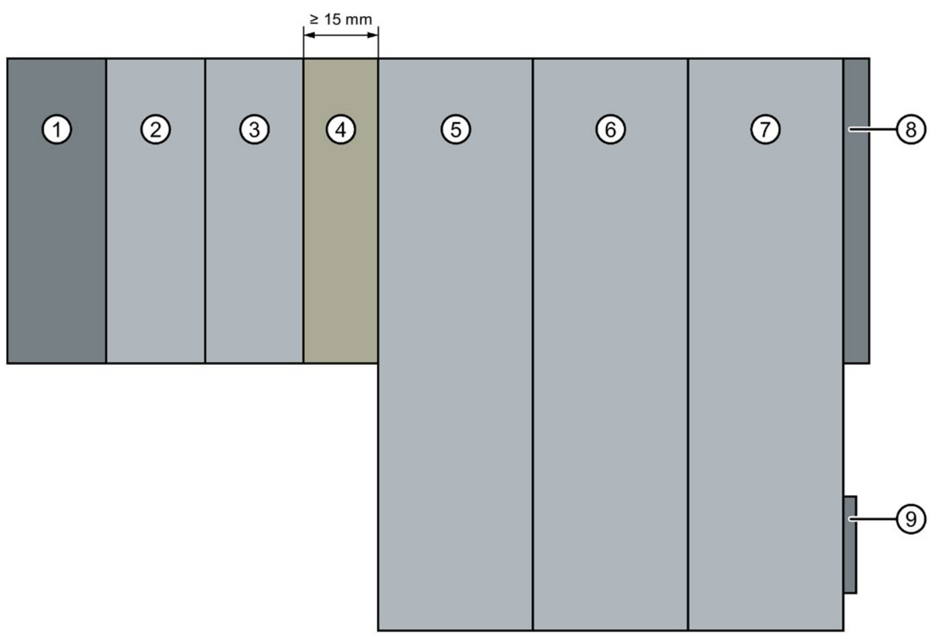
BU cover 15 mm: 6ES7133-6CV15-1AM0 with BaseUnit 6ES7193-6BP00-0BA0

For operation of the ET 200SP station with an unused BaseUnit, a cover must be provided for the open BaseUnit plug contacts (power connector, power bus connector, and backplane bus connector).

The cover protects the plug contacts against dirt. The BU cover can be ordered as an accessory.

Mount the dummy module

The figure below provides a schematic representation of how to implement measures for improving interference immunity.



①	Interface module	⑥	Motor starter
②	Digital input module	⑦	Motor starter
③	Digital output module	⑧	Server module
④	Dummy module	⑨	Infeed bus cover
⑤	Motor starter		

NOTICE
Ensure interference immunity
You must not plug any other module into the BaseUnit of the dummy module, otherwise interference immunity is no longer ensured.

5.3 Mounting the CPU/interface module

Introduction

The CPU/the interface module connects the ET 200SP distributed I/O system to the fieldbus and exchanges the data between the higher-level control system and the I/O modules / motor starters.

Requirement

The mounting rail is fitted.

Required tools

3 to 3.5 mm screwdriver (only for mounting and removing the BusAdapter)

Mounting the CPU/interface module

Watch the video sequence (http://support.automation.siemens.com/WW/view/en/95886218)

To install a CPU/interface module, follow these steps:

1. Install the CPU/interface module on the mounting rail.
2. Swivel the CPU/interface module towards the back until you hear the mounting rail release button click into place.

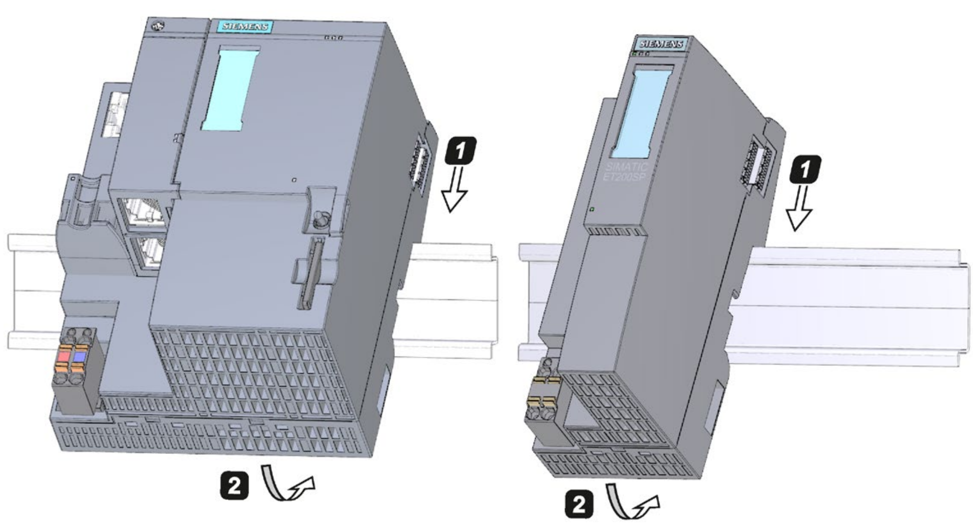


Figure 5-2 Mounting the CPU/interface module

Dismantling the CPU/interface module

The CPU/interface module is wired and BaseUnits are located to its right.

To remove the CPU/interface module, follow these steps:

1. Switch off the supply voltage on the CPU/interface module. Remove the 24 V DC connector from the CPU/interface module.
2. Press the mounting rail release button on the first BaseUnit. At the same time, shift the CPU/interface module parallel to the left until it detaches from the rest of the module group.

   Note: The mounting rail release button is located above the CPU/interface module or BaseUnit.
3. While pressing the mounting rail release button on the CPU/interface module, swivel the CPU/interface module off of the mounting rail.

Note

It is not necessary to remove the BusAdapter from the CPU/interface module.

5.4 Installing the CM DP communication module

Introduction

You need the CM DP communication module to use the CPU with a DP master or DP slave.

Requirements

- The mounting rail is fitted.
- The CPU is installed.

Installing CM DP

To install the CM DP communication module, follow these steps:

1. Install the CM DP to the right of the CPU.
2. Swivel the CM DP towards the back until you hear the mounting rail release button click into place.
3. Slide the CM DP to the left until you hear it click into the CPU.

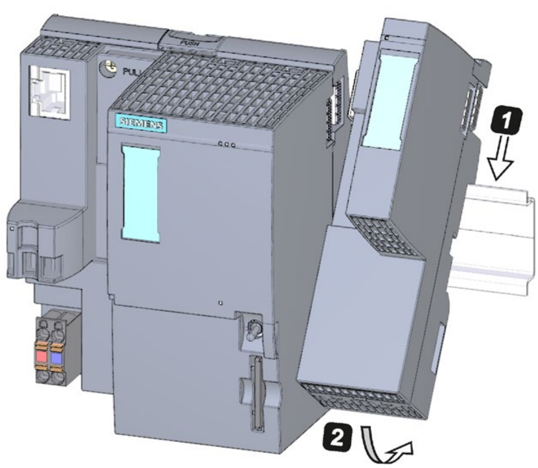

Figure 5-3 Installing CM DP

Removing a CM DP

The CPU and the CM DP are wired and BaseUnits are located to its right.

To remove the CM DP communication module, follow these steps:

1. Switch off the supply voltage on the CPU.
2. Press the mounting rail release button on the first BaseUnit and, at the same time, move the CPU and the CM DP parallel to the left until they detach from the rest of the module group (clearance about 16 mm).
3. Press the mounting rail release button on the CM DP and move it to the right until it detaches from the CPU (clearance about 8 mm).
4. While pressing the mounting rail release button on the CM DP, swivel the CM DP off of the mounting rail.

Note

It is not necessary to remove the bus connector from the CM DP unless you have to replace the CM DP.

5.5 Mounting BaseUnits for I/O modules

Introduction

The BaseUnits are used for electromechanical connection between the individual ET 200SP components. They also provide terminals for connecting external sensors, actuators and other devices.

Requirements

The mounting rail is fitted.

Required tools

3 to 3.5 mm screwdriver (only for dismantling the terminal box and the encoding element)

Installing a BaseUnit

Watch "Install configuration" video sequence (http://support.automation.siemens.com/WW/view/en/95886218)

To install a BaseUnit, follow these steps:

1. Install the BaseUnit on the mounting rail.
2. Swivel the BaseUnit backwards until you hear it click into the mounting rail.
3. Slide the BaseUnit parallel to the left until you hear it click into the preceding CPU/interface module or BaseUnit.

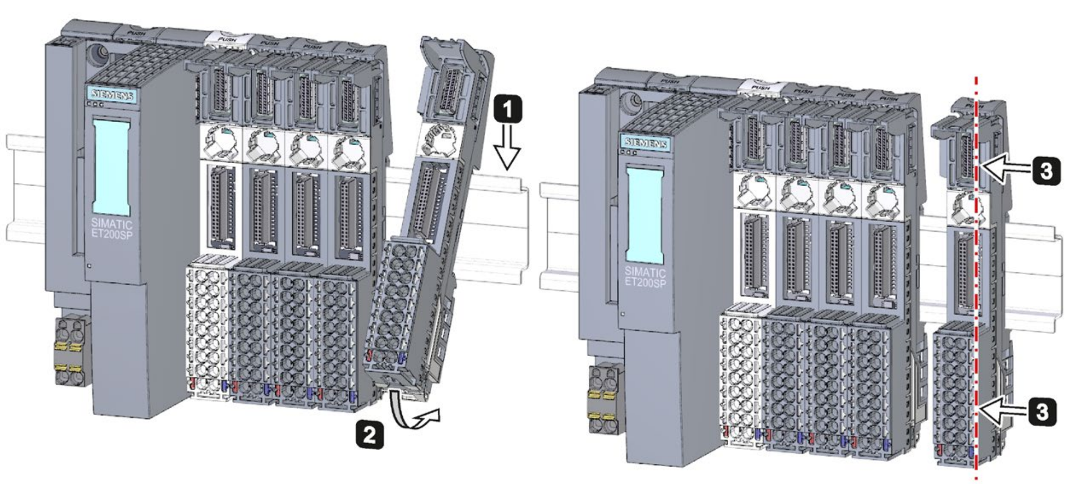

Figure 5-4 Installing a BaseUnit

Removing a BaseUnit

WARNING

Hazardous Voltage

Hazardous electrical voltage can cause electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

To remove a BaseUnit, follow these steps:

The BaseUnit is wired and there are other BaseUnits to its right and left.

To remove a specific BaseUnit, move the neighboring modules. As soon as you have created a clearance of about 8 mm from the neighboring BaseUnits, you can remove the BaseUnit.

Note

The terminal box can be replaced without removing the BaseUnit. Refer to section Replacing the terminal box on the BaseUnit (Page 255).

To remove a BaseUnit, follow these steps:

1. If present, turn off the supply voltage on the BaseUnit.
2. Loosen the wiring on the BaseUnit (with a 3 to 3.5 mm screwdriver).
3. **Removing (from the right):**

   Press the mounting rail release button on the corresponding BaseUnit. Move the BaseUnit parallel to the right and swivel the BaseUnit off of the mounting rail while pressing the mounting rail release button.

   Removing (from the left):

   Press the mounting rail release button on the corresponding BaseUnit and on the BaseUnit to the right of this. Move the BaseUnit parallel to the left and swivel it out of the mounting rail while pressing the mounting rail release button.

   Note: The mounting rail release button is located above the BaseUnit.

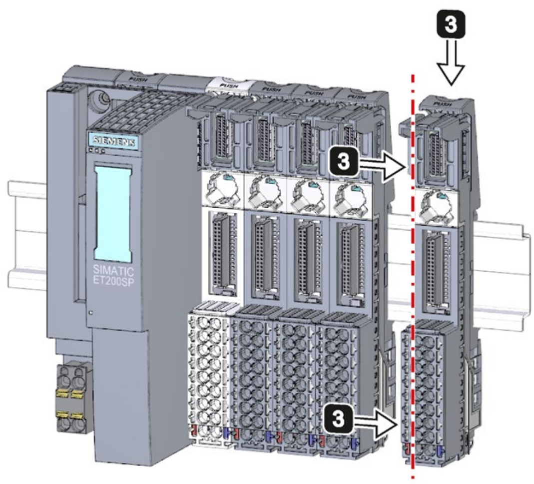

Figure 5-5 Removing the BaseUnit (removing from the right)

5.6 Mounting and dismantling BaseUnits for motor starters

Requirements

- The mounting rail is fitted.
- When using a 15 mm mounting rail, the mechanical bracket (3RK1908-1EA00-1BP0) must be mounted.

Note

Mechanical bracket for BaseUnit

You will find out how to mount the mechanical bracket for the BaseUnit in chapter "Mounting the mechanical bracket for the BaseUnit (Page 83)".

CAUTION

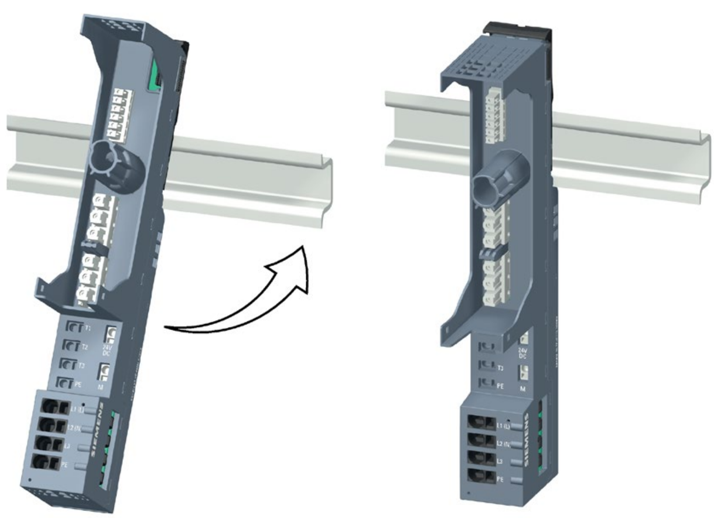
Protection against electrostatic charge

When handling and installing the SIMATIC ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.

Mounting a BaseUnit

Proceed as follows to mount a BaseUnit for motor starters:

1. Hook the BaseUnit into the DIN rail from above.
2. Swing the BaseUnit to the rear until the BaseUnit audibly engages.



3. Slide the individual BaseUnits to the left to the previous BaseUnit until they audibly engage.

   Assemble the BaseUnits only on the DIN rail.

Note

The BaseUnits for motor starters can be plugged together with the BaseUnits for I/O modules.

Disassembling the BaseUnit

WARNING

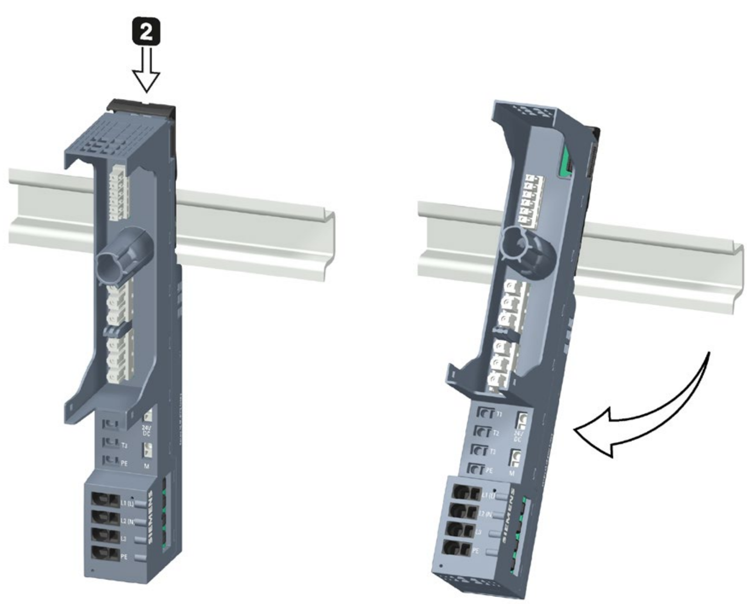
Hazardous Voltage

Hazardous electrical voltage can cause electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

To disassemble the BaseUnit, proceed as follows:

1. Disconnect the main power supply and the control current supply of the SIMATIC ET 200SP motor starter.
2. Actuate the DIN rail release on the BaseUnit of the motor starter.
3. Move the BaseUnit to the left. As soon as there is a clearance of approximately 8 mm to the neighboring BaseUnits, you can disassemble the BaseUnit of the motor starter.
4. Swing the BaseUnit away from the DIN rail while pressing the DIN rail release.



5.7 Installing potential distributor modules

Introduction

You use the potential distributor module to distribute a variety of potentials (P1, P2).

Requirements

The mounting rail is installed.

Installing and uninstalling PotDis-BaseUnit

You install/uninstall PotDis-BaseUnits as you would the BaseUnits for I/O modules. You can find additional information in section Mounting BaseUnits for I/O modules (Page 74).

Installing and uninstalling PotDis-TerminalBlock

Installing

Plug the PotDis-TerminalBlock in die PotDis-BaseUnit. Proceed exactly as described in Section Inserting I/O modules / motor starters and BU covers (Page 118).

Uninstalling

To remove a PotDis-TerminalBlock, follow these steps:

1. Switch off the supply voltage at the PotDis-BaseUnit.
2. Simultaneously press the top and bottom release buttons of the PotDis-TerminalBlock.
3. Remove the PotDis-TerminalBlock from the front of the PotDis-BaseUnit.

5.8 Installing the server module

Introduction

The server module on the far right of the assembly/line completes the ET 200SP distributed I/O system.

Requirement

The last BaseUnit is mounted.

Installing the server module

Watch "Install configuration" video sequence (http://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to install a server module:

1. Install the server module on the mounting rail on the right next to the last BaseUnit.
2. Swivel the server module backwards on the mounting rail.
3. Move the server module parallel to the left until you hear it click into the last preceding BaseUnit.

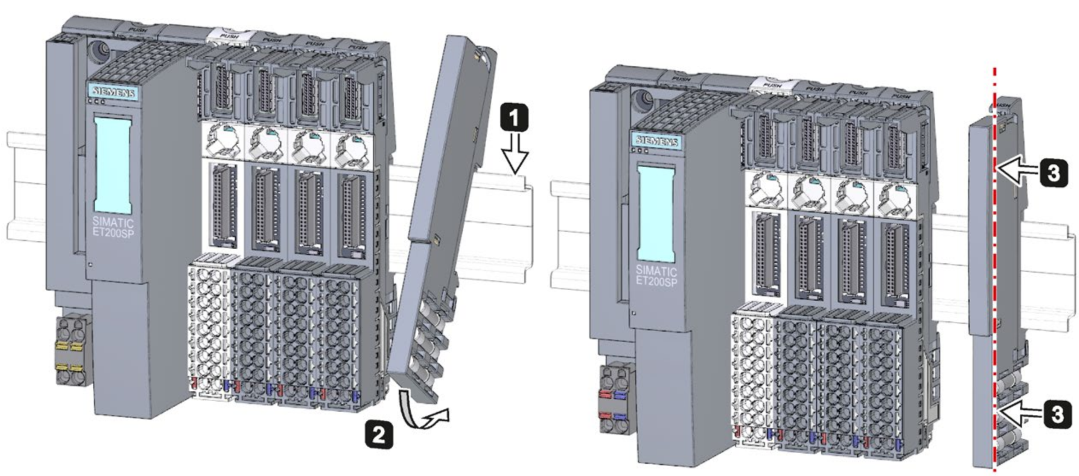


Figure 5-6 Installing the server module

Removing the server module

Proceed as follows to remove a server module:

1. Press the mounting rail release button on the server module.
2. Move the server module parallel to the right.
3. While pressing the mounting rail release button, swivel the server module off the mounting rail.

5.9 Mounting further accessories for motor starters

5.9.1 Mounting the cover for the 500 V AC infeed bus

Introduction

The 500 V infeed bus connects all SIMATIC ET 200SP motor starters. For finger-safe termination of the infeed bus, you must use the cover.

DANGER

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Hazardous electrical voltage causes electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

DANGER

Infeed bus - electric shock

You must provide the infeed bus with a touch protection cover on the right (Article No.: 3RK1308-1DA00-2BP0).

Failure to do so will result in the danger of electric shock.

WARNING

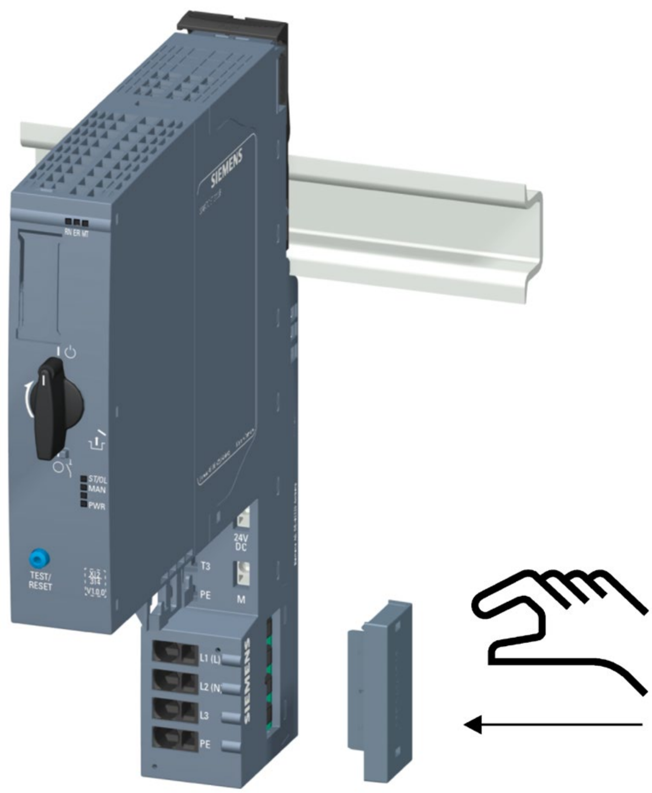
Personal injury may occur

On the last plugged-in BaseUnit of a motor starter, place a cover on the opening of the contacts of the infeed bus.

Procedure

Proceed as follows to mount the infeed bus cover on a SIMATIC ET 200SP motor starter:

1. Press the cover onto the opening of the BaseUnit on the right until it audibly engages.

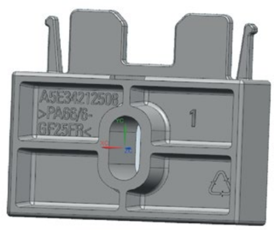


The cover can be removed again using 2 fingers and without tools.

5.9.2 Mounting the mechanical bracket for the BaseUnit

Introduction

To achieve higher stability, you can use a mechanical bracket on 7.5 mm and 15 mm mounting rails.



You must use the mechanical bracket in the following situations:

- When using a 15 mm mounting rail
- With a vertical mounting position
- For applications according to shipbuilding standards in all mounting positions with 7.5 mm and 15 mm mounting rails

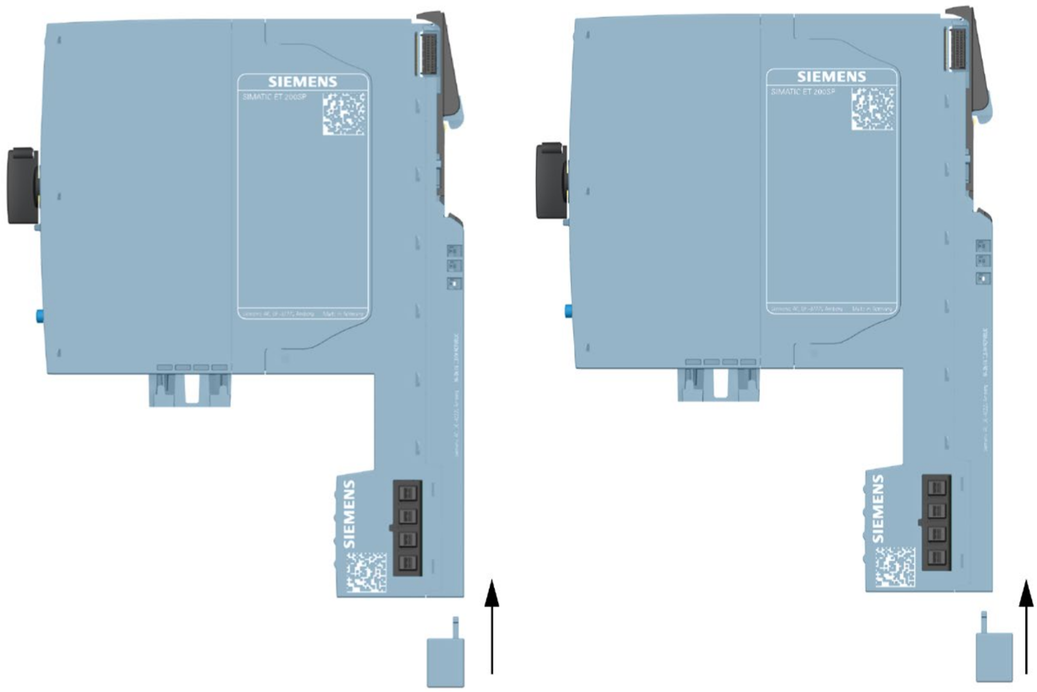
You can find further information on the mechanical bracket in chapter "Installation conditions for motor starters (Page 68)".

Procedure

To mount the mechanical bracket, proceed as follows:

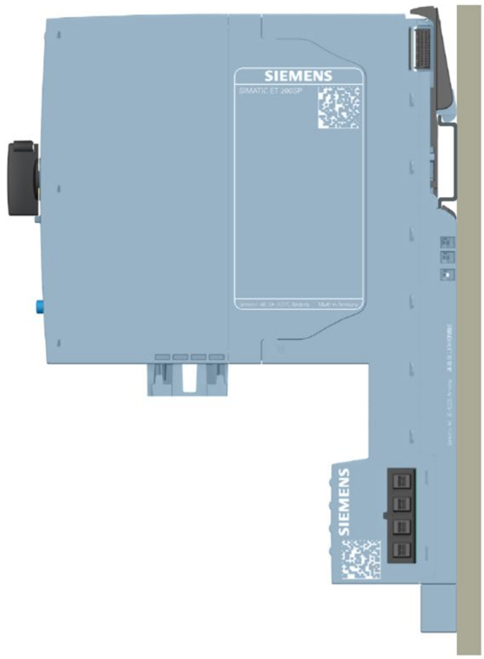
1. Insert the mechanical bracket into the opening at the bottom of the BaseUnit.

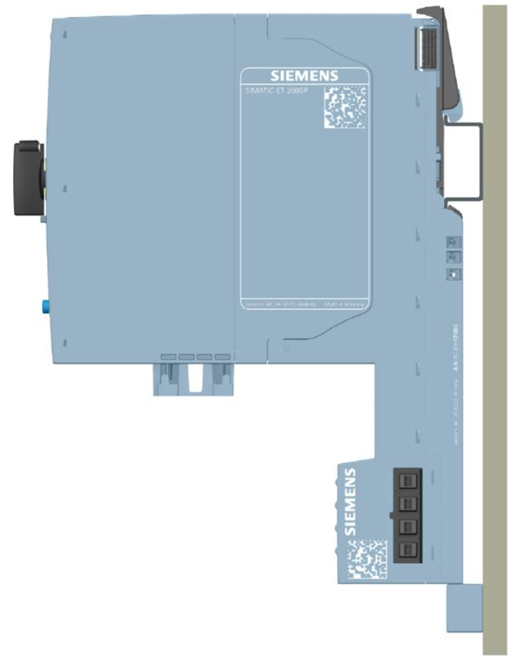
   You use the same mechanical bracket for both mounting rails, rotated through 180° respectively.



2. Hook the BaseUnit into the mounting rail.
3. Insert the mechanical bracket into the BaseUnit.
4. Screw the mechanical bracket securely onto the mounting panel. Use an M4 screw and a suitable washer.

The figures below show the mechanical bracket after installation on a 7.5 mm or 15 mm mounting rail.





5.9.3 Mounting the BU cover

Introduction

BU covers are plugged onto BaseUnits whose slots have been reserved for future expansion (as empty slots). The BU covers for motor starters serve as touch protection covers for unoccupied slots.

DANGER

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Hazardous electrical voltage causes electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

DANGER

BaseUnit without motor starter - electric shock

If you install a BaseUnit without motor starter in the ET 200SP system (e.g. options handling), you must provide the BaseUnit with a BU cover (Article No: 3RK1908-1CA00-0BP0).

Failure to do so will result in the danger of electric shock.

Procedure

To mount the BU cover onto a SIMATIC ET 200SP motor starter, insert the BU cover in the BaseUnit in parallel until both interlocks audibly engage.

Wiring 6

6.1 Rules and regulations for operation

Introduction

When installing the ET 200SP distributed I/O system as part of a plant or system, special rules and regulations need to be adhered to depending on the area of application.

This section provides an overview of the most important rules that must be observed for the integration of the ET 200SP distributed I/O system in a plant or system.

Specific application

Adhere to the safety and accident prevention regulations applying to specific applications, for example machine protection guidelines.

EMERGENCY STOP devices

EMERGENCY STOP devices in accordance with IEC 60204 (corresponds to DIN VDE 0113) must remain effective in all operating modes of the plant or system.

Excluding hazardous plant states

Hazardous operating states must not occur when

- the plant restarts after a voltage dip or power failure.
- Bus communication is reestablished following a fault.

If necessary, EMERGENCY STOP must be forced!

An uncontrolled or undefined startup must not occur after the EMERGENCY STOP is unlocked.

Line voltage

Below, everything you need to consider in terms of line voltage is described (refer to section Insulation, protection class, degree of protection and rated voltage (Page 298)):

- For fixed plants or systems without an all-pole mains disconnection switch, a mains disconnection device (all-pole) must be available in the building installation.
- For load power supplies, the configured rated voltage range must correspond to the local line voltage.
- For all power circuits of the ET 200SP distributed I/O system, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance.

24 V DC supply

Below you will find a description of what you need to pay attention to with 24 V DC supply:

- For buildings: In the event of danger through overload, you must provide lightning protection measures for external lightning protection (e.g. lightning protection elements).
- For 24 V DC supply lines and signal lines: If there is a risk of overvoltages, you need to take precautions to ensure internal lightning protection (e.g. lightning protection elements, refer to section Accessories/spare parts (Page 302)).
- For 24 V DC supply: Make sure there is safe (electrical) isolation and separate cable routing or increased insulation of the low voltage (SELV/PELV) to electric circuits with dangerous potentials in accordance with IEC61131-2 / IEC 61010-2-201.

Requirements for power supplies in the event of voltage interruption

---

Note

To ensure adherence to IEC 61131-2 and NAMUR Recommendation NE 21, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least 20 ms. Observe the relevant requirement in your product standards (e.g. 30 ms for "burners" pursuant to EN 298) as regards possible voltage interruptions. The latest information on PS components is available on the Internet (https://mall.industry.siemens.com).

These requirements, of course, also apply to power packs/power supply units not constructed using ET 200SP or S7-300-/400-/1500 technology.

Protection against outside electrical influences

Below is a description of what you must pay attention to in terms of protection against electrical impacts and/or faults:

- Make sure that the system for discharging electromagnetic interference is connected to a functional earth or to protective conductor with a sufficient cross-section for all plants with an ET 200SP distributed I/O system.
- For supply, signal and bus lines, you must ensure that the laying of the lines and the installation is correct.
- For signal and bus lines, you must ensure that a wire/cable break or a cross-circuit does not lead to undefined states of the plant or system.

Reference

You can find more information in the Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) function manual.

6.2 Additional rules and regulations for the operation of the ET 200SP with fail-safe modules

6.2.1 Safety extra-low voltage (SELV, PELV) for failsafe modules and failsafe motor starters

WARNING

The failsafe modules must be operated with safety extra-low voltage (SELV, PELV).

You can find more information on safety extra-low voltage (SELV, PELV) in the data sheets of the applicable power supplies, for example.

The fail-safe modules operate with the 24 V DC rated voltage. The tolerance range is 19.2 V DC to 28.8 V DC.

The fail-safe motor starters operate with the 24 V DC rated voltage. The tolerance range is 20.4 V DC to 28.8 V DC.

Within the overvoltage range from 32 V DC to 36 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 36 V DC, the F-modules are permanently de-energized.

Use a power supply unit that does not exceed U_m = 36 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g. use of an overvoltage protector.

All system components that can supply electrical energy in any form whatsoever must fulfill this condition.

Each additional circuit (24 V DC) used in the system must have a safety extra-low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.

Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safety extra-low voltage (SELV, PELV) as well. The process signal of a 24 V DC digital module may not exceed a fault voltage U_m in the event of a fault.

WARNING

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.

An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the fault voltage U_m to be exceeded.

6.2.2 Requirements for sensors and actuators for fail-safe modules and fail-safe motor starters

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

WARNING
Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have proof-test intervals of 20 years as defined in IEC 61508:2010 without considerable loss of safety. The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics". To achieve the required safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat. 3/PLe, a single-channel sensor is adequate. However, to achieve SIL3/Cat. 3/PLe with a single-channel sensor, the sensor itself must be SIL3/Cat. 3/PLe-capable; otherwise the sensor must be connected by two channels to achieve this safety level.

To achieve SIL3/Cat. 4/PLe, sensors must be connected by two channels.

WARNING
In the case of fail-safe input modules, the value "0" is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state. Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the relevant actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Additional requirements for sensors for fail-safe motor starters

Only single-channel sensors that fulfill the required safety category themselves may be connected to the fail-safe motor starter's F-DI. Fail-safe laying must be observed in accordance with the required safety category.

Duration requirements for sensor signals

WARNING

Observe the following requirements for sensor signals:

- To ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- For pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in the section "Response times" of the relevant F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

Fast reacting actuators may briefly drop out or be activated during the test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

WARNING

If the actuators switch voltages higher than 24 V DC (e.g. 230 V DC), safe galvanic isolation must be ensured between the outputs of a fail-safe output module and the parts carrying a higher voltage (in compliance with the IEC 60664-1 standard).

This is generally the case for relays and contactors. Particular attention must be paid to this with semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

6.2.3 Crosstalk of digital input/output signals

When fail-safe digital output and input signals are in a single cable, F-DQ modules and F-PM-E modules may experience readback errors.

Cause: capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. A cross circuit/short-circuit is detected, which leads to safety-related tripping.

Remedy:

- Separate cables for F-DI modules, F-DQ modules, and F-PM-E modules or non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels for the F-PM-E module
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it.

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

Remedy:

- Separate the inductive loads spatially or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

6.3 Additional rules and instructions for operation with motor starters

6.3.1 Protection against short circuit

The motor starter complies with type of coordination 1. Secure the feeder cable for the infeed bus according to current, country-specific rules for conductor protection.

WARNING
Hazardous Voltage at the Motor **Can Cause Death, Serious Injury, or Property Damage.** Following a short-circuit, the SIMATIC ET 200SP motor starter is defective. Replace the motor starter following a short-circuit.

6.4 Operating the ET 200SP on grounded incoming supply

Introduction

Below you will find information on the overall configuration of an ET 200SP distributed I/O system on a grounded incoming supply (e.g. TN-S network). The specific subjects discussed are:

- Disconnecting devices and short-circuit and overload protection according to IEC 60364 (corresponds to DIN VDE 0100) and IEC 60204 (corresponds to DIN VDE 0113)
- Load power supplies and load circuits.

Grounded incoming supply

In the case of grounded incoming supplies (TN-S system) the neutral conductor (N) and the protective conductor (PE) are each grounded. Both conductors form a part of the overvoltage concept. When a plant is in operation, the current flows across the neutral conductor. When a fault occurs, for example, a single ground fault between a live conductor and ground, the current flows through the protective conductor.

Safe electrical isolation (SELV/PELV in accordance with IEC 61131-2 or 61010-2-201)

Load current / power supply modules with safe electrical isolation are required for the operation of the ET 200SP distributed I/O system. In accordance with IEC 61131-2 / 61010-2-201, this protection is referred to as SELV (Safety Extra Low Voltage)/PELV (Protective Extra Low Voltage).

The wiring of SELV/PELV circuits must either be isolated from the wiring of other circuits that are not SELV/PELV or the insulation of all conductors must be dimensioned for the higher voltage.

Configuration of ET 200SP with ungrounded reference potential

To conduct interference currents, the reference potential of the CPU/interface module and the BaseUnits BU15...D is connected internally via an RC combination (IM/CPU: R = 10 MΩ / C = 100 nF, BU15...D: R = 10 MΩ / C = 4 nF) with the mounting rail (functional grounding).

- This configuration conducts high-frequency interference currents and prevents static charges.
- It is always possible to configure an ungrounded setup of the ET 200SP distributed I/O system as the ET 200SP distributed I/O system has no fixed ground connection. The power pack/power supply module for 24 V DC must also be ungrounded and electrically isolated.

If you want to configure the ET 200SP distributed I/O system with grounded reference potential, connect the 1M connection of the CPU/interface module electrically with the protective conductor.

Short-circuit / overload protection

Various measures as protection against short-circuits and overloads are required for setting up a full installation. The type of components and the binding protective measures depend on which IEC (DIN VDE) regulation applies to your system configuration. The table refers to the figure below and compares the IEC (DIN VDE) regulations.

Table 6- 1 Components and protective measures

	Refer to figure	IEC 60364 (DIN VDE 0100)	IEC 60204 (DIN VDE 0113)
Disconnecting device for controller, sensors, and actuators	①	Main switch	Disconnector
Short-circuit / overload protection: In groups for sensors and actuators	② ③	Single-pole protection of circuits	With grounded secondary circuit: **single-pole** protection otherwise: **all-pole** protection
Load current supply for AC load circuits with more than five items of electromagnetic equipment	②	Galvanic isolation by transformer **recommended**	Galvanic isolation by transformer **recommended**

Cable temperature measurement threshold

Note

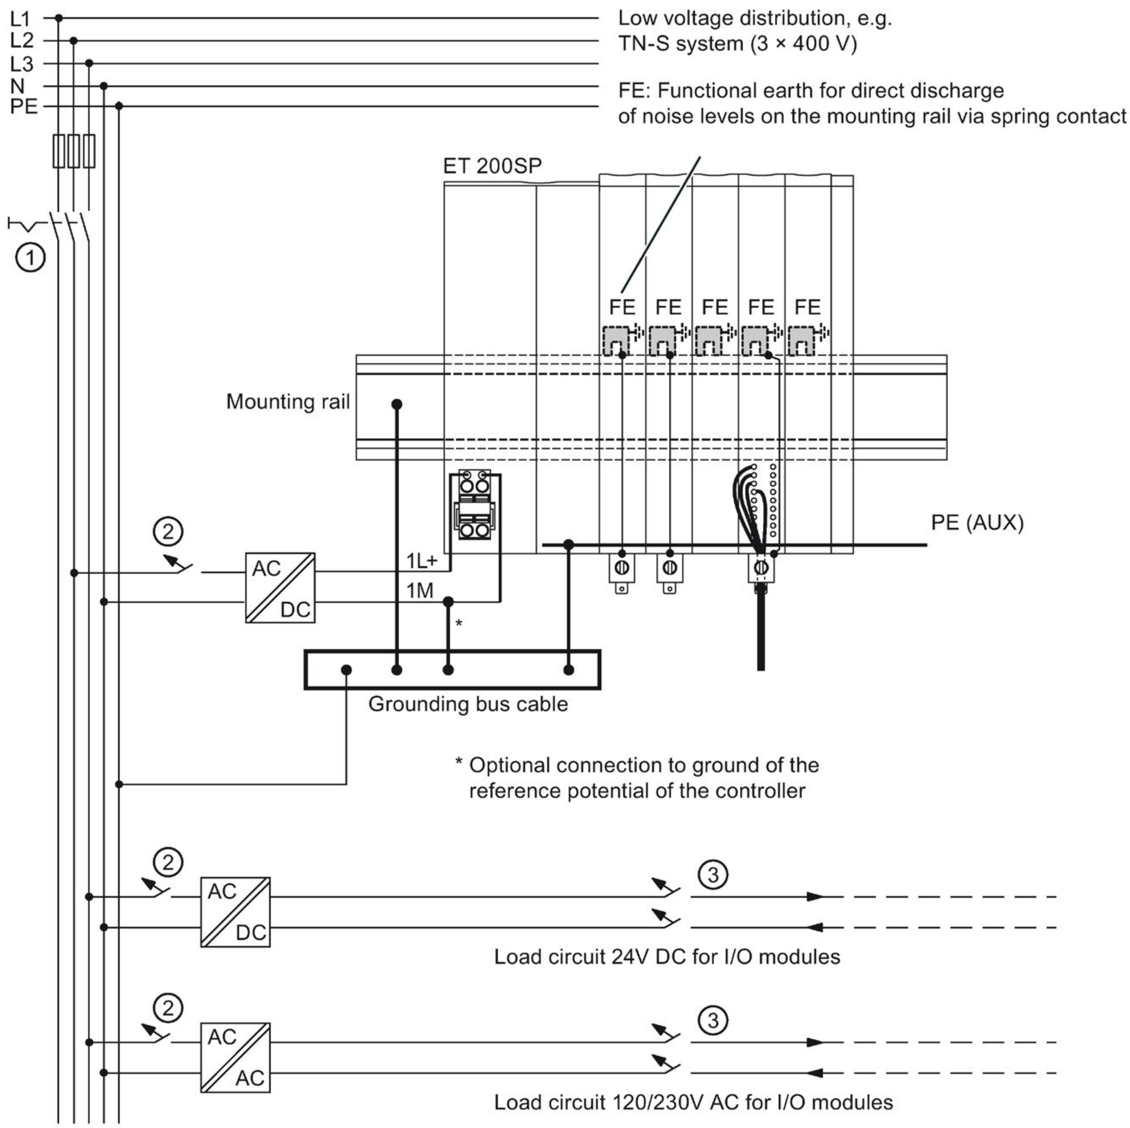
Cable temperature measurement threshold

When choosing a cable, remember that the cable temperature in operation can be up to 30 °C higher than the ambient temperature of the ET200SP system (example: at an ambient temperature of 60 °C, a connection conductor must be dimensioned for a temperature range of at least 90 °C).

You should specify other connection types and material requirements based on the electrical characteristics of the circuits you use and the installation environment.

ET 200SP in the overall configuration

The figure below shows the overall configuration of the ET 200SP distributed I/O system (load current supply and grounding concept) with supply from a TN-S network.



① Main switch

② Short-circuit / overload protection

③ The load current supply (galvanic isolation)

Figure 6-1 ET 200SP in the overall configuration

6.5 Electrical configuration of the ET 200SP

Electrical isolation

Electrical relationships

With the ET 200SP distributed I/O system, there is electrical isolation between:

- The load circuits/process and all other circuit components of the ET 200SP distributed I/O system.
- The communication interfaces of the CPU (PROFINET) or of the interface module (PROFINET/PROFIBUS) and all other circuit components.

The figures below show the electrical relationships of the ET 200SP distributed I/O system with the CPU and the interface module. Only the most important components are represented in the figures.

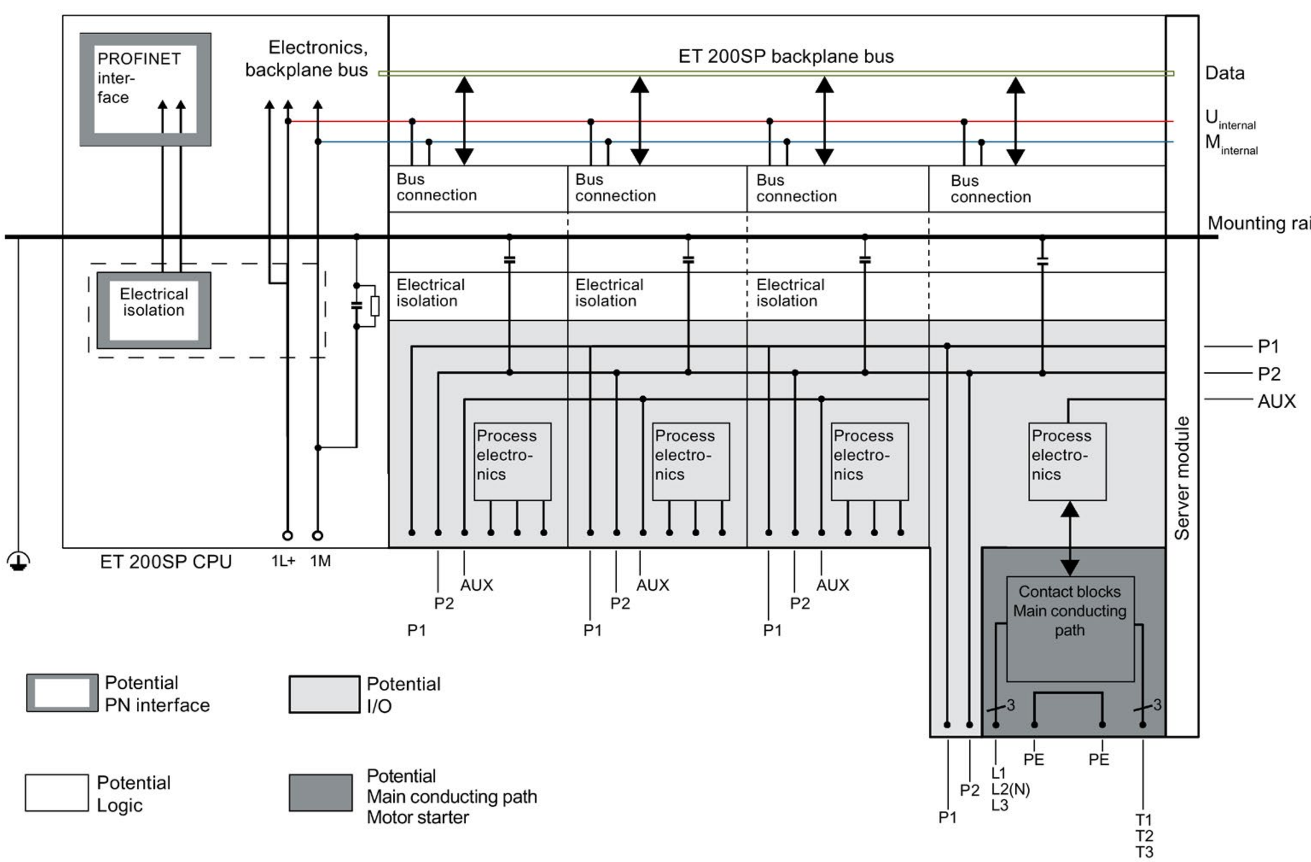


Figure 6-2 Electrical relationships for ET 200SP with CPU

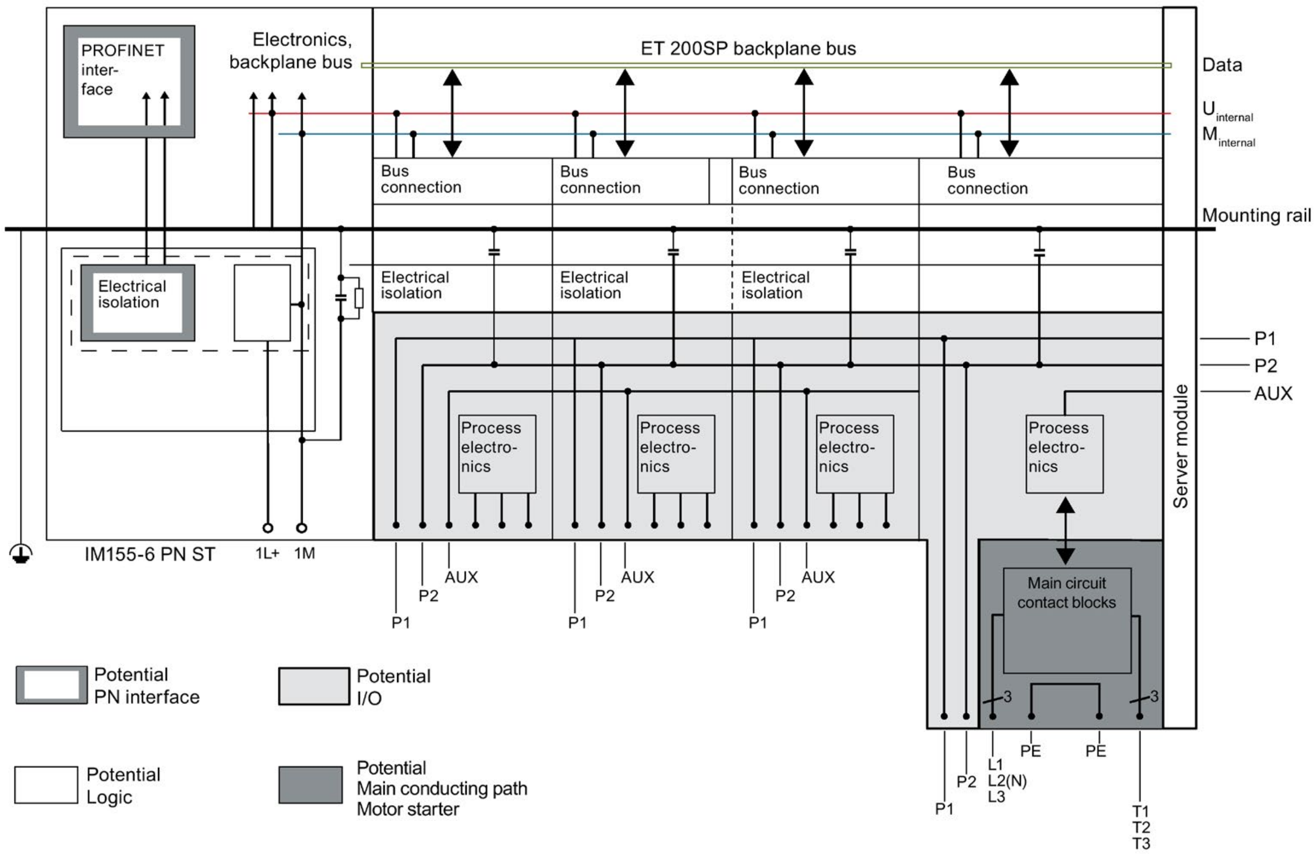

Figure 6-3 Electrical relationships for ET 200SP with interface module (using IM 155-6 PN ST as an example)

6.6 Wiring rules

Wiring rules for the CPU/interface module and BaseUnits for I/O modules

Wiring rules for ...		CPU/interface module (supply voltage)	BaseUnits (push-in terminal)
Permitted cable cross-sections of solid cables (Cu)		0.2 to 2.5 mm^2	
		AWG*: 24 to 13	
Permitted cable cross-sections of flexible cables (Cu)	Without end sleeve	0.2 to 2.5 mm^2	
		AWG*: 24 to 13	AWG*: 24 to 14
	With end sleeve (with plastic sleeve)***	0.25 mm to 1.5 mm^2**	0.14 mm to 1.5 mm^2
		AWG*: 24 to 16	AWG*: 26 to 16
	With TWIN end sleeve***	0.5 mm to 1 mm^2	0.5 to 0.75 mm^2 (see below)
		AWG*: 20 to 17	AWG*: 20 to 18
Stripping length of the wires		8 to 10 mm	
End sleeves in accordance with DIN 46228 with plastic sleeve***		8 and 10 mm long	

* AWG: American Wire Gauge

** End sleeves without plastic sleeve: 0.25 to 2.5 mm^2/AWG: 24 to 13

*** See note on end sleeves

Note

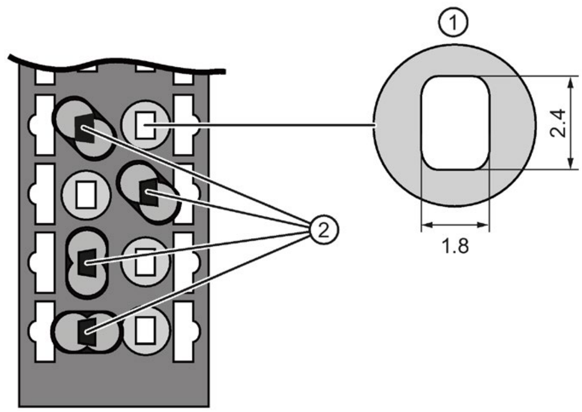
End sleeves

Optimum results with respect to a high-quality and permanent electrical connection with maximum conductor pull forces at the same time can be achieved by using crimping dies, preferably with smooth surfaces, which are provided, for example, with rectangular and trapezoidal crimp cross-sections.

Crimping dies with a pronounced wave profile are unsuitable.

TWIN end sleeves for the cables of the I/O modules' push-in terminals

Due to the space required by TWIN end sleeves with 0.75 mm² cross-section, you must ensure a correct angle for the cable arrangement when crimping the TWIN end sleeve so that the cables are optimally arranged.



① Cross-section of the terminal compartment

② Crimping TWIN end sleeves at the correct angle

Figure 6-4 TWIN end sleeves

Wiring rules for motor starters

Wiring rules for ...		L1(L), L2(N), L3, PE	T1, T2, T3, PE, 24 V DC, F-DI, M	DI1 ... DI3, LC, M, 24 V OUT
Permitted cable cross-sections of solid cables (Cu)		1 to 6 mm²	0.5 to 2.5 mm²	0.2 to 1.5 mm²
		AWG: 18 to 10	AWG: 20 to 12	AWG: 24 to 16
Permitted cable cross-sections of flexible cables (Cu)	Without end sleeve	1 to 6 mm²	0.5 to 2.5 mm²	0.2 to 1.5 mm²
		AWG: 18 to 10	AWG: 20 to 12	AWG: 24 to 16
	With end sleeve	1 to 6 mm²	0.5 to 2.5 mm²	0.25 to 1.5 mm²
		AWG: 18 to 10	AWG: 20 to 12	AWG: 24 to 16
	With end sleeve (with plastic sleeve)	1 to 4 mm²	0.5 to 1.5 mm²	0.25 to 0.75 mm²
		AWG: 18 to 11	AWG: 20 to 16	AWG: 24 to 18
Stripping length of the wires		15 mm	10 mm	8 mm
End sleeves according to DIN 46228 with plastic sleeve		15 mm long	10 mm long	8 mm long

Safety standards for fail-safe motor starters

Fail-safe motor starters fulfill the following standards under certain conditions:

- PL e/Cat. 4 according to EN ISO 13849-1
- Safety Integrity Level SILCL3 acc. to IEC 62061

To fulfill both standards, lay cross-circuit proof and P-cross-circuit proof control cables from the safe output of a sensor or F-DQ to the safe input of the motor starter, e.g. as a separately sheathed cable or in a separate cable duct.

Line protection

The line protection of the SIMATIC ET 200SP motor starter is provided for the motor outgoing feeder cable when the following condition is met:

The cross-section of the motor outgoing feeder cable must be dimensioned for the load ratios of the motor and for the cable-laying method.

Comply with national regulations. The user is responsible for the correct selection and dimensioning of the motor connection cable to DIN VDE 0100 and DIN VDE 0298-4 and/or UL 508.

The conductor protection for the incoming feeders must be ensured by the owner of the installation depending on the cross-section.

Cable temperature measurement threshold

Note

Cable temperature measurement threshold

When choosing a cable, remember that the cable temperature in operation can be up to 30 °C higher than the ambient temperature of the ET200SP system (example: at an ambient temperature of 60 °C, a connection conductor must be dimensioned for a temperature range of at least 90 °C).

You should specify other connection types and material requirements based on the electrical characteristics of the circuits you use and the installation environment.

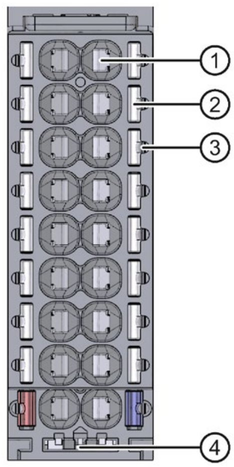
6.7 Wiring BaseUnits for I/O modules

Introduction

The BaseUnits connect the ET 200SP distributed I/O system to the process. The following versions of the BaseUnits can be used:

- BaseUnits (with light-colored terminal box) for opening a potential group: BU..D
- BaseUnits (with dark-colored terminal box) for extending the potential group: BU..B
- BaseUnits with additional AUX terminals or additional terminals: BU..+10..
- BaseUnits with integrated thermal resistor for compensation of the reference junction temperature when connecting thermocouples: BU..T

- PotDis-BaseUnits (with light-colored terminal box) for opening a PotDis potential group: PotDis-BU..D
- PotDis-BaseUnits (with dark-colored terminal box) for extending the potential group: PotDis-BU..B



① Push-in terminal
② Spring release
③ Measuring probe (suitable probes: 1 mm diameter, length ≥ 10 mm while observing the permitted voltage category)
④ Holder for shield connection

Figure 6-5 View of the BaseUnit

Note

The pin assignment of the BaseUnit depends on the connected I/O module. Information on the BaseUnits and I/O modules can be found in the associated manuals.

Replacement of the terminal box on the BaseUnit is described in the section Replacing the terminal box on the BaseUnit (Page 255).

Note

Special terminal designations in the wiring and block diagrams of the I/O modules/BaseUnits

- **RES**: Reserve, these terminals must remain unconnected so that they can be used for future expansions
- **n.c.**: Not connected, these terminals have no function. However, they can be connected to potentials specifically defined for a module, for example, for the laying unused wires.

Requirements

- The supply voltages are turned off.
- Follow the wiring rules.
- Color identification labels (Page 130) (optional) have been applied.

Required tools

3 to 3.5 mm screwdriver

Tool-free connection of cables: single-wire without wire end ferrule, multi-wire (stranded) with wire end ferrule or ultrasonically sealed

Watch the video sequence (http://support.automation.siemens.com/WW/view/en/95886218)

To connect a wire without tools, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Only in the case of stranded conductors (except for 2.5 mm² cross-section):

   Seal or crimp the wire with wire end ferrules.
3. Insert the wire into the push-in terminal as far as it will go.

Connection of cables: multi-wire (stranded), without wire end ferrule, unprocessed

To connect a wire without a wire end ferrule, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Push with the screwdriver into the spring release.
3. Insert the wire into the push-in terminal as far as it will go.
4. Pull the screwdriver out of the spring release.

Removing wires

Using the screwdriver, press the spring release of the terminal as far as it will go and pull out the wire.

Note

When you press the spring release, you should not pull on the wire/cable at the same time. This prevents you from damaging the terminal.

6.8 Connecting cable shields for I/O modules

Introduction

- You need the shield connector to contact cable shields (e.g. for analog modules). The shield connector conducts interference currents on cable shields to ground via the mounting rail. It is not necessary to contact the shield at where the cable enters the cabinet.
- Attach the shield connector to the BaseUnit.
- The shield connector consists of a shield contact and a shield terminal.
- The shield connector is automatically connected to the functional ground (FG) of the mounting rail after installation.

Requirements

- BaseUnit with a width of 15 mm
- The shield terminal is suitable for cables with max. ∅ 7 mm each.

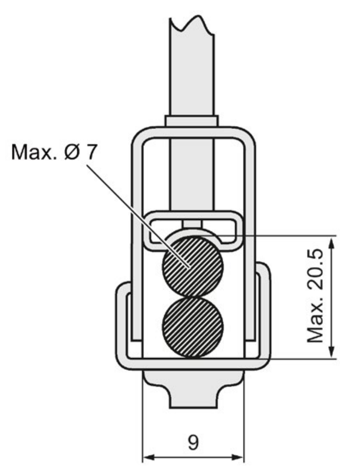


Figure 6-6 Shield terminal

Required tools

- Stripping tool

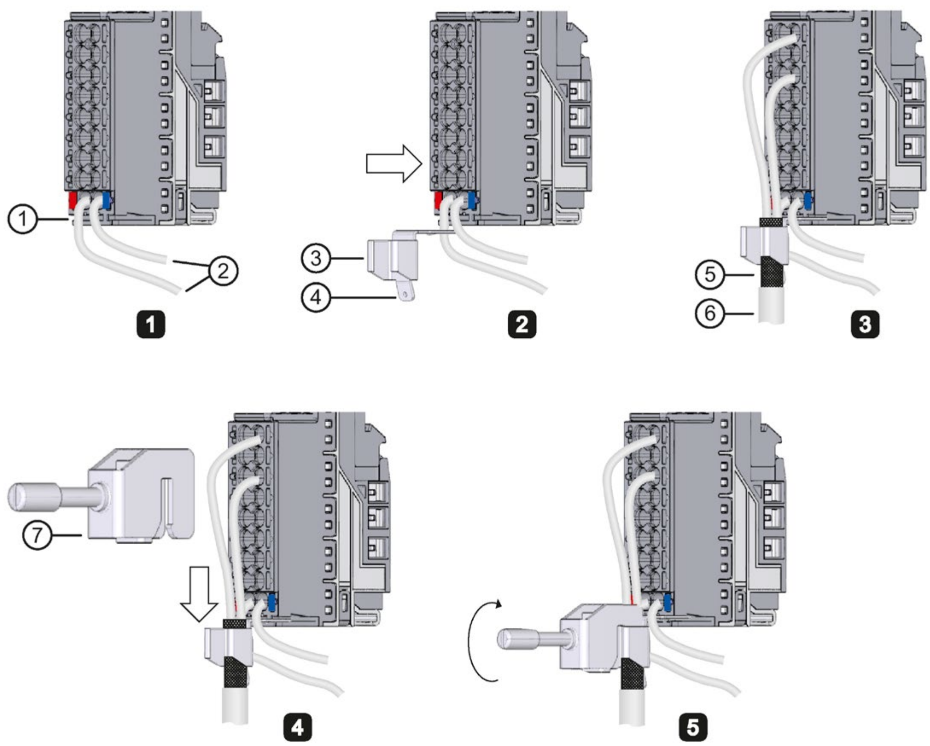
Procedure

Watch the "Wiring BaseUnits" video sequence (http://support.automation.siemens.com/WW/view/en/95886218)

To connect the cable shield, follow these steps:

1. If necessary, connect the supply voltage L+ and ground to the BaseUnit.
2. Press the shield contact up into the mount until you hear it click into place.
3. Remove the cable insulation material around the shield terminal.

   Connect the cable to the BaseUnit and place the cable in the shield contact.
4. Insert the shield terminal into the shield contact.
5. Tighten the shield terminal with approximately 0.5 Nm.



①	Mount	⑤	Insulation material removed (approx. 20 mm)
②	Supply voltage L+, ground	⑥	Cable to the encoder
③	Shield contact	⑦	Shield terminal
④	Flat connector for push-on contacts (6.3 × 0.8 mm)		

Figure 6-7 Mounting the shield contact

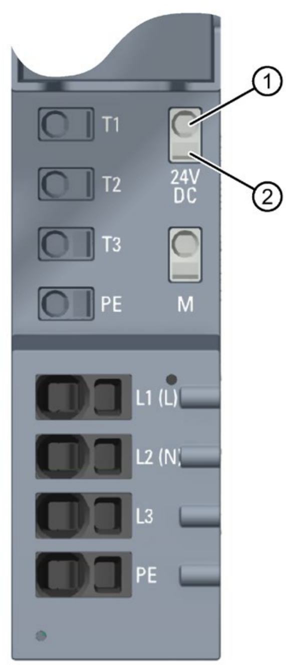
6.9 Wiring BaseUnits for motor starters

Introduction

The following versions of BaseUnits can be used:

- BU30-MS1 (with 500 V and 24 V infeed)
- BU30-MS2 (with 500 V infeed and 24 V forwarding)
- BU30-MS3 (with 24 V infeed and 500 V forwarding)
- BU30-MS4 (with 500 V and 24 V forwarding)
- BU30-MS5 (with 500 V infeed, 24 V and F-DI forwarding)
- BU30-MS6 (with 500 V, 24 V and F-DI forwarding)

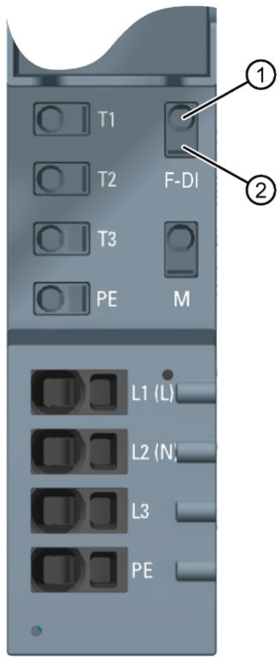
The following figure shows an example of a BaseUnit BU30-MS1 (with the maximum number of terminals):



① Push-in terminal
② Spring release

Figure 6-8 Terminals on a BaseUnit BU30-MS1

The following figure shows an example of a BaseUnit BU30-MS5 (with the maximum number of terminals):



① Push-in terminal
② Spring release

Figure 6-9 Terminals on a BaseUnit BU30-MS5

DANGER

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Hazardous electrical voltage can cause electric shock, burns and property damage.

Turn off and lock out all power supplying this device before working on this device.

For wiring finely-stranded or stranded conductors without end sleeves on push-in connections, a screwdriver is required.

Requirements

- The supply voltages are switched off
- Observe the wiring rules

NOTICE
Wire the F-DI inputs of the BaseUnits BU-30-MS5 and BU-30-MS6 to surge filters
If your system requires overvoltage protection, you must wire the F-DI inputs of the BaseUnits BU-30-MS5 and BU-30-MS6 to surge filters.
Please see "Electromagnetic Compatibility" in the technical specifications.

Required tools

Use the screwdriver "SZF 1-0.6x3.5" (for finely-stranded cables only).

Connecting conductors: Solid without end sleeve, stranded (stranded wire) with end sleeve

To connect a cable, proceed as follows:

1. Insulate the cables in accordance with the table in chapter "Electromagnetic compatibility of fail-safe modules (Page 292)".
2. Only in the case of stranded conductors:

   Crimp the cable with end sleeves.
3. Insert the cable into the push-in terminal as far as it will go.
4. Pull on the cable to ensure it is tight.

Connecting conductors: multi-wire (stranded), without end sleeve, unfinished

To connect a cable, proceed as follows:

1. Insulate the cables in accordance with the table in chapter "Wiring rules (Page 99)".
2. Press the screwdriver into the spring release.
3. Insert the conductor into the push-in terminal until it engages.
4. Pull the screwdriver out of the spring release.
5. Check whether or not the conductor is firmly connected by pulling on the cable.

Video sequence

At the following Internet link, you can see a video about connecting conductors: Wire BaseUnits (http://support.automation.siemens.com/WW/view/en/95886218)

Releasing conductors

To release a conductor, proceed as follows:

1. Press the screwdriver into the spring release of the terminal until it engages.
2. Pull the conductor out.

Note

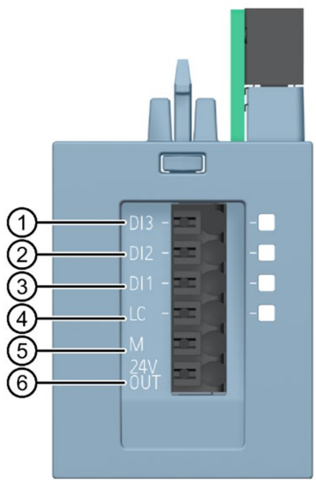
When pressing the spring release, you must not pull on the wire/cable at the same time. In this way, you avoid damaging the terminal.

6.10 Connecting the 3DI/LC module for the motor starter

You will find further information on the 3DI/LC module in the ET 200SP motor starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) manual.

Procedure

The figure below shows the connections of the 3DI/LC module.



①	Digital input 3
②	Digital input 2
③	Digital input 1
④	Local control (manual local)
⑤	Ground
⑥	24 V DC/ 100 mA output

Note

The digital inputs (1 to 4) are not isolated. The reference potential is M (5). Control the digital inputs only via a unit supplied from the 24 V DC output (6).

Connect only cables of a width not exceeding 30 m to the 3DI/LC module.

The supply (5 and 6) is protected against short-circuits.

Terminal sketch of the 3DI/LC module

The following diagram shows a terminal sketch of the 3DI/LC module:

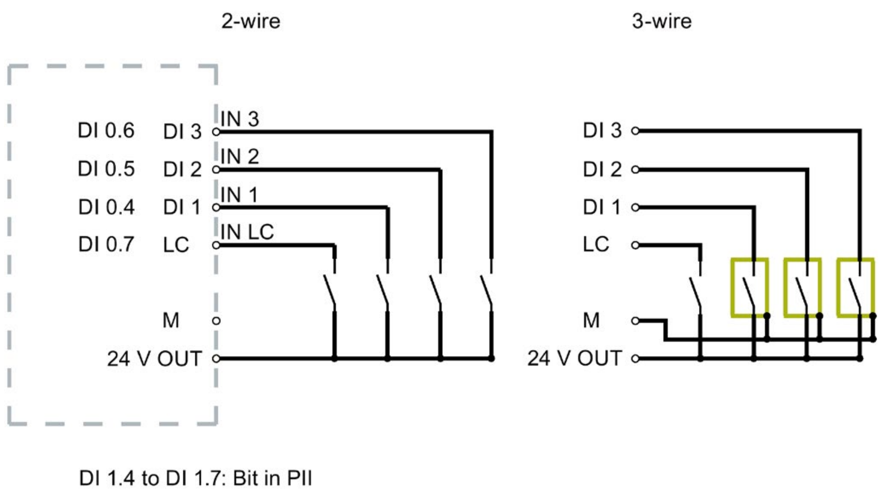


Figure 6-10 Connection example of inputs

6.11 Connecting the supply voltage to the CPU/interface module

Introduction

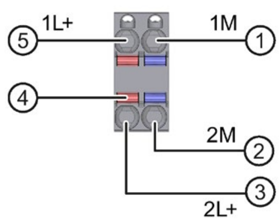
The supply voltage of the CPU/interface module is supplied by means of a 4-pin connector plug located on the front of the CPU/interface module.

Power supply unit

Only use power supply units of type SELV/PELV with safe electrically isolated functional extra low voltage (≤ 28.8 V DC).

Connection for supply voltage (X80)

The connections have the following meaning:



① Ground of the supply voltage
② Ground of the supply voltage for looping through (permitted value 10 A)
③ + 24 V DC of the supply voltage for looping through (permitted value 10 A)
④ Spring release
⑤ + 24 V DC of the supply voltage
1L+ and 2L+ and 1M and 2M are internally jumpered.

Figure 6-11 Supply voltage connection

The maximum cross-section of the connection is 2.5 mm² without wire-end ferrule or 1.5 mm² with wire-end ferrule. A strain relief is not present. The connector plugs provide you with the option of looping the supply voltage through without interruption, even when it is unplugged.

Requirements

- Only wire up the connector plug when the supply voltage is turned off.
- Follow the wiring rules (Page 99).

Required tools

3 to 3.5 mm screwdriver

Tool-free connection of cables: single-wire without end sleeve, multi-wire (stranded) with end sleeve or ultrasonically sealed

Watch video sequence: "Connect BusAdapter to the interface module" (http://support.automation.siemens.com/WW/view/en/95886218)

To connect a wire without tools, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Only in the case of stranded conductors:

   Seal or crimp the wire with end sleeves.
3. Insert the cable into the push-in terminal as far as it will go.
4. Push the wired connector plug into the plug socket of the interface module.

Connection of cables: multi-wire (stranded), without end sleeve, unfinished

To connect a wire without an end sleeve, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Using a screwdriver, press the spring release and insert the wire into the push-in terminal as far as it will go.
3. Pull the screwdriver out of the spring release.
4. Push the wired connector plug into the socket in the interface module.

Removing a wire

Using the screwdriver, press the spring release as far as it will go and pull out the wire.

6.12 Connecting interfaces for communication

Connect the communication interfaces of the ET 200SP distributed I/O system using the standardized connector or directly. If you want to prepare communication cables yourself, the interface assignment is specified in the manuals of the corresponding modules. Observe the mounting instructions for the connectors.

Detailed information on the available BusAdapters and the procedure for connecting PROFINET IO to the CPU/interface module is available in the BusAdapter (https://support.industry.siemens.com/cs/ww/en/view/109751716) manual.

6.12.1 Connecting PROFINET IO (port P3) to the CPU

Introduction

You use the RJ-45 bus connector to connect PROFINET IO (port P3) directly to the CPU.

Required accessories

- Cable ties with standard width of 2.5 mm or 3.6 mm for strain relief
- Please observe the specifications in the PROFINET Installation Guide (http://www.profibus.com).

Mounting the bus connector

Mount the PROFINET connector in accordance with the instructions in the PROFINET Installation Guide (http://www.profibus.com).

Procedure

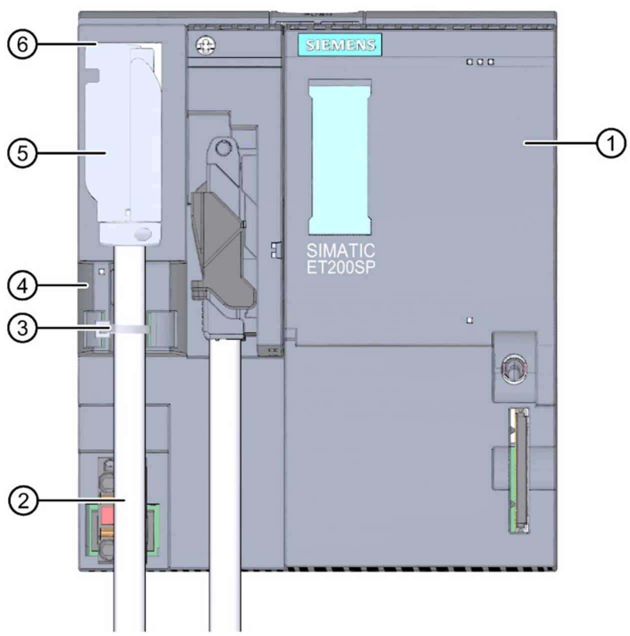
Insert the RJ45 bus connector into the PROFINET port (port P3) on the CPU.

Note

Cable support and strain relief

If you are using a FastConnect RJ-45 bus connector with 90° cable outlet (6GK1901-1BB20-2AA0), we recommend you provide strain relief for the PROFINET connecting cable. To do so, you need a cable tie with a standard width of 2.5 mm or 3.6 mm.

Use it to fasten the PROFINET connecting cable directly after it exits the bus connector to the intended cable support on the CPU (on the front directly below the PROFINET interface X1P3).



① CPU
② PROFINET connecting cable
③ Strain relief (cable tie)
④ Cable support
⑤ FastConnect RJ45 bus connector with 90° cable outlet
⑥ PROFINET connector (port P3)

Figure 6-12 Connecting PROFINET IO (port P3) to the CPU

6.12.2 Connecting the PROFIBUS DP interface to the interface module/communications module CM DP

Introduction

Using the bus connector (RS485), connect the PROFIBUS DP to the interface module/communications module CM DP.

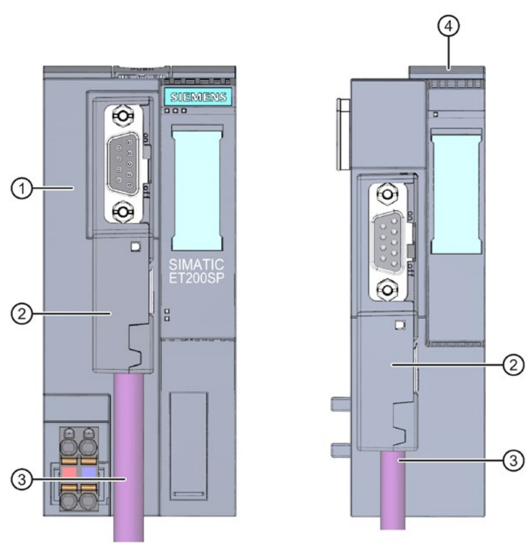
Required tools

3 to 3.5 mm screwdriver

Procedure

To connect the PROFIBUS DP interface to the interface module / DP communication module CM DP, follow these steps:

1. Connect the PROFIBUS cable to the bus connector.
2. Plug the bus connector into the PROFIBUS DP connector.
3. Securely tighten the fixing screws of the bus connector (0.3 Nm).



① Interface module
② PROFIBUS FastConnect bus connector
③ PROFIBUS connecting cable
④ Communications module CM DP

Figure 6-13 Connect PROFIBUS DP to the interface module/communications module CM DP

Reference

You can find additional information on the PROFIBUS FastConnect bus connector in the corresponding product information on the Internet (http://support.automation.siemens.com/WW/view/en/58648998).

6.13 Inserting I/O modules / motor starters and BU covers

Introduction

- You insert the I/O modules on the BaseUnits. The I/O modules are self-coding and type-coded.
- You insert the PotDis-TerminalBlocks on the PotDis-BaseUnits.
- You insert the BU covers on BaseUnits whose slots are not equipped with I/O modules/PotDis-TerminalBlocks.
- You insert the BU covers on BaseUnits whose slots have been reserved for future expansion (as empty slots).
- The BU covers for motor starters serve as touch protection covers for unoccupied slots.

  The BU covers have a holder for the reference identification label on the inside. For future expansion of the ET 200SP, remove the reference identification label from the holder and insert it into the final I/O module.
  It is not possible to attach a reference identification label to the BU cover itself.

  There are three versions:

  – BU cover with a width of 15 mm

  – BU cover with a width of 20 mm

  – BU cover with a width of 30 mm (for motor starters)

Requirement

Refer to chapter "Application planning (Page 36)".

Plugging in I/O modules and BU covers

Watch video sequence: "Insert I/O modules" (http://support.automation.siemens.com/WW/view/en/95886218)

Insert the I/O module or BU cover parallel into the BaseUnit until you hear both latches click into place.

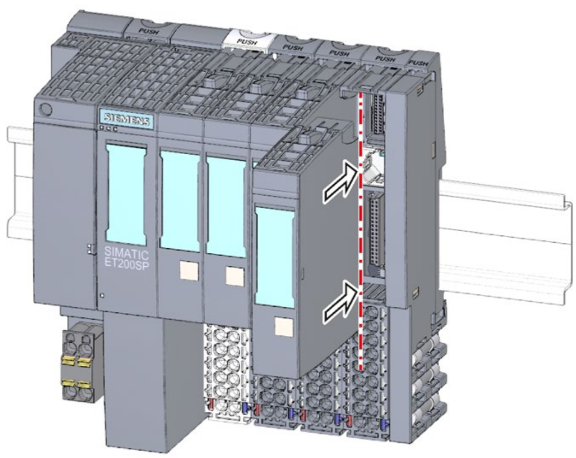


Figure 6-14 Plugging in I/O modules or BU covers (using an I/O module as example)

6.14 Mounting/disassembly of motor starters

6.14.1 Mounting the fan

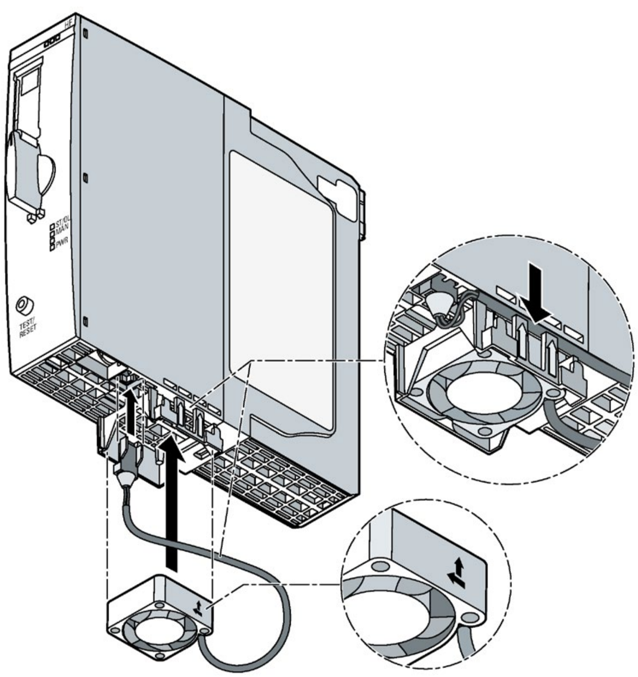
Procedure

Proceed as follows to mount a fan on a SIMATIC ET 200SP motor starter:

1. Slide the fan onto the motor starter until you can hear the fan engage.

   Observe the blowing direction of the fan when mounting. The air stream must be directed to the inside of the motor starter. The correct blowing direction is indicated by arrows on the bottom of the fan.

2. Insert the connection plug into the opening above the fan.



3. Secure the fan cable to the fixing eyes on the right-hand side of the fan cover.

Note

Specified ambient temperatures are not reached if the fan is incorrectly installed

If you do not observe the blowing direction of the fan when mounting, the specified ambient temperatures will not be reached. The device shuts down prematurely due to excessively high temperature.

6.14.2 Mounting/disassembly of motor starters

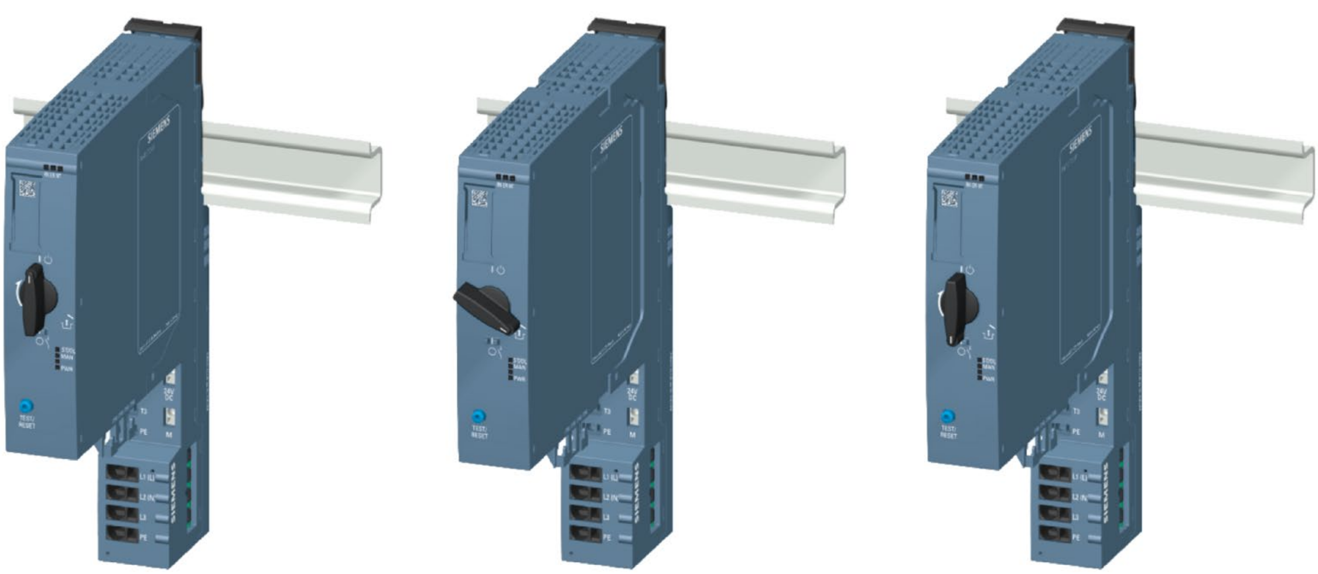
Procedure

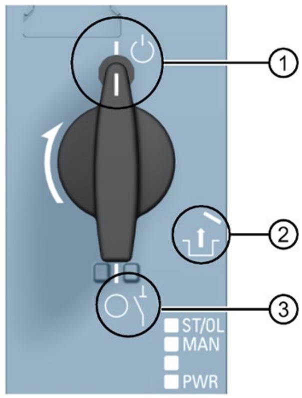
> **CAUTION**
>
> **Protection against electrostatic charge**
>
> When handling and installing the SIMATIC ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.

To assemble a SIMATIC ET 200SP motor starter, proceed as follows:

- Position the mechanical interlock of the SIMATIC ET 200SP motor starter in the assembly/disassembly position ②
- Place the SIMATIC ET 200SP motor starter onto the BaseUnit.
- Turn the mechanical interlock clockwise to the parking position ③
- Turn the mechanical interlock counterclockwise to the operating position (= end position) ①

① ② ③





①	Operating position/READY The motor starter is firmly locked in the BaseUnit, and all electrical contacts are connected.
②	Assembly/disassembly position All electrical contacts are open, and you can use the SIMATIC ET 200SP motor starter in the BaseUnit, or you can remove it from the BaseUnit.
③	Parking position/OFF In this position, you cannot remove the SIMATIC ET 200SP motor starter from the BaseUnit, but all electrical contacts are open. In addition, you can open the locking lever on the mechanical rotary interlock in this position, and fix the position with a padlock (shackle diameter 3 mm). This ensures the isolating function in accordance with IEC 60947-1. In the parking position, the motor starter counts as a disconnected element for the head module. During operation, the parking position is therefore a hot swapping state. See also Removing and inserting I/O modules/motor starters (hot swapping) (Page 247)

Note

Parking position/OFF

This position is only permissible for maintenance purposes and not for continuous operation. In this position, dust protection and mechanical durability are not ensured.

If you do not use the motor starter for an extended period, remove it and attach the BU cover (3RK1908-1CA00-0BP0).

Mount the touch protection cover for the infeed bus on the last BaseUnit.

Note

Touch protection cover for the infeed bus

You will find out how to mount the touch protection cover of the infeed bus on a SIMATIC ET 200SP motor starter in chapter "Mounting the cover for the 500 V AC infeed bus (Page 81)".

To connect the assembly, mount the server module after the last BaseUnit.

Note

Server module

You can find out how to assemble/disassemble the server module in chapter "Installing the server module (Page 80)".

Note

Removing the motor starter

You will find out how to remove the motor starter in chapter "Replacing a motor starter (Page 254)".

6.14.3 3DI/LC module

Introduction

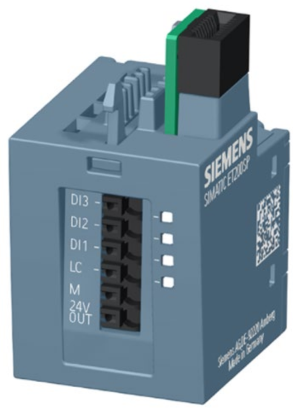
The optional 3DI/LC module with three inputs and one further LC input can be connected to the motor starter. The status of the inputs of the 3DI/LC module can be seen via the process image input (PII) of the motor starter.

Note

The 3DI/LC module can be used for the motor starter and the fail-safe motor starter.

The input actions can be parameterized. For reasons of operational safety, the LC input is permanently set to manual local mode. For example, by parameterizing the inputs DI1 - DI3 with motor CLOCKWISE or motor COUNTER-CLOCKWISE, you can control the motor in manual local mode.

The figure below shows the 3DI/LC module.



Assembly

> **WARNING**
>
> Risk of injury from automatic restart
>
> When you mount the the 3DI/LC module, the motor starter can switch on autonomously if an ON command (DI1 to DI3) is active. This can result in property damage or serious injury caused by connected devices that are automatically started up.
>
> Revoke the ON commands at DI1 to DI3 before mounting the 3DI/LC module.

Proceed as follows to mount a 3DI/LC module onto a motor starter:

1. Wire the 3DI/LC module according to the connection diagram.

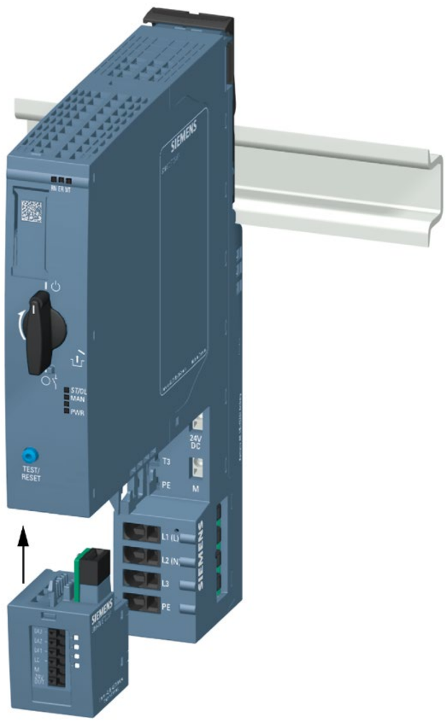
   Note

   Connecting the 3DI/LC module

   You will find out how to connect the 3DI/LC module in chapter "Connecting the 3DI/LC module for the motor starter (Page 111)".

   ---

2. Slide the 3DI/LC module into the motor starter until the 3DI/LC module engages.

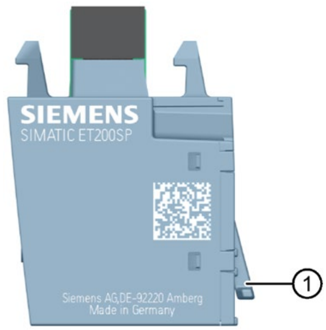


The figure below shows a motor starter with a mounted 3DI/LC module.

Disassembly

Proceed as follows to remove a 3DI/LC module from a motor starter:

1. Push the release lever on the rear of the 3DI/LC module.



① Release lever

2. Remove the 3DI/LC module from the motor starter while pressing the release lever.

6.15 Labeling ET 200SP

6.15.1 Factory markings

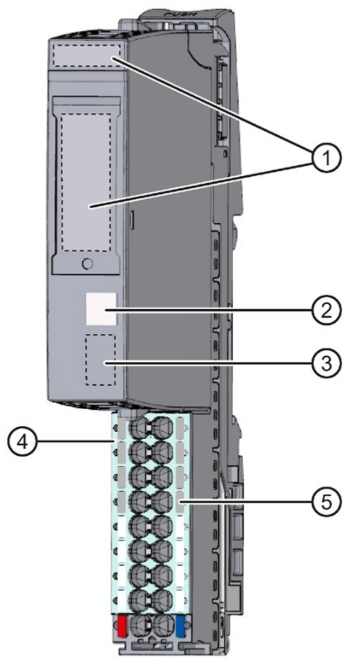
Introduction

For better orientation, the ET 200SP is equipped with various markings ex factory, which help in the configuration and connection of the modules.

Factory markings

- Module labeling
- Color coding of the module classes
  - Digital input modules: white
  - Digital output modules: black
  - Analog input modules: light blue
  - Analog output modules: dark blue
  - Technology module: turquoise
  - Communication module: light gray
  - Special module: mint green
- Module information
  - Functional version of the module, e.g. "X/2/3/4" (= functional version 1)
  - Firmware version of the module at delivery, e.g. "V1.0.0"
  - Color code for usable color identification label, e.g. "CC0"
  - Usable BaseUnit type, e.g. "BU: A0"
- Color coding of the potential group
  - Opening the potential group: Light-colored terminal box and light-colored mounting rail release button
  - Further conduction of the potential group: Dark-colored terminal box and dark-colored mounting rail release button

- Color coding of the spring releases
  - Process terminals: gray, white
  - AUX terminals: turquoise
  - Additional terminals: red, blue
  - Terminals for self-assembling voltage buses P1, P2: red, blue



① Module labeling
② Color coding of the module classes
③ Module information
④ Color coding of the potential group
⑤ Color coding of the spring releases (by group)

Figure 6-15 Factory markings

6.15.2 Optional markings

Introduction

In addition to the factory markings, there are also other options for labeling and/or marking terminals, BaseUnits and I/O modules for the ET 200SP distributed I/O system.

Optional markings

Color identification labels

The color identification labels are module-specific labels for color coding the potentials of the I/O modules. A color code (e.g. 01) is printed on each color identification label and I/O module. The color code allows you to read which color identification label is required for the terminals of the associated BaseUnit directly from the I/O module.

The following versions of color coded labels are available:

- Module-specific color combinations for the process terminals (see the device manuals I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300)).
  The different colors have the following meaning: Gray = input or output signal, red = potential +, blue = ground.
- For the AUX terminals in the colors yellow-green, blue or red
- For the add-on terminals in the colors blue-red
- For the potential distributor modules (see manual BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)):
  - For PotDis-BaseUnit PotDis-BU-P1/x-R: red
    For PotDis-BaseUnit PotDis-BU-P2/x-B: blue
  - For PotDis-TB-P1-R: red or gray
    For PotDis-TB-P2-B: blue or gray
    For PotDis-TB-BR-W: depending on application, yellow/green, blue, red or gray
    For PotDis-TB-n.c.-G: gray

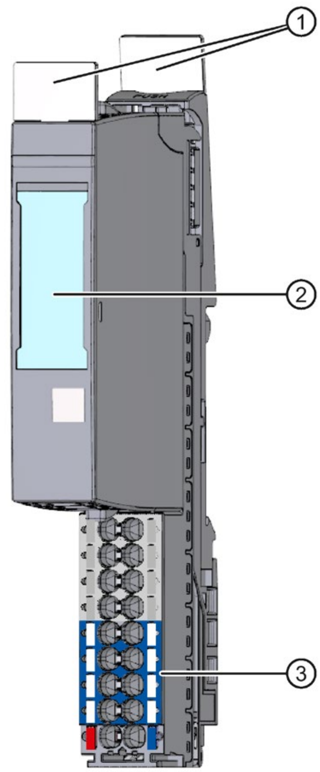
Reference identification labels

The reference identification labels (in accordance with EN 81346) can be inserted onto each CPU/interface module, BusAdapter, BaseUnit, I/O module and PotDis-TerminalBlock. This makes it possible to create a fixed assignment between the reference identification label of the BaseUnit and the I/O module/PotDis-TerminalBlock.

With the standard plotter setting, the reference identification label is suitable for automatic labeling with E-CAD systems.

Labeling strips

The labeling strips can be inserted in the CPU/interface module, I/O module and BU cover and allow identification of the ET 200SP distributed I/O system. The labeling strips can be ordered on a roll for thermal transfer printers or as DIN A4 format sheets for laser printers.



① Reference identification labels
② Labeling strips
③ Color identification labels

Figure 6-16 Optional markings

6.15.3 Applying color identification labels

Requirements

The BaseUnits must not be wired when you apply the color identification labels.

Required tools

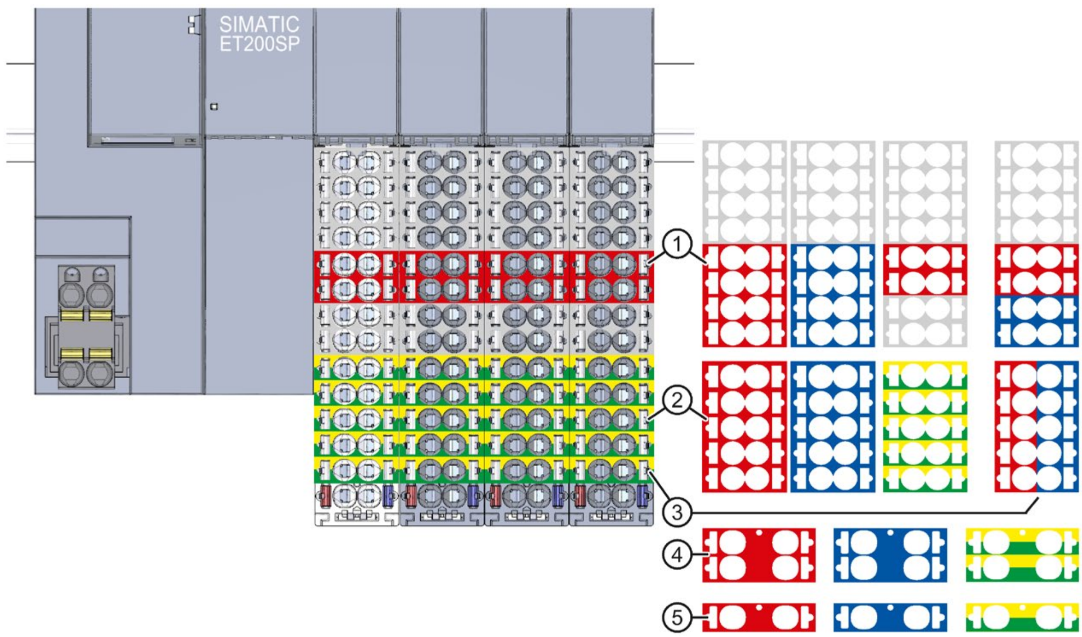
3 mm screwdriver (only for removing the color identification labels)

Applying color identification labels

Press color identification labels into the terminal box of the BaseUnit.

Note

To remove the color identification labels, you must first disconnect the wiring on the BaseUnit and then carefully lever the color identification labels out of the holder using a screwdriver.



①	Module-specific color identification labels (15 mm) for the process terminals. You can find additional information in the I/O Module (http://support.automation.siemens.com/WW/view/en/55679691/133300) manual.
②	Color identification labels (15 mm) for the 10 AUX terminals
③	Color identification label (15 mm) for the 10 add-on terminals
④	Color identification labels (20 mm) for the 4 AUX terminals
⑤	Color identification labels (20 mm) for the 2 AUX terminals

Figure 6-17 Applying color identification labels (example)

NOTICE
AUX bus as PE bar
If you use an AUX bus as a protective conductor (PE), attach the yellow-green color identification labels to the AUX terminals. If you stop using the AUX terminals as a protective conductor bar, remove the yellow-green color identification labels and make sure that the system is still protected.

NOTICE
Supply of incorrect potential possible
Check that the color-coded labels/wiring is correct before commissioning the plant.

6.15.4 Applying labeling strips

Procedure

Watch video sequence: "Labeling"
(http://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to install a labeling strip:

1. Label the strips.
2. Insert the labeling strip into the interface module or I/O module.

6.15.5 Applying reference identification labels

Procedure

Watch video sequence: "Labeling" (http://support.automation.siemens.com/WW/view/en/95886218)

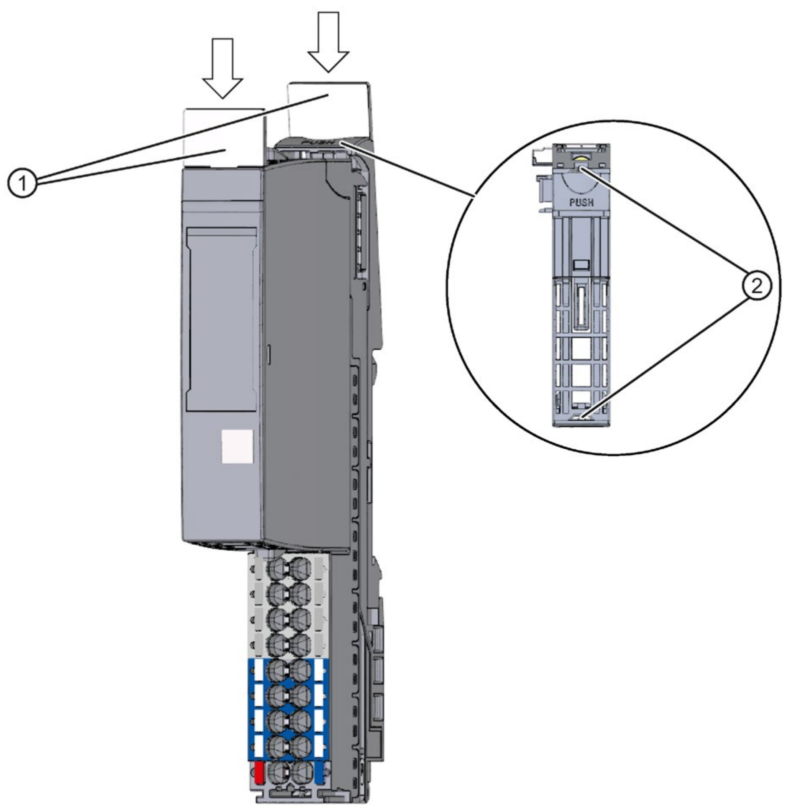
Proceed as follows to install a reference identification label:

3. Break off the reference identification labels from the sheet.
4. Insert the reference identification labels into the opening on the CPU/interface module, BusAdapter, BaseUnit, I/O module and PotDis-TerminalBlock. The insertion opening is located on top of the BaseUnit or the I/O module/PotDis-TerminalBlock.

Note

Reference identification label

The printable side of the reference identification label must be facing forward.



① Reference identification labels

② Opening for label

Figure 6-18 Applying reference identification labels

Configuring 7

7.1 Configuring ET 200SP

Introduction

The ET 200SP distributed I/O system is configured and assigned parameters with STEP 7 (CPU/interface module, I/O modules, motor starter and server module) or using configuration software of a third-party manufacturer (interface module, I/O modules, motor starter and server module).

"**Configuring**" is understood to mean the arranging, setup and networking of devices and modules within the device view or network view. STEP 7 graphically represents modules and racks. Just like "real" module racks, the device view allows the insertion of a defined number of modules.

When the modules are inserted, STEP 7 automatically assigns the addresses and a unique hardware identifier (HW identifier). You can change the addresses later. The hardware identifiers cannot be changed.

When the automation system is started, the CPU/interface module compares the configured planned configuration with the system's actual configuration. You can make parameter settings to control the response of the CPU/interface module to errors in the hardware configuration.

"**Parameterizing**" the components used signifies setting their properties. During parameter assignment, the hardware parameters are set and the settings for data exchange are made:

- Properties of the modules to which parameters can be assigned
- Settings for data exchange between components

STEP 7 compiles the hardware configuration (result of "configuring" and "assigning parameters") and downloads it to the CPU/interface module. The CPU/interface module then connects to the configured components and transfers their configuration and parameters. Modules can be replaced very easily because STEP 7 transfers the configuration and parameters when a new module is inserted.

Requirements for configuration of the CPU

Table 7- 1 Requirement for installing the CPU

Configuration software	Requirements	Installation information
CPU 151xSP-1 PN: STEP 7 (TIA Portal) as of V13 Update 3	• PROFINET IO • PROFIBUS DP (optional): With the communication module CM DP	STEP 7 online help
CPU 151xSP F-1 PN: STEP 7 (TIA Portal) as of V13 SP1		
CPU 151xSP-1PN (as of FW version V1.8), CPU 151xSP F-1 PN (as of FW version V1.8): STEP 7 (TIA Portal) as of V13 SP1 Update 4		

Requirements for configuration of the interface module

Table 7- 2 Requirement for installing the interface module

Configuration software	Requirements	Installation information
STEP 7 (TIA Portal) as of V11 SP2*	• PROFINET IO: As of Support Package HSP0024	STEP 7 online help
STEP 7 as of V5.5 SP2	• PROFINET IO: GSD file GSDML-Vx.y-siemens-et200sp-"Date in format yyyymmdd".xml (http://support.automation.siemens.com/WW/view/en/19698639/130000) • PROFIBUS DP: GSD file SI0xxxxx.gsx (http://support.automation.siemens.com/WW/view/en/10805317/14280)	
Software of third-party manufacturer		Manufacturer documentation

* The TIA Portal supports GSDML specification V2.25. The ET 200SP distributed I/O system is delivered with a GSD file based on specification V2.3. The GSD file can be installed in the TIA Portal and used without restrictions.

Configuring a motor starter

You configure SIMATIC ET 200SP motor starters in exactly the same way as the I/O modules of the ET 200SP distributed I/O system. The GSD files can be used with STEP 7 V5.5 SP4 and higher, and TIA Portal V13 SP1 and higher.

Configuration of the ET 200SP

See the STEP 7 online help or the documentation of the configuration software manufacturer.

Note

For I/O modules that are installed on a BaseUnit BU..D (light-colored BaseUnit), you always have to set the parameter "Potential group" to "Enable new potential group". If you do not set this parameter correctly, the CPU/interface module goes to STOP and generates a parameter error.

Note

For PROFIBUS with configuration via GSD file

In the configuration software, you must set for the BU covers whether these are on a light-colored or dark-colored BaseUnit.

7.2 Configuring the CPU

7.2.1 Reading out the configuration

Introduction

When a connection exists to a physically present CPU, you can load the configuration of this CPU (including centrally present modules) from the device into your project using the "Hardware detection" function. You do not need to manually configure the CPU and the centrally present modules, as the physical configuration is read out automatically.

If you have already configured a CPU and the centrally present modules and you want to load the current configuration and parameters in a new project, it is advisable to use the "Upload device as new station" function. For additional information about this function, refer to section Backing up and restoring the CPU configuration (Page 231).

Procedure for reading out an existing configuration

5. Create a new project and configure an "Unspecified CPU".

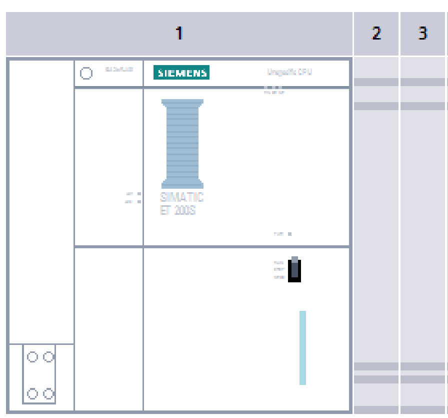


Figure 7-1 Unspecified CPU in the device view

6. In the device view (or in the network view), select the "Hardware detection" command in the "Online" menu.

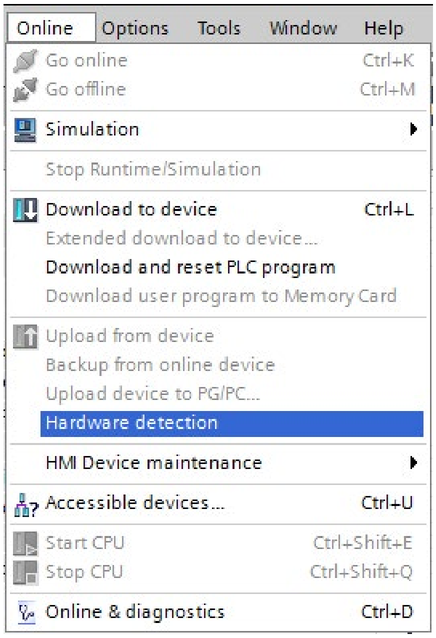

Figure 7-2 Hardware detection in the Online menu

You can also double-click the CPU and click "Detect" in the message.

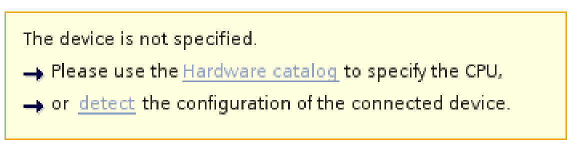

Figure 7-3 Hardware detection message in the device view

7. In the "Hardware detection for PLC_x" dialog box, click "Refresh". Then, select the CPU and the PG/PC interface and click "Detect".
   STEP 7 downloads the hardware configuration including the modules from the CPU to your project.

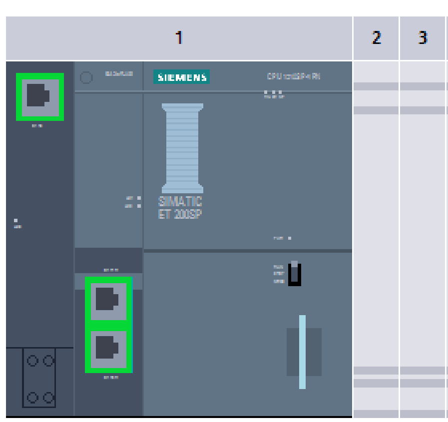

Figure 7-4 Result of the hardware detection in the device view

STEP 7 assigns a valid default parameter assignment for all modules. You can change the parameter assignment subsequently.

Note

If you want to go online after the hardware detection, you have to first download the detected configuration to the CPU; otherwise, an error may occur due to inconsistent configurations.

Properties of central modules

The properties of the CPUs have special significance for system behavior. You can set the following for a CPU using STEP 7:

- Startup behavior
- Parameter assignment of the interface(s), for example, IP address, subnet mask
- Web server, e.g. activation, user administration, and languages
- OPC UA server
- Global Security Certificate Manager
- Cycle times, e.g. maximum cycle time
- System and clock memory
- Protection level for access protection with assigned password parameter
- Time and day settings (daylight saving/standard)

The properties that can be set and the corresponding value ranges are specified by STEP 7. Fields that cannot be edited are grayed out.

Reference

Information about the individual settings can be found in the online help and in the manuals of the relevant CPUs.

7.2.2 Addressing

Introduction

In order to address the automation components or I/O modules, they have to have unique addresses. The following section explains the various address areas.

I/O address

I/O addresses (input/output addresses) are required in the user program to read inputs and set outputs.

STEP 7 automatically assigns input and output addresses when you connect the modules. Each module uses a continuous area in the input and/or output addresses corresponding to its volume of input and output data.

Module	Rack	Slot	I address	Q addr...	Type	Order no.	Firmware
▼ PLC_1	0	1			CPU 1510SP-1 PN	6ES7 510-1DJ00-0AB0	V1.6
▼ PROFINET-Schnittstelle_1	0	1 X1			PROFINET interface		
Port_1	0	1 X1 P1			Port		
Port_2	0	1 X1 P2			Port		
Port_3	0	1 X1 P3			Port		
	0	1 X2					
DI 4x120..230VAC ST_1	0	2	0		DI 4x120..230VAC ST	6ES7 131-6FD00-0BB1	V1.0
DQ 8x24VDC/0.5A ST_1	0	3		0	DQ 8x24VDC/0.5A ST	6ES7 132-6BF00-0BA0	V1.1
AI 8xRTD/TC 2-wire HF_1	0	4	1...16		AI 8xRTD/TC 2-wire ...	6ES7 134-6JF00-0CA1	V2.0
AQ 2xU/I HF_1	0	5		1...4	AQ 2xU/I HF	6ES7 135-6HB00-0CA1	V1.0

Figure 7-5 Example with input / output addresses from STEP 7

STEP 7 assigns the address areas of the modules by default to the process image partition 0 ("Automatic updating"). This process image partition is updated in the main cycle of the CPU.

Device address (e.g. Ethernet address)

Device addresses are addresses of programmable modules with interfaces to a subnet (e.g., IP address or PROFIBUS address). They are required to address the various devices on a subnet, for example, to download a user program.

Hardware identifier

STEP 7 automatically assigns a hardware identifier to identify and address modules and submodules. You use the hardware identifier in the case of diagnostic messages or operations, for example, to identify a defective module or the module addressed.

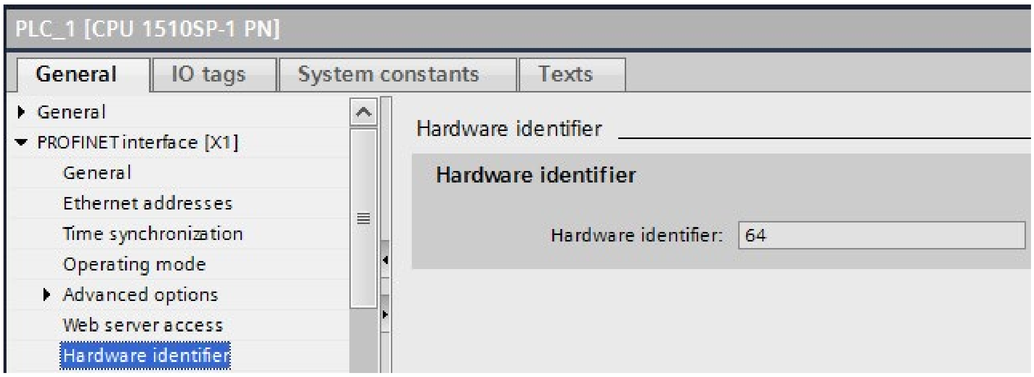

Figure 7-6 Example of a hardware identifier from STEP 7

In the "System constants" tab, you will find all hardware identifiers and their symbolic names (of the hardware identifier) for the selected module.

You can also find the hardware identifiers and names for all modules of a device in the default tag table of the "System constants" tab.

	Name	Data type	Value	Comment
39	PROFINET-Schnittstelle_1	Hw_Interface	64	
40	Port_3[PN]	Hw_Interface	67	
41	Port_1[PN]	Hw_Interface	65	
42	Port_2[PN]	Hw_Interface	66	
43	OB_Main	OB_PCYCLE	1	
44	DI_4x120..230VAC_ST_1[DI]	Hw_SubModule	260	
45	DQ_8x24VDC_0.5A_ST_1[DO]	Hw_SubModule	261	
46	AI_8xRTD_TC_2-wire_HF_1[AI]	Hw_SubModule	262	
47	AQ_2xU_I_HF_1[AO]	Hw_SubModule	263	

Figure 7-7 Example of an excerpt from a default tag table in STEP 7

7.2.3 Process images and process image partitions

7.2.3.1 Process image - overview

Process image of the inputs and outputs

The process image is a memory area of the CPU and includes an image of the signal states of the input/output modules. At the start of the cyclic program, the CPU transfers the signal states of the input modules to the process image of the inputs. At the end of the cyclic program, the CPU transfers the process image of the outputs as a signal state to the output modules. You access this process image memory area in the user program by addressing the operand areas inputs (I) and outputs (O).

Advantages of the process image

A process image offers the advantage that you can access a consistent image of the process signals during cyclic program execution. If a signal state at an input module changes during program processing, the signal state is retained in the process image. The CPU does not update the process image until the next cycle.

You can only assign the addresses of a module to a single process image partition.

32 process image partitions

By means of process image partitions, the CPU synchronizes the updated inputs/outputs of particular modules with defined user program sections.

The overall process image is subdivided into up to 32 process image partitions (PIP).

The CPU updates PIP 0 in each program cycle (automatic update) and assigns it to OB 1.

You can assign the process image partitions PIP 1 to PIP 31 to the other OBs during configuration of the input/output modules in STEP 7.

After the OB has been started, the CPU updates the assigned process image partition for inputs and reads in the process signals. At the end of the OB the CPU writes the outputs of the assigned process image partition directly to the peripheral outputs without having to wait for the completion of the cyclic program processing.

7.2.3.2 Automatically updating process image partitions

You can assign one process image partition to each organization block. In this case, the user program automatically updates the process image partition. The exceptions are PIP 0 and isochronous OBs.

Updating the process image partition

The process image partition is divided into two parts:

- Process image partition of the inputs (PIPI)
- Process image partition of the outputs (PIPQ)

The CPU always updates/reads the process image partition of the inputs (PIPI) before processing of the associated OB. The CPU outputs the process image of the outputs (PIPQ) at the end of the OB.

The figure below illustrates the updating of the process image partitions.

PIPIx read in	Processing of the program in the called OB	PIPQx output

Figure 7-8 Updating process image partitions

7.2.3.3 Update process image partitions in the user program

Requirements

As an alternative to the automatic updating of process image partitions, you can update process images with the "UPDAT_PI" instruction or the "UPDAT_PO" instruction. In STEP 7, these instructions are available on the "Instructions" task card under "Extended instructions". They can be called from any point in the program.

Requirements for updating process image partitions with the "UPDAT_PI" and "UPDAT_PO" instructions:

- The process image partitions are not allowed to be assigned to any OB, which means they are not allowed to be automatically updated.

Note

Update of PPI 0

PIP 0 (automatic update) cannot be updated with the "UPDAT_PI" and "UPDAT_PO" instructions.

UPDAT_PI: updates the process image partition of the inputs

With this instruction you read the signal states from the input modules into the process image partition of the inputs (PIPI).

UPDAT_PO: updates the process image partition of the outputs

With this instruction you transfer the process image partition of the outputs to the output modules.

Synchronous cycle interrupt OB

In the synchronous cycle interrupt OBs, you use the "SYNC_PI" and "SYNC_PO" operations to update the process image partitions of the operations. For additional information on the synchronous cycle interrupt OBs, refer to the STEP 7 Online Help.

Direct I/O access to the inputs and outputs of the module

You also have direct read and write access to the I/O, as an alternative to access via the process image, should direct access be required for programming reasons. This prevents a subsequent output of the process image from again overwriting the value written by direct access.

Reference

Additional information on process image partitions is available in the function manual, Cycle and response times (http://support.automation.siemens.com/WW/view/en/59193558).

7.3 Configuring the interface module

Configuring

Read the STEP 7 online help and/or the documentation of the configuration software manufacturer when configuring the interface module.

The F-destination address is saved permanently on the coding element of the ET 200SP fail-safe modules. Fail-safe motor starters do not need an F-destination address or a coding element.

Note

The supply voltage L+ must be applied to the F-module when the F-destination address is assigned.

Note

Note the following in conjunction with configuration control:

Before you can use configuration control together with F-modules, you must assign the F-destination address to the F-modules at the designated slots. For this, each F-module must be inserted in the slot configured for it. The actual configuration can then differ from the specified configuration.

For additional information on assigning the F-destination address, refer to the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) Programming and Operating Manual and to the online help for the *S7 Configuration Pack*.

Basics of program execution 8

8.1 Events and OBs

Response to triggers

The occurrence of a start event results in the following reaction:

- If the event comes from an event source to which you have assigned an OB, this event triggers the execution of the assigned OB. The event enters the queue according to its priority.
- If the event comes from an event source to which you have not assigned an OB, the CPU executes the default system reaction.

Note

Some event sources, such as startup, pull/plug, exist even if you do not configure them.

Start events

The table below provides an overview of:

- Possible event sources
- Possible values for the OB priority
- Possible OB numbers
- Default system reaction
- Number of OBs

Table 8- 1 Start events

Types of event sources	Possible priorities (default priority)	Possible OB numbers	Default system response 1)	Number of OBs
Starting 2)	1	100, ≥ 123	Ignore	0 to 100
Cyclic program 2)	1	1, ≥ 123	Ignore	0 to 100
Time-of-day interrupt 2)	2 to 24 (2)	10 to 17, ≥ 123	Not applicable	0 to 20
Time-delay interrupt 2)	2 to 24 (3)	20 to 23, ≥ 123	Not applicable	0 to 20
Cyclic interrupt 2)	2 to 24 (8 to 17, frequency dependent)	30 to 38, ≥ 123	Not applicable	0 to 20
Hardware interrupt 2)	2 to 26 (18)	40 to 47, ≥ 123	Ignore	0 to 50
Status interrupt	2 to 24 (4)	55	Ignore	0 or 1
Update interrupt	2 to 24 (4)	56	Ignore	0 or 1
Manufacturer-specific or profile-specific interrupt	2 to 24 (4)	57	Ignore	0 or 1

Types of event sources	Possible priorities (default priority)	Possible OB numbers	Default system response [1]	Number of OBs
Synchronous cycle interrupt	16 to 26 (21)	61 to 64, ≥ 123	Ignore	0 to 2
Time error [3]	22	80	Ignore	0 or 1
Cycle monitoring time exceeded once			STOP	
Diagnostics interrupt	2 to 26 (5)	82	Ignore	0 or 1
Pull/plug interrupt for modules	2 to 26 (6)	83	Ignore	0 or 1
Rack error	2 to 26 (6)	86	Ignore	0 or 1
MC-servo [4]	17 to 26 (25)	91	Not applicable	0 or 1
MC-PreServo [4]	17 to 26 (25)	67	Not applicable	0 or 1
MC-PostServo [4]	17 to 26 (25)	95	Not applicable	0 or 1
MC-Interpolator [4]	16 to 26 (24)	92	Not applicable	0 or 1
Programming error (only for global error handling)	2 to 26 (7)	121	STOP	0 or 1
I/O access error (only for global error handling)	2 to 26 (7)	122	Ignore	0 or 1

1) If you have not configured the OB.

2) In the case of these event sources, besides the permanently assigned OB numbers (see column: Possible OB numbers) in STEP 7 you can assign OB numbers from the range ≥ 123.

3) If the maximum cycle time has been exceeded twice within one cycle, the CPU always assumes the STOP state, regardless of whether you have configured OB 80.

4) You will find more information on these event sources and the starting behavior in the S7-1500 Motion Control function manual.

Assignment between event source and OBs

The type of OB determines where you make the assignment between OB and event source:

- With hardware interrupts and isochronous mode interrupts, the assignment is made during the configuration of the hardware or when the OB is created.
- In the case of the MC-Servo, MC-PreServo, MC-PostServo and MC-Interpolator, STEP 7 automatically assigns the OBs 91/92 as soon as you add a technology object.
- For all other types of OB, the assignment is made when the OB is created, where applicable after you have configured the event source.

For hardware interrupts, you can change an assignment which has already been made during runtime with the instructions ATTACH and DETACH. In this case, only the actually effective assignment changes, and not the configured assignment. The configured assignment takes effect after loading, and at startup.

The CPU ignores hardware interrupts to which you did not assign an OB in your configuration or which occur after the DETACH instruction. The CPU does not check whether an OB is assigned to this event when an event arrives, but only prior to the actual processing of the hardware interrupt.

OB priority and runtime behavior

If you have assigned an OB to the event, the OB has the priority of the event. The CPU supports the priority classes 1 (lowest priority) to 26 (highest priority). The following items are essential to the processing of an event:

- Calling and processing of the assigned OB
- The update of the process image partition of the assigned OB

The user program processes the OBs exclusively on a priority basis. This means the program processes the OB with the highest priority first when multiple OB requests occur at the same time. If an event occurs that has a higher priority than the currently active OB, this OB is interrupted. The user program processes events of the same priority in order of occurrence.

Note

Communication

Communication (e.g. test functions with the PG) always works permanently with the priority 15. So as not to unnecessarily prolong program runtime in the case of time-critical applications, these OBs should not be interrupted by communication. Assign a priority >15 for these OBs.

Reference

You can find more information on organization blocks in the STEP 7 online help.

8.2 CPU overload behavior

Requirement

For the event scenarios considered in the following section, we assume that you have assigned an OB to each event source and that these OBs have the same priority. The second condition, in particular, is only for the sake of a simplified representation.

Principle of CPU overload behavior

An occurring event triggers the execution of the associated OB. Depending on the OB priority and the current processor load, a time delay may occur before the OB is executed when there is an overload. The same event can therefore occur once or several times before the user program processes the OB belonging to the preceding event. The CPU treats such a situation as follows: The operating system positions the events in the order of their occurrence into the queue for their priority level.

To cope with temporary overload situations, you can limit the number of pending events originating from one and the same source. The next event is discarded as soon as the maximum number of pending start events of a specific cyclic interrupt OB, for example, is reached.

An overload occurs when events which originate from the same source occur faster than they can be processed by the CPU.

More detailed information is available in the following sections.

Discarding similar events or handling them later

Below, the term "similar events" refers to events from a single source, such as triggers for a specific cyclic interrupt OB.

The OB parameter "Events to be queued" is used to specify how many similar events the operating system places in the associated queue and therefore post-processes. If this parameter has the value 1, for example, exactly one event is stored temporarily.

Note

The post-processing of cyclic events is often undesirable, as this can lead to an overload with OBs of the same or lower priority. Therefore, it is generally advantageous to discard similar events and to react to the overload situation during the next scheduled OB processing. If the value of the "Events to be queued" parameter is low, this ensures that an overload situation is defused rather than aggravated.

If the maximum number of start events is reached in the queue for a cyclic interrupt OB (Cyclic interrupt), for example, each additional start event is only counted and subsequently discarded. During the next scheduled execution of the OB, the CPU provides the number of discarded start events in the "Event_Count" input parameter (in the start information). You can then react appropriately to the overload situation. The CPU then sets the counter for lost events to zero.

If the CPU discards a start event for a cyclic interrupt OB the first time, its further behavior depends on the OB parameter "Report event overflow into diagnostics buffer": If the check box is selected, the CPU enters the event DW#16#0002:3507 once in the diagnostics buffer for the overload situation at this event source. The CPU suppresses additional diagnostics buffer entries of the event DW#16#0002:3507 that refer to this event source until all events from this source have been post-processed.

Threshold mechanism for time error OB request

The cyclic interrupt OB parameter "Enable time error" is used to specify whether the time error interrupt should be called when a specific overload level is reached for similar events. You can find the OB parameter "Enable time error" in the properties of the OB in the "Attributes" category.

If you enable the time error OB (option box set), you define, with the "Event threshold for time error" OB parameter, the number of similar events in the queue that cause the user program to call the time error OB. If this parameter has the value 1, for example, the CPU enters the event DW#16#0002:3502 once in the diagnostics buffer and requests the time error OB when the second event occurs. The CPU suppresses additional diagnostics buffer entries of the event DW#16#0002:3502 until all events from this source have been post-processed.

In the event of an overload, you therefore have the option of programming a reaction well before the limit is reached for similar events and thus before the events are discarded.

The following value range applies to the "Event threshold for time error" parameter: 1 ≤ "Event threshold for time error" ≤ "Events to be queued".

8.3 Asynchronous instructions

Difference between synchronous/asynchronous instructions

In program processing, a differentiation is made between synchronous and asynchronous instructions.

The "synchronous" and "asynchronous" properties relate to the temporal relationship between the call and execution of the instruction.

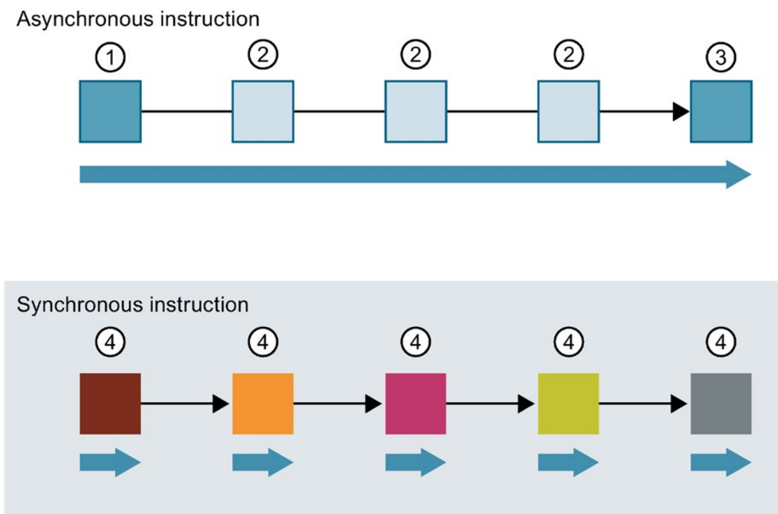
The following applies to synchronous instructions: When the call of a synchronous instruction is ended, the execution is also ended.

This is different in the case of asynchronous instructions: When the call of an asynchronous instruction is ended, the execution of the asynchronous instruction is not necessarily ended yet. This means the execution of an asynchronous instruction can extend over multiple calls. The CPU processes asynchronous instructions in parallel with the cyclic user program. Asynchronous instructions generate jobs in the CPU for their processing.

Asynchronous instructions are usually instructions for transferring data (data records for modules, communication data, diagnostics data).

Processing of asynchronous instructions

The figure below shows the difference between processing an asynchronous instruction and processing a synchronous instruction. In this figure the asynchronous instruction is called five times before the execution is completed, for example, a data record is completely transferred.



① First call of the asynchronous instruction, start of processing
② Intermediate call of asynchronous instruction, continuation of processing
③ Last call of the asynchronous instruction, termination of processing
④ The synchronous instruction is completely processed at each call
➡ Duration of the complete processing

Figure 8-1 Difference between synchronous and asynchronous instructions

Parallel processing of asynchronous instruction jobs

A CPU can process several asynchronous instruction jobs in parallel. The CPU processes the jobs in parallel under the following conditions:

- Several asynchronous instruction jobs are called at the same time.
- The maximum number of concurrently running jobs for the instruction is not exceeded.

The figure below shows the parallel processing of two jobs of the instruction WRREC. The two instructions are processed in parallel for a specific period here.

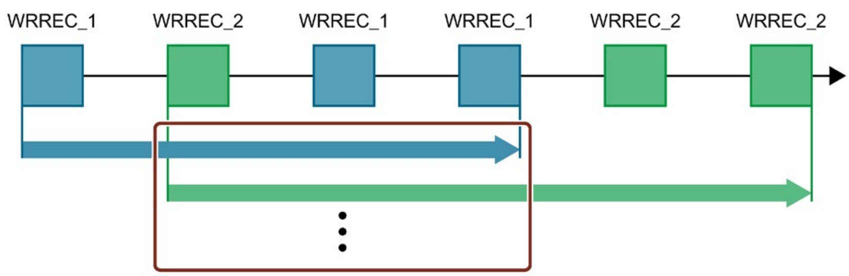


Figure 8-2 Parallel processing of the asynchronous instruction WRREC

Assignment of call to job of the instruction

To execute an instruction over multiple calls, the CPU must be able to uniquely assign a subsequent call to a running job of the instruction.

To assign a call to a job, the CPU uses one of the following two mechanisms, depending on the type of the instruction:

- Via the instance data block of the instruction (in the case of the "SFB" type)
- The input parameters of the instruction identifying the job. These input parameters must match in each call during processing of the asynchronous instruction.
  Example: A "Create_DB" instruction job is identified by the input parameters LOW_LIMIT, UP_LIMIT, COUNT, ATTRIB and SRCBLK.

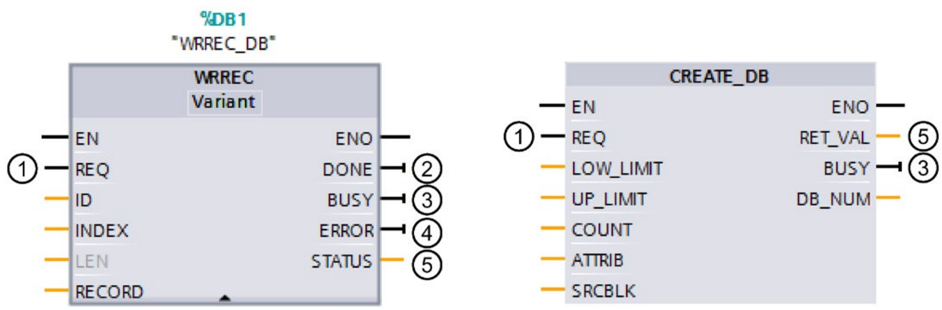
  The following table shows which instruction you can identify with which input parameters.

Instruction	Job is identified by
DPSYC_FR	LADDR, GROUP, MODE
D_ACT_DP	LADDR
DPNRM_DG	LADDR
WR_DPARM	LADDR, RECNUM
WR_REC	LADDR, RECNUM
RD_REC	LADDR, RECNUM
CREATE_DB	LOW_LIMIT, UP_LIMIT, COUNT, ATTRIB, SRCBLK
READ_DBL	SRCBLK, DSTBLK
WRIT_DBL	SRCBLK, DSTBLK
RD_DPARA	LADDR, RECNUM
DP_TOPOL	DP_ID

Status of an asynchronous instruction

An asynchronous instruction shows its status via the block parameters STATUS/RET_VAL and BUSY. Many asynchronous instructions also use the block parameters DONE and ERROR.

The figure below shows the two asynchronous instructions WRREC and CREATE_DB.



① The input parameter REQ starts the job to execute the asynchronous instruction.

② The output parameter DONE indicates that the job was completed without error.

③ The output parameter BUSY indicates whether the job is currently being processed. When BUSY =1, a resource is assigned for the asynchronous instruction. If BUSY = 0, then the resource is free.

④ The output parameter ERROR indicates that an error has occurred.

⑤ The output parameter STATUS/RET_VAL provides information on the status of the job execution. The output parameter STATUS/RET_VAL receives the error information after the occurrence of an error.

Figure 8-3 Block parameters of asynchronous instructions using the instructions WRREC and CREATE_DB as examples.

Summary

The table below provides you with an overview of the relationships described above. It shows in particular the possible values of the output parameters if processing is not completed after a call.

Note

Following every call, you must evaluate the relevant output parameters in your program.

Relationship between REQ, STATUS/RET_VAL, BUSY and DONE during a "running" job.

Seq. no. of the call	Type of call	REQ	STATUS/RET_VAL	BUSY	DONE	ERROR
1	First call	1	W#16#7001	1	0	0
			Error code (for example, W#16#80C3 for lack of resources)	0	0	1
2 to (n - 1)	Intermediate call	Not relevant	W#16#7002	1	0	0
n	Last call	Not relevant	W#16#0000, if no errors have occurred.	0	1	0
			Error code, if errors have occurred	0	0	1

Consumption of resources

Asynchronous instructions occupy resources in the CPU while they are being processed. The resources are limited depending on the type of CPU and instruction; the CPU can only process a maximum number of asynchronous instruction jobs simultaneously. The resources are available again after a job has been successfully completed or processed with an error.

Example: For the RDREC instruction, a 1512SP-1 PN CPU can process up to 20 jobs in parallel.

If the maximum number of simultaneous jobs for an instruction is exceeded, the instruction returns the error code 80C3 (lack of resources) in the block parameter STATUS. The execution of the job is stopped until a resource becomes free again.

Note

Lower-level asynchronous instructions

Several asynchronous instructions use one or more lower-level asynchronous instructions for their processing. This dependence is shown in the tables below.

Please note that, if there are several lower-level instructions, typically only one lower-level instruction is occupied at one time.

Extended instructions: maximum number of concurrently running jobs

The table below shows the maximum number of concurrently running jobs for asynchronous extended instructions.

Extended instructions	**CPU 1510SP-1 PN** **CPU 1510SP F-1 PN**	**CPU 1512SP-1 PN** **CPU 1512SP F-1 PN**

Additional information

You can find additional information on block parameter assignment in the STEP 7 online help.

Protection 9

9.1 Overview of the protective functions of the CPU

Introduction

This chapter describes the following functions for protecting the ET 200SP against unauthorized access:

- Access protection
- Know-how protection
- Copy protection

Further measures for protecting the CPU

The following measures additionally increase the protection against unauthorized access to functions and data of the CPU from external sources and via the network:

- Deactivation of the Web server
- Deactivation of the OPC UA server (you will find further information on the security mechanisms for OPC UA servers in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) function manual)
- Deactivation of time synchronization via an NTP server
- Deactivation of PUT/GET communication

When using the Web server, you protect your ET 200SP distributed I/O system against unauthorized access

- By setting password-protected access rights for certain users in user management.
- By using the default "Allow access via HTTPS only" option.
  This option allows access to the Web server with the secure Hypertext transfer protocol HTTPS only.

9.2 Configuring access protection for the CPU

Introduction

The CPU offers four access levels to limit access to specific functions.

By setting up the access levels and the passwords for a CPU, you limit the functions and memory areas that are accessible without entering a password. You specify the individual access levels as well as the entry of their associated passwords in the object properties of the CPU.

Access levels of the CPU

Table 9- 1 Access levels and access restrictions

Access levels	Access restrictions
Full access (no protection)	Any user can read and change the hardware configuration and the blocks.
Read access	With this access level, read-only access to the hardware configuration and the blocks is possible without entering a password, which means you can download the hardware configuration and blocks to the programming device. In addition, HMI access and access to diagnostics data is possible. Without entering the password, you cannot load any blocks or hardware configuration into the CPU. Additionally, the following are **not** possible without the password: • Writing test functions • Firmware update (online)
HMI access	With this access level only HMI access and access to diagnostics data are possible without entering the password. Without entering the password, you can neither load blocks nor the hardware configuration into the CPU, nor load blocks and hardware configuration from the CPU into the programming device. Additionally, the following are **not** possible without the password: • Writing test functions • Changing the mode (RUN/STOP) • Firmware update (online) • Display of the online/offline comparison status
No access (complete protection)	When the CPU has complete protection, no read or write access to the hardware configuration and the blocks is possible (without access authorization in the form of a password). HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed). Authentication with the password will again provide you full access to the CPU.

You can find a list of which functions are possible in the various protection levels in the STEP 7 online help under the entry "Setting options for the protection".

Properties of the access levels

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

The CPU's default setting is "No restriction" and "No password protection". In order to protect access to a CPU, you need to edit the properties of the CPU and set up a password. In the default access level "Full access (no protection)" every user can read and change the hardware configuration and the blocks. A password is not set and is also not required for online access.

Communication between the CPUs (via the communication functions in the blocks) is not restricted by the access level of the CPU, unless PUT/GET communication is deactivated in the "No access" (complete protection) access level.

Entry of the right password allows access to all the functions that are allowed in the corresponding level.

Note

Configuring an access level does not replace know-how protection

Configuring access levels offers a high degree of protection against unauthorized changes to the CPU by restricting the rights to download the hardware and software configuration to the CPU. However, blocks on the SIMATIC memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the SIMATIC memory card.

Behavior of functions with different access levels

The STEP 7 online help includes a table which lists the online functions that are available in the different access levels.

Selecting the access levels

To configure the access levels of a CPU, follow these steps:

1. Open the properties of the CPU in the Inspector window.
2. Open the "Protection" entry in the area navigation.

   A table with the possible access levels is available in the Inspector window.

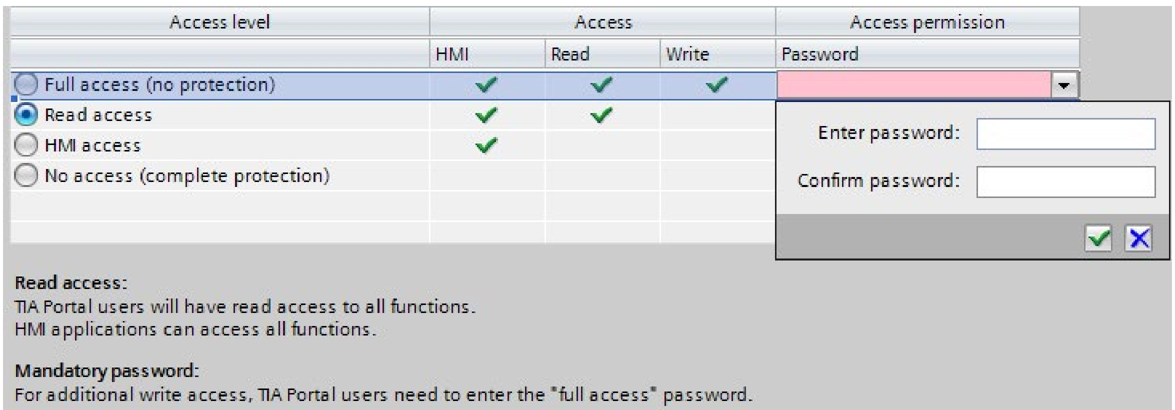

Figure 9-1 Possible access levels

3. Activate the desired protection level in the first column of the table. The green check marks in the columns to the right of the access level show you which operations are still available without entering the password. In the example (see above), read access and HMI access are still possible without a password.
4. In the "Enter password" column, specify a password for the access level "Full access" in the first row. In the "Confirm password" column, enter the selected password again to guard against incorrect entries.

   Ensure that the password is sufficiently secure, i.e. does not follow a pattern that can be recognized by a machine.
5. Assign additional passwords as needed to other access levels if the selected access level allows you to do so.
6. Download the hardware configuration for the access level to take effect.

The CPU logs the entry of the correct or incorrect password and any changes in the configuration of the access levels by a corresponding entry in the diagnostics buffer.

Behavior of a password-protected CPU during operation

The CPU protection takes effect after you have downloaded the settings to the CPU.

Before an online function is executed, the CPU checks the necessary permission and, if necessary, prompts the user to enter a password. You can only execute password-protected functions from one programming device/PC at any time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until you rescind the access authorization manually with "Online > Delete access rights".

Access levels for F-CPUs

For the fail-safe CPUs, there is an additional access level in addition to the four described access levels. For additional information on this access level, refer to the description of the fail-safe system SIMATIC Safety Programming and Operating Manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

9.3 Using the user program to set additional access protection

Access protection via user program

You can also restrict access to a password-protected CPU in STEP 7 via the ENDIS_PW operation. You can find a description of this block in the online help under the keyword "ENDIS_PW: Limit and enable password legitimation".

9.4 Know-how protection

Application

You can use know-how protection to protect one or more OB, FB or FC blocks as well as global data blocks in your program from unauthorized access. Enter a password to restrict access to a block. The password offers high-level protection against unauthorized reading or manipulation of the block.

Password provider

As an alternative to manual entry of password, you can connect a password provider to STEP 7. When using a password provider, you select a password from a list of available passwords. When a protected block is opened, STEP 7 connects to the password provider and retrieves the corresponding password.

To connect a password provider you have to install and activate it. A settings file in which you define the use of a password provider is also required.

A password provider offers the following advantages:

- The password provider defines and manages the passwords. When know-how protected blocks are opened, you work with symbolic names for passwords. A password is marked, for example, with the symbolic name "Machine_1" n the password provider. The actual password behind "Machine1" remains hidden from you.
  A password provider therefore offers you optimum block protection as the users do not know the password themselves.
- STEP 7 automatically opens know-how protected blocks without the direct entry of a password. This saves you time.

You will find more information on connecting a password provider in the STEP 7 online help.

Readable data

If a block is know-how protected, only the following data is readable without the correct password:

- Block title, comments and block properties
- Block parameters (INPUT, OUTPUT, IN, OUT, RETURN)
- Call structure of the program
- Global tags without information on the point of use

Further actions

Further actions that can be carried out with a know-how protected block:

- Copying and deleting
- Calling in a program
- Online/offline comparison
- Load

Global data blocks and array data blocks

You can provide global data blocks (global DBs) with know-how protection. Users who do not possess the valid password can read the global data block but not change it.

You cannot provide array data blocks (array DBs) with know-how protection.

Setting up block know-how protection

To set up block know-how protection, follow these steps:

1. Open the properties of the block in question.
2. Select the "Protection" option under "General".

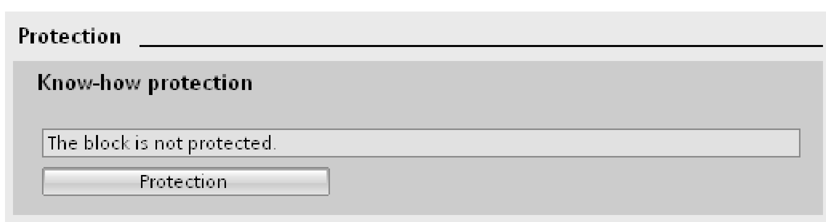

Figure 9-2 Setting up block know-how protection (1)

3. Click the "Protection" button to display the "Know-how protection" dialog.

Figure 9-3 Setting up block know-how protection (2)

4. Click the "Define" button to open the "Define Password" dialog.

Figure 9-4 Setting up block know-how protection (3)

5. Enter the new password in the "New password" box. Enter the same password in the "Confirm password" box.
6. Click "OK" to confirm your entry.
7. Close the "Know-how protection" dialog by clicking "OK".

Result: The selected blocks are now know-how protected. Know-how protected blocks are marked with a lock in the project tree. The password entered applies to all blocks selected.

Note

Password provider

Alternatively, you can set up know-how protection for blocks with a password provider.

Opening know-how protected blocks

To open a know-how protected block, follow these steps:

1. Double-click the block to open the "Access protection" dialog.
2. Enter the password for the know-how protected block.
3. Click "OK" to confirm your entry.

Result: The know-how-protected block is open.

Once you have opened the block, you can edit the program code and the block interface of the block for as long as the block or STEP 7 is open. You must enter the password again the next time you open the block. If you close the "Access protection" dialog with "Cancel", you will be able to open the block but you cannot display the block code or edit the block.

If you copy the block or add it to a library, for example, this does not cancel the know-how protection of the block. The copies will also be know-how-protected.

Removing block know-how protection

To remove block know-how protection, follow these steps:

1. Select the block from which you want to remove know-how protection. The protected block must not be open in the program editor.
2. In the "Edit" menu, select the "Know-how protection" command to open the "Know-how protection" dialog.
3. Clear the "Hide code (Know-how protection)" check box.

Figure 9-5 Removing block know-how protection (1)

4. Enter the password.

Figure 9-6 Removing block know-how protection (2)

5. Click "OK" to confirm your entry.

Result: Know-how protection is removed from the selected block.

9.5 Copy protection

Application

The copy protection allows you to protect your program against unauthorized duplication. With copy protection you associate the blocks with a specific SIMATIC memory card or CPU. Through the linking of the serial number of a SIMATIC memory card or of a CPU the use of this program or of this block is only possible in conjunction with a specific SIMATIC memory card or CPU.

Copy and know-how protection

Recommendation: to prevent unauthorized reset of copy protection, additionally apply know-how protection to a copy-protected block. To do this, first set up copy protection and then apply know-how protection for the block.

Setting up copy protection

To set up copy protection, follow these steps:

1. Open the properties of the block in question.
2. Select the "Protection" option under "General".

Figure 9-7 Setting up copy protection (1)

3. In the "Copy protection" area, select either the "Bind to serial number of the CPU" entry or the "Bind to serial number of the memory card" entry from the drop-down list.

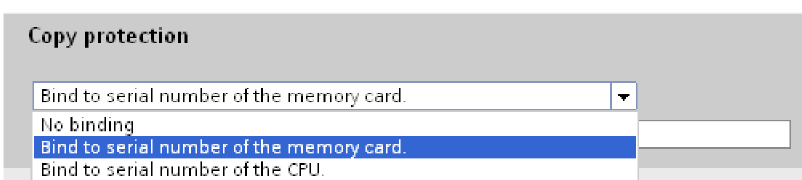

Figure 9-8 Setting up copy protection (2)

4. Activate the option "Serial number is inserted when downloading to a device or a memory card" if the serial number is to be inserted automatically during the uploading process (dynamic binding). Assign a password using the "Define password" button to link the use of a block additionally to the input of a password.
   Activate the option "Enter serial number" if you want to manually bind the serial number of the CPU or the SIMATIC memory card to a block (static binding).
5. You can now set up the know-how protection for the block in the "Know-how protection" area.

Note

If you download a copy-protected block to a device that does not match the specified serial number, the entire download operation will be rejected. This means that blocks without copy protection will also not be downloaded.

Removing copy protection

To remove copy protection, follow these steps:

1. Remove any existing know-how protection.
2. Open the properties of the block in question.
3. Select the "Protection" option under "General".
4. In the "Copy protection" area, select the "No binding" entry from the drop-down list.

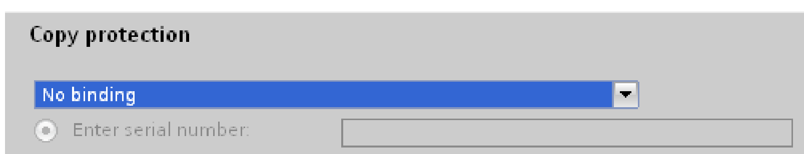

Figure 9-9 Removing copy protection

Configuration control (option handling) 10

Introduction

Configuration control (option handling) is used to operate various standard machine configuration levels in one project without changing the configuration or the user program.

Operating principle of configuration control

You can use configuration control to operate different standard machine configurations with a single configuration of the ET 200SP distributed I/O system.

- A station master is configured in a project (maximum configuration). The station master comprises all modules needed for all possible plant parts of a modular standard machine.
- The project's user program provides for several station options for various standard machine configuration levels as well as selection of a station option. A station option uses, for example, only some of the configured modules of the station master and these modules are inserted in the slots in a different order.
- The standard machine manufacturer selects a station option for a configuration of the standard machine. To do this, the project need not be modified, and it is not necessary to load a modified configuration.

You use a control data record you have programmed to notify the CPU/interface module as to which modules are missing or located on different slots in a station option as compared to the station master. The configuration control does not have an impact on the parameter assignment of the modules.

Configuration control allows you to flexibly vary the centralized/distributed configuration. This is only possible if the station option can be derived from the station master.

The following figure shows three configurations of a standard machine with the corresponding station options of the ET 200SP distributed I/O system.

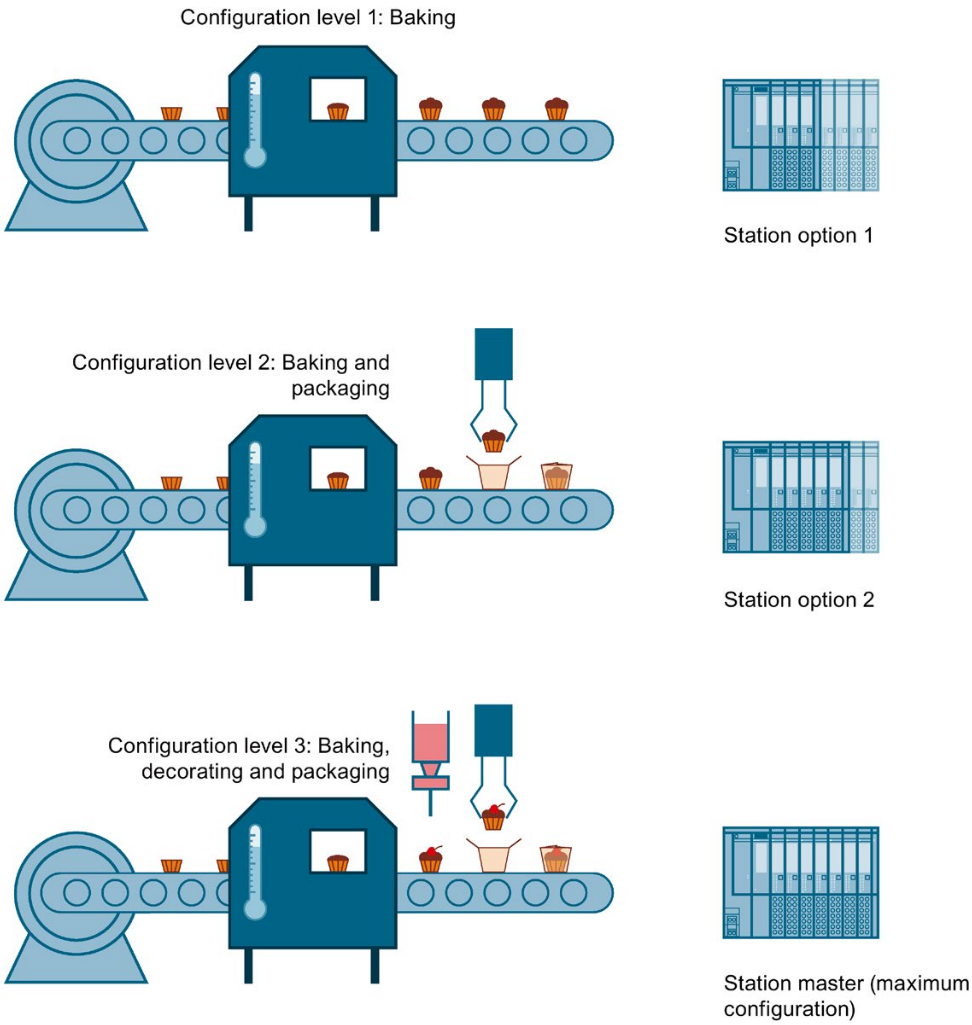

Figure 10-1 Various configuration levels of a standard machine with the corresponding station options of the ET 200SP distributed I/O system.

Advantages

- Simple project management and commissioning by using a single STEP 7 project for all station options.
- Simple handling for maintenance, versioning and upgrade:
- Hardware savings: Only those I/O modules are installed that are required for the machine's current station option.
- Savings potential in the creation, commissioning and the documentation for standard machines.
- Simple station expansion by using pre-wired empty slots. To expand, you simply exchange the BU cover for the new model.

Procedure

To set up the configuration control, follow these steps:

Step	Procedure	See...
1	Enable configuration control in STEP 7	Section Configuring (Page 175)
2	Create control data record	Section Creating the control data record (Page 177)
3	Transfer control data record	Section Transferring the control data record in the startup program of the CPU (Page 188)

Block library "OH_S71x00_Library"

The block library OH_S71x00_Library (https://support.industry.siemens.com/cs/#document/29430270?lc=en-WW) is available for download from the Internet. The block library contains data types with the structure of the control data records for the ET 200SP distributed I/O system. You can implement your flexible automation solution inexpensively with the help of these data types.

Note

Configuration control in the case of motor starters

"Manual local" mode is possible in the case of motor starters when configuration control is active. The motor starter works with the last valid parameters. Do not change the parameterization while "manual local" mode is active.

10.1 Configuring

Requirements

Configuration control is supported by the ET 200SP distributed I/O system with both an ET 200SP CPU and with interface modules via PROFINET IO and PROFIBUS DP.

Centrally for ET 200SP CPU:

- STEP 7 Professional V13 Update 3 or higher
- CPU 1510SP-1 PN/CPU 1512SP-1 PN
- Firmware version V1.6 or higher
- All modules of the CPU must be able to start up even with different configurations.
  - The startup parameter "Comparison preset to actual configuration" of the CPU is set to "Startup CPU even if mismatch" (default setting) and the module parameter "Comparison preset to actual module" of the module is set to "From CPU" (default setting).
    or
  - The module parameter "Comparison preset to actual module" for the module is set to "Startup CPU even if mismatch".

Distributed via PROFINET IO:

- Engineering Tool (e.g. STEP 7)
- IM 155-6 PN BA/ST/HF/HS
- You have assigned the interface module to an IO controller.

Distributed via PROFIBUS DP:

- Engineering Tool (e.g. STEP 7)
- IM 155-6 DP HF
- You have assigned the interface module to a DP master.
- The startup parameter is set to "Operate if preset configuration does not match actual configuration"

Required steps

Enable the "Allow to reconfigure the device via the user program" parameter when configuring the CPU/interface module in STEP 7 (TIA Portal).

- The "Allow to reconfigure the device via the user program" parameter is located in the "Configuration control" area for an ET 200SP CPU.
- The "Allow to reconfigure the device via the user program" parameter is located in the "Module parameter" area under "General" for an IM 155-6 PN interface module.

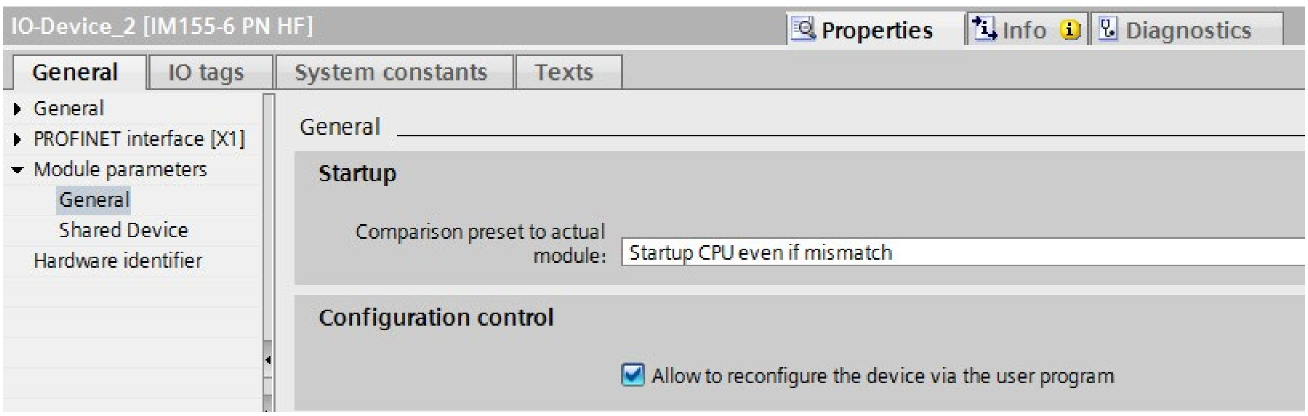

Figure 10-2 Enabling configuration control using an IM 155-6 PN HF as an example

10.2 Creating the control data record

10.2.1 Introduction

Required steps

To create a control data record for the configuration control, follow these steps:

1. Create a PLC data type which contains the structure of the control data record.
   The following figure shows a PLC data type "CTR_REC", which contains the structure of the control data record for an ET 200SP interface module.

   CTR_REC

	Name	Data type	Default value	A...	V...	S...	Comment
1	Block_Lenght	USInt	134	☑	☑	☐	4 + (2 x number of Slots)
2	Block_ID	USInt	196	☑	☑	☐	
3	Version	USInt	2	☑	☑	☐	ET 200SP
4	Subversion	USInt	0	☑	☑	☐	
5	Slot 1	USInt	1	☑	☑	☐	assigned "real" slot
6	Add 1	USInt	0	☑	☑	☐	additional function
7	Slot 2	USInt	2	☑	☑	☐	assigned "real" slot
8	Add 2	USInt	0	☑	☑	☐	additional function
9	Slot 3	USInt	3	☑	☑	☐	assigned "real" slot
10	Add 3	USInt	0	☑	☑	☐	additional function
11	Slot 4	USInt	4	☑	☑	☐	assigned "real" slot
12	Add 4	USInt	0	☑	☑	☐	additional function
		USInt	5	☑	☑	☐	

   Figure 10-3 Creating control data record 196 using an IM 155-6 PN HF as an example

2. Create a global data block.
3. In the data block, create an array that is based on the created PLC data type.

4. In the control data records, enter the slot assignments in the "Start value" column.

   The figure below shows the global data block "ConfDB". The data block "ConfDB" contains an array [0..5] of the PLC_DataType "CTR_REC".

ConfDB

	Name	Data type	Start value	R..	A...	V...	S..	Comment
1	Static			☐	☐	☐	☐	
2	Option	Int	0	☑	☑	☑	☐	Selection of record
3	ConfigControl	Array[0..5] of "CTR_REC"		☐	☑	☑	☐	
4	ConfigControl[0]	"CTR_REC"		☐	☑	☑	☐	
5	ConfigControl[1]	"CTR_REC"		☐	☑	☑	☐	
6	Block_Length	USInt	0	☐	☑	☑	☐	4 + (2 x number of slots)
7	Block_ID	USInt	196	☐	☑	☑	☐	
8	Version	USInt	2	☐	☑	☑	☐	ET 200SP
9	Subversion	USInt	0	☐	☑	☑	☐	
10	Slot 1	USInt	1	☐	☑	☑	☐	assigned "real" slot
11	Add 1	USInt	0	☐	☑	☑	☐	additional function
12	Slot 2	USInt	2	☐	☑	☑	☐	assigned "real" slot
13	Add 2	USInt	0	☐	☑	☑	☐	additional function
14	Slot 3	USInt	3	☐	☑	☑	☐	assigned "real" slot
15	Add 3	USInt	0	☐	☑	☑	☐	additional function
16	Slot 4	USInt	4	☐	☑	☑	☐	assigned "real" slot
17	Add 4	USInt	0	☐	☑	☑	☐	additional function

Figure 10-4 Data block for configuration control

Rules

Observe the following rules:

- Slot entries in the control data record outside the station master are ignored by the CPU/interface module.
- The control data record must contain the entries up to the last slot of the station option.
- Multiple configured slots may not be assigned to the same actual slot. In other words, each station option slot may be present only once in the control data record.

10.2.2 Control data record for an ET 200SP CPU

Slot assignment

The following table shows the possible slots for the various modules for an ET 200SP CPU:

Table 10- 1 Slot assignment

Modules	Possible slots	Comment
CPU	1	Slot 1 is always the CPU
I/O modules	2 - 65	Downstream of CPU
Server module	2 - 66	The server module completes the configuration of the ET 200SP station after the CPU/the last I/O module.

Control data record

For the configuration control of an ET 200SP CPU, you define a control data record 196 V2.0, which includes a slot assignment. The maximum slot corresponds to the slot of the server module.

The table below shows the structure of a control data record with explanations of the individual elements.

Table 10- 2 Configuration control: Structure of control data record 196

Byte	Element	Code	Explanation
0	Block length	4 + (number of slots × 2)	Header
1	Block ID	196	
2	Version	2	
3	Version	0	
4	Slot 1 of the station master	Slot assignment 1 in the station option (always 1, because the CPU is always in slot 1)	**Control element** Contains the information on which module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0. **Additional function** Contains information on whether a new potential group will be opened in the station option - by replacing a dark-colored BaseUnit with a light-colored BaseUnit. • If you replace a dark-colored BaseUnit with a light-colored BaseUnit, enter 1 as additional function. • If you accept the BaseUnit from the station master, enter 0 as additional function.
5	Additional function for slot 1		
6	Slot 2 of the station master	Slot assignment in the station option	
7	Additional function for slot 2		
8	Slot 3 of the station master	Slot assignment in the station option	
9	Additional function for slot 3		
:	:	:	
4 + ((max. slot - 1) × 2)	Server module slot	Server module slot assignment in the station option*	
4 + ((max. slot - 1)× 2) + 1	Additional function for server module slot		

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

10.2.3 Control data record for an interface module

Slot assignment

The following table shows the possible slots for the various modules for an ET 200SP interface module:

Table 10- 3 Slot assignment

Modules	Possible slots		Comment
Interface module	0		The interface module (slot 0) is not an element of the configuration control, but instead controls this.
Station extension BA-Send	1		For mixed configuration with ET 200AL modules, BA-Send is always on slot 1.
ET 200SP I/O module	1 - 12	for IM 155-6 PN BA	Downstream from the interface module
	1 - 30	for IM 155-6 PN HS	
	1 - 32	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 64	for IM 155-5 PN HF	
Server module	1 - 13	for IM 155-6 PN BA	The server module completes the configuration of the ET 200SP station after the last I/O module.
	1 - 31	for IM 155-6 PN HS	
	1 - 33	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 65	for IM 155-5 PN HF	
ET 200AL I/O module	34 - 49	for IM 155-6 DP HF	For mixed configuration with ET 200AL modules
	66 - 81	for IM 155-6 PN ST, IM 155-6 PN HF	

Simplified control data record (V1)

For the configuration control of interface modules of the ET 200SP distributed I/O system, you define a control data record 196 V1.0, which includes a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or ET 200AL I/O module (in a mixed ET 200SP / ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 10- 4 Structure of the simplified control data record V1.0

Byte	Element	Code	Explanation
0	Block length	4 + maximum slot	Header
1	Block ID	196	
2	Version	1	
3	Version	0	
4	Slot 1 of the station master	Slot assignment in the station option	**Control element ET 200SP** Contains the information on which ET 200SP module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0.
5	Slot 2 of the station master	Slot assignment in the station option	
:	:	:	
4 + (slot server module - 1)	Server module slot	Server module slot assignment in the station option*	
:	:	:	:
4 + (first slot ET 200AL - 1)	First slot ET 200AL	Slot assignment in the station option	**Control element ET 200AL** Contains information on which ET 200AL module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module does not exist in the station option, enter 0.
:	:	:	
4 + (last slot ET 200AL - 1)	Last slot ET 200AL	Slot assignment in the station option	

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Control data record (V2)

If you change the potential groups in the station option compared to the station master, define a control data record 196 V2.0 for the ET 200SP interface module which contains a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or ET 200AL I/O module (in a mixed ET 200SP / ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 10- 5 Structure of control data record 196 V2.0

<table>
<tr><th>Byte</th><th>Element</th><th>Code</th><th>Explanation</th></tr>
<tr><td>0</td><td>Block length</td><td>4 + (maximum slot x 2)</td><td rowspan="4">Header</td></tr>
<tr><td>1</td><td>Block ID</td><td>196</td></tr>
<tr><td>2</td><td>Version</td><td>2</td></tr>
<tr><td>3</td><td>Version</td><td>0</td></tr>
<tr><td>4</td><td>Slot 1 of the station master</td><td>Slot assignment in the station option</td><td rowspan="9">Control element ET 200SP
Contains the information on which ET 200SP module is inserted in which slot.
The value that you need to enter in the corresponding byte depends on the following rule:
• If the module exists in the station option, enter the slot number of the module.
• If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element)
• If the module does not exist in the station option, enter 0.
Additional function
Contains information on whether a new potential group will be opened in the station option - by replacing a dark-colored BaseUnit with a light-colored BaseUnit.
• If you replace a dark-colored BaseUnit with a light-colored BaseUnit, enter 1 as additional function.
• If you accept the BaseUnit from the station master, enter 0 as additional function.</td></tr>
<tr><td>5</td><td colspan="2">Additional function for slot 1</td></tr>
<tr><td>6</td><td>Slot 2 of the station master</td><td>Slot assignment in the station option</td></tr>
<tr><td>7</td><td colspan="2">Additional function for slot 2</td></tr>
<tr><td>8</td><td>Slot 3 of the station master</td><td>Slot assignment in the station option</td></tr>
<tr><td>9</td><td colspan="2">Additional function for slot 3</td></tr>
<tr><td>:</td><td>:</td><td>:</td></tr>
<tr><td>4 + ((server module slot - 1) × 2)</td><td>Server module slot</td><td>Server module slot assignment in the station option*</td></tr>
<tr><td>4 + ((server module slot - 1) × 2) + 1</td><td colspan="2">Additional function for server module slot</td></tr>
</table>

<table>
<tr><th>Byte</th><th>Element</th><th>Code</th><th>Explanation</th></tr>
<tr><td>:</td><td>:</td><td>:</td><td>:</td></tr>
<tr><td>4 + ((first slot
ET 200AL - 1) x 2)</td><td>First slot ET 200AL</td><td>Slot assignment in the station option</td><td rowspan="5">Control element ET 200AL
Contains information on which ET 200AL module is inserted in which slot.
The value that you need to enter in the corresponding byte depends on the following rule:
• If the module exists in the station option, enter the slot number of the module.
• If the module does not exist in the station option, enter 0.</td></tr>
<tr><td>4 + ((first slot
ET 200AL - 1) x 2)
+ 1</td><td colspan="2">Reserved</td></tr>
<tr><td>:</td><td>:</td><td>:</td></tr>
<tr><td>4 + ((last slot
ET 200AL - 1) x 2)</td><td>Last slot ET 200AL</td><td>Slot assignment in the station option</td></tr>
<tr><td>4 + ((last slot
ET 200AL - 1) x 2)
+ 1</td><td colspan="2">Reserved</td></tr>
</table>

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Note

If a BU cover or no I/O module is plugged on a light-colored BaseUnit, you should enter 1 in the additional function for the slot.

The function "Group diagnostics: Missing supply voltage L+" requires proper assignment of the slots to a shared supply voltage L+ (potential group). All light-colored BaseUnits must be known to the interface module. By entering 1 in the additional function, you make a light-colored BaseUnit known to the interface module, even if an I/O module is not inserted.

Combination of configuration control and shared device (for PROFINET)

The configuration control function in a shared device is therefore only for the I/O modules of the IO controller to which the interface module has subscribed. I/O modules that are assigned to no controller or a different controller behave like a station without activated configuration control.

You cannot make any change to the slot assignment for modules that are assigned to another IO controller or are not assigned to an IO controller (shared device on module level). The CPU assumes a one-to-one assignment for the modules.

If additional IO controllers subscribe to a module intended for configuration control (shared device on submodule level), only one-to-one assignment is permitted for this module. It is not possible to deselect such a module using the control data record (code 0 for this slot in the control data record). This means the combination of "Configuration control" and "Shared device on submodule level" is only possible to a limited extent.

Please note that all modules affected by the configuration control including all assigned submodules are reset when you change the module assignment. Submodules that are assigned to a second IO controller are affected as well.

10.2.4 Feedback data record for interface modules

Operating principle

The feedback data record informs you about the accuracy of the module assignment and gives you the option of detecting assignment errors in the control data record. The feedback data record is mapped via a separate data record 197 V2.0. The feedback data record exists only with configured configuration control.

Slot assignment

The feedback data record refers to the configured station configuration and always includes the maximum configuration limits. The maximum configuration limits comprise 13/49/81 slots depending on the interface module in use. Partial reading of the feedback data record is possible.

The following table shows the slot assignment of the modules:

Table 10- 6 Slot assignment

Modules	Possible slots		Comment
Station extension BA-Send	1		For mixed configuration with ET 200AL modules, BA-Send is always on slot 1.
ET 200SP I/O module	1 - 12	for IM 155-6 PN BA	Downstream from the interface module
	1 - 30	for IM 155-6 PN HS	
	1 - 32	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 64	for IM 155-5 PN HF	
Server module	1 - 13	for IM 155-6 PN BA	The server module completes the configuration of the ET 200SP station after the last I/O module.
	1 - 31	for IM 155-6 PN HS	
	1 - 33	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 65	for IM 155-5 PN HF	
ET 200AL I/O module	34 - 49	for IM 155-6 DP HF	For mixed configuration with ET 200AL modules
	66 - 81	for IM 155-6 PN ST, IM 155-6 PN HF	

Feedback data record

Table 10- 7 Feedback data record

Byte	Element	Code	Explanation
0	Block length	4 + (number of slots x 2)	Header
1	Block ID	197	
2	Version	2	
3		0	
4	Slot 1 status	0/1	Status = 1: • Module from station master is inserted in the station option • Slot is marked as not available in the control data record Status = 0: • Module pulled • Incorrect module is inserted in the station option*
5	Reserved	0	
6	Slot 2 status	0/1	
7	Reserved	0	
:	:	:	
4 + ((max. slot - 1) × 2)	Max. slot status	0/1	
4 + ((max. slot - 1) × 2) + 1	Reserved	0	

* Not possible if the slot is marked as not available.

Note

The data in the feedback data record is always mapped for all modules. In a shared device configuration, it is therefore irrelevant which IO controller the respective modules are assigned to.

As long as no control data record has been sent, a one-to-one module assignment is assumed for the compilation of data record 197 (station master → station option).

Error messages

In case of error, the RDREC instruction returns the following error messages via the STATUS block parameter while reading the feedback data record:

Table 10- 8 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 197 is not correct.
$80B5_H$	Configuration control not configured
$80B8_H$	Parameter error The following events cause a parameter error: • Incorrect block ID in the header (not equal to 197) • Invalid version identifier in the header • A reserved bit has been set • The same slot in the station option has been assigned to more than one slot in the station master

10.2.5 Data records and functions

Supported data records and functions

The table below shows a comparison of the supported data records and functions depending on the CPU/interface module used.

	CPU...		Interface module (IM...)				
Supported data records and functions	**1510SP-1 PN** **1510SP F-1 PN**	**1512SP-1 PN** **1512SP F-1 PN**	**155-6 PN HS**	**155-6 PN HF**	**155-6 PN ST**	**155-6 PN BA**	**155-6 DP HF**
Control data record (V2)	✓	✓	✓	✓	✓	✓	✓
Simplified control data record (V1)	--	--	✓	✓	✓	✓	--
Read back control data record *	✓	✓	✓	✓	✓	✓	✓
Read feedback data record	--	--	✓	✓	✓	✓	✓

* You can read back the control data record with the RDREC instruction.

10.3 Transferring control data record in the startup program of the CPU

Required steps

Transfer the created control data record 196 to the CPU/the interface module using the instruction WRREC (Write data record) instruction.

Parameters of the instruction WRREC

Below, you will find explanations of individual parameters of the WRREC instruction which you must supply with specific values in the configuration control context. You can find additional information on the WRREC instruction in the STEP 7 online help.

ID	Hardware identifier • Use the HW identifier of the CPU for the configuration control for centrally arranged modules. If you have selected the CPU in the network view or device view, the HW identifier is available in the **System constants** tab of the Inspector window. Use the value of the system constant "Local~Configuration". • Use the HW identifier of the interface module for the configuration control for distributed I/O. If you have selected the interface module in the network view or device view, the HW identifier is available in the **System constants** tab of the Inspector window. Use the value of the system constant "<Name_of_the_interface_module>~Head".
INDEX	Data record number: 196 (decimal)
RECORD	Control data record to be transferred. See the section Creating the control data record (Page 177) for the structure of the control data record.

Error messages

In case of error, the instruction WRREC returns the following error messages via the STATUS block parameter:

Table 10- 9 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 196 is not correct.
$80B5_H$	Configuration control parameters not assigned.
$80E2_H$	Data record was transferred in the wrong OB context. The data record must be transferred in the startup program.
$80B8_H$	Parameter error A parameter error is caused by: • Incorrect block ID in the header (not equal to 196) • Invalid version identifier in the header • A reserved bit was set • A station master slot was assigned an invalid slot in the station option • Multiple slots in the station master are assigned to the same slot in the station option • For shared device on submodule level: Violation of defined restrictions

Selection of the station option in the user program

In order for the CPU to know which station option you want to operate, you must set up a selection option between the various control data records in the user program. You can implement the selection, for example, via an Int tag which references an array element.

Note that the tag for selecting the control data record must be located in the retentive memory area. If the tag is not retentive it will be initialized during the startup of the CPU and thus be unavailable for selection of the station option.

Special aspects relating to the transfer of the control data record to the CPU

- If you have enabled configuration control, the CPU is not ready for operation without a control data record. The CPU returns from startup to STOP if a valid control data record is not transferred in the startup OB. The central I/O is not initialized in this case. The cause for the STOP mode is entered in the diagnostics buffer.

  Note

  If an incorrect control data record is transferred to the CPU in the startup OB, the startup of the CPU may be prevented.

  In this case, perform a reset to factory settings of the CPU and then transfer a correct control data record.

- The CPU processes the WRREC instruction for transfer of the control data record asynchronously. For this reason, you must call WRREC in the startup OB repeatedly in a loop until the output parameters "BUSY" or "DONE" indicate that the data record has been transferred.
  – Tip: To program the loop, use the SCL programming language with the REPEAT ... UNTIL instruction.

```
REPEAT
 "WRREC_DB"(REQ := "start_config_control",
            ID := "Local~Configuration",
            INDEX := 196,
            LEN := "conf_LEN",
            DONE => "conf_DONE",
            BUSY => "conf_BUSY",
            RECORD := "ConfDB".ConfigControl["ConfDB".Option],
 //Selection of control data record
            ERROR => "conf_ERROR",
            STATUS => "conf_STATUS");
UNTIL NOT "conf_BUSY"
END_REPEAT;
```

  – In the graphical programming languages, you implement the loop using instructions for program control.

Example in FBD: Use the LABEL (jump label) and JMP (jump at RLO=1) instructions to program a loop.

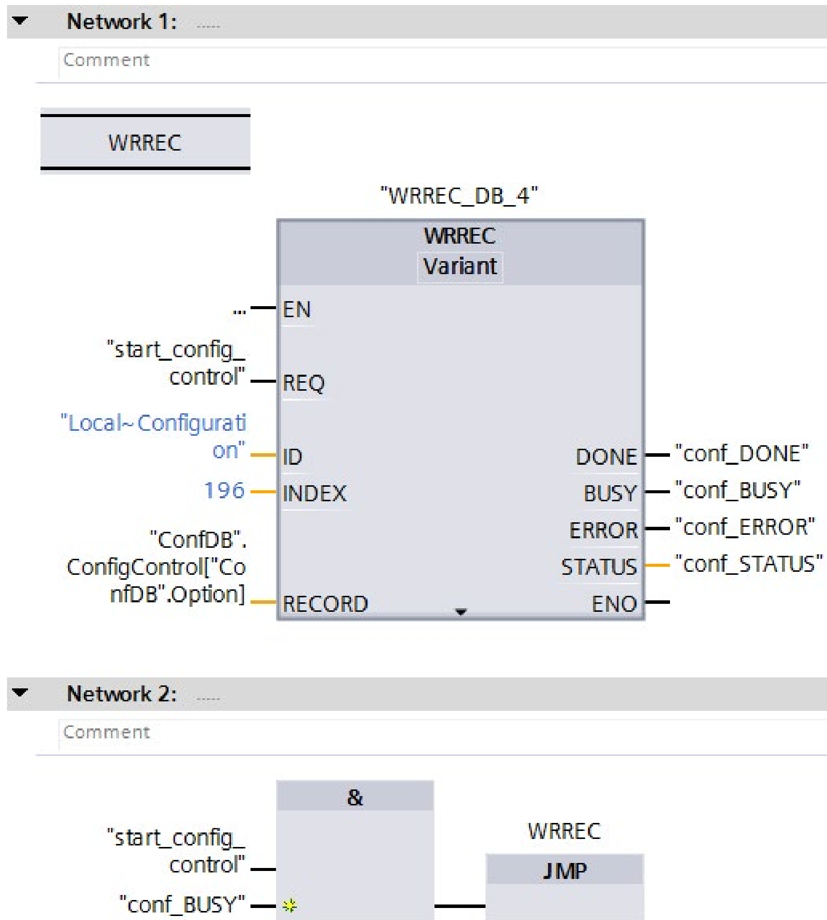

Figure 10-5 WRREC

- The control data record is stored retentively in the CPU. Note:
  - The retentivity of the control data record is independent of the retentivity settings in the STEP 7 memory area. This means that the memory area in which the control data record is configured does not have to be configured as retentive for this purpose.
  - If you write a control data record with modified configuration, the original data record 196 is deleted and the new data record 196 is saved retentively. The CPU will then restart with the modified configuration.

Special aspects relating to the transfer of the control data record to the interface module

- If you have enabled configuration control, the ET 200SP station is not ready for operation without a control data record. As long as no valid control data record has been transferred, the I/O modules are considered as failed by the CPU and exhibit substitute value behavior. The interface module continues to exchange data.
- The control data record is stored retentively in the interface module. Note:
  - If there have been no changes to the configuration, you do not need to rewrite the control data record 196 during restart.
  - If you write a control data record with modified configuration to the interface module, it will result in a station failure in the distributed I/O system. The original data record 196 is deleted and the new data record 196 is saved retentively. The station will then restart with the modified configuration.

10.4 Behavior during operation

Effect of discrepancy between station master and station option

For the online display and for the display in the diagnostics buffer (module OK or module faulty), the station master is always used and not the differing station option.

Example: A module supplies diagnostic information. This module is configured in slot 4 in the station master, but is inserted in slot 3 in the station option (missing module; see example in the next section). The online view (station master) shows a faulty module in slot 4. In the real configuration, the module in slot 3 indicates an error via an LED display.

Response when modules are missing

If modules are entered as not present in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK.
- Direct write access to the outputs that are not present or write access to the process image of the outputs that are not present: Remains without effect; no access error is signaled.
- Direct read access to the inputs that are not present or read access to the process image of the inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: An error is signaled because a valid data record cannot be returned.

10.5 Examples of configuration control

A station master consisting of an interface module, three I/O modules and the server module is configured in STEP 7 in the following section.

Four station options are derived from the station master with the configuration control:

- Station option 1 with module that is not present
- Station option 2 with modified order of modules
- Station option 3 with empty slot
- Station option 4: Opening a new potential group

Station option 1 with module that is not present

The module that is located in slot 3 in the station master is not present in the station option 1. Slot 3 must be designated in the control data record accordingly with 0 (= not present). The server module is located in slot 3 in the station option.

11 Commissioning

11.1 Overview

Introduction

This section includes information on the following topics:

- Commissioning the ET 200SP distributed I/O system on the PROFINET IO
- Commissioning the ET 200SP distributed I/O system on the PROFIBUS DP
- Startup of the ET 200SP distributed I/O system with empty slots
- Removing/inserting the SIMATIC memory card
- Operating modes of the CPU
- CPU memory reset
- Reassigning parameters during operation
- Identification and maintenance data

Commissioning requirements

Note

Performing tests

You must ensure the safety of your plant. You therefore need to run a complete functional test and make the necessary safety checks before the final commissioning of a plant.

Also allow for any possible foreseeable errors in the tests. This avoids endangering persons or equipment during operation.

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the system network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (http://support.automation.siemens.com/WW/view/en/67460624).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal.

General function overview:

- Network browsing and creation of a table showing the accessible devices in the network.
- Flashing of device LEDs or HMI display to locate a device
- Loading addresses (IP, subnet, gateway) into a device
- Loading the PROFINET name (station name) into a device name
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your programming device/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- General reset of a CPU's memory
- Resetting devices to factory settings
- Downloading a firmware update to a device
- ...

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/de/view/98161300).

11.2 Commissioning the ET 200SP for PROFINET IO

Requirements

- The CPU/interface module is in the "Factory settings" status or has been reset to factory settings (see section Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300)).
- For CPU: The SIMATIC memory card is as delivered or has been formatted.

11.2.1 ET 200SP CPU as an IO controller

Configuration example

To use the ET 200SP distributed I/O system as an IO controller, you require the CPU 151xSP-1 PN.

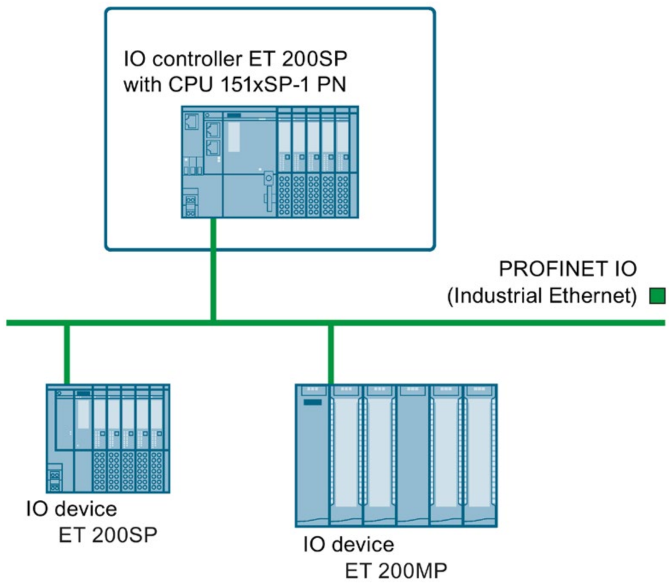

Figure 11-1 ET 200SP CPU as an IO controller

Commissioning procedure

To commission the ET 200SP distributed I/O system CPU as an IO controller for PROFINET IO, we recommend the following procedure:

Table 11- 1 Procedure for commissioning the ET 200SP CPU as an IO controller for PROFINET IO

Step	Procedure	See ...
1	Installing ET 200SP	Section Installation (Page 64)
2	Connecting ET 200SP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 87)
3	Inserting a SIMATIC memory card in the IO controller	Section Removing/inserting a SIMATIC memory card on the CPU (Page 213)
4	Configuring the IO controller[1]	Section Configuring (Page 134)
5	Checking the protective measures	-

Step	Procedure	See ...
6	Switching on supply voltages for the IO controller	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
7	Switching on supply voltages for IO devices	Documentation of the IO device
8	Downloading the configuration to the IO controller	STEP 7 online help
9	Switching IO controller to RUN mode	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
10	Checking LEDs	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
11	Testing inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, controlling the outputs. See section Test functions and eliminating problems (Page 273)

[1] The IO devices are configured with the IO controller.

11.2.2 ET 200SP CPU as an I-device

Configuration example

You need the CPU 151xSP-1 PN to use the ET 200SP distributed I/O system as an I-device.

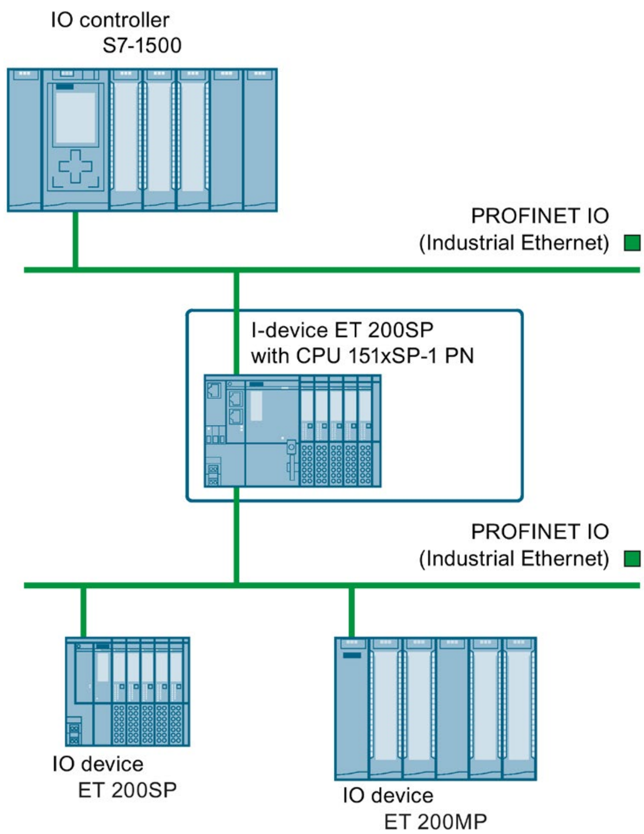

Figure 11-2 ET 200SP CPU as an I-device

Commissioning procedure

For commissioning of the ET 200SP distributed I/O system as an I-device on the PROFINET IO, we recommend the following procedure:

Table 11- 2 Procedure for commissioning the ET 200SP as an I-device on the PROFINET IO

Step	Procedure	See ...
1	Installing ET 200SP	Section Installation (Page 64)
2	Connecting ET 200SP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 87)
3	Inserting a SIMATIC memory card in the I-device	Section Removing/inserting a SIMATIC memory card on the CPU (Page 213)
4	Configuring the I-device	Section Configuring (Page 134)
5	Checking the protective measures	-
6	Switching on supply voltages for the IO controller	Documentation of the IO controller
7	Switching on supply voltages for I-device and IO devices	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual and documentation of the IO devices
8	Download configuration to the I-device	STEP 7 online help
9	Switching IO controller and I-device to RUN mode	Documentation of the IO controller and CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
10	Checking LEDs	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
11	Testing inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, controlling the outputs. See section Test functions and eliminating problems (Page 273)

11.2.3 ET 200SP as an IO device

Configuration example

To use the ET 200SP distributed I/O system as an IO device, you need the IM 155-6 PNxx interface module.

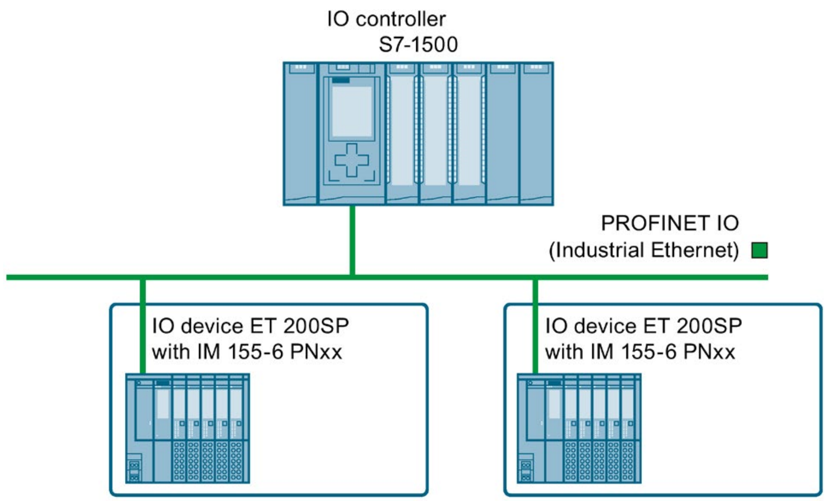

Figure 11-3 ET 200SP as an IO device

Commissioning procedure

For commissioning of the ET 200SP distributed I/O system as an IO device on the PROFINET IO, we recommend the following procedure:

Table 11- 3 Procedure for commissioning the ET 200SP as an IO device for PROFINET IO

Step	Procedure	See ...
1	Installing ET 200SP	Section Installation (Page 64)
2	Connecting ET 200SP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 87)
4	Configuring IO controller	Documentation of the IO controller
5	Checking the protective measures	-
6	Switching on supply voltages for the IO controller	Documentation of the IO controller
7	Switching on supply voltages for IO devices	Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300) Manual
8	Downloading the configuration to the IO controller	STEP 7 online help
9	Switching IO controller to RUN mode	Documentation of the IO controller

Step	Procedure	See ...
10	Checking LEDs	Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300) Manual
11	Testing inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, controlling the outputs. Refer to section Test functions and eliminating problems (Page 273)

11.3 Commissioning the ET 200SP on PROFIBUS DP

Requirements

- The CPU/interface module is in the "Factory settings" status or has been reset to factory settings (see section Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300)).
- For CPU: The SIMATIC memory card is as delivered or has been formatted.

11.3.1 ET 200SP as a DP master

Configuration example

To use the ET 200SP distributed I/O system as a DP master, you need the CPU 151xSP-1 PN and the CM DP communication module.

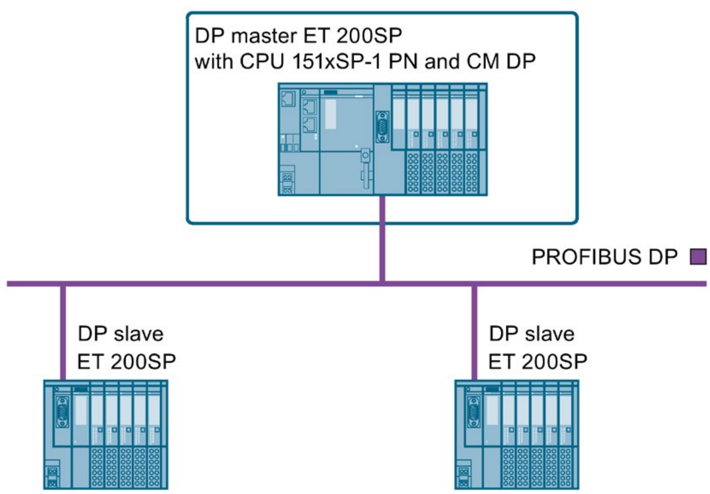

Figure 11-4 ET 200SP as a DP master

Commissioning procedure

To commission the ET 200SP distributed I/O system as a DP master on PROFIBUS DP, we recommend the following procedure:

Table 11- 4 Procedure for commissioning the ET 200SP as a DP master on the PROFIBUS DP

Step	Procedure	See ...
1	Installing ET 200SP (with CPU and CM DP)	Section Installation (Page 64)
2	Connecting ET 200SP • Supply voltages • PROFIBUS DP • Sensors and actuators	Section Wiring (Page 87)
3	Inserting a SIMATIC memory card in the DP master (CPU)	Section Removing/inserting a SIMATIC memory card on the CPU (Page 213)
4	Configuring DP master (including PROFIBUS address)	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) and CM DP manual
5	Switching on supply voltages for DP master	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
6	Switching on supply voltages for DP slaves	Documentation of the DP slave
7	Download configuration to the DP master	STEP 7 online help
8	Switching DP master to RUN	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
9	Checking LEDs	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
10	Testing inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, controlling the outputs. See section Test functions and eliminating problems (Page 273)

11.3.2 ET 200SP as I-slave

Configuration example

To use the ET 200SP distributed I/O system as I-slave, you need the CPU 151xSP-1 PN and the CM DP communication module.

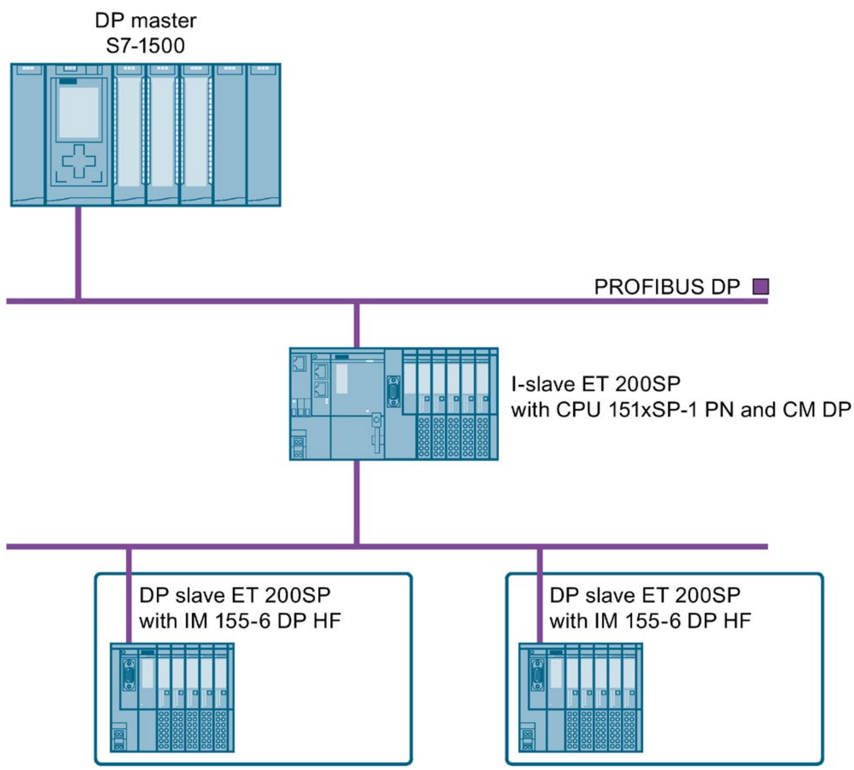

Figure 11-5 ET 200SP as I-slave

Commissioning procedure

For commissioning of the ET 200SP distributed I/O system as an I-slave on the PROFIBUS DP, we recommend the following procedure:

Table 11- 5 Procedure for commissioning the ET 200SP as an I-slave for PROFIBUS DP

Step	Procedure	See ...
1	Installing ET 200SP (with CPU and CM DP)	Section Installation (Page 64)
2	Connecting ET 200SP • Supply voltages • PROFIBUS DP • Sensors and actuators	Section Wiring (Page 87)
3	Configuring DP master (including PROFIBUS address)	Documentation of the DP master
4	Inserting a SIMATIC memory card in the I-slave (CPU)	Section Removing/inserting a SIMATIC memory card on the CPU (Page 213)
5	Configuring I-slave (including PROFIBUS address)	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) and CM DP manual
6	Switching on supply voltages for DP master	Documentation of the DP master
7	Switching on supply voltages for I-slaves	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
8	Loading configuration in the DP master and I-slaves	STEP 7 online help
9	Switching DP master and I-slaves to RUN	Documentation of the DP master and CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
10	Checking LEDs	CPU 15xxSP-1 PN (http://support.automation.siemens.com/WW/view/en/90466439/133300) manual
11	Testing inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, controlling the outputs. See the Test functions and fault resolution (http://support.automation.siemens.com/WW/view/en/90466439/133300) section

11.3.3 ET 200SP as a DP slave

Configuration example

To use the ET 200SP distributed I/O system as a DP slave, you need the IM 155-6 DP HF.

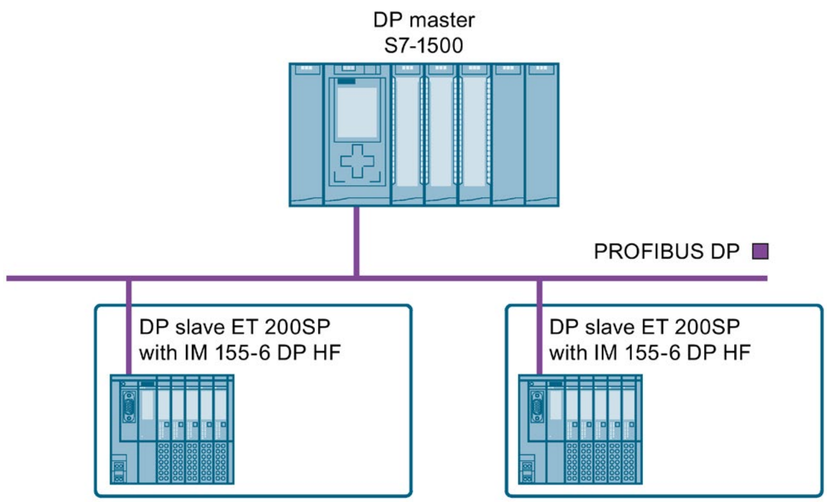

Figure 11-6 ET 200SP as a DP slave

Commissioning procedure

To commission the ET 200SP distributed I/O system as a DP slave on PROFIBUS DP, we recommend the following procedure:

Table 11- 6 Procedure for commissioning the ET 200SP as a DP master for PROFIBUS DP

Step	Procedure	See ...
1	Installing ET 200SP (with IM 155-6 DP HF)	Section Installation (Page 64)
2	Setting the PROFIBUS address on the interface module	Section Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300)
3	Connecting ET 200SP • Supply voltages • PROFIBUS DP • Sensors and actuators	Section Wiring (Page 87)
4	Configuring DP master (including PROFIBUS address)	Documentation of the DP master
5	Switching on supply voltages for DP master	Documentation of the DP master
6	Switching on supply voltages for DP slaves	Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300) Manual
7	Download configuration to the DP master	STEP 7 online help

Step	Procedure	See ...
8	Switching DP master to RUN	Documentation of the DP master
9	Checking LEDs	Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300) Manual
10	Testing inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, controlling the outputs. Refer to section Test functions and eliminating problems (Page 273)

11.4 Startup of the ET 200SP with empty slots

Procedure

You can configure the ET 200SP distributed I/O system with any number of empty slots.

To build the ET 200SP distributed I/O system with any number of empty slots, follow these steps:

1. Cover all empty slots with BU covers.
2. Finish the configuration with a server module.

Special consideration: A "Module missing in slot x" diagnostic message is generated by the CPU/interface module for empty slots in which I/O modules are configured.

11.5 Removing/inserting a SIMATIC memory card on the CPU

Requirement

The CPU only supports pre-formatted SIMATIC memory cards. If necessary, delete all previously stored data before using the SIMATIC memory card. Additional information about deleting the contents of the SIMATIC memory card can be found in the section, SIMATIC memory card - overview (Page 240).

In order to work with the SIMATIC memory card, first ensure that the SIMATIC memory card is not write-protected. If it is, move the slider out of the lock position.

Inserting the SIMATIC memory card

To insert a SIMATIC memory card, follow these steps:

1. Ensure that the CPU is either switched off or in STOP mode.
2. Insert the SIMATIC memory card, as depicted on the CPU, into the slot for the SIMATIC memory card.

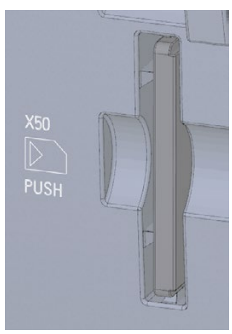

Figure 11-7 Slot for the SIMATIC memory card

3. Insert the SIMATIC memory card with light pressure into the CPU, until the SIMATIC memory card latches.

Removal of the SIMATIC memory card

To remove a SIMATIC memory card, follow these steps:

1. Switch the CPU to STOP mode.
2. Press the SIMATIC memory card into the CPU with light pressure. After audible unlatching of the SIMATIC memory card, remove it.

Only remove the SIMATIC memory card in POWER OFF or STOP mode of the CPU. Ensure that no writing functions (online functions with the programming device, e.g. loading/deleting a block, test functions) are active in STOP mode or were active before POWER OFF.

Reactions after removing/inserting the SIMATIC memory card

Inserting and removing the SIMATIC memory card in STOP, STARTUP or RUN mode triggers a re-evaluation of the SIMATIC memory card. The CPU hereby compares the content of the configuration on the SIMATIC memory card with the backed-up retentive data. If the backed-up retentive data matches the data of the configuration on the SIMATIC memory card, the retentive data is retained. If the data differs, the CPU automatically performs a memory reset (which means the retentive data is deleted) and then goes to STOP.

The CPU evaluates the SIMATIC memory card, and this is indicated by the RUN/STOP LED flashing.

Reference

Additional information on the SIMATIC memory card can be found in the SIMATIC memory card (Page 240) section.

11.6 Operating modes of the CPU

Introduction

Operating modes describe the status of the CPU. The following operating modes are possible using the mode selector:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate, for example, via the PROFINET interface.

The status LEDs on the front of the CPU indicate the current operating mode.

11.6.1 STARTUP mode

Function

Before the CPU starts to execute the cyclic user program, a startup program is executed.

By suitably programming startup OBs, you can specify initialization tags for your cyclic program in the startup program. You have the option of programming no, one or several startup OBs.

Special features during startup

Note the following points regarding the STARTUP mode:

- All outputs are disabled or react according to the parameter settings for the particular I/O module: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe operational status.
- The process image is initialized.

  The process image is not updated.

  In order to read the current state from inputs during STARTUP, you can access inputs directly via I/O access.

  In order to initialize outputs during STARTUP, values can be written via the process image or via direct I/O access. The values are output at the outputs during the transition to the RUN mode.
- The CPU always starts up in warm restart mode.
  - The non-retentive bit memory, timers and counters are initialized.
  - The non-retentive tags in data blocks are initialized.
- During startup, cycle time monitoring is not yet running
- The startup OBs are executed in the order of the startup OB numbers. All startup OBs that you have programmed are executed, regardless of the selected startup mode.
- The following OBs can be started during startup, if a corresponding event occurs:
  - OB 82: Diagnostics interrupt
  - OB 83: Pull/plug interrupt for modules
  - OB 86: Rack error
  - OB 121: Programming error (only for global error handling)
  - OB 122: I/O access error (only for global error handling)

    You can find a description of how to use global and local error handling in the STEP 7 online help.

  No other OBs can be started until after the transition to RUN mode.

Response when expected and actual configurations do not match

The configuration downloaded to the CPU represents the expected configuration. The actual configuration is the actual configuration of the ET 200SP distributed I/O system. If the expected configuration and the actual configuration do not match, the setting of the "Comparison preset to actual configuration" parameter determines the reaction of the CPU (see section Operating mode transitions (Page 218)).

Canceling a startup

If errors occur during startup, the CPU cancels the startup and returns to STOP mode.

The CPU does not execute a startup or cancels a startup under the following conditions:

- If no SIMATIC memory card is inserted or an invalid SIMATIC memory card is inserted.
- If no hardware configuration has been downloaded.

Setting the startup behavior

To set the startup behavior, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the CPU.
2. In the properties under "General" select the "Startup" area.

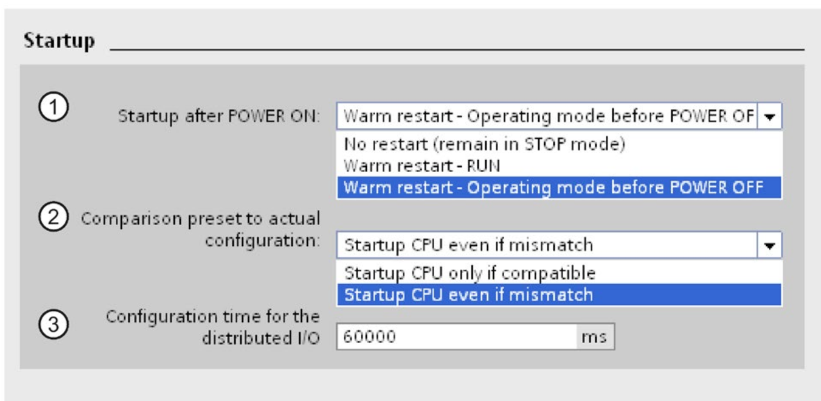

Figure 11-8 Setting the startup behavior

① Sets the startup type after POWER ON

② Defines the startup behavior when a module in a slot does not correspond to the configured module. You can set this parameter centrally, on the CPU or for each module. When you change the setting for a module, the setting made centrally for this module no longer applies.

- Startup CPU only if compatible: In this setting a module on a configured slot has to be compatible with the configured module. Compatible means that the module matches in terms of the number of inputs and outputs and with respect to its electrical and functional properties.
- Startup CPU even if mismatch: With this setting the CPU starts up regardless of the type of module plugged in.

③ Specifies a maximum period (default: 60000 ms) in which the I/O must be ready for operation. The CPU changes to RUN.

If the central and distributed I/O is not ready for operation within the configuration time, the startup characteristics of the CPU depends on the setting of the "Comparison preset to actual configuration" parameter.

Example for the "Comparison preset to actual configuration" parameter

"Startup CPU only if compatible":

The input module DI 16x24VDC ST with 16 digital inputs is a compatible replacement for the input module DI 8x24VDC ST with 8 digital inputs, because the pin assignment and all the electrical and functional properties match.

"Startup CPU even if mismatch":

Instead of a configured digital input module, you insert an analog output module or no module is present in this slot and thus in all subsequent slots. Although the configured inputs cannot be accessed, the CPU starts up.

Note that the user program cannot function correctly in this case and take the appropriate measures.

11.6.2 STOP mode

Function

The CPU does not execute the user program in STOP mode.

All outputs are disabled or react according to the parameter settings for the particular I/O module: They provide a substitute value as set in the parameters or retain the last value output keeping the controlled process in a safe operating status.

In STOP mode, the motor starter responds according to how it was parameterized for the CPU STOP state. The CPU STOP state can be circumvented with the manual local control (Local Control) function. If the CPU is switched off, a motor can be switched on in the motor starter's commissioning mode.

You will find additional information in the Motor starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) manual.

11.6.3 RUN mode

Function

In "RUN" mode the cyclic, time-driven, and interrupt-driven program is executed. Addresses that are in the "Automatic Update" process image are automatically updated in each program cycle. See also the section Process images and process image partitions (Page 142).

Execution of the user program

Once the CPU has read the inputs, the cyclic program is executed from the first instruction to the last instruction.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time is finished even if the user program is completed sooner.

A cycle monitoring time is set to ensure that the cyclic program is completed within a specified time. You can change the cycle monitoring time to suit your requirements. If the cyclic program has not finished running within this time, the system responds with a time error.
Further events such as hardware interrupts and diagnostics interrupts can interrupt the cyclic program flow and prolong the cycle time.

Reference

Further information about cycle and response times is available in the Function Manual Cycle and response times (http://support.automation.siemens.com/WW/view/en/59193558).

11.6.4 Operating mode transitions

Operating modes and operating mode transitions

The following figure shows the operating modes and the operating mode transitions:

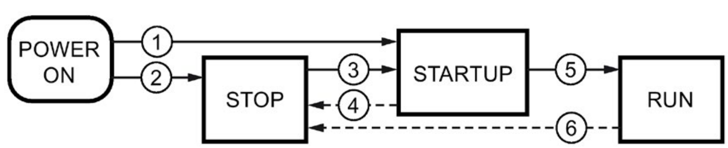

Figure 11-9 Operating modes and operating mode transitions

The table below shows the effects of the operating mode transitions:

Table 11- 7 Operating mode transitions

No.	Operating mode transitions		Effects
①	POWER ON → STARTUP	After switching on, the CPU switches to "STARTUP" mode if: • The hardware configuration and program blocks are consistent. • Startup type "Warm restart - RUN" is set. Or • Startup type "Warm restart mode before POWER OFF" is set and the CPU was in RUN mode before POWER OFF.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
②	POWER ON → STOP	After switching on, the CPU goes to "STOP" mode if: • The hardware configuration and program blocks are inconsistent. Or • The "No restart" startup type is set. Or • Startup type "Warm restart mode before POWER OFF" is set and the CPU was in STOP mode before POWER OFF.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.

No.	Operating mode transitions		Effects
③	STOP → STARTUP	The CPU switches to "STARTUP" mode if: • The hardware configuration and program blocks are consistent. • You set the CPU to "RUN" mode via the programming device and the mode switch in is RUN position. Or • You set the mode switch from STOP to RUN.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
④	STARTUP → STOP	The CPU returns to the "STOP" mode in the following cases of "STARTUP": • The CPU detects an error during startup. • You set the CPU to "STOP" via the programming device or mode switch. • The CPU executes a STOP command in the Startup OB.	These operating mode transitions have no effect on data.
⑤	STARTUP → RUN	The CPU goes to the "RUN" mode in the following cases of "START-UP": • The CPU has initialized the PLC tags. • The CPU has executed the startup blocks successfully.	
⑥	RUN → STOP	The CPU returns to the "STOP" mode in the following cases of "RUN": • The CPU detects an error which prevents further work. • The CPU executes a STOP command in the user program. • You set the CPU to "STOP" via the programming device or mode switch.	

11.7 CPU memory reset

Basics of a memory reset

A memory reset on the CPU is possible only in the STOP mode.
When memory is reset, the CPU is changed to a so-called "initial status".
This means that:

- An existing online connection between your programming device/PC and the CPU is terminated.
- The content of the work memory and the retentive and non-retentive data (applies only to manual memory reset by the user) are deleted.
- The diagnostics buffer, time of day, IP address and the device name are retained.
- Subsequently the CPU is initialized with the loaded project data (hardware configuration, code and data blocks, force jobs). The CPU copies this data from the load memory to the work memory.

  Result:
  - If you set an IP address in the hardware configuration ("Set IP address in the project" option) and a SIMATIC memory card with the project is in the CPU, this IP address is valid after the memory reset.
  - Data blocks no longer have current values but rather their configured start values.
  - Force jobs remain active.

How can I tell if the CPU is performing a memory reset?

The RUN/STOP LED flashes yellow at 2 Hz. After completion the CPU goes into STOP mode, and the RUN/STOP LED is switched on (permanently lit yellow).

Result after memory reset

The following table provides an overview of the contents of the memory objects after memory reset.

Table 11- 8 Result after memory reset

Memory object	Content
Actual values of the data blocks, instance data blocks	Initialized
Bit memory, timers and counters	Initialized
Retentive tags from technology objects (for example, adjustment values of absolute encoders)*	Retained
Diagnostics buffer entries	Retained
IP address	Retained
Device name	Retained
Counter readings of the runtime meters	Retained
Time of day	Retained

* The retentive tags from technology objects are retained but the content of specific tags is partly re-initialized.

11.7.1 Automatic memory reset

Possible cause of an automatic memory reset

The CPU executes an automatic memory reset if an error occurs that prevents normal further processing.

Causes for such errors can be:

- User program is too large, and cannot be completely loaded into work memory.
- The project data on the SIMATIC memory card is corrupt, for example, because a file was deleted.
- If you remove or insert the SIMATIC memory card and the backed-up retentive data differs in structure from that of the configuration on the SIMATIC memory card.

11.7.2 Manual memory reset

Reason for a manual memory reset

CPU memory reset is required to reset the CPU to its "original state".

CPU memory reset

There are two options for performing a CPU memory reset:

- Using the mode selector
- Using STEP 7

Procedure using the mode selector

Note

Memory reset ↔ Reset to factory settings

The operation described below also reflects the procedure for resetting to factory settings:

- Selector operation with inserted SIMATIC memory card: CPU executes a memory reset
- Selector operation without inserted SIMATIC memory card: CPU executes reset to factory settings

---

To reset the CPU memory using the mode selector, proceed as follows:

1. Set the mode selector to the STOP position.

   Result: The RUN/STOP LED lights up yellow.
2. Set the mode selector to the MRES position. Hold the selector in this position until the RUN/STOP LED lights up for the 2nd time and remains continuously lit (this takes three seconds). After this, release the switch.
3. Within the next three seconds, switch the mode selector back to the MRES position, and then back to STOP again.

Result: The CPU executes memory reset.

For information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (Page 264).

Procedure using STEP 7

For a memory reset of the CPU using STEP 7 proceed as follows:

1. Open the "Online Tools" task card of the CPU.
2. Click the "MRES" button in the "CPU control panel" pane.
3. Click "OK" in response to the confirmation prompt.

Result: The CPU switches to STOP mode and performs a memory reset.

11.8 Reassigning parameters during operation

Introduction

You have the option of reassigning the parameters for the ET 200SP I/O modules during operation.

Changing parameters during operation

You make the parameter settings of the I/O modules using data records. Each I/O module has a separate data record. The instruction "WRREC" applies the changed parameters to the I/O module.
If you are using the CPU as an I-device, you reassign the parameters of the I/O modules via the I-device.

Note

If you write data records from the user program to the modules of the distributed I/O, make sure that these modules actually exist and are available. You can evaluate OB83 for this purpose. After inserting a module, the CPU does not call OB83 until the module has started up and its parameters are assigned. This ensures the execution of the data record operations without errors.

Note

You need to transfer the new parameters with the "WRREC" instruction after a POWER OFF/POWER ON of the ET 200SP.

Instruction for parameter assignment

The following instruction is provided for assigning parameters to the I/O module in the user program:

Instruction	Application
"WRREC"	Transfer the modifiable parameters to the addressed ET 200SP module.

Error message

In the event of an error, the following return values are reported:

Table 11- 9 Error message

Error code	Meaning
$80E0_H$	Error in header information
$80E1_H$	Parameter error

Reference

You will find the setup of the parameter data record in the manuals of the I/O modules (http://support.automation.siemens.com/WW/view/es/55679691/133300).

11.9 Identification and maintenance data

11.9.1 Reading out and entering I&M data

I&M data

I&M identification data is information which is stored on the module either as read-only data (I-data) or read/write data (M-data).

Identification data (I&M0): Manufacturer information about the module that can only be read and is in part also printed on the housing of the module, for example, article number and serial number.
Maintenance data (I&M1, 2, 3): Plant-dependent information, e.g. installation location. Maintenance data is created during configuration and written to the module.
All modules of the ET 200SP distributed I/O system support identification data (I&M0 to I&M3).

The I&M identification data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a plant
- Correcting errors in a plant

Modules can be clearly identified online using the I&M identification data.

STEP 7 allows you to read the identification I&M data (see STEP 7 online help).

Note

The BusAdapter and the interface module IM 155-6 PN HF support the identification data I&M0 to I&M4 (signature).

Options for reading out I&M data

- Via the user program
- Via STEP 7 or HMI devices
- Via the CPU web server

Procedure for reading I&M data by means of the user program

You have the following options to read the modules' I&M data in the user program:

- using the RDREC instruction

  The record structure for distributed modules that are accessible via PROFINET IO/PROFIBUS DP, is described in the chapter Record structure for I&M data (Page 227).
- using the Get_IM_Data instruction

Reference

The description of the instructions can be found in the STEP 7 online help.

Procedure for reading the I&M data via STEP 7

Requirements: There must be an online connection to the CPU/interface module.

To read I&M data using STEP 7, follow these steps:

1. In the project tree, under "Distributed I/O" select the IO device IM 155-6 PN ST (for example).
2. Select **> IO device > Online & diagnostics > Identification & Maintenance**.

Procedure for entering maintenance data via STEP 7

STEP 7 assigns a default module name. You can enter the following information:

- Plant designation (I&M1)
- Location identifier (I&M1)
- Installation date (I&M2)
- Additional information (I&M3)

To enter maintenance data via STEP 7, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the interface module, for example.
2. In the properties under "General", select the "Identification & Maintenance" area and enter the data.

During the loading of the hardware configuration, the I&M data is also loaded.

Procedure for reading I&M data via the Web server

The procedure is described in detail in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) Function Manual.

11.9.2 Data record structure for I&M data

Reading I&M data records (distributed via PROFINET IO)

You can directly access specific identification data by selecting **Read data record** (RDREC instruction). You obtain the corresponding part of the identification data under the relevant data record index.

The data records are structured as follows:

Table 11- 10 Basic structure of data records with I&M identification data

Content	Length (bytes)	Coding (hex)
Header information		
BlockType	2	I&M0: 0020_H I&M1: 0021_H I&M2: 0022_H I&M3: 0023_H
BlockLength	2	I&M0: 0038_H I&M1: 0038_H I&M2: 0012_H I&M3: 0038_H
BlockVersionHigh	1	01
BlockVersionLow	1	00
Identification data		
Identification data (see table below)	I&M0/index $AFF0_H$: 54 I&M1/index $AFF1_H$: 54 I&M2/index $AFF2_H$: 16 I&M3/index $AFF3_H$: 54	

Table 11- 11 Data record structure for I&M identification data

Identification data	Access	Default	Explanation
Identification data 0: (data record index AFF0 hex)			
VendorIDHigh	Read (1 byte)	00_H	This is where the name of the manufacturer is stored (42_D = SIEMENS AG).
VendorIDLow	Read (1 byte)	$2\ A_H$	
Order_ID	Read (20 bytes)	6ES7155-6AU00-0BN0	Article number of the module (e.g. of the interface module)
IM_SERIAL_NUMBER	Read (16 bytes)	-	Serial number (device-specific)
IM_HARDWARE_REVISION	Read (2 bytes)	1	Corresponding HW version
IM_SOFTWARE_REVISION	Read	Firmware version	Provides information about the firmware version of the module
• SWRevisionPrefix	(1 byte)	V	
• IM_SWRevision_Functional_Enhancement	(1 byte)	$00 - FF_H$	
• IM_SWRevision_Bug_Fix	(1 byte)	$00 - FF_H$	

Identification data	Access	Default	Explanation
• IM_SWRevision_Internal_ Change	(1 byte)	00 - FF_H	
IM_REVISION_COUNTER	Read (2 bytes)	0000_H	Provides information about parameter changes on the module (not used)
IM_PROFILE_ID	Read (2 bytes)	0000_H	Generic Device
IM_PROFILE_SPECIFIC_TYPE	Read (2 bytes)	0005_H	Interface modules/BusAdapters
		0003_H	I/O modules and motor starters
		0001_H	CPU
IM_VERSION	Read	0101_H	Provides information on the version of the identification data (0101_H = Version 1.1)
• IM_Version_Major	(1 byte)		
• IM_Version_Minor	(1 byte)		
IM_SUPPORTED	Read (2 bytes)	$000E_H$	Provides information about the available identification data (I&M1 to I&M3)
Maintenance data 1: (data record index AFF1 hex)			
IM_TAG_FUNCTION	Read/write (32 bytes)	-	Enter a module identifier here that is unique plant-wide.
IM_TAG_LOCATION	Read/write (22 bytes)	-	Enter the installation location of the module here.
Maintenance data 2: (data record index AFF2 hex)			
IM_DATE	Read/write (16 bytes)	YYYY-MM-DD HH:MM	Enter the installation date of the module here.
Maintenance data 3: (data record index AFF3 hex)			
IM_DESCRIPTOR	Read/write (54 bytes)	-	Enter a comment describing the module.

Reading I&M data records with data record 255 (distributed via PROFIBUS DP)

The modules support standardized access to identification data via DS 255 (index 65000 to 65003). For further information on the DS 255 data structure, refer to the specifications of the Profile Guidelines Part 1: Identification & Maintenance Functions, Order No.: 3.502, Version 2.1, May 2016

11.9.3 Example: Read out firmware version of the CPU with Get_IM_Data

Automation task

You want to check whether the modules in your automation system have the current firmware. The firmware version of the modules can be found in the I&M 0 data. The IM 0 data are the basic information of a device and contain information such as the manufacturer ID, order number, serial number and the hardware and firmware version.

To read out the I&M 0 data, use the "Get_IM_Data" instruction. You read the I&M 0 data of all the modules in the user program of the CPU via "Get_IM_Data" instructions and store them in a data block.

Conditions and parameters

To read out the I&M data of the CPU, use the following block parameters of the "Get_IM_Data" instruction:

- LADDR: Enter the HW ID of the module at the block parameter "LADDR".
- IM_TYPE: Enter the I&M data number (e.g. "0" for I&M 0 data) at the "IM_TYPE" block parameter.
- DATA: Area for storing the read I&M data (for example. in a global data block). Store the I&M 0 data in an area of the data type "IM0_Data".

This example shows you how to read out the I&M 0 data of an ET 200SP CPU. To read out the I&M 0 data of a different module, simply use the HW ID of the module at the parameter LADDR.

Solution

To read out the I&M 0 data of the CPU, follow these steps:

1. Create a global data block to store the I&M 0 data.
2. Create a structure of the data type "IM0_Data" in the global data block. You can assign any name to the structure ("imData") in this case.

SLI_gDB_Get_IM_Data

	Name	Data type	Start value
1	Static		
2	imData	IM0_Data	
3	done	Bool	false
4	busy	Bool	false
5	error	Bool	false
6	status	Word	16#0

Figure 11-10 Example: Data block for I&M data

3. Create the "Get_IM_Data" instruction in the user program, e.g. in OB 1.

4. Connect the "Get_IM_Data" instruction as follows:

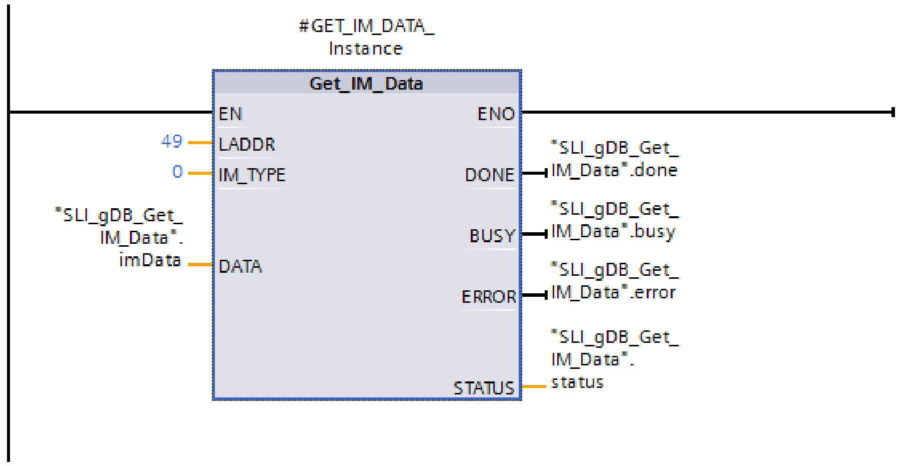

Figure 11-11 Example: Calling the "Get_IM_Data" instruction

5. Call the "Get_IM_Data" instruction in the user program.

Result

The "Get_IM_Data" instruction has stored the I&M 0 data in the data block.

You can view the I&M 0 data online in STEP 7, for example, in the data block with the "Monitor all" button. The CPU in the example is a 1512SP-1 PN (6ES7512-1DK01-0AK0) with the firmware version V2.5.

SLI_gDB_Get_IM_Data

	Name	Data type	Start value	Monitor value
1	Static			
2	imData	IM0_Data		
3	Manufacturer_ID	UInt	0	42
4	Order_ID	String[20]	''	'6ES7 512-1DK01-0...
5	Serial_Number	String[16]	''	'S C-DOS710132013'
6	Hardware_Revision	UInt	0	3
7	Software_Revision	IM0_Version		
8	Type	Char	' '	'V'
9	Functional	USInt	0	2
10	Bugfix	USInt	0	5
11	Internal	USInt	0	0
12	Revision_Counter	UInt	0	0
13	Profile_ID	UInt	0	0
14	Profile_Specific_Ty...	UInt	0	0
15	IM_Version	Word	16#0	16#0101
16	IM_Supported	Word	16#0	16#001E
17	done	Bool	false	TRUE
18	busy	Bool	false	FALSE
19	error	Bool	false	FALSE
20	status	Word	16#0	16#0000

Figure 11-12 Example: I&M 0 data of an ET 200SP CPU

11.10 Shared commissioning of projects

Team Engineering

In Team Engineering several users from various engineering systems work on a project at the same time and access one ET 200SP CPU.

The users can edit separate parts of a master project independently of one another at the same time. The changes of the other editors are displayed in a synchronization dialog during the loading of the configuration in the CPU and synchronized automatically, if possible.

Certain online functions can also be executed at the same time from several engineering systems on a shared CPU, such as:

- Monitoring blocks on the CPU
- Modifying blocks on the CPU
- Trace functions

You can find detailed information on the topic of Team Engineering in the STEP 7 online help.

11.11 Backing up and restoring the CPU configuration

11.11.1 Overview

Backup from online device

You will make a number of changes to your plant over time, for example, add new devices, replace existing devices or adapt the user program. If these changes result in undesirable behavior, you can restore the plant to an earlier state. Before you load a changed configuration to the CPU, first use the option "Backup from online device" to create a complete backup of the current device status.

Upload from device (software)

With the option "Upload from device (software)", you load the software project data from the CPU to an existing CPU in the project.

Upload device as new station

If you are operating a new programming device/PC in the plant, the STEP 7 project that was used to create the plant configuration might not be available. In this case you can use the option "Upload device as new station" to load the device's data into a project in your PG/PC.

Snapshot of the monitor values

You can use the option "Snapshot of the monitor values" to backup the current values of the data block, in order to be able to restore the current values if necessary at a later date.

Overview of backup types

The table below shows the backup of CPU data depending on the selected type of backup and its specific characteristics:

	Backup from online device	Upload from device (software)	Upload device as new station	Snapshot of the monitor values
Current values of all DBs (global and instance data blocks) 1)	✓	✓	✓	✓
Blocks of the type OB, FC, FB and DB	✓	✓	✓	--
PLC tags (tag names and constant names)	✓	✓	✓	--
Technology objects	✓	✓	✓	--
Hardware configuration	✓	--	✓	--
Actual values (bit memories, timers, counters)*	✓	--	--	--
Contents of the SIMATIC memory card	✓	--	--	--
Archives, recipes	✓	--	--	--
Entries in the diagnostics buffer	--	--	--	--
Current time	--	--	--	--
Properties of the type of backup				
Backup possible for fail-safe CPUs	✓	✓ 2)	--	✓
Backup can be edited	--	✓	✓	✓
Backup possible in operating mode	STOP	RUN, STOP	RUN, STOP	RUN, STOP

1) Only the values of the tags that are set as retentive are saved.

2) Only possible in the STOP operating state and for individual fail-safe blocks.

Reference

You can find more information on the different backup types in the STEP 7 online help.

Emergency address (emergency IP)

The emergency address (emergency IP address) of a CPU was conceived for diagnostic and downloading functions, e.g. if the CPU can no longer be reached via the IP protocol due to loading of an incorrect project. You can find information on the emergency address in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/97649773).

Archiving multilingual project texts

When you configure a CPU, different categories of texts come into being, e.g.

- Object names (names of blocks, modules, tags, etc.)
- Comments (for blocks, networks, watch tables, etc.)
- Messages and diagnostic texts

Texts are provided by the system (e.g. diagnostic buffer texts) or are created during configuration (e.g. messages).

In a project, texts exist in one single language or in several languages after a translation process. You can maintain project texts in all languages, which are at your disposal in the project navigator (Languages & Resources > Project Texts). The texts arising during configuration can be loaded into the CPU.

The following texts containing the project data are loaded into the CPU in the chosen languages and are also used by the Web server:

- Diagnostic buffer texts (not editable)
- Module status texts (not editable)
- Message texts with associated text lists
- Tag comments and step comments for S7 GRAPH and PLC Code Viewer
- Comments in watch tables

The following texts containing the project languages are also loaded into the CPU in the chosen languages, but are not used by the Web server:

- Comments in tag tables (for tags and constants)
- Comments in global data blocks
- Comments of elements in block interfaces of FBs, FCs, DBs and UDTs
- Network titles in data blocks that are written in ladder logic (LAD), function block diagram (FBD) or statement list (STL)
- Block comments
- Network comments
- Comments of LAD and FBD elements

The CPUs support archiving of multilingual project texts in up to three different project languages. If the project texts belonging to a specific project language nevertheless exceed the memory space reserved for them, it is not possible to load the project into the CPU. The operation is canceled with a message indicating that not enough free storage space is available. In such a case, take measures to reduce the required storage space, for example by shortening comments.

Note

Size of the SIMATIC memory card

If the storage space needed to load projects exceeds the storage space available on the SIMATIC memory card in use, loading into the CPU is canceled with an error message.

Therefore, make sure that there is enough available storage space on your SIMATIC memory card for loading projects.

You will find information on reading out the storage space capacity utilization of the CPU and the SIMATIC memory card in the Structure and use of the CPU memory (https://support.industry.siemens.com/cs/de/de/view/59193101/en) function manual.

You will find information on parameterization of multilingual project texts in STEP 7 in the STEP 7 online help.

11.12 Time synchronization

NTP procedure

All CPUs are equipped with an internal clock. The clock always shows the time-of-day with a resolution of 1 millisecond and the date including the day of the week. The time adjustment for daylight saving time is also taken into account.

You can synchronize the time of the CPUs with an NTP server in NTP mode (NTP: Network Time Protocol).

In NTP mode, the device sends time queries at regular intervals (in client mode) to the NTP server in the subnet (LAN). Based on the replies from the server, the most reliable and most accurate time is calculated and the time on the CPU is synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. You can configure the IP addresses of up to a maximum of four NTP servers. You address a communications processor or an HMI device, for example, as sources for time synchronization via the IP addresses.

The update interval defines the interval between the time queries (in seconds). The value of the interval ranges between 10 seconds and one day. In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred; this corresponds to GMT (Greenwich Mean Time).

NTP server for the ET 200SP CPU

You can assign an ET 200SP CPU to up to 4 NTP servers.

In STEP 7 you enable the time synchronization in NTP mode. You can configure up to four NTP servers for the ET 200SP CPU in STEP 7.

If you have enabled time synchronization via NTP for the CPU, then you can enter the IP addresses of up to four NTP servers in the user program. For this, use the "T_CONFIG" instruction.

Enabling time synchronization via NTP server

To enable the time synchronization for the ET 200SP CPU via NTP servers, follow these steps:

1. In the Inspector window, navigate in the properties of the CPU to "General" > "PROFINET interface" > Time synchronization".
2. Enable the option "Enable time synchronization via NTP server".

Configuring NTP server in STEP 7

To configure one or more NTP servers for the ET 200SP CPU, follow these steps:

1. In the Inspector window, navigate in the properties of the CPU to "General" > "PROFINET interface" > Time synchronization".
2. Enter the IP addresses of up to four NTP servers at the parameters "Server 1" to "Server 4".
3. Set the interval of the time queries at the "Update interval" parameter. Set the update interval to between 10 s and 86400 s.

Changing the IP addresses of the NTP servers with the "T_CONFIG" instruction

Requirements:

Before using the instruction you have to specify to the hardware configuration that the IP address is assigned via the user program:

1. For this purpose, open the properties of the PROFINET interface in the device view.
2. Select the following option in the "Time synchronization" dialog: Select "Enable time synchronization via NTP server" and specify the IP address of at least one NTP server.

T_CONFIG instruction:

You store the IP addresses for the NTP time synchronization at the CONF_DATA parameter in the system data type.

Reference

For additional information on time synchronization in the automation environment, refer to the following FAQ on the Internet (https://support.industry.siemens.com/cs/de/en/view/86535497).

11.12.1 Example: Configuring and changing NTP server

Configuring time synchronization with your own NTP server

Automation task

You use your own server in your network. Your own server provides you with the following advantages:

- Protection against unauthorized accesses from outside
- Every device that you synchronize with your own NTP server uses the same time.

You want to synchronize the ET 200SP CPU with this NTP server.

Conditions and parameters

You have your own NTP server in your network with the IP address 192.168.1.15.

They are located in STEP 7 in the Inspector window in the properties of the PROFINET interface X1.

Solution

1. Navigate to "Properties > General > PROFINET interface > Time synchronization > NTP mode".
2. For "Server 1" enter the IP address of the NTP server: 192.168.1.15.

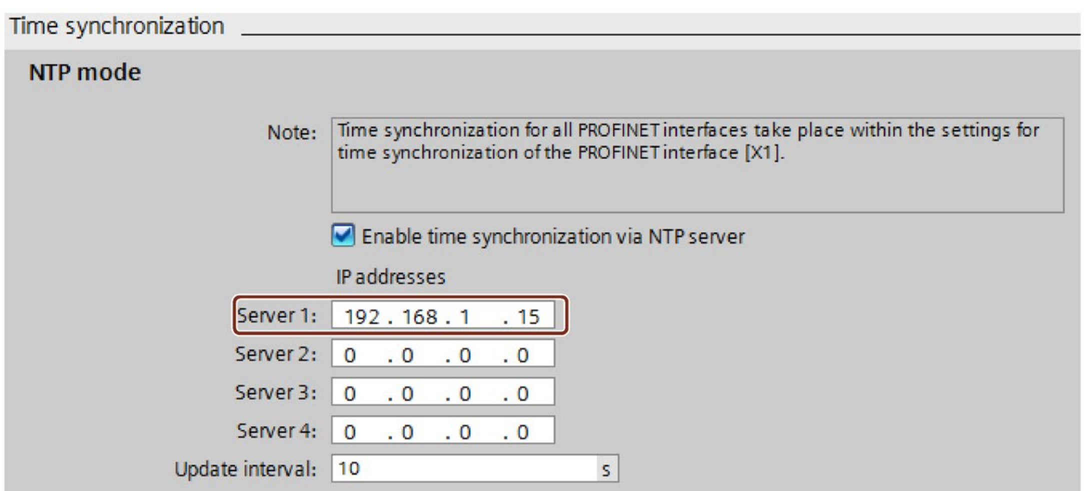

Figure 11-13 Example: Configuring the NTP server

3. Download the hardware configuration to the CPU.

Result

The ET 200SP CPU synchronizes the time with the NTP server 192.168.1.15.

Changing the IP address of an NTP server in the user program

Automation task

You change the NTP server in your network. The new NTP server has the address "192.168.1.10".

You want to change the IP address of the NTP server with which your ET 200SP CPU synchronizes via the user program.

The example shows how you change the IP address of the NTP server to "192.168.1.10"via the user program with the instruction "T_CONFIG".

Conditions and parameters

Requirements:

- You have enabled the option "Enable time synchronization via NTP server" for your CPU in STEP 7.
- You have configured the following NTP servers in STEP 7: Server 1 "192.168.1.15"

To change the IP addressed for NTP servers, use the following block parameter of the "T_CONFIG" instruction:

- Req: A positive edge at the block parameter "Req" starts a job of the "T_CONFIG" instruction.
- Interface: Enter the hardware identifier of the PROFINET interface 1 of the CPU at the "Interface" block parameter. In this example, the HW ID is "64".
- Conf_Data: Area in which you save the IP addresses of the NTP server. Use the data type "IF_CONF_NTP" for this purpose.

Solution

To change the IP address of the NTP server in the user program to "192.168.1.10", follow these steps:

1. Create a global data block in the project tree under "Program blocks > Add new block". Name the global data block "NTP".
2. Create a tag of the data type "IF_CONF_NTP" in the global data block "NTP".

NTP

	Name	Data type	Start value	Comment
1	Static			
2	NTP_Server	IF_CONF_NTP		
3	Id	UInt	17	
4	Length	UInt	22	
5	Mode	UInt	0	
6	NTP_IP	Array[1..4] of IP_V4		
7	NTP_IP[1]	IP_V4		
8	ADDR	Array[1..4] of Byte		IPv4 address
9	ADDR[1]	Byte	192	IPv4 address
10	ADDR[2]	Byte	168	IPv4 address
11	ADDR[3]	Byte	1	IPv4 address
12	ADDR[4]	Byte	10	IPv4 address
13	NTP_IP[2]	IP_V4		
14	NTP_IP[3]	IP_V4		
15	NTP_IP[4]	IP_V4		
16	change_NTP-Server	Bool	false	
17	done	Bool	false	
18	busy	Bool	false	
19	error	Bool	false	
20	status	DWord	16#0	
21	err_loc	DWord	16#0	

Figure 11-14 Example: Data block with IF_CONF_NTP

3. Create a "T_CONFIG" instruction in the user program.
4. Connect the "T_CONFIG" instruction as follows.

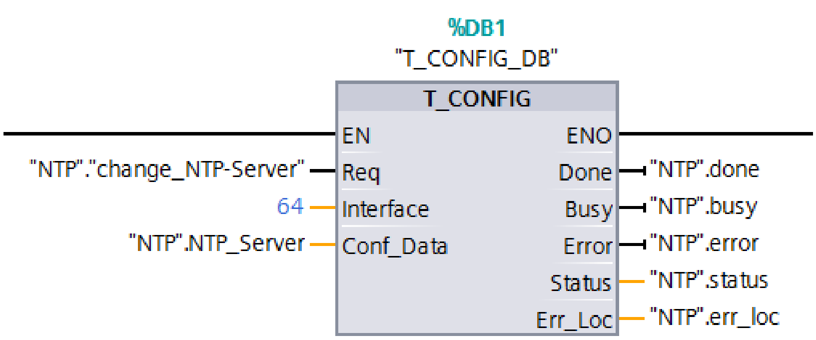

Figure 11-15 Example T_CONFIG: Changing the NTP server

5. In the user program, assign the IP address 192.168.1.10 to the data type "IF_CONF_NTP":

   ```
   "NTP".NTP_Server.NTP_IP[1].ADDR[1] := 192;

   "NTP".NTP_Server.NTP_IP[1].ADDR[2] := 168;

   "NTP".NTP_Server.NTP_IP[1].ADDR[3] := 1;

   "NTP".NTP_Server.NTP_IP[1].ADDR[4] := 10;
   ```

6. You change the IP address of the NTP server by generating a positive edge for the tag "change_NTP-Server" in the user program.

   ```
   "NTP"."change_NTP-Server" := true;
   ```

Result

The ET 200SP CPU synchronizes the time with the NTP server 192.168.1.10.

SIMATIC memory card 12

12.1 SIMATIC memory card - overview

Introduction

The CPU uses a SIMATIC memory card as a memory module. The SIMATIC memory card is a preformatted memory card compatible with the Windows file system. The memory card is available in different memory sizes and can be used for the following purposes:

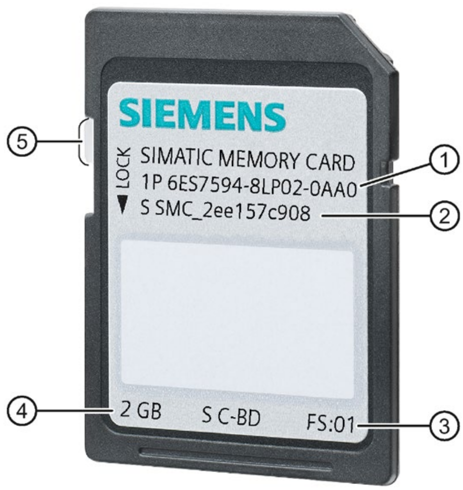
- Transportable data carrier
- Program card
- Firmware update card
- Service data card

If you transfer the user program to the CPU via an online connection, it is written to the SIMATIC memory card, which must be in the card slot of the CPU for this to work.

You can also write the SIMATIC memory card in the PG/PC. A commercially available SD card reader is required to write / read the SIMATIC memory card with the programming device / PC. This is used to copy files directly to the SIMATIC memory card using the Windows Explorer, for example.

A SIMATIC memory card is absolutely required in order to operate the CPU.

Labeling of the SIMATIC memory card



① Article number
② Serial number
③ Production version
④ Memory size
⑤ Slider for enabling write protection:
- Slider up: Not write-protected
- Slider down: Write-protected

Figure 12-1 Labeling of the SIMATIC memory card

Folders and files on the SIMATIC memory card

The following folders and files can be found on the SIMATIC memory card:

Table 12- 1 Folder structure

Folder	Description
FWUPDATE.S7S	Firmware update files for CPU and I/O modules
SIMATIC.S7S	User program, i.e. all blocks (OBs, FCs, FBs, DBs) and system blocks, project data of the CPU
SIMATIC.HMI	HMI-relevant data
DataLogs	DataLog files
Recipes	Recipe files
Backups	Files for backing up and restoring via the display

Table 12- 2 File structure

File type	Description
S7_JOB.S7S	Job file
SIMATIC.HMI\Backup*.psb	Panel backup files
SIMATICHMI_Backups_DMS.bin	Protected file (required to use panel backup files in STEP 7)
__LOG__	Protected system file (required in order to use the card)
crdinfo.bin	Protected system file (required in order to use the card)
DUMP.S7S	Service data file
*.pdf, *.txt, *.csv, etc.	Further files with different formats that you can also store in folders of the SIMATIC memory card

Use the serial number for copy protection

You can set up copy protection for CPUs which binds execution of the block to a specific SIMATIC memory card. Configuration is carried out in STEP 7 in the properties of the block "Bind to serial number of the SIMATIC memory card".

You can only execute the block if it is on the SIMATIC memory card with the specified serial number (see section Copy protection (Page 170)).

Removing a SIMATIC memory card

Only remove the SIMATIC memory card in POWER OFF or STOP mode of the CPU. Make sure that no writing functions (e.g. loading/deleting a block) are active in STOP mode, or were active at POWER OFF. To do this, disconnect the communication connections.

If you remove the SIMATIC memory card during a write process, the following problems can occur:

- The data contents of a file are incomplete.
- The file is no longer readable, or no longer exists.
- The entire content of the card is corrupted.

Inserting the SIMATIC memory card in the CPU in STOP mode triggers a re-evaluation of the SIMATIC memory card. The CPU hereby compares the content of the configuration on the SIMATIC memory card with the backed-up retentive data. If the backed-up retentive data matches the data of the configuration on the SIMATIC memory card, the retentive data is retained. If the data differs, the CPU automatically performs a memory reset (which means the retentive data is deleted) and then goes to STOP.

Also note the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/59457183) in connection with the removal of the SIMATIC memory card.

Removing a SIMATIC memory card from Windows computers

If you are using the card in a commercially available card reader under Windows, use the "Eject" function before you remove the card from the card reader. If you remove the card without using the "Eject" function, you may lose data.

Deleting the contents of the SIMATIC memory card

You have the following options for deleting the content of the SIMATIC memory card:

- Delete files using Windows Explorer
- Format with STEP 7

Note

If you format the card with Windows utilities, you will render the SIMATIC memory card unusable as a storage medium for a CPU.

Deletion of files and folders is permitted, with the exception of the "__LOG__" and "crdinfo.bin" system files. The CPU needs these system files. If you delete the files, you will no longer be able to use the SIMATIC memory card with the CPU.

If you have deleted the "__LOG__" and "crdinfo.bin" system files, format the SIMATIC memory card as described in the following section.

Formatting the SIMATIC memory card

Note

You may only format a SIMATIC memory card in the CPU; otherwise, the SIMATIC memory card cannot be used in the CPU.

If you want to format the SIMATIC memory card using STEP 7, an online connection to the relevant CPU must exist. The CPU is in STOP mode.

Follow these steps to format a SIMATIC memory card with inserted SIMATIC memory card:

1. Open the Online and Diagnostics view of the CPU (either from the project context or via "Accessible devices").
2. In the "Functions" folder, select the "Format memory card" group.
3. Click the "Format" button.
4. Click "Yes" in response to the confirmation prompt.

Result:

- The SIMATIC memory card is formatted for use in the CPU.
- The data on the CPU is deleted with the exception of the IP address.

You will find information on how to repair an inconsistently or incorrectly formatted card in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/69063974).

Service life of a SIMATIC memory card

The service life of a SIMATIC memory card depends essentially on the following factors:

- Number of delete or write operations per memory block
- Number of bytes written
- External influences such as ambient temperature

Reference

You will find further information on the service life of the SIMATIC memory card and also storage space capacity utilization, and on the memory areas used, in the Structure and use of the CPU memory (https://support.industry.siemens.com/cs/de/de/view/59193101/en) function manual.

GetSMCinfo instruction

In the TIA Portal, you have the option of reading out the inserted SIMATIC memory card with the GetSMCinfo instruction. The following information can be read via the instruction:

- Memory size in KB
- Assigned memory space in KB
- Maintenance information: Previously used up portion of the service life in %
- Set proportion of the service life as a percentage after which the CPU creates a diagnostics buffer entry and the maintenance LED switches on.

You can find additional information on the GetSMCinfo instruction in the STEP 7 online help.

12.2 Setting the card type

Introduction

You can use the SIMATIC memory card as a program card or as a firmware update card.

Procedure

1. To set the card type, insert the SIMATIC memory card into the card reader of the programming device.
2. Select the "SIMATIC Card Reader" folder in the project navigator.
3. In the properties of the selected SIMATIC memory card, specify the card type:

- **Program card**

  You use a program card as an external load memory for the CPU. It contains the entire user program for the CPU. The CPU transfers the user program from the load memory into the work memory. The user program runs in the work memory.

  The following folder is created on the SIMATIC memory card: SIMATIC.S7

- **Firmware update card**

  You can save firmware for CPUs and for I/O modules on a SIMATIC memory card. It is thus possible to perform a firmware update with the help of a specifically prepared SIMATIC memory card.

  The following folder is created on the SIMATIC memory card: FWUPDATE.S7S

Reference

You can find more information on this topic in the STEP 7 online help.

12.3 Data transfer with SIMATIC memory cards

Transferring objects from the project to a SIMATIC memory card

When the SIMATIC memory card is inserted into the programming device or into an external card reader, you can transfer objects from the project tree (STEP 7) to the SIMATIC memory card as follows:

- Individual blocks (multiple selection possible)

  In this case, the transfer is consistent, i.e. the function takes dependencies between blocks due to block calls into account.

- CPU folder

  In this case, all runtime-relevant objects including blocks and the hardware configuration are transferred onto the SIMATIC memory card - just as when downloading.

- Service data
  In this case, the service data previously saved (see chapter Reading out/saving service data (Page 280)) is transferred to the SIMATIC memory card.

To perform a transfer, you can transfer the objects by dragging and dropping, or use the "Card Reader/USB memory > Write to memory card" command in the "Project" menu.

Firmware update using a SIMATIC memory card

You can find information on how to perform a firmware update using a SIMATIC memory card in the section Firmware update (Page 257).

Reference

For additional information about the SIMATIC memory card, refer to the STEP 7 online help.

Maintenance 13

13.1 Removing and inserting I/O modules/motor starters (hot swapping)

Introduction

The ET 200SP distributed I/O system supports removal and insertion of I/O modules and motor starters (hot swapping) during operation (RUN mode):

- CPU/interface module HF, HS: You can remove and insert any number of I/O modules/motor starters.
- ST, BA interface module: You can only remove and insert one I/O module/motor starter.

This section provides further information on removing and inserting I/O modules/motor starters.

I/O modules/motor starters must not be removed or inserted during operation (RUN operating state) in hazardous areas.

Requirements

The following table describes which modules you may insert and remove under which conditions:

Table 13- 1 Removal and insertion of modules

Modules	Removal and insertion	Conditions
CPU	No	---
BusAdapter	No	---
CM DP module	No	---
Interface module	No	---
I/O modules	Yes	• Digital output modules: Only when load is switched off • Digital modules: For load voltage above the safe extra-low voltage: Only with switched off load voltage supply • Technology modules: Only with switched off supply voltage L+ • AI Energy Meter ST: – Only when measuring voltage on primary side is switched off, or – Without the special current transformer terminal, measuring voltage and load current must be through the converters, which means the machine or the load must be switched off in the process. With the special terminal, the process can continue because the current transformer is isolated safely. However, the measuring voltage on the module, at connections UL1-UL3, still needs to be isolated.

Modules	Removal and insertion	Conditions
PotDis-TerminalBlock	Yes	Only in de-energized state.
Motor starter	Yes 1)	Only when the load is disconnected; when switched on, the motor starter switches off automatically when the rotary interlock is operated.
Server module	No	---

1) The motor starter also counts as removed in the parking position

NOTICE

Risk of hazardous system states

If you remove and insert digital output modules with the load switched on or technology modules with the supply voltage switched on, this can result in hazardous system states.

The ET 200SP distributed I/O system or the connected sensors may be damaged as a result.

Therefore, a digital output module may only be inserted and removed when the load is switched off and a technology module may only be inserted and removed when the supply voltage is switched off.

NOTICE

Risk of hazardous system states

If you remove and insert the AI Energy Meter ST with the primary-side voltage switched on at the current transformer, this can result in hazardous system states.

The ET 200SP distributed I/O system may be damaged as a result.

For this reason, remove and insert the AI Energy Meter ST

- Only when measuring voltage on primary side is switched off, or
- Only when a special current transformer terminal is used which short-circuits the secondary end of the transformer when a module is removed.

Do not remove or insert the AI Energy Meter ST until you have removed this current transformer terminal. With the special terminal, the process can continue because the current transformer is isolated safely. However, the measuring voltage on the module at the connections UL1-UL3 still needs to be isolated.

WARNING

Risk of injury from automatic restart

Inserting a motor starter can result in dangerous system states. The motor starter can restart again autonomously if an ON command is active.

This can result in serious injury caused by connected devices that are automatically started up.

Withdraw and insert a motor starter only after disconnecting the load.

Removing and inserting I/O module or motor starter with CPU/interface module HF, HS

You can remove and insert any number of I/O modules/motor starters during operation. The CPU/interface module and the inserted I/O modules/motor starters remain in operation.

> **NOTICE**
>
> **Reaction of the CPU to removal and insertion of the ET 200SP server module**
>
> Please note that the backplane bus is deactivated when you remove the server module, regardless of the CPU operating state. Also note that the outputs do not adopt their configured substitute value behavior when you remove the server module.
>
> This means you should not remove the server module in the CPU operating states STARTUP, RUN and STOP. If you have nevertheless removed the server module, perform a POWER OFF/POWER ON after you have inserted the server module again.

Removing and inserting BusAdapter or CM DP module

Do not remove or insert the BusAdapter or CM DP module when the supply voltage is switched on. If you remove the BusAdapter or CM DP module after CPU startup, the supply voltage of the BusAdapter or CM DP module is switched off automatically. To switch on the supply voltage again, you need to perform a POWER OFF/POWER ON after inserting the BusAdapter/CM DP module.

Removing and inserting I/O module or motor starter with interface module ST, BA

1. You can remove **one** I/O module/**one** motor starter during operation. If you remove another I/O module/motor starter, this results in a station stop of the ET 200SP distributed I/O system:
   – All I/O modules/motor starters of the ET 200SP distributed I/O system fail → Substitute value behavior.
   – The interface module continues to exchange data with the IO controller and report diagnostics.

   Note

   If you want to replace several I/O modules/motor starters during operation, you must replace them one after the other.

   ---
2. If you insert all but one of the I/O modules/motor starters withdrawn during operation, all I/O modules will start up again.

   Note

   I/O modules/motor starters inserted in empty slots and then removed are also regarded as withdrawn during operation.

   ---
3. After a POWER OFF/POWER ON of the supply voltage 1L+ of the interface module, all available I/O modules/motor starters start up again in line with the configuration. Evaluation of the I/O modules/motor starters removed during operation starts again (see 1).

Removing I/O modules

To remove an I/O module, follow these steps:

1. Simultaneously press the top and bottom release buttons of the I/O module.
2. Pull the I/O module out of the BaseUnit, parallel in a forward direction.

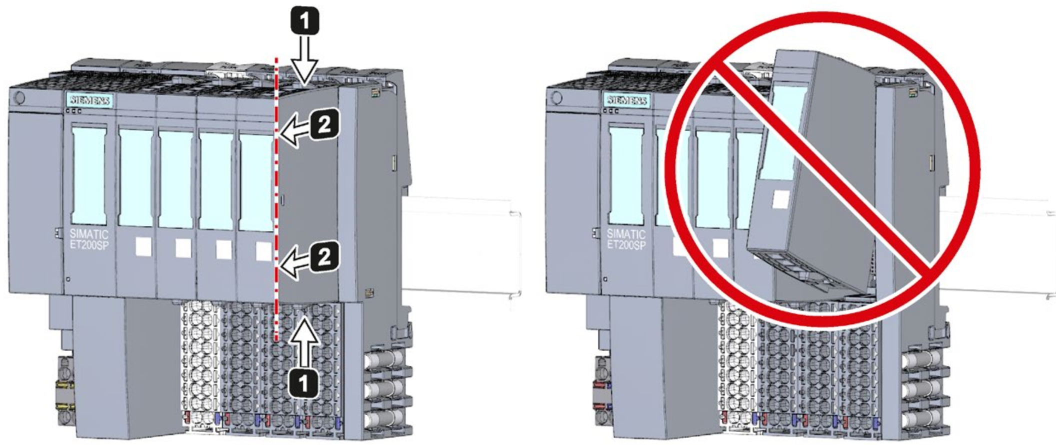


Figure 13-1 Removing I/O modules

See also

Interface modules (http://support.automation.siemens.com/WW/view/en/55683316/133300)

13.2 Changing the type of an I/O module

Introduction

The coding element is a two-part element. When shipped from the factory, both parts are in the I/O module. When an I/O module is installed for the first time, a part of the coding element clicks into the BaseUnit. This mechanically prevents the insertion of a different module type.

There are two versions of the ET 200SP distributed I/O system:

- Mechanical coding element: Ensures the mechanical coding described above.
- Electronic coding element: In addition to the above-mentioned mechanical coding, this version also has an electronic, rewritable memory for module-specific configuration data (such as the F-destination address for fail-safe modules, parameter data for IO link master).

Requirement

Refer to section Application planning (Page 36).

NOTICE
Do not manipulate the coding element Making changes to the coding element may cause dangerous conditions in your plant and/or result in damage to the outputs of the ET 200SP distributed I/O system. To avoid physical damage, do not manipulate the coding.

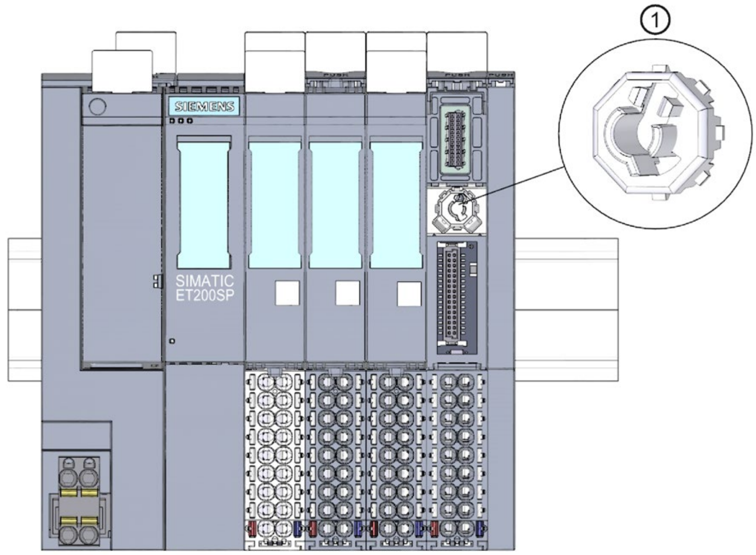
Changing the type of an I/O module

You have already removed the I/O module.

To make a type change for an I/O module, follow these steps:

1. Push the coding element out of the BaseUnit using a screwdriver.
2. Put the coding element back onto the removed I/O module.
3. Insert the new I/O module (other module type) into the BaseUnit until you hear it click into place.

4. Label the new I/O module.



① Coding element

Figure 13-2 Changing the type of an I/O module

13.3 Replacing an I/O module

Introduction

When an I/O module is installed for the first time, a part of the coding element clicks into the BaseUnit. When you replace an I/O module with the same type of module, the correct coding element is already present in the BaseUnit.

Requirement

Refer to section Application planning (Page 36).

Replacing an I/O module

You have already removed the I/O module.

To replace an I/O module, follow these steps:

1. Remove the coding element (part) from the underside of the new I/O module.
2. Insert the new I/O module (same module type) into the BaseUnit until you hear it click into place.
3. Mark the new I/O module (labeling strip, equipment labeling plate).

13.4 Replacing a motor starter

The SIMATIC ET 200SP motor starter is wired.

To replace a SIMATIC ET 200SP motor starter, proceed as follows:

1. Turn the mechanical rotary interlock counter-clockwise to the assembly/disassembly position.

Note

Operating position/READY

Turn the mechanical rotary interlock out of the READY position only in the current-free state (motor off).

---

2. Remove the SIMATIC ET 200SP motor starter from the BaseUnit.
3. Assemble the new motor starter as described.

Note

Mounting the motor starter

You will find out how to mount the motor starter in chapter "Mounting/disassembly of motor starters (Page 120)".

WARNING

Risk of injury from automatic restart

When you replace the motor starter, the motor starter can restart again autonomously if an ON command is active. This can result in property damage or serious injury caused by connected devices that are automatically started up.

Revoke the ON commands on the motor starter before replacing the motor starter.

CAUTION

Protection against electrostatic charge

When handling and installing the SIMATIC ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.

13.5 Replacing the terminal box on the BaseUnit

Introduction

The terminal box is part of the BaseUnit. You can replace the terminal box if necessary. You do not need to dismantle the BaseUnit to do this.

The power and AUX buses of the potential group are not interrupted when you replace the terminal box.

Requirements

- The BaseUnit is mounted, wired and fitted with an I/O module.
- The terminal may only be replaced when the supply voltage is switched off.

Required tools

3 to 3.5 mm screwdriver

Procedure

Watch the video sequence: "Replace terminal box on BaseUnit" (http://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to replace the terminal box on a BaseUnit:

1. If present, turn off the supply voltage on the BaseUnit.
2. Simultaneously press the top and bottom release buttons of the I/O module and pull the module out of the BaseUnit.
3. Disconnect the wiring on the BaseUnit.
4. The release button of the terminal box is located on the underside of the BaseUnit. Use a screwdriver to push in the small opening at an angle from above.
5. Swivel the screwdriver slightly upwards to loosen the locking mechanism of the terminal box and lever the terminal box up out of the BaseUnit at the same time.
6. Remove the coding element (part) from the terminal box and press it onto the coding element (part) of the I/O module that you removed in step 2.
7. Insert the new terminal box into the BaseUnit at the top and swivel it downwards until it clips into the BaseUnit.
8. Wire up the BaseUnit.

9. Insert the I/O module into the BaseUnit.
10. Switch on a supply voltage on the BaseUnit.

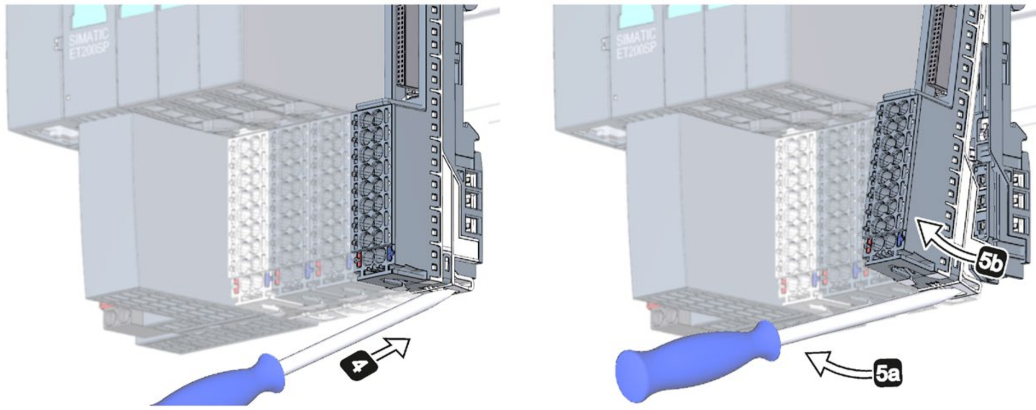


Figure 13-3 Replacing the terminal box on the BaseUnit

13.6 Firmware update

Introduction

During operation it may be necessary to update the firmware (e.g. to extend the available functions).

Update the firmware of the CPU/interface module and the I/O modules using firmware files. The retentive data is retained after the firmware has been updated.

Requirement

- You have downloaded the file(s) for the firmware update from the Product Support (https://support.industry.siemens.com/cs/ww/en/ps) web page.

  On this web page, select:

  – Automation Technology > Automation Systems > Industrial Automation Systems SIMATIC > SIMATIC ET 200 I/O Systems > ET 200 systems for the cabinet > ET 200SP.

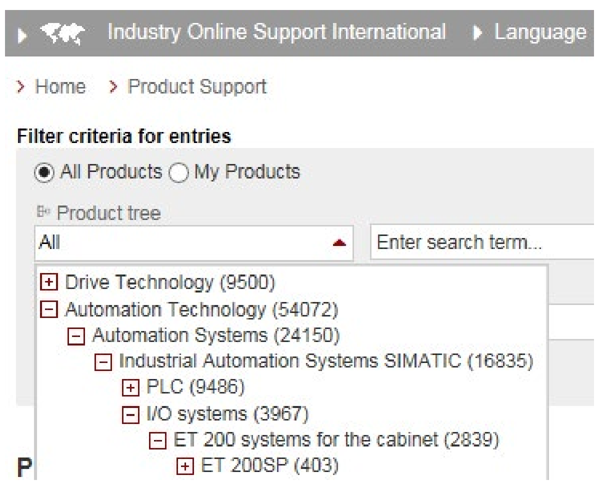

Figure 13-4 ET 200SP in the product tree

From there, navigate to the specific type of module that you want to update. To continue, click on the "Software downloads" link under "Support". Save the desired firmware update files.

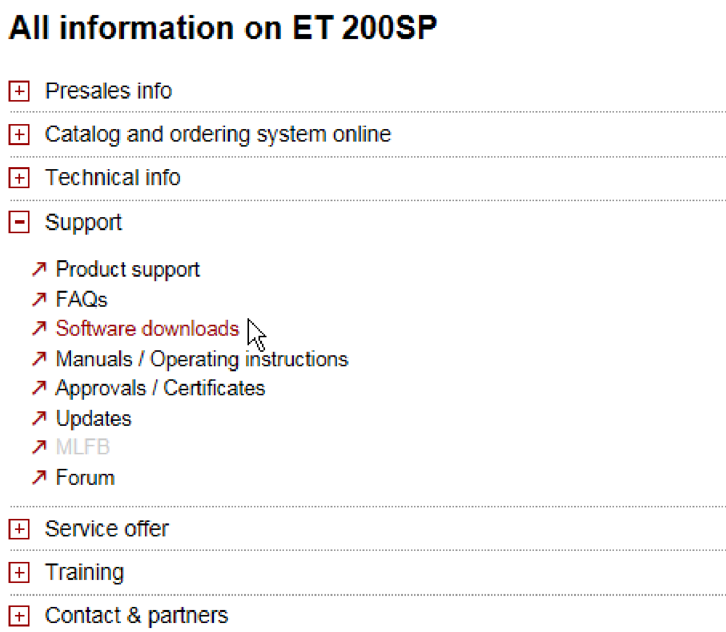

Figure 13-5 Selecting the software downloads

- Before installing the firmware update, make sure that the modules are not being used.

Note

Firmware update of I/O modules

The L+ supply voltage must be present on the module at the start of and during the firmware update.

Additional requirement for fail-safe modules

WARNING

Check the firmware version

When using a new firmware version, always check that the version is approved for use in the module in question.

The attachments of the certificate (http://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Options for the firmware update

The following options are available for updating firmware:

- Online in STEP 7 via Online & Diagnostics
- Online in STEP 7 via accessible devices (PROFINET)
- Using a SIMATIC memory card (possible for CPU and central I/O modules)
- Via the integrated Web server (possible for CPU as well as centralized and distributed I/O modules)
- Online via the SIMATIC Automation Tool

Note

Firmware files of the CPU

If you perform a CPU update with STEP 7, you require STEP 7 (TIA Portal as of V13 Update 3).

The table below provides an overview of the media that can be used to update the firmware of a specific module.

Table 13- 2 Overview of firmware update options

Firmware update	CPU	Interface module	I/O module
STEP 7 (TIA Portal)	✓ 1)	✓	✓
STEP 7 (V5.5 SP2 or higher) 2)	--	✓	✓
Accessible devices	✓	✓	✓
SIMATIC memory card	✓	--	✓
Web server of the CPU	✓	--	✓
SIMATIC Automation Tool	✓	✓	✓

1) V13 update 3 or higher

2) If the firmware files are only available in this format, you can also install the files using STEP 7 (TIA Portal) but not the SIMATIC memory card or the Web server.

Firmware update for the motor starter

The following options are available for updating firmware for the motor starter.

- Online via PROFINET IO/PROFIBUS DP (with STEP 7)
- Via the integrated Web server (possible for CPU as well as centralized and distributed I/O modules)
- With the TIA Portal:
  - As of SIMATIC STEP 7 V13 SP1 with installed HSP for the ET 200SP motor starter
  - SIMATIC STEP 7 V14 and higher

  Over a SIMATIC memory card
- With SIMATIC STEP 7 version V5.5 SP4 and higher
- For fail-safe motor starters with the TIA Portal Version V14 SP1 or higher and installed HSP.

Note

The firmware update for fail-safe motor starters must take place in a separate ET 200SP system in which only the fail-safe motor starter that is to be updated is inserted.

Installation of the firmware update

WARNING

Risk of impermissible system states

The CPU switches to STOP mode or the interface module to "station failure" as a result of the firmware update being installed. STOP or station failure can have an adverse effect on the operation of an online process or a machine.

Unexpected operation of a process or a machine can lead to fatal or severe injuries and/or to material damages.

Make sure that the CPU/interface module is not executing any active process before installing the firmware update.

Procedure online in STEP 7 via Online & Diagnostics

Proceed as follows to perform an online firmware update via STEP 7:

1. Select the module in the device view.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select the "Firmware update" group in the "Functions" folder.
4. Click the "Browse" button to select the path to the firmware update files in the "Firmware update" area.
5. Select the suitable firmware file. The table in the firmware update area lists all modules for which an update is possible with the selected firmware file.
6. Click the "Run update" button. If the module can interpret the selected file, the file is downloaded to the module.

Updating the firmware

The "Run firmware after update" check box is always selected.

When the loading process is complete, the CPU adopts the firmware and then operates with this new firmware.

Note

If a firmware update is interrupted, you need to remove and insert the module before starting the firmware update again.

Procedure online in STEP 7 via accessible devices

To perform a firmware update online via accessible devices, follow these steps:

1. From the "Online" menu, select the "Accessible devices" menu item.
2. In the "Accessible devices" dialog, search for the accessible devices for the selected PROFINET interface.
3. To go to a device in the project tree, select the desired device from the list of accessible devices and click the "Show" button.
4. In the project tree, select the "Online & diagnostics" option of the relevant device and perform the firmware update under the category "Functions/Firmware Update" (CPU, Local modules).

Procedure using the SIMATIC memory card

To perform a firmware update using the SIMATIC memory card, follow these steps:

1. Insert a SIMATIC memory card into the SD card reader of your programming device/computer.
2. To store the update file on the SIMATIC memory card, select the SIMATIC memory card in the "Card Reader/USB memory" folder in the project tree.
3. Select the "Card Reader/USB memory > Create firmware update memory card" command in the "Project" menu.
4. Use a file selection dialog to navigate to the firmware update file. In a further step you can decide whether you want to delete the content of the SIMATIC memory card or whether you want to add the firmware update files to the SIMATIC memory card.
5. Insert the SIMATIC memory card with the firmware update files into the CPU.

Point to note when updating firmware for analog modules and the IO-Link Master CM 4xIO-Link communication module

If you want to update firmware for analog modules or the IO-Link Master CM 4xIO-Link communication module, you must supply a load current of 24 V DC to the modules through the infeed element.

Procedure

1. Remove any inserted SIMATIC memory card.
2. Insert the SIMATIC memory card with the firmware update files into the CPU.
3. The firmware update begins shortly after the SIMATIC memory card has been inserted.
4. Remove the SIMATIC memory card after the firmware update has been completed.
   The RUN LED on the CPU lights up yellow, the MAINT LED flashes yellow.

If you want to use the SIMATIC memory card later as a program card, delete the firmware update files manually.

Note

If your hardware configuration contains several modules, the CPU updates all affected modules in the slot sequence, which means in ascending order of the module position in the STEP 7 device configuration.

Note

Memory size of the SIMATIC memory card

If you perform a firmware update via the SIMATIC memory card, you must use a large enough card based on the CPU used and the associated I/O modules.

Therefore, be sure to note the file size of the update files when downloading them from the Product Support website. The file size information is especially important when you perform the firmware update not only for the CPU but also for the associated I/O modules, communication modules, etc. The total size of the update files must not exceed the available memory size of your SIMATIC memory card.

Procedure: via the integrated Web server

The procedure is described in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual.

Procedure: online via the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) manual (included in the SIMATIC Automation Tool).

Behavior during the firmware update

Note the following behavior of the relevant I/O module when carrying out a firmware update:

- The DIAG LED display flashes red.
- The I/O module retains its current diagnostic status.
- Diagnostics alarm: Channel temporarily unavailable (error code $31_D/1F_H$)
- All outputs are in a current-free/voltage-free state

Note the following behavior when carrying out the firmware update of the motor starter:

- RN flashes green and ER flashes red.
- ST/OL flashes green and MAN flashes yellow.
- The motor starter powers up after completion of the firmware update. Diagnoses are reset. The firmware update does not affect the TMM and the cooling time.
- The sensor supply of the DI module remains active.

Behavior after the firmware update

After the firmware update, check the firmware version of the updated module.

Reference

You will find more information on these procedures in the STEP 7 online help.

13.7 Resetting CPU/interface module (PROFINET) to factory settings

13.7.1 Resetting the CPU to factory settings

Function

The CPU can be reset to its delivery state using "Reset to factory settings". The function deletes all information saved internally on the CPU.

Recommendation:

If you want to remove a PROFINET CPU and use it elsewhere with a different program, or put it into storage, we recommend that you reset the CPU to its factory settings. When restoring the factory settings, remember that you also delete the IP address parameters.

Options for resetting a CPU to factory settings

The following options are available for resetting the CPU to its factory settings:

- Using the mode selector
- Using STEP 7
- Using the SIMATIC Automation Tool

Procedure using the mode selector

Make sure that there is no SIMATIC memory card in the CPU and that the CPU is in STOP mode (the RUN/STOP LED is lit yellow).

Note

Reset to factory settings ↔ Memory reset

The procedure described below also corresponds to the procedure for a memory reset:

- Selector operation with inserted SIMATIC memory card: CPU executes a memory reset
- Selector operation without inserted SIMATIC memory card: CPU executes reset to factory settings

---

Perform a reset to factory settings when there is no SIMATIC memory card inserted as follows:

1. Set the mode selector to the STOP position.

   Result: The RUN/STOP LED lights up yellow.

2. Set the mode selector to the MRES position. Hold the mode selector in this position until the RUN/STOP LED lights up for the 2nd time and remains continuously lit (after three seconds). After this, release the switch.

3. Within the next three seconds, switch the mode selector back to the MRES position, and then back to STOP again.

Result: The CPU executes the "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up yellow, the CPU has been reset to factory settings and is in the STOP mode. The "Reset to factory settings" event is entered in the diagnostics buffer.

Note

The IP address of the CPU is also deleted when the CPU is reset to the factory settings through the mode selector.

For information on the memory reset of the CPU, refer to the section CPU memory reset (Page 221).

Procedure using STEP 7

Make sure that an online connection to the CPU exists.

To reset a CPU to factory settings using STEP 7, follow these steps:

1. Open the Online and Diagnostics view of the CPU.

2. In the "Functions" folder, select the "Reset to factory settings" group.

3. If you want to keep the IP address, select the "Retain IP address" option button. If you want to delete the IP address, select the "Reset IP address" option button.

   Note

   The "Delete IP address" option deletes all IP addresses. This applies regardless of how you established the online connection.

   If a SIMATIC memory card is inserted, the "Delete IP address" option deletes the IP addresses and resets the CPU to factory settings. Then, the configuration (including IP address) that is stored on the SIMATIC memory card is transferred to the CPU (see below). If you formatted the memory card before the reset to factory settings or if the memory card is empty, no IP address is transferred to the CPU.

   ---

4. Click the "Reset" button.

5. Click "OK" in response to the confirmation prompts.

Result: The CPU executes the "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up yellow, the CPU has been reset to factory settings and is in the STOP mode. The "Reset to factory settings" event is entered in the diagnostics buffer.

Procedure using the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) manual (included in the SIMATIC Automation Tool).

Result after resetting to factory settings

The following table provides an overview of the contents of the memory objects after the reset to factory settings.

Table 13- 3 Result after resetting to factory settings

Memory object	Content
Actual values of the data blocks, instance data blocks	Initialized
Bit memory, timers and counters	Initialized
Certain retentive tags from technology objects (e.g. adjustment values of absolute encoders)	Initialized
Diagnostics buffer entries	Initialized
IP address	Depends on the procedure: • Using mode switch: is deleted • Using STEP 7: Depending on the setting of the "Keep IP address"/"Delete IP address" option buttons
Device name	Initialized
Counter readings of the runtime meters	Initialized
Time of day	Initialized

If a SIMATIC memory card was inserted prior to the factory reset, the CPU downloads the configuration contained on the SIMATIC memory card (hardware and software). A configured IP address then becomes valid again.

Reference

Additional information on the topic "Resetting to factory settings" can be found in the Structure and use of the CPU memory (http://support.automation.siemens.com/WW/view/en/59193101) function manual, section on memory areas and retentivity, and in the STEP 7 online help.

13.7.2 Resetting interface module (PROFINET IO) to factory settings

Function

The "Reset to factory settings" function returns the interface module (PROFINET) to its delivery state.

Reset options

- Using STEP 7 (online via PROFINET IO)
- Using a reset button on the interface module (on rear). Exception: The IM 155-6 PN BA does not possess this reset button. See section Resetting the interface module (PROFINET IO) to factory settings with a RESET button (Page 268).

Procedure using STEP 7

To reset an interface module to factory settings using STEP 7, follow these steps:

Make sure that an online connection to the interface module exists.

1. Open the online and diagnostics view of the interface module.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. Click the "Reset" button.
4. Click "OK" in response to the confirmation prompt.

Result: The interface module then performs "Reset to factory settings".

Result after resetting to factory settings

The following table shows the values of the interface module properties after a factory reset:

Table 13- 4 Properties of the interface module as shipped

Properties	Value
Parameters	Default setting
IP address	Not available
Device name	Not available
MAC address	Available
I&M data	Identification data (I&M0) available Maintenance data (I&M1, 2, 3, 4) reset *
Firmware version	Available

* Can be selected with STEP 7 V14 or higher: "Keep I&M data"/"Delete I&M data"

Note

Failure of downstream stations is possible

Downstream stations on a bus segment can fail when the factory settings are restored on an interface module.

Note

Behavior of the installed I/O modules during reset to factory settings

When "Resetting to factory settings", the I/O modules of the ET 200SP distributed I/O system take on the non-configured state, which means input data are not entered and output data are not output.

Reference

You will find more information on the procedure in the STEP 7 online help.

13.7.3 Resetting the interface module (PROFINET IO) to factory settings with a RESET button

Requirement

The supply voltage to the interface module is turned on.

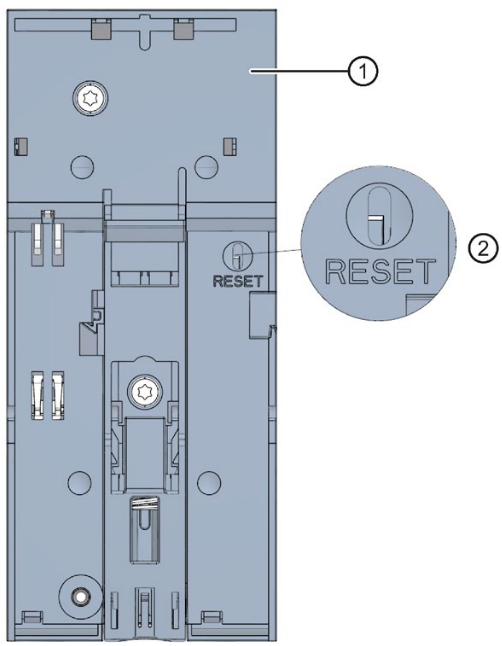
Required tools

3 to 3.5 mm screwdriver (for resetting with a RESET button)

Procedure

Proceed as follows to reset an interface module to factory settings by means of the RESET button:

1. Remove the interface module from the mounting rail (see Mounting the CPU/interface module (Page 70)) and swivel it downwards.
2. The RESET button is located on the rear of the interface module behind a small opening: Press a screwdriver into the small opening for at least 3 seconds to activate the RESET button.
3. Install the interface module back on the mounting rail (see Mounting the CPU/interface module (Page 70)).
4. Assign parameters to the interface module again.



① Rear of the interface module
② RESET button

Figure 13-6 RESET button

13.8 Reaction to faults in fail-safe modules and fail-safe motor starters

Safe state (safety concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

Note

For digital F-modules, this safe state is the value "0". This applies to both sensors and actuators. In the case of the fail-safe motor starters, the load is shut down in a fail-safe manner.

Fault reactions and startup of the F-system

The safety function means that fail-safe modules use substitute values (safe state) instead of process values (**passivation of the fail-safe module**) in the following situations:

- When the F-system is started up
- If errors are detected during safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- If F-I/O faults or channel faults are detected (e.g. crossover or discrepancy errors)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. After a POWER OFF / POWER ON, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

WARNING

For channels that you set to "deactivated" in STEP 7, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group fault ("Channel activated/deactivated" parameter).

Remedying faults in the F-system

To remedy faults in your F-system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

The following steps must be performed:

1. Diagnosing and repairing the fault
2. Revalidation of the safety function
3. Recording in the service report

Substitute value output for fail-safe modules

In the case of F-modules with inputs, if there is passivation, the F-system provides substitute values (0) for the safety program instead of the process data pending at the fail-safe inputs.

In the case of F-modules with outputs, if there is passivation, the F-system transfers substitute values (0) to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized. This also applies when the F-CPU goes into STOP mode. Assignment of substitute values is not possible.

Depending on which F-system you are using and the type of fault that occurred (F-I/O fault, channel fault or communication error), substitute values are used either for the relevant channel only or for all channels of the relevant fail-safe module.

Reintegration of a fail-safe module

The system changes from fail-safe to process values (reintegration of an F-module) either automatically or only after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in the section Diagnostic messages of the respective F-module.

After reintegration, the following occurs:

- In the case of an F-module with inputs, the process data pending at the fail-safe inputs is made available to the safety program again
- In the case of an F-module with outputs, the output values provided in the safety program are transferred to the fail-safe outputs again

Additional information on passivation and reintegration

For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Behavior of the fail-safe module with inputs in the event of a communication disruption

F-modules with inputs respond differently to communication errors compared to other errors.

If a communication error is detected, the current process values remain set at the inputs of the F-module. There is no passivation of the channels. The current process values are passivated in the F-CPU.

13.9 Maintenance and repair

The components of the SIMATIC ET 200SP system are maintenance-free.

Note

Repairs to a SIMATIC ET 200SP system may only be carried out by the manufacturer.

13.10 Warranty

To meet the conditions of the warranty, you must observe the safety and commissioning instructions.

Test functions and eliminating problems 14

14.1 Test functions

Introduction

You have the option of testing the operation of your user program on the CPU. You can then monitor signal states and values of tags and can assign values to tags to simulate specific situations in the running of the program.

Note

Using test functions

The use of test functions can influence the program execution time and thus the cycle and response times of the controller to a slight extent (a few milliseconds).

Requirements

- There is an online connection to the relevant CPU.
- An executable program is in the CPU.

Test options

- Testing with program status
- Testing with breakpoints
- Testing with a watch table
- Testing with a force table
- Testing with PLC tag table
- Testing with data block editor
- Testing with the LED flash test
- Testing with trace function

Testing with program status

The program status allows you to monitor the execution of the program. You can display the values of operands and the results of logic operations (RLO) allowing you to recognize and fix logical errors in your program.

Note

Restrictions for the "Program status" function

Monitoring loops can clearly increase the cycle time, depending on the number of tags monitored and depending on the actual number of loops run through.

WARNING

Testing with program status

A test with the "Program status" function can produce serious property damage and personal injury in the event of malfunctions or program errors.

Make sure that you take appropriate measures to exclude the risk of hazardous conditions occurring before running a test with the "Program status" function.

Testing with breakpoints

With this test option, you set breakpoints in your program, establish an online connection, and enable the breakpoints on the CPU. You then execute a program from one breakpoint to another.

Requirements:

- Setting breakpoints is possible in the programming language SCL or STL.

Testing with breakpoints provides you with the following advantages:

- Localization of logic errors step by step
- Simple and quick analysis of complex programs prior to actual commissioning
- Recording of current values within individual executed loops
- Use of breakpoints for program validation also possible in SCL/STL networks within LAD/FBD blocks

---

Note

Restriction during testing with breakpoints

When you test with breakpoints, there is a risk of overwriting the cycle time of the CPU.

Note

F-System SIMATIC Safety

Setting breakpoints in the standard user program results in errors in the security program:

- Sequence of F cycle time monitoring
- Error in communication with the fail-safe I/O
- Error during safety-oriented CPU-CPU communication
- internal CPU error

If you still wish to use breakpoints for testing, you must deactivate the safety mode beforehand. This will result in the following errors:

- Error in communication with the fail-safe I/O
- Error during safety-oriented CPU-CPU communication

Testing with watch tables

The following functions are available in the watch table:

- Monitoring of tags

  With watch tables, you can monitor the current values of individual tags of a user program or a CPU on the PG/PC and Web server. For the Web server to be able to display the value of tags, you must specify a symbolic name for each tag in the "Name" column of the watch table.

  You can monitor the following operand areas:

  – Inputs and outputs (process image) and bit memory
  – Contents of data blocks
  – Peripheral inputs and peripheral outputs
  – Timers and counters

- Modifying tags

  Use this function to assign fixed values to the individual tags of a user program or CPU. Modifying is also possible for testing with program status.

  You can control the following operand areas:

  – Inputs and outputs (process image) and bit memory
  – Contents of data blocks
  – Peripheral inputs and peripheral outputs (for example, %I0.0:P, %Q0.0:P)
  – Timers and counters

- "Enable peripheral outputs" and "Control immediately"

  These two functions enable you to assign fixed values to individual peripheral outputs of a CPU in the STOP mode. You can also use them to check your wiring.

Testing with the force table

The following functions are available in the force table.

- Monitoring of tags

  With force tables, you can display the current values of individual tags of a user program or a CPU on the PG/PC and Web server. You can monitor the table with or without a trigger condition. For the Web server to be able to display the value of tags, you must specify a symbolic name for each tag in the "Name" column of the force table.

  You can monitor the following tags:

  – Bit memory

  – Contents of data blocks

  – Peripheral inputs (e.g. %I0.0:P)

- Modifying tags

  With this function, you assign fixed values to the individual tags of a user program or a CPU on the PG/PC and Web server. Modifying is also possible for testing with program status.

  You can control the following tags:

  – Bit memories

  – Contents of data blocks

  – Peripheral inputs (e.g. %I0.0:P)

- Forcing of peripheral inputs and peripheral outputs

  You can force individual peripheral inputs or peripheral outputs.

  – Peripheral inputs: Forcing of peripheral inputs (for example %I0.0:P) represents the "bypassing" of sensors/inputs by specifying fixed values to the program. Instead of the actual input value (via process image or via direct access) the program receives the force value.

  – Peripheral outputs: Forcing of peripheral outputs (for example %Q0.0:P) represents the "bypassing" of the complete program by setting fixed values for the actuators.

The force table offers the advantage both of being able to simulate different test environments and also of being able to overwrite tags in the CPU with a fixed value. Thus, you have a possibility of intervening in the ongoing process to regulate it.

Difference between modifying and forcing

The fundamental difference between the modifying and forcing functions consists in the storage behavior:

- Modifying: Modifying of tags is an online function and is not stored in the CPU. You can end modifying of tags in the watch table or by disconnecting the online connection.
- Forcing: A force job is written to the SIMATIC memory card and is retained after a POWER OFF. You can only end the forcing of peripheral inputs and peripheral outputs in the force table.

Testing with PLC tag table

You can monitor the data values that tags currently assume in the CPU directly in the PLC tag table. To do this, open the PLC tag table and start monitoring.

Additionally, you have a possibility of copying PLC tags to a monitoring or force table and of monitoring, controlling or forcing them there.

Testing with data block editor

Various possibilities of monitoring and controlling tags are at your disposal in the data block editor. These functions directly access the current values of the tags in the online program. Current values are the values that the tags assume at the current time during program execution in the CPU's work memory. The following functions for monitoring and control are possible via the data block editor:

- Monitoring tags online
- Controlling individual actual values
- Creating a snapshot of the actual values
- Overwriting actual values with a snapshot

Note

Setting data values during commissioning

During commissioning of a system, data values often have to be adjusted to optimally adapt the program to the general conditions prevailing locally. To this end, the declaration table offers a few functions for data blocks.

Testing with the LED flash test

In many online dialogs, you can perform an LED flash test. This function is useful, for example, when you are not sure which device in the hardware configuration corresponds to the device currently selected in the software.

When you click the "Flash LED" button, an LED flashes on the currently selected device. In the case of the CPU, the RUN/STOP, ERROR and MAINT LEDs flash. They flash until you cancel the flashing test.

Testing with trace function

The trace function is used to record the CPU tags, depending on the settable trigger conditions. Tags are, for example, the drive parameters or system and user tags of a CPU. The CPU saves the recordings. You can display and evaluate the recordings with STEP 7, if necessary.

The trace function can be called from the CPU's folder in the project tree, under the name "Traces".

In connection with trace functions, also pay attention to the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/102781176).

Simulation

With STEP 7 you can run and test the hardware and software of the project in a simulated environment. Start the simulation using the menu command "Online" > "Simulation" > "Start".

Reference

You can find more information on test functions in the STEP 7 online help.

Further information about testing with trace and logic analyzer functions is available in the Function Manual Using the trace and logic analyzer function (http://support.automation.siemens.com/WW/view/en/64897128).

14.2 Reading out/saving service data

Service data

In addition to the contents of the diagnostics buffer, the service data contains a wide range of extra information about the internal status of the CPU. If a problem occurs the CPU that cannot be solved with other methods, send the service data to our Service & Support team. The service data allows Service & Support to run fast analysis of the problems that have occurred.

Note

You cannot simultaneously execute a download to the device while reading out the service data of the CPU.

Methods of reading service data

You can read service data with:

- The Web server
- STEP 7
- the SIMATIC memory card

Procedure using the Web server

To read service data using the Web server, follow these steps:

1. Open a Web browser that is suitable for communication with the CPU.
2. Enter the following address in the address bar of the web browser: https://<CPU IP address>/save_service_data, e.g. https://172.23.15.3/save_service_data
3. The service data page will appear on your screen, with a button for saving the service data.

Figure 14-1 Reading out service data with the Web server

4. Save the service data locally on your PC/programming device, by clicking "Save ServiceData".

Result: The CPU stores the data in a .dmp file with the following naming convention: "<Article number> <Serial number> <Time stamp>.dmp". The file name cannot be changed.

Note

If you have defined your user page as the Web server's home page, direct access to the service data by entering the CPU's IP address is not possible. You will find further information on reading out service data via a user-defined page in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual.

Procedure using STEP 7

A description of how to save service data is available under the keyword "Save service data" in STEP 7 online help.

Procedure via the SIMATIC memory card

Use the SIMATIC memory card to read out the service data only if you are no longer able to communicate with the CPU via Ethernet. In all other cases it is preferable to read out the service data via the Web server or STEP 7.

The procedure using the SIMATIC memory card is more time-consuming than the other options for reading out the service data. You must also ensure before reading out that there is sufficient memory space on the SIMATIC memory card.

To read service data using the SIMATIC memory card, follow these steps:

1. Insert the SIMATIC memory card into the card reader of your PC / programming device.
2. Open the job file S7_JOB.S7S in an editor.
3. Overwrite the entry PROGRAM with the string DUMP in the editor.
   Do not use any spaces/line breaks/quotation marks to ensure that the file size is exactly 4 bytes.
4. Save the file under the existing file name.
5. Ensure that the SIMATIC memory card is not write protected and insert it in the card slot of the CPU. Pay attention to the procedure described in Removing/inserting the SIMATIC memory card on the CPU (Page 213).

Result: The CPU writes the service data file DUMP.S7S to the SIMATIC memory card and remains in STOP mode.

The transfer of the service data has been completed as soon as the STOP LED stops flashing and lights up continuously. If the transfer was successful, only the STOP LED lights up. If transfer was not successful, the STOP LED and the ERROR LED flash. In case of an error, the CPU stores a text file with a note on the error that occurred in the DUMP.S7S folder.

15 Technical specifications

Introduction

This chapter lists the technical specifications of the system:

- The standards and test values that the ET 200SP distributed I/O system complies with and fulfills.
- The test criteria according to which the ET 200SP distributed I/O system was tested.

Technical specifications for the modules

The technical specifications of the individual modules can be found in the manuals of the modules themselves. In the event of deviations between the statements in this document and the manuals, the statements in the manuals take priority.

15.1 Standards, approvals and safety notes

Currently valid markings and approvals

Note

Information on the components of the ET 200SP

The currently valid markings and approvals are printed on the components of the ET 200SP distributed I/O system.

Safety information

⚠ WARNING
Personal injury and damage to property may occur
In hazardous areas, personal injury and damage to property may occur if you disconnect plug-in connections during operation of an ET 200SP distributed I/O system.
Always switch off the power to the ET 200SP distributed I/O system when disconnecting plug-in connections in hazardous areas.

⚠ WARNING
Explosion hazard
If you replace components, compliance with Class I, Div. 2 or zone 2 may become invalid.

⚠ WARNING
Area of application
This device is only suitable for use in Class I, Div. 2, Group A, B, C, D; Class I, zone 2, Group IIC, or in non-hazardous areas.

Five safety rules for work in or on electrical installations

A set of rules, which are summarized in DIN VDE 0105 as the "five safety rules", are defined for work in or on electrical installations as a preventative measure against electrical accidents:

1. Isolate
2. Secure against switching on again
3. Verify that the equipment is not live
4. Ground and short-circuit
5. Erect barriers around or cover adjacent live parts

These five safety rules must be applied in the above order prior to starting work on an electrical system. After completing the work, proceed in the reverse order.

It is assumed that every electrician is familiar with these rules.

CE marking

The ET 200SP distributed I/O system meets the general and safety-related requirements of the following directives and conforms to the harmonized standards (EN) for programmable controllers published in the official journals of the European Union:

- 2014/35/EU "Electrical equipment designed for use within certain voltage limits" (Low Voltage Directive)
- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
- 2014/34/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (Explosion Protection Directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
- 2006/42/EC "Machinery Directive" for ET 200SP fail-safe modules

The EC declarations of conformity are available for the responsible authorities at:

Siemens AG
Digital Factory

Factory Automation
DF FA AS SYS
Postfach 1963
D-92209 Amberg

They are also available for download on the Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/) website, keyword "Declaration of Conformity".

RCM (C-Tick) Declaration of conformity for Australia/New Zealand

The ET 200SP distributed I/O system fulfills the requirements of the standards

- EN 61000-6-4.

Korea Certificate KCC-REM-S49-ET200SP

Note that this device corresponds to limit class A in terms of the emission of radio frequency interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

Marking for the Eurasian Customs Union

EAC (Eurasian Conformity)

Customs Union of Russia, Belarus and Kazakhstan

Declaration of conformity with the technical requirements of the Customs Union (TR CU).

IEC 61131

The ET 200SP distributed I/O system meets the requirements and criteria of the standard IEC 61131-2 (Programmable logic controllers, part 2: Equipment requirements and tests).

IEC 60947

The motor starters belonging to the ET 200SP distributed I/O system meet the requirements and criteria of the IEC 60947 standard.

PROFINET standard

The ET 200SP distributed I/O system is based on IEC 61158 Type 10.

PROFIBUS standard

The ET 200SP distributed I/O system is based on IEC 61158 Type 3.

IO-Link standard

The ET 200SP distributed I/O system is based on IEC 61131-9.

Shipbuilding approval

Classification societies:

- ABS (American Bureau of Shipping)
- BV (Bureau Veritas)
- DNV-GL (Det Norske Veritas - Germanischer Lloyd)
- LRS (Lloyds Register of Shipping)
- Class NK (Nippon Kaiji Kyokai)
- KR (Korean Register of Shipping)
- CCS (China Classification Society)

Use in industrial environments

The ET 200SP distributed I/O system is suitable for use in industrial environments. It meets the following standards for this type of use:

- Requirements on interference emission EN 61000-6-4: 2007 + A1: 2011
- Requirements on immunity EN 61000-6-2: 2005

Use in mixed areas

Under specific prerequisites you can use the ET 200SP distributed I/O system in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact the residential purpose.

If you want to use the ET 200SP distributed I/O system in residential areas, you must ensure that its radio frequency interference emission complies with limit class B in accordance with EN 61000-6-3. Suitable measures for observing these limits for use in a mixed area are, for example:

- Installation of the ET 200SP distributed I/O system in grounded control cabinets
- Use of filters in the supply lines

An additional individual acceptance test is also required.

Use in residential areas

Note

ET 200SP distributed I/O system is not intended for use in residential areas

The ET 200SP distributed I/O system is not intended for use in residential areas. If you are using the ET 200SP distributed I/O system in residential areas, radio and TV reception may be affected.

Reference

The certificates for the markings and approvals can be found on the Internet under Service&Support (http://www.siemens.com/automation/service&support).

15.2 Electromagnetic compatibility

Definition

Electromagnetic compatibility (EMC) is the ability of an electrical installation to function satisfactorily in its electromagnetic environment without interfering with that environment.

Among other things, the ET 200SP distributed I/O system also meets the requirements of the EMC legislation for the European single market. The prerequisite is that the ET 200SP distributed I/O system complies with the requirements and guidelines relating to electrical equipment.

EMC in accordance with NE21

The ET 200SP distributed I/O system meets the EMC specifications of the NAMUR recommendation NE21.

Pulse-shaped disturbance variables of the ET 200SP system

The table below shows the electromagnetic compatibility of the ET 200SP distributed I/O system with regard to pulse-shaped disturbance variables.

Table 15- 1 Pulse-shaped disturbance variables

Pulse-shaped disturbance variable	**Tested with**	**Equivalent to severity**
Electrostatic discharge in accordance with IEC 61000-4-2	Air discharge ±8 kV Contact discharge: ±6 kV	3 3
Burst pulses (fast transients) in accordance with IEC 61000-4-4	±2 kV (power supply line) ±2 kV (signal line >30 m) ±1 kV (signal cable <30 m)	3 3
High-energy single pulse (surge) in accordance with IEC 61000-4-5 External protective circuit required (see Function manual Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566))		3
• Asymmetric coupling	±2 kV (power supply lines) DC with protective elements ±2 kV (signal lines/data lines only >30 m) with protective elements if necessary	
• Symmetric coupling	±1 kV (power supply line) DC with protective elements ±1 kV (signal line/data line only >30 m) with protective elements if necessary	

Pulse-shaped disturbance variables of motor starters

The following table shows the electromagnetic compatibility of the ET 200SP motor starters with regard to pulse-shaped interference.

Table 15- 2 Pulse-shaped disturbance variables

Pulse-shaped disturbance variable	Tested with	Equivalent to severity
Burst pulses (fast transients) in accordance with IEC 61000-4-4, tested with 5 kHz.	±2 kV (24 V supply cables) ±2 kV (500 V AC infeed*) ±1 kV (signal cable <30 m)	3
If you mount the motor starter to the right of a 15 mm or 20 mm I/O module or immediately next to a head module, use a dummy module. You will find further information in "Selecting motor starters with a suitable BaseUnit (Page 42)."		
High-energy single pulse (surge) in accordance with IEC 61000-4-5	500 V AC infeed ±2 kV conducted interference - phase to ground ±1 kV conducted interference - phase to phase 24 V supply cable: ±1 kV conducted interference - phase to ground **) ±0.5 kV conducted interference - phase to phase **)	3
**) An RC circuit is not required for hybrid switching devices. If higher values (2 kV (phase to ground) or 1 kV (phase to phase) are required, you will need an additional external protective circuit (see Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) function manual).		

Sinusoidal disturbance variables

The tables below show the electromagnetic compatibility of the ET 200SP distributed I/O system with regard to sinusoidal disturbance variables.

- RF radiation

Table 15- 3 Sinusoidal disturbance variables with RF radiation

RF radiation according to IEC 61000-4-3/NAMUR 21 Electromagnetic RF field, amplitude-modulated		Corresponds to degree of severity
80 to 1000 MHz; 1.0 to 2.0 GHz	2.0 GHz to 6.0 GHz	3
10 V/m	3 V/m	
80% AM (1 kHz)		

- RF coupling

Table 15- 4 Sinusoidal disturbance variables with RF coupling

RF coupling in accordance with IEC 61000-4-6	Corresponds to degree of severity
(10 kHz) 150 kHz to 80 MHz	3
10 V_{rms} unmodulated	
80% AM (1 kHz)	
150 Ω source impedance	

Emission of radio frequency interference

Interference emission of electromagnetic fields according to EN 55016 (measured at a distance of 10 m).

Table 15- 5 Interference emission of electromagnetic fields

Frequency	Interference emission
30 MHz to 230 MHz	<40 dB (μV/m) Q
230 MHz to 1000 MHz	<47 dB (μV/m) Q
1 GHz to 3 GHz	<66 dB (μV/m) P
3 GHz to 6 GHz	<70 dB (μV/m) P

Interference emission via the AC power supply according to EN 55016.

Table 15- 6 Interference emission via the AC power supply

Frequency	Interference emission
0.15 MHz to 0.5 MHz	< 79 dB (μV/m)Q < 66 dB (μV/m) M
0.5 MHz to 30 MHz	< 73 dB (μV/m)Q < 60 dB (μV/m) M

15.3 Electromagnetic compatibility of fail-safe modules

Protecting ET 200SP with fail-safe modules against overvoltages

If your equipment requires protection from overvoltage, we recommend that you use an external protective circuit (surge filter) between the load voltage power supply and the load voltage input of the BaseUnits to ensure surge immunity for the ET 200SP with fail-safe modules.

Note

Overvoltage protection measures always require a case-by-case examination of the entire plant. Almost complete protection from overvoltages, however, can only be achieved if the entire building surroundings have been designed for overvoltage protection. In particular, this involves structural measures in the building design phase.

For detailed information regarding overvoltage protection, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

The following figure shows an example configuration with fail-safe modules. Voltage is supplied by one power supply unit. Note, however, that the total current of the modules fed by the power supply unit must not exceed the permissible limits. You can also use multiple power supply units.

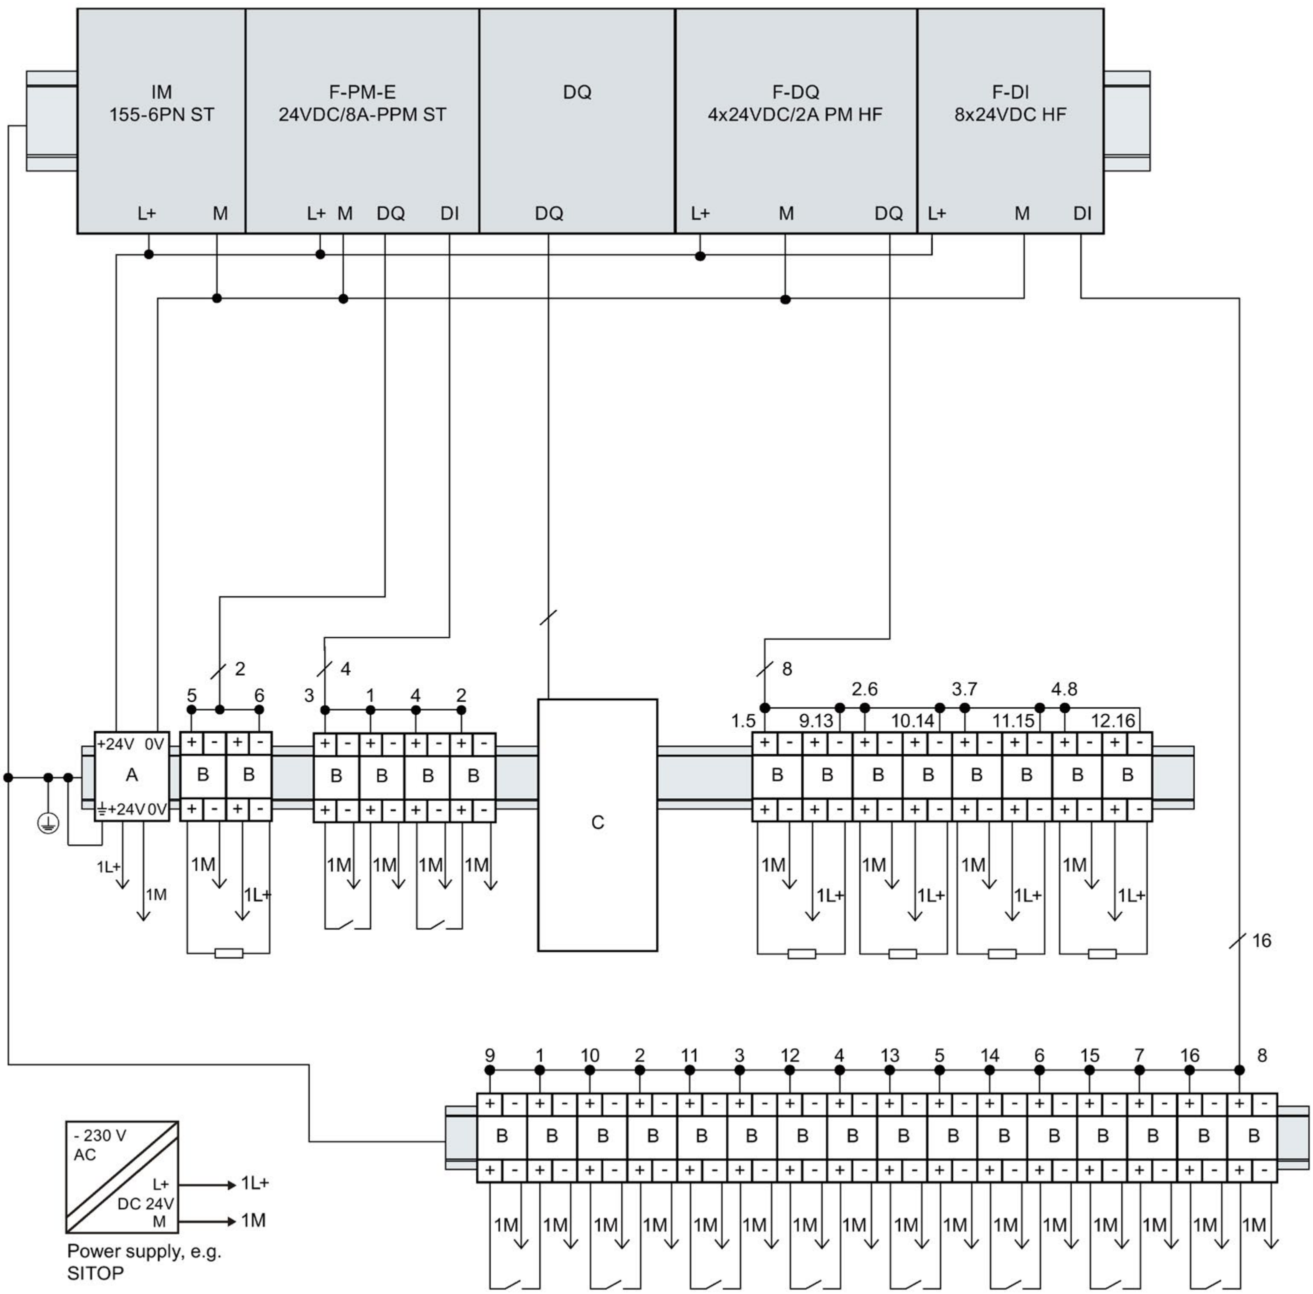

Figure 15-1 External protective circuit (surge filter) for ET 200SP with failsafe modules

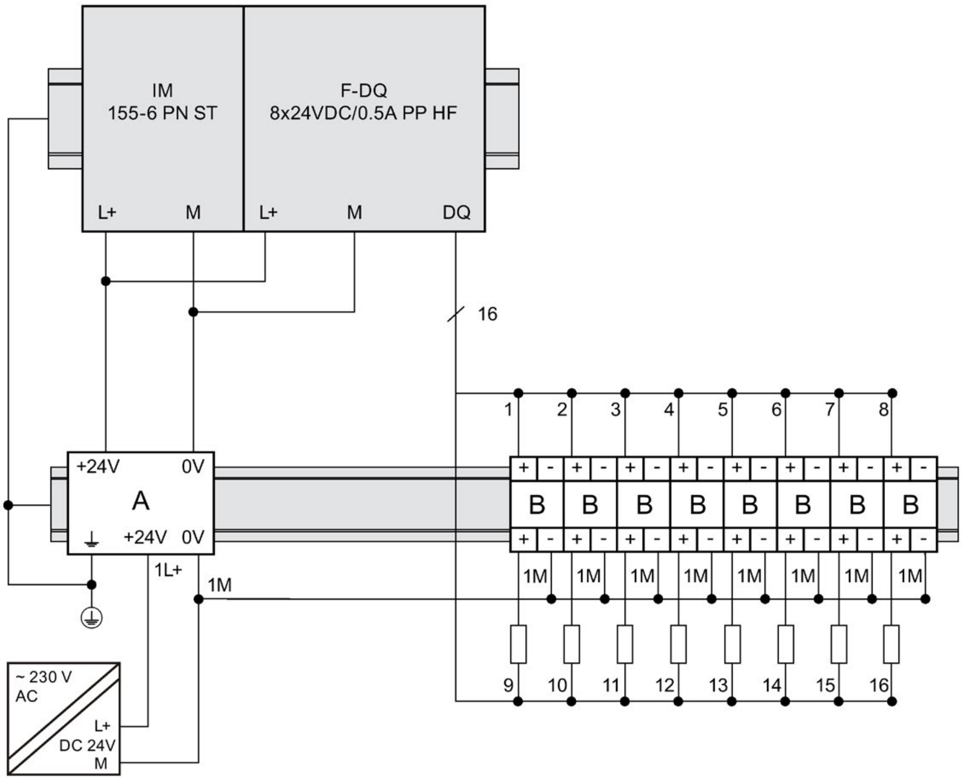

Figure 15-2 External protective circuit (surge filter) for ET 200SP with fail-safe modules

Name	Part number of Dehn Co.
A = BVT AVD 24	918 422
B = DCO RK D 5 24	919 986
C = The external protective circuit required at the outputs of the modules F-PM-E power module load group can be found in the Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) function manual.	

15.4 Shipping and storage conditions

Introduction

The ET 200SP distributed I/O system exceeds requirements in terms of shipping and storage conditions according to IEC 61131-2. The following information applies to modules that are shipped and/or stored in their original packaging.

Table 15- 7 Shipping and storage conditions for modules

Type of condition	Permissible range
Free fall (in shipping package)	≤1 m
Temperature	From -40 °C to +70 °C
Barometric pressure	from 1140 to 660 hPa (corresponds to an elevation of -1000 to 3500 m)
Relative humidity	5% to 95%, without condensation
Sinusoidal oscillations according to IEC 60068-2-6	5 - 8.4 Hz: 3.5 mm 8.4 - 500 Hz: 9.8 m/s^2
Impact acc. to IEC 60068-2-27[1)]	250 m/s^2, 6 ms, 1000 shocks

1) Not applicable to motor starters

15.5 Mechanical and climatic environmental conditions

Operating conditions

The ET 200SP distributed I/O system is suitable for use in weather-proof, fixed locations. The operating conditions are based on the requirements of DIN IEC 60721-3-3:

- Class 3M3 (mechanical requirements)
- Class 3K3 (climatic requirements)

You will find the permissible ambient conditions for the motor starter in the Technical data of the motor starter (https://support.industry.siemens.com/cs/ww/en/ps/21859/td).

Mechanical environmental conditions

The following table shows the mechanical environmental conditions in the form of sinusoidal vibrations.

Table 15- 8 Mechanical environmental conditions

Frequency band	**ET 200SP with IM 155-6 DP HF, BusAdapters BA 2×FC, BA 2xSCRJ, BA SCRJ/FC, BA 2xLC and BA LC/FC**	**ET 200SP with BusAdapters BA 2×RJ45, BA SCRJ/RJ45 and BA LC/RJ45**	**ET 200SP with IM 155-6 PN BA**	**ET 200SP with digital output module F-RQ 1x24VDC/24..230VAC/5 A**
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude			
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration			
10 ≤ f ≤ 60 Hz	0.35 mm amplitude	---	---	---
60 ≤ f ≤ 1000 Hz	5 g constant acceleration			

Tests of mechanical environmental conditions

The following table provides important information with respect to the type and scope of the tests of environmental mechanical conditions.

Table 15- 9 Tests of mechanical environmental conditions

Condition tested	Test standard	Comment
Vibrations [2]	Vibration test according to IEC 60068-2-6 (sinusoidal)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. BA 2×RJ45, BA SCRJ/RJ45, BA LC/RJ45, IM 155-6 PN BA, digital output module F-RQ 1x24VDC/24..230VAC/5A • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration IM 155-6 DP HF, BA 2×FC, BA 2xSCRJ, BA SCRJ/FC, BA 2xLC, BA LC/FC • 10 Hz ≤ f ≤ 60 Hz, 0.35 mm constant amplitude • 60 Hz ≤ f ≤ 1000 Hz, 5 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock [2]	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes
Repetitive shock [1] [2]	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 25 g peak value, 6 ms duration Direction of shock: 1000 shocks in each direction (+/-) at each of three vertically aligned axes

[1] Not applicable in the case of the digital output module F-RQ 1x24VDC/24..230VAC/5A

[2] Not applicable for motor starters

Climatic environmental conditions

The table below shows the permissible climatic environmental conditions for the ET 200SP distributed I/O system:

Table 15- 10 Climatic environmental conditions

Environmental conditions	Permissible range	Comments
Temperature: horiz. mounting position: vertical mounting position:	 0 to 60 °C 0 to 50 °C	-
Permitted temperature change	10 K/h	-
Relative humidity	from 10 to 95%	Without condensation
Barometric pressure	from 1140 to 795 hPa	Corresponds to an altitude of -1000 to 2000 m
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

SIPLUS products based on ET 200SP are offered for reliable operation under heavy to extreme operating conditions.

15.6 Insulation, protection class, degree of protection and rated voltage

Insulation

The insulation for the I/O modules is designed in accordance with the requirements of EN 61131-2:2007. The insulation for the motor starters is designed in accordance with the requirements of IEC 60947-1.

Note

In the case of modules with 24 V DC (SELV/PELV) supply voltage, galvanic isolations are tested with 707 V DC (type test).

Pollution degree/overvoltage category according to IEC 61131

- Pollution degree 2
- Overvoltage category: II

Pollution degree/overvoltage category according to IEC 60947

- Pollution degree 2
- Overvoltage category: III

Protection class according to IEC 61131-2:2007

The ET 200SP distributed I/O system meets protection class I and includes parts of protection classes II and III.

The grounding of the mounting rail must meet the requirements for a functional earth FE.

Recommendation: For a configuration immune to interference, the line for the ground should have a cross-section > 6 mm^2.

The installation location (e.g. enclosure, control cabinet) must have a protective conductor connection that meets the standard to maintain protection class I.

Degree of protection IP20

Degree of protection IP20 in accordance with IEC 60529 for all modules of the ET 200SP distributed I/O system, which means:

- Protection against contact with standard probes
- Protection against foreign objects with diameters in excess of 12.5 mm
- No protection against water

Note

Use a BU cover

To meet the requirements of the degree of protection "IP20", fit a BU cover onto unfitted BaseUnits.

To ensure touch safety, fit a cover onto the opening of the infeed bus contacts belonging to the last plugged-in motor starter BaseUnit.

Rated voltage for operation

The ET 200SP distributed I/O system works with the rated voltage and corresponding tolerances listed in the following table.

Note the supply voltage of each module when selecting the rated voltage.

Table 15- 11 Rated voltage for operation

Rated voltage	Tolerance range
24 V DC	19.2 to 28.8 V DC 1)
	18.5 to 30.2 V DC 2)
120 V AC	93 to 132 V AC
230 V AC	187 to 264 V AC
400 V AC 3)	48 to 500 V AC

1) Static value: Creation as functional extra-low voltage with safe electrical isolation according to IEC 60364-4-41

2) Dynamic value: Including ripple, e.g. as in the case of three-phase bridge power rectification

3) Valid for the infeed bus of the modules and BaseUnits of motor starters only

15.7 Use of the ET 200SP in zone 2 potentially explosive atmospheres

See product information "Use of subassemblies/modules in Zone 2 Hazardous Area" (http://support.automation.siemens.com/WW/view/en/19692172).

Components for lightning protection (lightning protection zone transition 0_B to 1, 1 to 2 and 2 to 3)

You must install overvoltage protection devices in the ET 200SP distributed I/O system for lightning protection purposes. You can find more information in the Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) function manual.

Online catalog

Additional article numbers for ET 200SP can be found on the Internet (http://mall.industry.siemens.com) in the online catalog and online ordering system.

B.1 Lightning protection and overvoltage protection for fail-safe modules

Overvoltage arrestors for fail-safe modules

Note

This section only lists the overvoltage arrestors that may be used to protect the fail-safe modules.

Be sure to observe the detailed information on lightning protection and overvoltage protection of the ET 200SP distributed I/O system in Electromagnetic compatibility of fail-safe modules (Page 292).

Components for overvoltage protection of fail-safe modules (lightning protection zone transition 0_B to 1)

The overvoltage arrestors are only required for unshielded cables. The Configuring interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) Function Manual lists the overvoltage arrestors which you may use for fail-safe modules.

Calculating the leakage resistance

C

Introduction

If you wish to protect the ET 200SP using a ground-fault detector or a residual current circuit breaker, then you need the leakage resistance to select the correct safety components.

Ohmic resistance

When determining the leakage resistance of the ET 200SP, you must take into account the ohmic resistance from the RC combination of the module in question:

Table C- 1 Ohmic resistance

Module	Ohmic resistance from RC network
CPU/interface module	10 MΩ (±5 %)
BaseUnit BU15...D	10 MΩ (±5 %)
BaseUnit BU30-MSx	10 MΩ (±5 %)

Formula

You can calculate the leakage resistance of the ET 200SP using the following formula if you protect all of the modules listed above with one ground-fault detector:

$R_{ET200SP}$	=	R_{module} / N
$R_{ET200SP}$	=	Leakage resistance of the ET 200SP
R_{module}	=	Leakage resistance of a module
N	=	Number of BaseUnits BU15...D and interface module in the ET 200SP
$R_{CPU/IM}$	=	$R_{BU15...D} = R_{Module} = 9.5\ M\Omega$
$R_{CPU/IM}$	=	Leakage resistance of CP/interface module
$R_{BU15...D}$	=	Leakage resistance of the BaseUnit BU15...D

If you protect the modules listed above within an ET 200SP with several ground-fault detectors, you must determine the leakage resistance for each individual ground-fault detector.

Example

The structure of an ET 200SP system consists of an IM 155-6 PN ST, two BaseUnits BU15...D and various input and output modules. The entire ET 200SP is protected with **one** ground-fault detector:

$$R_{ET\ 200SP} = \frac{9.5\ M\Omega}{3} = 3.17\ M\Omega$$

Figure C-1 Calculation example for leakage resistance

Safety-relevant symbols D

D.1 Safety-related symbols for devices without Ex protection

The following table contains an explanation of the symbols located in your SIMATIC device, its packaging or the accompanying documentation.

Symbol	Meaning
	General warning sign **Caution/Notice** You must read the product documentation. The product documentation contains information about the potential risks and enable you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by electrically skilled person. IEC 60417 No. 6182
 CABLE SPEC.	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
 EMC	Note that the device must be constructed and connected in accordance with EMC regulations.
 230V MODULES	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2
 24V MODULES	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
 INDOOR USE ONLY INDUSTRIAL USE ONLY	Be aware that the device is only approved for the industrial field and only for indoor use.
	Note that an enclosure is required for installing the device. Enclosures are considered: • Standing control cabinet • Serial control cabinet • Terminal boxes • Wall enclosure

D.2 Safety-related symbols for devices with Ex protection

The following table contains an explanation of the symbols located in your SIMATIC device, its packaging or the accompanying documentation.

Symbol	Meaning
 ONLY EX MODULES	The assigned safety symbols apply to devices **with Ex approval**. You must read the product documentation. The product documentation contains information about the potential risks and enable you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by electrically skilled person. IEC 60417 No. 6182
 F<2N DISPLAY F<4N HOUSING	Observe the mechanical rating of the device.
 CABLE SPEC.	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
 EMC	Note that the device must be constructed and connected in accordance with EMC regulations.
 U = 0V	When the device is under voltage, note that it may not be installed or removed, or plugged or pulled.
 230V MODULES	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2
 24V MODULES	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
 INDOOR USE ONLY INDUSTRIAL USE ONLY	Be aware that the device is only approved for the industrial field and only for indoor use.

Symbol	Meaning
	For Zone 2 potentially explosive atmospheres, be aware that the device may only be used when it is installed in an enclosure with a degree of protection ≥ IP54.
	For Zone 22 potentially explosive atmospheres, be aware that the device may only be used when it is installed in an enclosure with a degree of protection ≥ IP6x.

Glossary

1oo1 evaluation

Type of → sensor evaluation – in the case of the 1oo1 evaluation, there → is one sensor with a 1-channel connection to the F module.

1oo2 evaluation

Type of → sensor evaluation – in the case of 1oo2 evaluation , two input channels are assigned one two-channel sensor or two one-channel sensors. The input signals are compared internally for equivalence or nonequivalence.

Acknowledgment time

During the acknowledgment time, the → F-I/O acknowledge the sign of life specified by the → F-CPU. The acknowledgment time is included in the calculation of the → monitoring time and → response time of the overall fail-safe system.

Actuator

Actuators are, for example, power relays or contactors for switching on load devices or load devices themselves (e.g. directly controlled solenoid valves).

Automation system

Programmable logic controller for the open-loop and closed-loop control of process sequences of the process engineering industry and manufacturing technology. The automation system consists of different components and integrated system functions depending on the automation task.

AUX bus

Self-assembling bus, can be used individually, for example, as a protective conductor bus or for additional required voltage.

Availability

Availability is the probability that a system is functional at a specific point in time. Availability can be increased by redundancy, e.g., by using multiple -> sensors at thesame measuring point.

AWG (American Wire Gauge)

A standard measure for conductors used in the USA, which is assigned to a specific cross-sectional area of a conductor or wire. Each AWG number represents a jump of 26% in the cross-sectional area. The thicker the wire, the smaller the AWG number.

BaseUnit

BaseUnits realize the electrical and mechanical connection of the I/O modules with the interface module and the server module.

The inserted I/O module determines the signals at the terminals of the BaseUnits. Depending on the selected BaseUnit, only certain terminals are available.

BaseUnit, dark-colored

Conduction of the internal power and AUX buses from the left adjacent module to the subsequent modules on the right.

BaseUnit, light-colored

Inserted as first BaseUnit and opens a new potential group with electrical isolation. The power and AUX buses are separate from the adjacent module on the left. It feeds the supply voltage.

Baud rate

Speed at which data is transferred, indicating the number of transmitted bits per second (baud rate = bit rate).

BU cover

Cover for unused slots on the BaseUnit or placeholder for planned I/O modules. For a future expansion, the reference identification label of the planned I/O module can be kept here.

Bus

Joint transmission path to which all participants of a fieldbus system are connected; has two defined ends.

BusAdapter

Enables free selection of the connection technology for the PROFINET fieldbus.

Channel fault

Channel-specific fault, such as a wire break or short circuit.

In channel-specific passivation, the affected channel is either automatically reintegrated or the fail-safe module must be removed and reinserted after the fault has been eliminated.

Channel group

The channels of a module are grouped together in a channel group. Certain parameters in STEP 7 can only be assigned to channel groups, rather than to individual channels.

Channel number

Channel numbers are used to uniquely identify the inputs and outputs of a module and to assign channel-specific diagnostic messages.

Channel-specific passivation

With this type of passivation, only the affected channel is passivated in the event of a → channel fault. In the event of a → module fault, all channels of the → fail-safe module are passivated.

Configuration

Systematic arrangement of the individual modules.

Configuration control

Function that enables a flexible adjustment of the actual configuration based on a configured maximum configuration via the user program. Input, output and diagnostics addresses remain unchanged.

Connecting to common potential

Configuring a new potential group for which a new infeed is set up for the supply voltage.

Connection plug

Physical connection between device and cable.

CPU

The CPU uses the integrated system power supply to supply the electronics of the modules via the backplane bus. The CPU contains the operating system and executes the user program. The user program is located on the SIMATIC memory card and is processed in the work memory of the CPU. The PROFINET interfaces of the CPU establish an Industrial Ethernet connection. The CPUs of the ET 200SP support operation as an IO controller, I-device or standalone CPU.

CRC

Cyclic Redundancy Check

CRC signature

The validity of the process values in the safety frame, the accuracy of the assigned address references, and the safety-related parameters are validated by means of the CRC signature in the safety frame.

Crimping

Procedure in which two components, e.g. end sleeve and cable, are connected with each other by plastic strain.

Dark period

Dark periods occur during shutdown tests and complete bit pattern tests. The fail-safe output module switches test-related zero signals to the active output. This output is then briefly disabled (= dark period). An adequate carrier → actuator will not respond to this and will remain activated.

Derating

Derating allows devices to be used even in harsh operating conditions by selectively restricting the output capacity. In the case of motor starters, this usually refers to operation at high ambient temperatures.

Device name

Before an IO device can be addressed by an IO controller, it must have a device name.
An IO device is delivered without a device name. An IO device can only be addressed by the IO controller after it has been assigned a device name via the PG/PC or via the topology, e.g. for the transfer of configuration data (such as IP address) during startup or for the exchange of user data during cyclic operation.

Diagnostics

Monitoring functions for the recognition, localization, classification, display and further evaluation of errors, faults and alarms. They run automatically during plant operation. This increases the availability of plants because commissioning times and downtimes are reduced.

Discrepancy analysis

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is performed to determine whether the difference (for nonequivalence testing: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

The discrepancy analysis compares the two input signals of the 1oo2 sensor evaluation in the fail-safe input module.

Discrepancy time

Configurable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are extended unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily since a discrepancy error is detected when, in reality, no error exists.

Distributed I/O system

System with input and output modules that are configured on a distributed basis, far away from the CPU controlling them.

DP

→ *Distributed I/O system*

Earth

Conductive earth whose electrical potential can be set equal to zero at any point.

Equipotential bonding

Electrical connection (potential equalization conductor) that brings the bodies of electrical equipment and other conductive bodies to the same or almost the same potential, in order to prevent disruptive or dangerous voltages between these bodies.

Explosion protection

Requirement for the use of electrical equipment in hazardous areas in accordance with DIN EN 60079-0.

Fail-safe modules

ET 200SP modules with integrated safety functions that can be used for safety-related operation (safety mode).

Fail-safe systems

Fail-safe systems (F-systems) remain in a safe state or immediately assume another safe state as soon as particular failures occur.

Fault reaction time

The maximum fault reaction time of an F-system defines the interval between the occurrence of any fault and a safe reaction at all affected fail-safe outputs.

For → F-system overall: The maximum fault reaction time defines the interval between the occurrence of any fault in any → F-I/O and a safe response at the relevant fail-safe output.

For digital inputs: The maximum fault reaction time defines the interval between the occurrence of the fault and the safe reaction on the backplane bus.

For digital outputs: The maximum fault reaction time defines the interval between the occurrence of the fault and the safe reaction at the digital output.

Fault tolerance time

The fault tolerance time of a process is the time a process can be left unattended without risk to life and limb of the operating personnel, or damage to the environment.

Any type of F-system control is tolerated within this fault tolerance time, i.e. the → F-system can control its processes incorrectly or even not at all. The fault tolerance time depends on the type of process and must be determined on a case-by-case basis.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is permitted for use in SIMATIC Safety. A standard user program can also be run on the F-CPU.

F-I/O

Collective name for fail-safe inputs and outputs available in SIMATIC S7 for integration into the SIMATIC Safety F-system. Available F-I/O modules:

- Fail-safe I/O module for ET 200eco
- Fail-safe signal modules S7-300 (F-SMs)
- Fail-safe modules for ET 200S
- Fail-safe modules for ET 200SP
- Fail-safe modules for ET 200MP
- Fail-safe DP standard slaves
- Fail-safe PA field devices
- Fail-safe IO devices

Firmware update

Upgrade of firmware for modules (interface modules, I/O modules etc.), e.g. after function extensions, to the newest firmware version (update).

F-monitoring time

→ PROFIsafe monitoring time

F-Systems

→ fail-safe systems

Functional ground

Functional ground is a low-impedance current path between electric circuits and ground. It is not designed as a safety measure but instead, for example, as a measure to improve interference immunity.

Ground

All interconnected, inactive parts of a piece of equipment that cannot accept any dangerous contact voltage, even in the event of a fault.

Grounding

Grounding means connecting an electrically conductive part to a grounding electrode by means of a grounding system.

GSD file

As a Generic Station Description, this file contains all properties of a PROFINET or PROFIBUS device that are necessary for its configuration in XML format.

I/O modules

All modules, with the exception of the motor starters, that can be operated with a CPU or an interface module.

Identification data

Information that is saved in modules and that supports the user in checking the plant configuration and locating hardware changes.

Infeed system

The infeed system with the terminals L1(L), L2(N), L3, PE enables several SIMATIC ET 200SP motor starters to be supplied using a single infeed terminal.

Interface module

Module in the distributed I/O system. The interface module connects the distributed I/O system via a fieldbus to the CPU (IO controller) and prepares the data for and from I/O modules.

IO-Link

IO-Link is a point-to-point connection to conventional and intelligent sensors/actuators by unshielded standard cables in proven 3-wire technology. IO-Link is downward compatible to all DI/DQ sensors/actuators. Switching status channel and data channel are designed in proven 24 V DC technology.

Line

All the modules attached to a mounting rail.

Load current supply

Supply of modules like the interface module, power supply modules, I/O modules, and (if applicable) sensors and actuators.

MAC address

Device identification unique worldwide, which is already assigned to each PROFINET device in the factory. Its 6 bytes are divided into 3 bytes for the manufacturer ID and 3 bytes for the device ID (serial number). The MAC address is usually legible on the device.

Main switch

Every industrial machine that falls under the scope of DIN EN 60204 Part 1 (VDE 0113, Part 1) must be equipped with a main switch that disconnects all electrical equipment from the network while cleaning, maintenance, and repair work is being carried out, as well as during long periods of downtime. Usually a switch which can be operated by hand that is stipulated for electrical or mechanical prevention of a hazard. The main switch can also function as an EMERGENCY-OFF device.

The main switch must meet the following requirements:

- Externally accessible mechanical rotary lock.
- Only one OFF position and one ON position with allocated stops.
- Two positions labeled "0" and "I". 4th lockable OFF position.
- Cover for the power supply terminals to protect against accidental contact.
- The switching capacity must correspond to AC-23 for motor switches and AC-22 for load-break switches (utilization category).
- Switch position displayed automatically.

Module fault

Module faults can be external faults (e.g. missing load voltage) or internal faults (e.g. processor failure). Internal faults always require module replacement.

Monitoring time

→ PROFIsafe monitoring time

Motor starter

Motor starter is the generic term for direct-on-line and reversing starters.

M-switch

Each fail-safe digital output of ET 200SP F-modules consists of a P-switch DO-P_x (current sourcing) and an M-switch DO-M_x (current sinking). The load is connected between the P-switch and M-switch. The two switches are always activated so that voltage is applied to the load.

Node

Device that can send, receive or amplify data via the bus, e.g. IO device via PROFINET IO.

Nonequivalent sensor

A nonequivalent → sensor is a two-way switch that is connected to two inputs of an → F-I/O (via 2 channels) in → fail-safe systems (for → 1oo2 evaluation of sensor signals).

Overload release

Overcurrent release that provides protection against overload.

Parameter assignment

Parameter assignment is the transfer of parameters from the IO controller/DP master to the IO device/DP slave.

Passivation

If an → F-I/O module detects a fault it switches either the affected channel or all channels to a → safe state, i.e. the channels of this F-I/O module are passivated. The F-I/O module signals the detected faults to the → F-CPU.

When passivating channels at F-I/O with inputs, the → F-System provides fail-safe values for the → safety program instead of the process values pending at the fail-safe inputs.

When passivating channels at F-I/O with outputs, the F-system returns fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program.

PELV

Protective Extra Low Voltage

Performance Level

Performance Level (PL) in accordance with ISO 13849-1 or EN ISO 13849-1

Potential group

Group of I/O modules that are jointly supplied with voltage.

Prewiring

Wiring the electrics on a mounting rail before the I/O modules are connected.

Process image (I/O)

The CPU transfers the values from the input and output modules to this memory area. At the start of the cyclic program, the signal states of the input modules are transmitted to the process image input. At the end of the cyclic program, the process image output is transmitted as signal state to the output modules.

Product version (ES) = Functional status (FS)

The product version or functional status provides information on the hardware version of the module.

PROFIBUS

PROcess FIeld BUS, process and fieldbus standard that is specified in IEC 61158 Type 3. It specifies functional, electrical and mechanical properties for a bit-serial fieldbus system. PROFIBUS is available with the following protocols: DP (= Distributed Periphery), FMS (= Fieldbus Message Specification), PA (= Process Automation) or TF (= Technological Functions).

PROFINET

PROcess FIeld NETwork, open industrial Ethernet standard which continues PROFIBUS and Industrial Ethernet. A cross-manufacturer communication, automation and engineering model by PROFIBUS International e.V., defined as an automation standard.

PROFINET IO controller

Device used to address connected I/O devices (e.g. distributed I/O systems). This means: The IO controller exchanges input and output signals with assigned I/O devices. The IO controller often corresponds to the CPU in which the automation program is running.

PROFINET IO

Communication concept for the realization of modular, distributed applications within the scope of PROFINET.

PROFINET IO device

Distributed field device that can be assigned to one or more IO controllers (e.g. distributed I/O system, valve terminals, frequency converters, switches).

PROFIsafe

Safety-oriented PROFINET I/O bus profile for communication between the → safety program and the → F-I/O module in a → fail-safe system.

PROFIsafe address

The PROFIsafe address (code name according to IEC 61784-3-3: 2010) is used to protect standard addressing mechanisms such as IP addresses. The PROFIsafe address consists of the F-source address and F-destination address. Every → fail-safe module therefore has two address portions, the F-source address and the F-destination address.

The PROFIsafe address must be configured in the hardware and network editor.

PROFIsafe monitoring time

Monitoring time for safety-related communication between the F-CPU and F-I/O

Proof-test interval

Period after which a component must be forced to fail-safe state, that is, it is either replaced with an unused component, or is proven faultless.

Provider-Consumer principle

Principle of data communication on the PROFINET IO: in contrast to PROFIBUS, both parties are independent providers when sending data.

P-switch

→ M-switch

Push-in terminal

Push-in connections are a form of spring-loaded terminals allowing wiring without tools for rigid conductors or conductors equipped with end sleeves.

Redundancy, availability-enhancing

Multiple instances of components with the objective of maintaining component functionality in the event of hardware faults.

Redundancy, safety-enhancing

Multiple availability of components with the aim of exposing hardware faults based on comparison; such as → 1oo2 evaluation in → fail-safe modules.

Reference identification

In accordance with EN 81346, a specific object is clearly referenced in relation to the system to whose components the object belongs. Thus, unique identification of the modules in the entire system is possible.

Reference potential

Potential from which the voltages of the participating circuits are considered and/or measured.

Reintegration

After the elimination of a fault, it is necessary to ensure the reintegration (depassivation) of the → F-I/O. Reintegration (switchover from fail-safe values to process values) occurs either automatically or only after a user acknowledgment in the safety program.

In the case of a fail-safe input module, the process values pending at the fail-safe inputs are made available to thesafety program again after reintegration. In the case of a fail-safe output module, the → fail-safe system transfers the output values in the safety program to the fail-safe outputs again.

RIOforFA-Safety

Remote IO for Factory Automation with PROFIsafe; Profile for F-I/O

RoHS

EC Directive 2011/65/EU concerning the restriction of certain dangerous substances in electrical and electronic devices regulates the use of hazardous substances in devices and components. The English abbreviation RoHS is used to refer to this directive: (Restriction of the use of certain hazardous substances), as well as all related measures for implementing it into national legislation.

Safe state

The basic principle of the safety concept in F-systems is the existence of a safe state for all process variables. For the digital F-I/O, for example, the safe state is the value "0".

Safety class

Safety level (Safety Integrity Level) SIL according to IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and hardware failures.

The fail-safe modules support operation in safety mode up to safety class SIL3.

Safety frame

In safety mode, data are transferred between the → F-CPU and → F-I/O in a safety frame.

Safety function

A mechanism integrated in the → F-CPU and → F-I/O that enables their use in → the fail-safe system SIMATIC Safety.

According to IEC 61508:2010: A safety function is implemented by a safety system in order to maintain or force a system safe state in the event of a specific fault.

Safety mode

Operating mode of → F-I/O that enables → safety-related communication via → safety frames.

→ ET 200SP fail-safe modules can only used in safety mode.

Safety program

Safety-related user program

Safety-related communication

Communication used to exchange fail-safe data.

Self-assembling voltage buses

Three internal, self-assembling buses (P1, P2 and AUX) that supply the I/O modules with power.

SELV

Safety **E**xtra **L**ow **V**oltage

Sensor evaluation

There are two types of sensor evaluation:

→ 1oo1 evaluation – sensor signal is read once

→ 1oo2 evaluation – sensor signal is read in twice by the same F-module and compared internally

Sensors

Sensors are used for the accurate detection of routes, positions, velocities, rotational speeds, masses, etc. in the form of digital and analog signals.

Server module

The server module completes the configuration of the ET 200SP.

Service life

Period of time for which the switching device will work properly under normal operating conditions. This is specified as the number of operating cycles, the electrical durability (e.g. contact erosion), and the mechanical durability (e.g. operating cycles without load).

SIL (Safety Integrity Level)

Discrete level (one of three possibilities) for defining safety integrity specifications of safety-related control functions. Safety integrity level 3 is the highest possible level, level 1 the lowest.

Slave station

A slave can only exchange data after being requested to do so by the master.

SNMP

SNMP (Simple Network Management Protocol) is the standardized protocol for diagnosing and also configuring the Ethernet infrastructure.

In the office area and in automation technology, devices support a wide range of manufacturers on the Ethernet SNMP.

SNMP-based applications can be operated on the same network in parallel to applications with PROFINET.

Standard mode

Operating mode of F-I/O in which standard communication is possible by means of → safety frames, but not → safety-related communication.

Fail-safe ET 200SP modules can only be operated in safety mode.

Switch

PROFIBUS is a linear network. The communication nodes are linked by means of a passive cable - the bus.

By contrast, Industrial Ethernet consists of point-to-point connections: each communication node is interconnected directly with precisely one other communication node.

If a communication node is linked to several communication nodes, this communication node is connected to the port of an active network component - the switch. Other communications devices (including switches) can then be connected to the other ports of the switch. The connection between a communication node and the switch remains a point-to-point connection.

The task of a switch is thus to regenerate and distribute received signals. The switch "learns" the Ethernet address(es) of a connected PROFINET device or additional switches and only forwards those signals that are intended for the connected PROFINET device or switch.

A switch has a specific number of connections (ports). You connect at most one PROFINET device or additional switch to each port.

Technology object

A technology object supports you in the configuration and commissioning of a technological function.

The properties of real objects are represented by the technology objects in the controller. Real objects can be, for example, controlled systems or drives.

The technology object includes all data of the real object that is required for its open-loop or closed-loop control, and it signals the status information.

TIA Portal

Totally Integrated Automation Portal

The TIA Portal is the key to the full performance capability of Totally Integrated Automation. The software optimizes all operating, machine and process sequences.

Total current

Sum of the currents of all output channels of a digital output module.

TWIN end sleeve

End sleeve for two cables

Type of coordination 1

The motor starter may be non-operational after a short circuit has been cleared. Damage to the motor starter is permissible.

Types of coordination

The IEC 60947-4-1 (VDE 0660 Part 102) standard distinguishes between two types of coordination referred to as coordination type "1" and coordination type "2". The short circuit that needs to be dealt with is cleared reliably and safely with both types of coordination; the only differences are in the extent of the damage sustained by the device following a short circuit.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Validity

This product information supplements the documentation for the ET 200SP and takes precedence over our system manuals, function manuals and product manuals.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens’ products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Table of contents

Module overview of ET 200SP 1

1.1 Possible combinations of BaseUnits and I/O modules

Contents

This product information includes amendments and corrections to the documentation of the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Which I/O modules / motor starters fit on a BaseUnit?

The following table provides an overview of the I/O modules / motor starters that fit on the corresponding compatible BaseUnits:

Table 1- 1 Possible combinations of BaseUnits and I/O modules

1.2 CPUs

CPUs

CPU	Number in pack	Article number
CPU 1510SP-1 PN with server module	Pack of 1	6ES7510-1DJ0x-0AB0
CPU 1510SP F-1 PN with server module	Pack of 1	6ES7510-1SJ0x-0AB0
CPU 1512SP-1 PN with server module	Pack of 1	6ES7512-1DK0x-0AB0
CPU 1512SP F-1 PN with server module	Pack of 1	6ES7512-1SK0x-0AB0
CPU 1515SP PC with server module	Pack of 1	6ES7677-2AAxx-0xx0

Important differences between CPUs...PN				
Features	**CPU 1510SP-1 PN**	**CPU 1510SP F-1 PN**	**CPU 1512SP-1 PN**	**CPU 1512SP F-1 PN**
Bus connection	PROFINET: BusAdapter (port 1, 2) • BA 2xRJ45 (as of firmware version 1.6) • BA 2xFC (as of firmware version V1.6) RJ45, integrated (port 3)		PROFINET: BusAdapter (port 1, 2) • BA 2xRJ45 (as of firmware version 1.6) • BA 2xFC (as of firmware version V1.6) • BA 2xSCRJ (as of firmware V1.8)[1] • BA SCRJ/RJ45 (as of firmware V1.8)[1] • BA SCRJ/FC (as of firmware V1.8)[1] • BA 2xLC (as of firmware V2.0)[1] • BA LC/RJ45 (as of firmware V2.0)[1] • BA LC/FC (as of firmware V2.0)[1] RJ45, integrated (port 3)	
	PROFIBUS: PROFIBUS DP connection socket via CM DP communication module			
Number of modules	64			
Data work memory	750 KB	750 KB	1 MB	1 MB
Code work memory	100 KB	150 KB	200 KB	300 KB
Address space	1280 bytes/2560 bytes[2]			
Multi hot-swapping	Yes			
Can be used for safety applications (supports PROFIsafe V2.0)	No	Yes	No	Yes

[1] Only with article numbers 6ES7512-1DK01-0AB0 and 6ES7512-1SK01-0AB0

[2] Only 6ES7510-1DJ01-0AB0, 6ES7512-1SJ01-0AB0, 6ES7512-1DK01-0AB0 and 6ES7512-1SK01-0AB0 with FW version V2.0

Note

The CM AS-i Master ST and F-CM AS-i Safety ST communication modules are supported as of firmware V1.8 of the CPUs. Note the following additional requirements:

CM AS-i Master ST:

- Firmware version of the CM AS-i Master ST: V1.1
- STEP 7 (TIA Portal): V13 SP1 Update 4 or higher

F-CM AS-i Safety ST

- Firmware version of the CM AS-i Safety ST: V1.0
- STEP 7 (TIA Portal): as of V13 SP1 Update 4 and HSP0070 V3.0

1.3 Interface modules

Interface modules

Interface modules	Number in pack	Article number
Interface module IM 155-6 PN BA	Pack of 1	6ES7155-6AR00-0AN0

Accessories for motor starter	Packaging unit	Article number
3DI / LC module	Pack of 1	3RK1908-1AA00-0BP0
Fan	Pack of 1	3RW4928-8VB00
Additional mechanical bracket for BaseUnit	Pack of 1	3RK1908-1EA00-1BP0
Cover for an empty BaseUnit	Pack of 1	3RK1908-1CA00-0BP0
Touch protection cover for infeed bus	Pack of 1	3RK1908-1DA00-2BP0

2 Supplements to ET 200SP documentation

2.1 System manual

System manual ET 200SP Distributed I/O system, Edition 02/2018

Section 10.2 Creating the control data record

For the configuration control (option handling) you can plug the following communication modules:

- CM DP
- CP 1542SP-1
- CP 1543SP-1
- CP 1542SP-1 IRC
- BusAdapter BA-Send 1xFC

For the communication modules listed above special slot rules apply for use with the ET 200SP CPUs applies:

If you plug the communication modules in the central configuration control as mentioned above (e.g. CM DP), then these modules cannot be influenced by the configuration control. You must therefore leave these modules in the slots preassigned in the station master and enter the slot numbers from the station master in the control data record ("Station option slot = Station master slot").

In a station option, all slots up to the module furthest from the CPU (see list above) must be present in the control data record.

Section 13.6 Firmware update

Modules with firmware version V0.0.0 do not support the "firmware update" function.

Section 15.5 Climatic ambient conditions

The following table shows the permissible climatic ambient conditions for the ET 200SP distributed I/O system:

Table 2- 1 Climatic ambient conditions

Ambient conditions	Permitted range	Comments
Temperature: Horizontal mounting position: Vertical mounting position:	From 0 °C to 60 °C From 0 °C to 50 °C	Information on extended temperature ranges are defined in the respective product data sheet.
Permitted temperature change	10 K/h	-
Relative humidity	From 10% to 95%	Without condensation or icing.
Air pressure	From 1140 hPa to 795 hPa	Corresponds to an altitude of -1000 m to 2000 m
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

SIPLUS products based on ET 200SP are offered for reliable operation under heavy to extreme operating conditions.

Using the distributed IO system ET 200SP over 2000 m above sea level.

The maximum "operating elevation in relation to sea level" depends on the module and is described in the technical specifications of the respective module.

For altitudes > 2000 m the following constraints apply for the maximum specified ambient temperature:

Restrictions of the maximum ambient temperature specified with regard to the operating altitude

Operating altitude	Derating factor for ambient temperature [1)]
-1000 m to 2000 m	1.0
2000 m to 3000 m	0.9
3000 m to 4000 m	0.8
4000 m to 5000 m	0.7

1) Base value for application of the derating factor is the maximum permissible ambient temperature in °C for 2000 m.

Note

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air in higher altitudes due to lower density.
- Note the mounting position of the respective module in the technical specifications. The basis is the standard IEC 61131-2:2017.

Note

Power supplies

Make sure that the power supplies you use are rated for altitudes > 2000 m.

Details about certification on the components of the distributed I/O system ET 200SP

Fail-safe modules are certified for operation in safety mode up to the maximum altitude listed in the product data sheet (in accordance with IEC 61508-1: 2010, EN ISO 13849-1: 2015 and EN 62061:2005/ A2:2015).

All other markings and certifications are currently based on an altitude of up to 2000 m.

Effects on the availability of modules

The higher cosmic radiation present during operation at altitudes above 2000 m will also start to have an effect on the failure rate of electronic components (the so-called soft error rate). In rare cases this can result in a transition of the module into the safe state, especially for fail-safe modules. However, the functional safety of the module is fully retained.

2.2 BaseUnits manual

2.2.1 Special consideration for BaseUnits with functional versions < 04

The following BaseUnits with functional version < 04 can only be used in potential groups with rated voltages ≤ 48 V DC or 24 V AC:

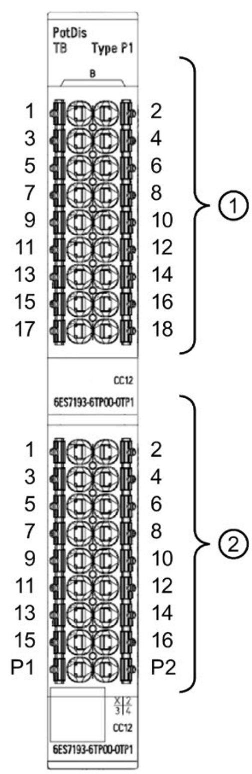
- BaseUnit BU20-P12+A0+4B (6ES7193-6BP20-0BB1).
- BaseUnit BU20-P12+A0+0B (6ES7193-6BP00-0BD0).

2.2.2 Terminal labeling of the PotDis-TB

New specification of the terminal labeling

New specification offers the following advantages:

- Unique terminal numbering per slot, even though the same reference identifier is used for the PotDis-BU and the PotDis-TB of a slot.
- Best possible readability
- Shortest possible designation to keep the work for conductor labeling as low as possible
- Compliant with ECAD rules
- Complies with the previous ET 200SP Logic
- You can continue using the color identification label CC00



①	**Terminal labeling of the PotDis-TB**	B1 to B18. To save space the preceding character "B" is printed once at the top and may not be covered by the color identification labels.
②	**Terminal labeling of the PotDis-BU**	1 to 16, the supply terminals P1 and P2.

2.3 CPU manuals

Manual CPU 1512SP-1 PN, Edition 09/2016

Section 4.1 Status and error display of the CPU

MT1/MT2 LEDs on BusAdapter BA 2xSCRJ, BA SCRJ/RJ45, BA SCRJ/FC

Table 2- 2 Status and error displays of MT1/MT2 LEDs

LED MT1/MT2*	Meaning	Solution
□ Off	No error	---
■ On	• Fiber-optic error • Maintenance demanded: Attenuation through the fiber-optic cable is so high that operation will soon no longer be possible.	Causes and measures for the transmission route: • Replacement of fiber-optic cable if damaged or aged • Correct installation of the PROFINET connector/PROFINET connections • Adherence to maximum length of 50 m for POF cable or 100 m for PCF cable • Secure fit of the FOC connector.

* Only available on BusAdapter BA 2xSCRJ

Section 6 Technical specifications

Technical specifications of the BusAdapters BA 2×SCRJ, BA SCRJ/RJ45, BA SCRJ/FC

The maximum length of the PCF-GI fiber-optic cable is 250 m.

Device manuals CPU 1510SP-1 PN and CPU 1512SP-1 PN, Edition 09/2016

"LED" instruction

You can read the status (e.g. "On" or "Off") of LEDs of a CPU or a module using the "LED" instruction. Note, however, that is not possible to read the LED status of the LINK RX/TX LEDs of the CPU 1510SP-1 PN and CPU 1512SP-1 PN.

You can find additional information on the "LED" instruction in the STEP 7 online help.

Compilation error with IM 155-6 PN HF as of V2.1, IM 155-6 PN HS V4.0

Affected components:

- IM 155-6 PN HF as of V2.1
- IM 155-6 PN HS V4.0

A compilation error can occur in isochronous mode of the ET200SP (IM 155-6 PN HF as of V2.1, IM 155-6 PN HS V4.0) with the setting "From OB" even if the settings are valid. The typical error message is: "The specific Ti value is invalid" or "The specific To value is invalid". But other error messages are possible as well.

Solution:

Upgrade the module description of the IM in this case. You can upgrade the module description of the IM in the network view or in the device view of the inspector window with the function "Update module description". The error can still occur with the current module description after the first compilation. If you have selected valid settings, the error will no longer occur with the subsequent compilation.

IM 155-6 PN ST Manual, Edition 04/2017

Response times

The response time of the IM 155-6 PN ST is made up of:

- Backplane bus cycle time
- Operating system processing

Note

Validity of the formula

The following formula applies to the ET 200SP backplane bus.

The formula does not apply to the ET-Connection bus.

Backplane bus cycle time

The backplane bus cycle time is the time the interface module requires to output new output data, read new input data and then copy the data to the PROFINET send buffer.

The backplane bus cycle time is the result of the update time configured for the interface module as IO device and amounts to at least 1 ms.

- If the configured update time ≥ 1 ms, the backplane bus cycle time is equal to the configured update time.
- If the configured update time < 1 ms, the backplane bus cycle time is the product of an integer multiple of the configured update time.

Table 2- 3 Example calculation

Configured update time	Backplane bus cycle time (integer multiple, minimum 1 ms)
250 µs	4 x 250 µs = 1000 µs
750 µs	2 x 750 µs = 1500 µs
1000 µs	1000 µs
2000 µs	2000 µs

Operating system processing time

The operating system processing time is calculated based on the following formula:

Operating system processing time output

Operating system processing time_output[µs] = 147 + 3.775 number_m + 0.275 bytes_out

Operating system processing time input

Operating system processing time_input[µs] = 158.3 + 2.325 number_m + 0.325 bytes_in

Explanation of the parameters:

Number_m: Total number of all modules (incl. server module)

Bytes_out: Sum of all output bytes

Bytes_in: Sum of all input bytes

Calculating the response time

Response time output

The response time output of the IM 155-6 PN ST is made up of:

- Backplane bus cycle time
- Operating system processing time_output.

Response time input

The response time input of the IM 155-6 PN ST is made up of:

- Backplane bus cycle time
- Operating system processing time_input.

IM 155-6 PN HF manual, Edition 12/2015

Section 3.1 Pin assignment

PROFINET interface X1 Port 2:

If autonegotiation is disabled, the RJ-45 socket (X1 Port 2) has the switch assignment (MDI-X).

IM 155-6 PN HS manual, Edition 09/2016

Section 3.1 Pin assignment

PROFINET interface X1 Port 2:

If autonegotiation is disabled, the RJ-45 socket (X1 Port 2) has the switch assignment (MDI-X).

Section 7 Technical specifications

- The PROFINET certification of network Class 3 is in preparation.
- Technical specifications of the BusAdapters BA 2×SCRJ, BA SCRJ/RJ45, BA SCRJ/FC: The maximum length of the PCF-GI fiber-optic cable is 250 m.

2.5 I/O module manuals

Configuration notes on the I/O modules (supplement to Product overview section in the manual)

I/O module		Article number	Firmware version	STEP 7 (TIA Portal)	STEP 7 V5.5 SP3

2.5.1 Digital module device manuals

Manuals for I/O modules ST, BA

When you have deactivated all channels of the I/O module, a diagnostics alarm is still generated in the case of a fault if the "Missing supply voltage L+" diagnostics is enabled. For the following I/O modules, this behavior is corrected as of firmware version > V1.1.0:

- DI 16x24VDC ST
- DI 8x24VDC ST
- DQ 16x24VDC/0.5A ST
- DQ 8x24VDC/0.5 A ST
- DQ 4x24VDC/0.5A ST

Manuals for digital input modules with wire-break detection

When wire-break detection is configured the module requires a low quiescent current at the digital input in case of "0" signal for the monitoring. The parallel connection of a resistor with 25 kΩ to 45 kΩ is required in order that this quiescent current can flow when encoder contacts are open.

If wire-break detection is disabled in the configuration, no parallel connection of the resistor is required.

If wire-break detection is configured, connect a resistor with 25 kΩ to 45 kΩ parallel to each mechanical encoder contact.

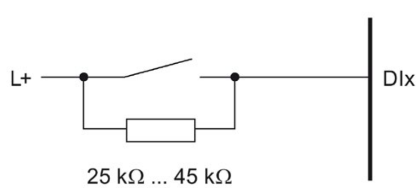

Figure 2-1 Connect mechanical encoder contact with resistor

Manuals DI 4x120...230VAC ST, Edition 02/2014; DQ 4x24...230VAC/2A ST, Edition 02/2014

Section 4.3 Address space

If you have enabled value status, the module returns value status 1, regardless of the state of the connected supply voltage.

Manual DI 8x24VDC HF, Edition 02/2014

Section 6.1 Technical specifications

- 24 V encoder supply
  – Output current, max.: 700 mA, total current

Manual DI 8xNAMUR HF, Edition 02/2014

Section A.2 Parameter assignment and structure of parameter data record

With data records 0 to 7, you can configure individual channels.

When the interface module IM 155-6 DP HF (PROFIBUS DP) is used and data records 0 and 1 are read, the module returns the diagnostics data records and not the parameter data records of the DI 8xNAMUR HF.

DQ 4x24VDC/2A HS manual, Edition 09/2016

Section 6.1 Technical specifications

For this module, the marine approval for the bridge and deck zone is valid from a bus cycle time of at least 250 μs.

Manual DQ 4x24..230VAC/2A ST digital output module, Edition 03/2015

Section 3.1 Pin assignment; Supply voltage fuse protection

The module has neither short-circuit protection nor overload protection. Protect the module from being destroyed by impermissible high current and install a fine fuse in the supply line. The maximum rated current of the fine fuse depends on the hardware function status (FS) of the module.

HW functional status of the module	Max. rated current of fuse	Tripping characteristic
FS ≤ 3	8 A	Quick response
FS ≥ 4	10 A	Quick response

Section 6.1 Technical specifications, Switching frequency with inductive load

The switching frequency of the outputs with inductive loads is max. 0.5 Hz.

Higher switching frequency is possible in spite of this, and depends on the alternating voltage and switched inductors or the power factor of the electric motor used.

Alternating voltage	Condition	Max. switching frequency
200 VAC or lower	---	10 Hz
200 VAC or higher	• Power factor of the electric motor cos φ > 0.35 • Electric motor must only be turned off after startup (no jogging mode). Electric motors which are turned off during startup could create inductive shutoff voltages > 600 V , which could destroy the output electronics (Triac).	10 Hz

DQ 8x24VDC/0.5A ST manual, Edition 07/2014

Section 4.2 Explanation of the parameters (as of functional version FS-05 of DQ 8x24VDC/0.5A ST)

Diagnostics: Wire break:
The module responds to a wire break as follows:

- Disabled:
  - Channel status LED lit green
  - Output voltage present at channel
- Enabled:
  - Channel status LED is off
  - Output is switched off
  - In addition, the wire break diagnostics is signaled and the DIAG LED on the module flashes red

---

Note

If one of the two parameters "Diagnostics: Short-circuit to L+" or "Diagnostics: Wire break" is enabled and one of these diagnostics occurs, the affected channel is switched off. This prevents undefined load switching and supports detection of a faulty channel for module diagnostics.

DQ 4x24..230VAC/2A HF Manual, Edition 02/2018

Section 3.1.1. und 4.1.1 Wiring and block diagram

The following figure shows an example for the terminal assignment of the digital output module DQ 4x24...230VAC/2A HF on the BaseUnit BU type U0 (3-wire connection) in combination with a potential distribution module and terminal block.

For a 3-wire connection you connect the protective earth (PE) of the actuator to the terminal block.

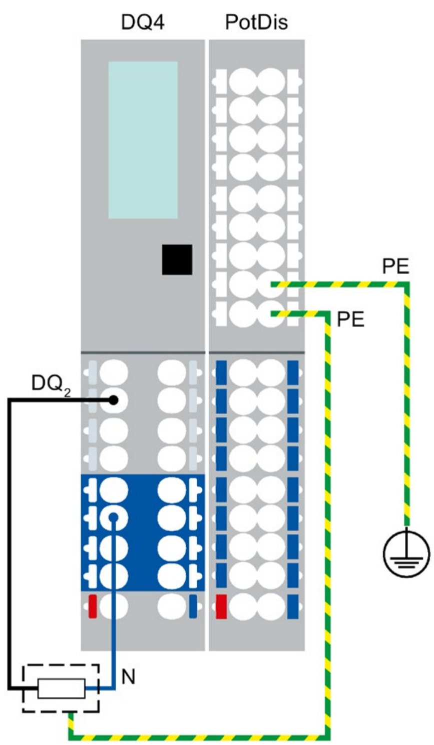

Figure 2-2 3-wire connection of actuators with potential distribution module at the digital output module DQ 4x24...230VAC/2A HF

RQ 4x120VDC-230VAC/5A NO ST manual, Edition 03/2015 and RQ 4x120VDC-230VAC/5A NO MA ST manual, Edition 12/2015

Section 3.1 Wiring and block diagram

The AUX terminals of the self-assembling voltage bus can be used for the connection of the protective conductor (PE) or for voltages up to a maximum of 24 V DC.

2.5.2 Analog module device manuals

Manuals for analog input modules

Manual	Edition
AI 8xI 2-/4-wire BA	03/2015
AI 8xU BA	03/2015
AI 2xU ST	12/2015
AI 4xI 2-wire 4..20mA HART	11/2014
AI 2xU/I 2-/4-wire HF	12/2015

Section 5.2 Parameters

Note

Please note that the settings in the "Interference frequency suppression" parameter have a direct effect on the cycle time of the module. The analog value is therefore also affected by additionally set filtering via the "Smoothing" parameter.

Manuals AI 2xU/I 2-/4-wire HF, Edition 12/2015; AI Energy Meter 480VAC ST, Edition 12/2015

For configuration with STEP 7 V13 or higher (TIA Portal), real values between -7×10^{28} and $+7 \times 10^{28}$ can be input. This is true for configuration via HSP and via GSD file (PROFINET).

For configuration with STEP 7 V5.5 SP4 as of HF7, configuration by means of GSD file (PROFINET) with REAL values of -1.175×10^{38} to $+3.402 \times 10^{38}$ is possible.

With STEP 7 SP4 to HF6, parameter assignment of REAL values is not possible. Functions that require REAL values are not available in this case.

AI Energy Meter 480VAC/CT HF, Edition 07/2018, and AI Energy Meter 480VAC/RC HF, Edition 07/2018 device manuals

Section A.2 Structure of the parameter data record 128 for the entire module

Module parameter block

Byte 4 (bits 7 6 5 4 3 2 1 0)

Connection type of the phases

- 00_H = Disabled
- $0B_H$ = 1P2W: 1-phase AC, 2 conductors
- $0C_H$ = 3P4W: 3-phase, 4 conductors
- $0D_H$ = 3P4WI: 3-phase current measurement, 4 conductors
- $0E_H$ = 3P4W1: 3-phase, 4 conductors, balanced load
- $0F_H$ = 3x1P2W: 3x1-phase AC, 2 conductors
- 10_H = 2P3W: 2-phase, 3-wire
- 11_H = 3P3W: 3-phase, 3-wire
- 12_H = 3P3W1: 3-phase, 3-wire, balanced load

Byte 5 (bits 7 6 5 4 3 2 1 0)

Voltage measuring range of the power supply system (Supply voltage, nominal value of phase voltage)

- 01_H = 100 V
- 02_H = 110 V
- 03_H = 115 V
- 04_H = 120 V
- 05_H = 127 V
- 06_H = 190 V
- 07_H = 200 V
- 08_H = 208 V
- 09_H = 220 V
- $0A_H$ = 230 V
- $0B_H$ = 240 V
- $0C_H$ = 277 V

Byte 6 (bits 7 6 5 4 3 2 1 0)

Line frequency of the power supply system (bits 3–0)

- 0001 = 60 Hz
- 0010 = 50 Hz

End value for energy meter (bits 6–4)

- 000 = No end value - infinite counting
- 001 = Count periodically to 10^3
- 010 = Count periodically to 10^6
- 011 = Count periodically to 10^9
- 100 = Count periodically to 10^{12}
- 101 = Count periodically to 10^{15}

Energy meter gate (bit 7)

- 0 = Energy meters always counting
- 1 = Energy meter gate

Byte 7 (bits 7 6 5 4 3 2 1 0: 0 0 0 0 0 0 0 0)

Reserved

Manuals AI Energy Meter 400VAC ST, Edition 12/2015; AI Energy Meter 480VAC ST, Edition 12/2015

Requirements for the operation of the AI Energy Meter on slot 1 of the ET 200SP:

Interface module / CPU	AI Energy Meter 400VAC ST (6ES7134-6PA01-0BD0)	AI Energy Meter 480VAC ST (6ES7134-6PA20-0BD0)
IM 155-6 PN BA (6ES7155-6AR00-0AN0)	Can be operated on slot 1 for all IM 155-6 PN BA	
IM 155-6 PN ST (6ES7155-6AU00-0BN0)	Can be operated on slot 1 for IM 155-6 PN ST from firmware version V3.1 and higher and functional status FS 07	
IM 155-6 PN HF (6ES7155-6AU00-0CN0)	Can be operated on slot 1 for IM 155-6 PN HF from firmware version V3.0 and higher and functional status FS 05	
IM 155-6 DP HF (6ES7 155-6BU00-0CN0)	Can be operated on slot 1 for IM 155-6 DP HF from firmware version V3.0 and higher	
CPU 1510SP-1 PN, CPU 1512SP-1 PN, CPU 1515SP PC	Can be operated on slot 1 for all CPUs	

In the manual for Energy Meter 480VAC ST, Edition 12/2015

In the device manual for Energy Meter 480VAC ST, the measured value ID and the associated measured variables for the complete performance are reversed. The correct association is shown in the table below:

Measured value ID	Measured variables	Unit
34	Total active power L1L2L3	W
35	Total reactive power L1L2L3	var
36	Total apparent power L1L2L3	VA
65	Max. total active power	W
66	Max. total reactive power	var
67	Max. total apparent power	VA
95	Min. total active power	W
96	Min. total reactive power	var
97	Min. total apparent power	VA

If you use the user-data mapping via data record DS 130, please note that the texts for the measured variables are also displayed incorrectly during configuration.

During configuration of the measured variables for the total active, reactive, and apparent power, select the following texts:

Desired measured variable for the user-data mapping	Text to select during configuration
Total active power L1L2L3	Total apparent power L1L2L3 (ID00034)
Total reactive power L1L2L3	Total active power L1L2L3 (ID00035)
Total apparent power L1L2L3	Total reactive power L1L2L3 (ID00036)
Max. total active power	Max. total apparent power (ID00065)
Max. total reactive power	Max. total active power (ID00066)
Max. total apparent power	Max. total reactive power (ID00067)
Min. total active power	Min. total apparent power (ID00095)
Min. total reactive power	Min. total active power (ID00096)
Min. total apparent power	Min. total reactive power (ID00097)

The project configuration modification described above is no longer required if the following tools and GSD files are used:

- STEP 7 (TIA Portal) as of V14
- STEP 7 (TIA Portal) as of V5.5 SP4 with HSP 0227
- GSD file GSDML-V2.32-ET200SP-20160706

Manual for AQ 2xU/I HF, Edition 02/2014

Section 3.1 Wiring and block diagram, pin assignment

You can now also use the 3-wire connection in addition to the 2-wire and 4-wire connection for the analog module AQ 2xU/I HF.

Pin assignment for AQ 2xU/I HF			**Explanation**
Voltage 2-wire connection 	Voltage 3-wire connection 	Voltage 4-wire connection 	• Qn+: Analog output voltage/current (positive), channel n • Qn-: Analog output voltage/current (negative), channel n • Sn+: Sensor line positive, channel n • Sn-: Sensor line negative, channel n

The 3-wire connection and 4-wire connection make compensation for line impedance possible. The compensation is not possible for 2-wire connections due to the missing sensor cable.

2.5.3 Communications module manuals

Communications module CM DP, Edition 12/2014

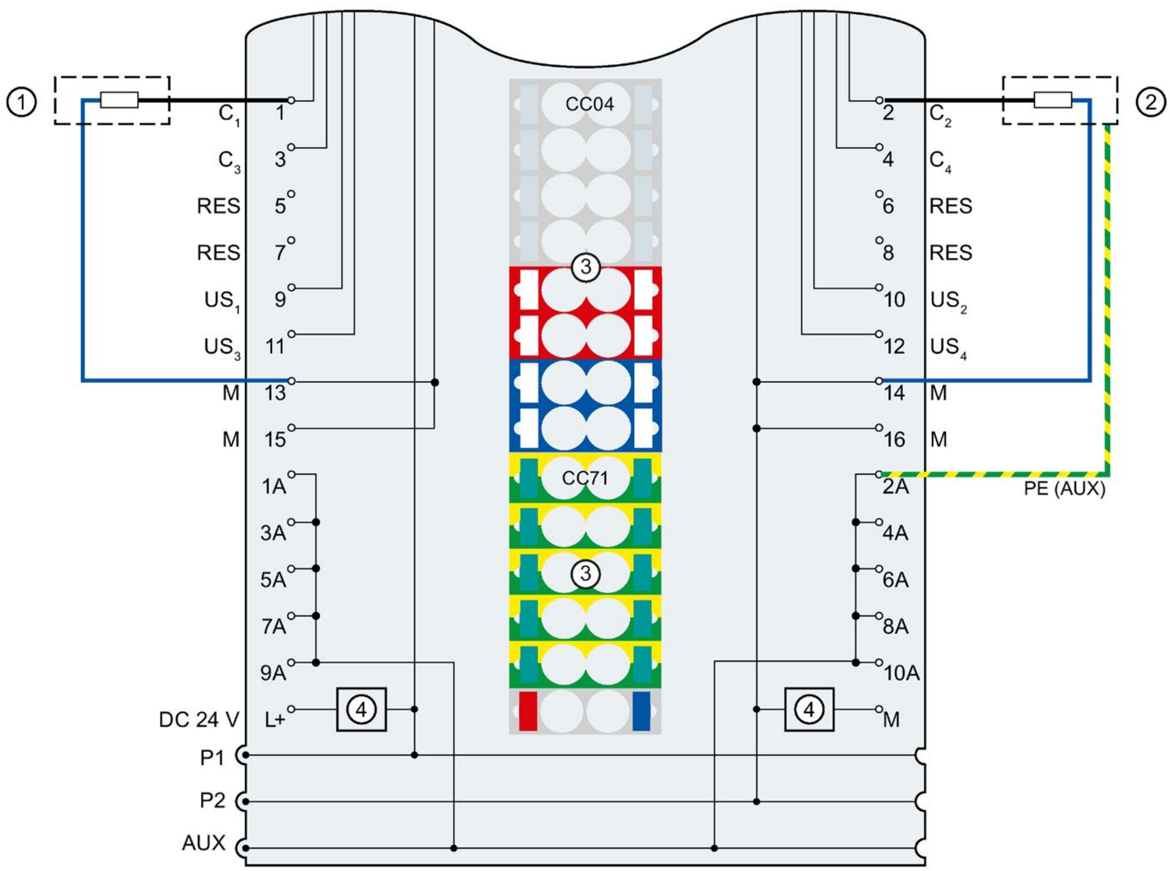
The communications module CM DP supports the PROFIsafe protocol V2.

Exception: Fail-safe modules that only support PROFIsafe V1 mode.

Communications module IO-Link Master CM 4xIO-Link, Edition 10/2017

Section Connecting, Wiring and block diagram

Connection: 2-wire and 3-wire connection in DQ operating mode:



①	2-wire connection	1 A to 10 A	AUX terminals
②	3-wire connection	PE (AUX)	Protective conductor connection
③	Color-coded labels with color code CC04 and CC71 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to the left (dark-colored BaseUnit) Connection to the left interrupted (light-colored BaseUnit)
④	Filter connection supply voltage (only when light-colored BaseUnit is present)	C_n	Communication signal, DI, DQ
24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)	RES	Reserved, must not be assigned
M	Ground	US_n	Supply voltage (positive)

Figure 2-3 Terminal assignment for 2-wire and 3-wire connection in DQ operating mode

2.5.4 Device manuals Technology modules

Technology module TM Pulse 2x24V, Edition 09/2015

Supplement in the section Preface

Please read the information about Open Source Software on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109740777).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Security information

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

1.1 Introduction

Introduction

PROFIenergy is a data interface based on PROFINET for switching off consumers centrally and in a coordinated manner during idle times, regardless of the manufacturer or device type. The goal is that the process is only provided with the energy that is absolutely required. The majority of the energy is saved by the process itself; the PROFINET device itself only contributes a few watts of saving potential. This operating mode is termed "pause" in PROFIenergy.

The PROFINET devices are turned off by special commands in the user program of the PROFINET IO controller. No additional hardware is required; the PROFIenergy commands are directly interpreted by the PROFINET devices.

The device which provides the PROFIenergy interface and supports the required control data record has the so-called PE-Entity, the access point for these control data records. This PE-Entity is located on the interface module as a substitute for I/O modules that do not have their own PE-Entity. I/O modules that have their own PE-Entity are always addressed directly.

Requirements

- Interface module IM 155-6 PN ST
- Interface module IM 155-6 PN HF
- ET 200SP I/O modules which support PROFIenergy
  - Digital input module DI 8x24VDC ST (6ES7131-6BF00-0BA0)
  - Digital input module DI 8x24VDC HF (6ES7131-6BF00-0CA0)
  - Digital input module DI 8xNAMUR HF (6ES7131-6TF00-0CA0)
  - Digital input module DI 8x24VDC HS (6ES7131-6BF00-0DA0)
  - Digital output module DQ 4x24VDC/2A ST (6ES7132-6BD20-0BA0)
  - Digital output module DQ 4x24VDC/2A HF (6ES7132-6BD20-0CA0)
  - Digital output module DQ 4x24VDC/2A HS (6ES7132-6BD20-0DA0)
  - Digital output module DQ 8x24VDC/0,5A ST (6ES7132-6BF00-0BA0)
  - Digital output module DQ 8x24VDC/0,5A HF (6ES7132-6BF00-0CA0)
  - Digital output module DQ 16x24VDC/0,5A ST (6ES7132-6BH00-0BA0)
  - Digital output module DQ 4x24..230VAC/2A ST (6ES7132-6FD00-0BB1)
  - Digital output module RQ 4x24VUC/2A CO ST (6ES7132-6GD50-0BA0)
  - Digital output module RQ 4x120VDC-230VAC/5A NO ST (6ES7132-6HD00-0BB0)
  - Digital output module RQ 4x120VDC-230VAC/5A NO MA ST (6ES7132-6MD00-0BB1)
  - Analog input module AI 2xU ST (6ES7134-6FB00-0BA1)
  - Analog input module AI 2xI 2-/4-wire ST (6ES7134-6GB00-0BA1)
  - Analog input module AI 4xI 2-/4-wire ST (6ES7134-6GD00-0BA1)
  - Analog input module AI 2xU/I 2-/4-wire HF (6ES7134-6HB00-0CA1)
  - Analog input module AI 4xU/I 2-wire ST (6ES7134-6HD00-0BA1)
  - Analog input module AI 2xU/I 2-/4-wire HS (6ES7134-6HB00-0DA0)
  - Analog output module AQ 2xU ST (6ES7135-6FB00-0BA1)
  - Analog output module AQ 2xI ST (6ES7135-6GB00-0BA1)
  - Analog output module AQ 4xU/I ST (6ES7135-6HD00-0BA1)
  - Analog output module AQ 2xU/I HF (6ES7135-6HB00-0CA1)
  - Analog output module AQ 2xU/I HS (6ES7135-6HB00-0DA1)
  - Communication module IO-Link Master CM 4xIO-Link (6ES7137-6BD00-0BA0)
- User program for sending the parameter data record, index 3
- User program with the function blocks for controlling the PROFIenergy commands ("PE_START_END" - FB 815, "PE_CMD" - FB 816).

Procedure

1. Create the parameter data record, Index 3 in STEP 7
2. Transfer the parameter data record to the interface module with the instruction "WRREC" - SFB 53.
3. Create the user program with the FBs for controlling the PROFIenergy commands ("PE_START_END" - FB 815, "PE_CMD" - FB 816).
4. Transfer the user program to the CPU.

Additional information

- System manual ET 200SP Distributed I/O System
- Device manual Interface Module
- Device manuals Digital and Analog I/O Modules
- System manual PROFINET System Description
- You will find additional information on PROFIenergy services, parameters of the service IDs on the Internet under Common Application Profile PROFIenergy; Technical Specification for PROFINET; Version 1.0; January 2010; Order No: 3.802.
- Additional information on PROFIenergy FBs ("PE_START_END" - FB 815, "PE_CMD" - FB 816) is available in the online help for STEP 7 V5.5 as of SP2 "Help on System Functions/System Function Blocks".

1.2 Principle of operation

"Pause" control and "Pause" behavior

At the beginning and end of pauses, you enable or disable the pause function of the system; the IO controller then sends the PROFIenergy command "Start_Pause" or "End_Pause" to the PROFINET devices. The device then interprets the contents of the PROFIenergy command and switches on or off. The interface module is the PE-Entity for I/O modules with PROFIenergy capability of the ET 200SP.

Other PROFIenergy commands allow device information to be accessed during the pauses. You can use these commands to transfer the "Start_Pause" / "End_Pause" command in good time.

Note

A complete PROFIenergy sequence consists of the commands "Start_Pause" and "End_Pause". Always observe this sequence during programming.

LED displays

In general, PROFIenergy does not have an effect on the LED display. Please see the device manuals of the relevant I/O modules for exceptions.

Response to error detection

All channels whose pause mode is set to "PE_MODE_PROCEED" report errors as in productive operation.

The following rules apply to channels which switch to a pause mode other than "PE_MODE_PROCEED":

- All errors that are unrelated to the switch to "Pause" are reported.
- If error recognition is possible during "Pause", these errors continue to be reported.
- All error messages which are caused by the switch to "Pause" are suppressed.
- The following applies if error recognition is not possible during the "Pause":
  - The status of errors already pending before the "Pause" is retained.
  - Incoming and outgoing errors are reported once the "pause" has ended.

Note

Switching to "Pause" and out of "Pause" may cause an error to be reported.

Additional information

Additional information on diagnostics can be found in the I/O module device manuals.

Hardware interrupt

No hardware interrupts are triggered within the "pause". The hardware interrupts are re-evaluated when the "pause" ends.

"Pause" behavior under certain operating conditions

A "Pause" is ended in the following cases:

Table 1- 1 Ending a "pause"

Ending a "pause"	Explanation
The supply voltage 1L+ of the interface module has failed	The "pause" is exited and can be re-activated by re-sending the PROFIenergy parameter assignment followed by the "Start_Pause" command.
• Controller stop[1] • Controller failure (connection interrupted)[1] • Firmware update • Reset to factory settings • Deactivation of the IO device[1]	
The I/O module is pulled and plugged	
Station stop[1] • Removal of more than one I/O module (depending on the interface module used) • Dismounting of the server module	The "pause" is exited , the PROFIenergy parameter assignment is still on the I/O module and the "pause" can be re-activated by the "Start_Pause" command.
Failure of the supply voltage L+ of the I/O module.	
Modification of the parameter settings of the I/O module during operation using data record 128	

[1] The substitute value behavior is activated.

1.3 Parameter assignment

Parameter assignment

- Parameter assignment of PROFIenergy takes place by means of the user program and parameter data record (version2), index 3. The interface module distributes the PROFIenergy parameters to the I/O modules.
- The parameter assignment of an additional pause behavior is possible immediately after the start of the previous "Pause". The required state for the following pause is activated with a new "Start_Pause" command.
- The parameter assignment can be written as often as necessary.
- The interface module checks the distribution of the parameters to the I/O modules and returns the result of the write job by means of return value. In the case of a negative return value, there are one or more I/O modules that have not accepted the parameter data record. In this case, the I/O modules respond according to their last valid PROFIenergy parameter assignment with an incoming "Start_Pause" command.
- Parameter assignment by means of the parameter data record has to be repeated in case of an I/O module failure or station failure.
- ET 200SP supports the setting for the behavior of **one** "Pause". If a different response is required for an additional "Pause", you will have to assign parameters again.

Note

Effect: The response (shutdown) of the I/O modules to PROFIenergy is related to the slot, which means that all channels of the slot show the same behavior.

Parameter data record

You specify which I/O modules (slots) are controlled with PROFIenergy commands in the parameter data record for PROFIenergy.

The content of the parameter data record for PROFIenergy, index 3 is described below; you can create it yourself and transmit it to the interface module.

Table 1- 2 Parameter data record for PROFIenergy (version 2), index 3

<table>
<tr><th>Byte</th><th colspan="2">Element</th><th>Coding</th><th>Explanation</th></tr>
<tr><td>0</td><td colspan="2">Version</td><td>02_D</td><td>Cannot be modified</td></tr>
<tr><td>1</td><td colspan="2">Number of blocks</td><td>01_D to n</td><td>Slots 1 to n depending
• on the number of slots supported by the interface module and
• the current configuration of the ET 200SP.</td></tr>
<tr><td rowspan="2">2</td><td rowspan="3">Block 1</td><td rowspan="2">Slot number</td><td>00_D</td><td>Unassigned</td></tr>
<tr><td>01_D to n</td><td>I/O module slot with PROFIenergy</td></tr>
<tr><td>3</td><td>Mode</td><td colspan="2">0_D: PE_MODE_PROCEED, proceed at "Pause"
1_D: PE_MODE_SHUTDOWN, shut down at "Pause" [1]
3_D: PE_MODE_LAST_VALUE, last output or measured value is retained
4_D: PE_MODE_SUBST_VALUE, substitute value "0" [2]</td></tr>
<tr><td>:</td><td>:</td><td>:</td><td colspan="2">:</td></tr>
<tr><td>128</td><td rowspan="2">Block 64</td><td>Slot number</td><td colspan="2" rowspan="2">See Block 1</td></tr>
<tr><td>129</td><td>Mode</td></tr>
</table>

[1] The specific behavior depends on the used I/O module (with a digital input module, for example, the sensor supply is turned off or the outputs of an analog output module are de-energized)

[2] An analog output module (e. g. with the output range 0 mA to 20 mA, ± 20 mA) or a digital output module issues the value "0".

Error messages

The feedback data record returns the following error messages, if needed:

Table 1- 3 Error messages

Error code	Meaning	
$80B1_H$	Impermissible length	Check the length of the data record
$80E0_H$	Error in header information	Check the data record header information
$80E1_H$	Parameter error • At least one I/O module does not support PROFIenergy • A parameter value has been incorrectly encoded	Check the content of the data record and correct the parameter assignment error before starting the "Pause". Parameter assignment errors which are not corrected can result in incorrect I/O module shutdown behavior.

1.4 PROFIenergy control data records

PROFIenergy control data records

The control data record for PROFIenergy, Index $80A0_H$, supports the following services of the Common Application Profile PROFIenergy V1.0 for the IM 155-6 PN ST, IM 155-6 PN HF:

Table 1- 4 Control data records for PROFIenergy

Service	Service ID	Meaning
Start pause [1]	01_H	Assuming the configured Pause behavior, suppressing all associated diagnostics data
End Pause	02_H	Leaving the pause
Query Modes	03_H	Reads the supported modes • Request List Energy Saving Modes • Request Get Mode (Energy Saving Mode Data)
PEM status	04_H	Reads the PROFIenergy status Status messages: • 00_H: PROFIenergy is ready for operation • 01_H: "Pause" is active • FF_H: "Pause" is not active
PE_Identify	05_H	Reads the supported PROFIenergy services

[1] The minimum (configurable) pause time for the ET 200SP is 10 s.

1.5 I/O modules

1.5.1 Digital input module

Requirements

- Digital input module DI 8x24VDC ST (6ES7131-6BF00-0BA0)
- Digital input module DI 8x24VDC HF (6ES7131-6BF00-0CA0)
- Digital input module DI 8xNAMUR HF (6ES7131-6TF00-0CA0)
- Digital input module DI 8x24VDC HS (6ES7131-6BF00-0DA0)

Display

DI 8x24VDC ST/ DI 8x24VDC HF/ DI 8x24VDC HS

- The channel LEDs are directly affected by the signal level at the terminal.
- Switching off the sensor supply also switches off the channel LED if an external sensor supply is connected.

DI 8xNAMUR

- The channel LEDs correspond to the signal state supplied by the I/O module.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is applied.

All channels which are set to "PE_MODE_PROCEED" in pause mode report errors as in productive operation.

The following applies for all channels which switch to a different pause mode:

- Sensor supply switch-off upon the start of "pause" does not result in the messages "Line break" or "Short circuit".
- "Line break" and "Short circuit" error recognition is not possible during the "pause":
  - Messages for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+
- Change in parameter assignment of I/O module with DS128
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 5 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Shut down at "Pause" [1] • Sensor supply switched off [2] • Pause substitute value: 0_B
	3_D: PE_MODE_LAST_VALUE	Last value at "pause" • Sensor supply switched off [2] • Pause substitute value: Last input value
	4_D: PE_MODE_SUBST_VALUE	Substitute value at "pause" • Sensor supply switched off [2] • Pause substitute value: Configured pause substitute value

[1] DI 8xNAMUR HF: A channel is set to "inverted". During the "pause", the PE substitute value is read in 1:1 (as in the parameter settings and not inverted again).

[2] DI 8x24VDC ST: As there is only one sensor supply for all channels, the supply can only be switched off at a "pause" if all channel parameters have been set to switch off.

1.5.2 Digital output modules

Requirements

- Digital output module DQ 4x24VDC/2A ST (6ES7132-6BD20-0BA0)
- Digital output module DQ 4x24VDC/2A HF (6ES7132-6BD20-0CA0)
- Digital output module DQ 4x24VDC/2A HS (6ES7132-6BD20-0DA0)
- Digital output module DQ 8x24VDC/0,5A ST (6ES7132-6BF00-0BA0)
- Digital output module DQ 8x24VDC/0,5A HF (6ES7132-6BF00-0CA0)
- Digital output module DQ 16x24VDC/0,5A ST (6ES7132-6BH00-0BA0)
- Digital output module DQ 4x24..230VAC/2A ST (6ES7132-6FD00-0BB1)
- Digital output module RQ 4x24VUC/2A CO ST (6ES7132-6GD50-0BA0)
- Digital output module RQ 4x120VDC-230VAC/5A NO ST (6ES7132-6HD00-0BB0)
- Digital output module RQ 4x120VDC-230VAC/5A NO MA ST (6ES7132-6MD00-0BB1)

Display

The channel LEDs are directly affected by the output value at the terminal.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is applied.

Line break and short circuit error recognition continues to be possible during the "pause". All channels therefore report errors as in productive operation, regardless of their pause mode.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+ (exception: The DQ 4x24..230VAC/2A ST remains in "Pause")
- Change in parameter assignment of I/O module with DS128
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 6 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Switch off at "pause" • Pause substitute value: 0_B
	3_D: PE_MODE_LAST_VALUE	Last value at "pause" • Pause substitute value: Last output value is maintained[1]
	4_D: PE_MODE_SUBST_VALUE	Substitute value at "pause" • Pause substitute value: Configured pause substitute value is output

[1] DQ 4x24VDC/2A HS: In the "Pulse width modulation" mode, the last value is output as frequency.

1.5.3 Analog input modules

Requirements

- Analog input module AI 2xU ST (6ES7134-6FB00-0BA1)
- Analog input module AI 2xI 2-/4-wire ST (6ES7134-6GB00-0BA1)
- Analog input module AI 4xI 2-/4-wire ST (6ES7134-6GD00-0BA1)
- Analog input module AI 2xU/I 2-/4-wire HF (6ES7134-6HB00-0CA1)
- Analog input module AI 4xU/I 2-wire ST (6ES7134-6HD00-0BA1)
- Analog input module AI 2xU/I 2-/4-wire HS (6ES7134-6HB00-0DA0)

Display

The channel LEDs are not affected by PROFIenergy.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is applied.

All channels which are set to "PE_MODE_PROCEED" in pause mode report errors as in productive operation.

The following applies for all channels which switch to a different pause mode:

- Sensor supply switch-off upon the start of "pause" does not result in the message "Line break".
- "Line break", "Short circuit", "High limit exceeded" and "Low limit exceeded" error recognition is not possible during the "pause":
  - Messages for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+
- Change in parameter assignment of I/O module with DS128
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 7 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Switch off at "pause" • Sensor supply switched off [1] • Pause substitute value: $7FFF_H$
	3_D: PE_MODE_LAST_VALUE	Last value at "pause" • Sensor supply switched off [1] • Pause substitute value: Last input value
	4_D: PE_MODE_SUBST_VALUE	Substitute value at "pause" • Sensor supply switched off [1] • Pause substitute value: Configured pause substitute value

[1] AI 2xI 2-/4-wire ST, AI 4xI 2-/4-wire ST, AI 4xU/I 2-wire ST, AI 2xU/I 2-/4-wire HS: As there is only one sensor supply for all channels, the supply can only be switched off at a "pause" if all channels have been configured to switch off.

1.5.4 Analog output module

Requirements

- Analog output module AQ 2xU ST (6ES7135-6FB00-0BA1)
- Analog output module AQ 2xI ST (6ES7135-6GB00-0BA1)
- Analog output module AQ 4xU/I ST (6ES7135-6HD00-0BA1)
- Analog output module AQ 2xU/I HF (6ES7135-6HB00-0CA1)
- Analog output module AQ 2xU/I HS (6ES7135-6HB00-0DA1)

Display

The channel LEDs are not affected by PROFIenergy.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is applied.

All channels which are set to "PE_MODE_PROCEED" in pause mode report errors as in productive operation.

The following applies to all channels which switch to the pause mode "PE_MODE_SHUTDOWN":

- "Line break" and "Short circuit" error recognition is not possible during the pause.
  - Messages for errors already pending before the "pause" are retained.
  - Incoming and outgoing errors are reported once the "pause" has ended.

The following applies for all channels which switch to a different pause mode:

- "Line break" and "Short circuit" error recognition continues to be possible during the pause. These errors are reported.
- The selection of an incorrect pause substitute value which does not correspond to the output range may result in the message "High limit exceeded" or "Low limit exceeded". The pause substitute output value effective at the terminal is limited to the high or low control limit for the output range.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+
- Change in parameter assignment of I/O module with DS128
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 8 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Switch off at "pause" • Outputs free from current and voltage
	3_D: PE_MODE_LAST_VALUE	Last value at "pause" • Pause substitute value: Last output value is maintained
	4_D: PE_MODE_SUBST_VALUE	Substitute value at "pause" • Pause substitute value: Configured pause substitute value is output

1.5.5 IO-Link Master

Requirements

Communication module IO-Link Master CM 4xIO-Link (6ES7137-6BD00-0BA0)

Note

The minimum pause time (10 s) must be observed. If it is undershot, problems may occur with the restart of IO-Link communication.

1.5.5.1 DI operating mode

Display

Switching off the supply voltage USn (port) also switches off the associated channel status LED Qn if an external supply voltage is connected.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is adopted.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+
- Re-assignment of the I/O module parameters
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 9 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Switch off at "pause" • Supply voltage USn (port) switched off • Pause substitute value: 0_B
	3_D: PE_MODE_LAST_VALUE	Last value at "pause" • Supply voltage USn (port) switched off • Pause substitute value: Last input value
	4_D: PE_MODE_SUBST_VALUE	Substitute value at "pause" • Supply voltage USn (port) switched off • Pause substitute value: Configured pause substitute value

1.5.5.2 DQ operating mode

Display

The channel status LEDs Qn show the output value.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is adopted.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+
- Re-assignment of the I/O module parameters
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 10 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Switch off at "pause" • Pause substitute value: 0_B
	3_D: PE_MODE_LAST_VALUE	Last value at "pause" • Pause substitute value: Last output value is maintained
	4_D: PE_MODE_SUBST_VALUE	Substitute value at "pause" • Pause substitute value: Configured pause substitute value is output

1.5.5.3 IO-Link operating mode

Display

When supply voltage USn (port) is switched off, the associated port status LED Cn and port error LED Fn are also switched off.

Response to error detection

The error "Missing supply voltage L+" is detected, reported and ends the "pause" regardless of whether the pause status is adopted.

All channels which are set to "PE_MODE_PROCEED" and "PE_MODE_LAST_VALUE" in pause mode report errors as in productive operation.

The following conditions apply to all channels (ports) which switch to a different pause mode ("PE_MODE_SHUTDOWN" and "PE_MODE_SUBST_VALUE"):

- Switching off the supply voltage USn (port) at the start of "pause" does not result in the messages "Line break" or "Short circuit".
- Error detection is not possible during the "pause" (no IO-Link device communication):
  - Messages for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

Ending a "pause"

The pause is ended in the following cases:

- Failure of the supply voltage L+
- Re-assignment of the I/O module parameters
- "End_Pause" command
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module

Mode parameter

Only the "Mode" parameter is shown below. The complete configuration can be found in the "Parameter assignment" chapter.

Table 1- 11 Mode parameter

Element	Coding	Explanation
Mode	0_D: PE_MODE_PROCEED	Proceed at "pause"
	1_D: PE_MODE_SHUTDOWN	Switch off at "pause" • Supply voltage USn (port) switched off[1] • Pause substitute value (input): 0_B
	3_D: PE_MODE_LAST_VALUE[2]	• Supply voltage USn (port) switched off • Last input and output value is maintained
	4_D: PE_MODE_SUBST_VALUE	see: 1_D: PE_MODE_SHUTDOWN

1 Supply voltage USn of the assigned port is switched off. Result: The IO-Link device fails.

2 With time-based IO, the IO-Link master behaves according to 1_D: PE_MODE_SHUTDOWN

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Scope

This product information supplements the ET 200SP system manual documentation.

Security information

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security in the Internet (http://www.siemens.com/industrialsecurity).

Table of contents

Application planning

1

Mixed configuration ET 200SP and ET 200AL with ET-Connection

You have the option of integrating the I/O modules of the ET 200AL distributed I/O system (IP65/IP67) in a configuration of the ET 200SP distributed I/O system (IP20).

The figure below shows a combination of the modules of the ET 200AL and ET 200SP distributed I/O system.

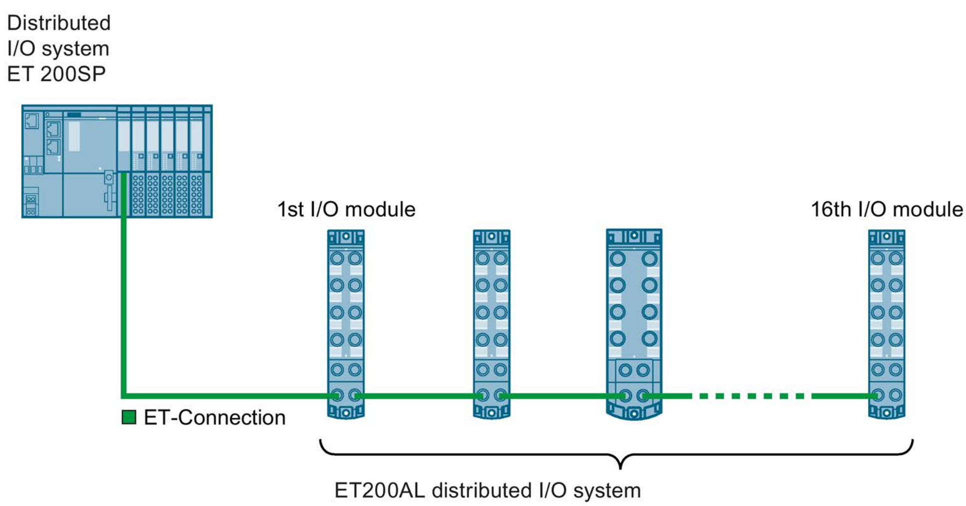

Image 1-1 Mixed configuration ET 200SP and ET 200AL with ET-Connection

Requirement

The following components support mixed configuration:

- Interface module
  - IM 155-6 PN HF (V3.0 or higher)
  - IM 155-6 PN ST (V3.1 or higher)
  - IM 155-6 DP HF (V3.0 or higher)
- CPU
  - CPU 1510SP-1 PN (V2.0 or higher)
  - CPU 1510SP F-1 PN (V2.0 or higher)
  - CPU 1512SP-1 PN (V2.0 or higher)
  - CPU 1512SP F-1 PN (V2.0 or higher)
- BaseUnit BU-Send with BusAdapter BA-Send 1xFC
- ET-Connection cable
- Power cable

Rules

You must observe the following rules when assembling a mixed configuration:

- The bus length of the ET 200SP distributed I/O system must not exceed 1 m (without interface module, including BU-Send/BA-Send 1xFC and server module)
- A maximum of 16 ET 200AL I/O modules can be connected to ET-Connection.
- The maximum length of the bus cable for ET-Connection between BA-Send and the first module or between two modules is 15 m.

The following table shows which firmware versions of your IM or CPU support which maximum bus cable length.

IM/CPU	2 m	5 m	10 m	15 m
IM 155-6 PN HF	V3.0 or higher	V3.0 or higher	V3.0 or higher	V3.3 or higher
IM 155-6 PN ST	V3.1 or higher	V3.1 or higher	V3.1 or higher	V3.3 or higher
IM 155-6 DP HF	V3.0 or higher	V3.0 or higher	V3.0 or higher	--
CPU 1510SP-1 PN	V2.0 or higher	V2.0 or higher	V2.0 or higher	V2.0 or higher
CPU 1510SP F-1 PN	V2.0 or higher	V2.0 or higher	V2.0 or higher	V2.0 or higher
CPU 1512SP-1 PN	V2.0 or higher	V2.0 or higher	V2.0 or higher	V2.0 or higher
CPU 1512SP F-1 PN	V2.0 or higher	V2.0 or higher	V2.0 or higher	V2.0 or higher

Procedure

To assemble a multi-tier configuration, follow these steps:

1. Install the BaseUnit BU-Send to the immediate right of the ET 200SP CPU/interface module.
   When the BaseUnit BU-Send is used next to the ET 200SP CPU, a CM DP and an Ethernet CP or a maximum of 2 Ethernet CPs can be inserted between the CPU and BU-Send.
2. Then mount the additional BaseUnits / I/O modules for the ET 200SP distributed I/O system and the server module.
3. Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1xFC and mount this on the BaseUnit BU-Send.
4. Screw the BusAdapter BA-Send 1×FC to the BaseUnit BU-Send (1 screw with 0.2 Nm tightening torque). To do this, use a screwdriver with a 3 to 3.5 mm blade.
5. Connect the other end of the bus cable for ET-Connection (with M8 connector) to the first ET 200AL I/O module (X30 socket ET-Connection IN).
6. Connect the supply voltage (24 V DC) to the ET 200AL I/O modules (X80 connector).

Note

Firmware update of an ET 200AL I/O module

When you run a firmware update of an ET 200AL I/O module, ET-Connection is briefly interrupted by the restart of the module. All downstream ET 200AL I/O modules report a pull/plug interrupt.

---

2 Mounting

Introduction

For the connection of the ET 200AL I/O module via ET-Connection to the ET 200SP, you require the BaseUnit BU-Send with the BusAdapter BA-Send 1xFC.

Requirement

- The mounting rail is mounted.
- The interface module is mounted.

Required tools

3 to 3.5 mm screwdriver (only for dismantling the BusAdapter)

Mounting BaseUnit BU-Send

To mount the BaseUnit BU-Send, follow these steps:

1. Mount the BU-Send to the right of the CPU/interface module.
2. Swivel the BU-Send back until you hear the mounting rail release click into place.
3. Move the BU-Send to the left until you hear it click into place on the CPU/interface module.

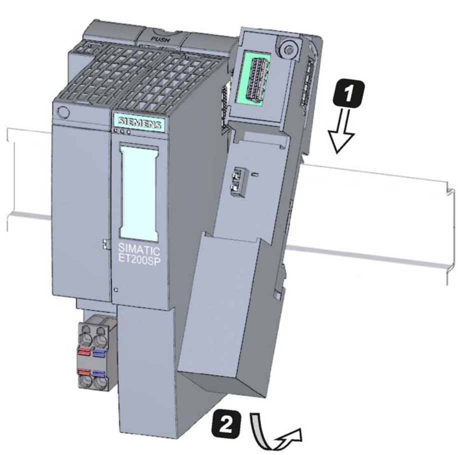

Image 2-1 Mounting BU-Send

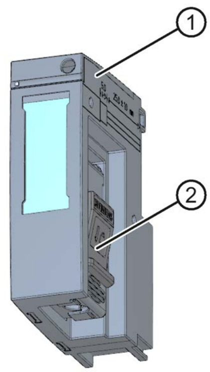
4. Mount the BusAdapter BA-Send 1xFC only after you have connected the bus cable for ET-Connection (see section Connecting (Page 9)).

Connection 3

Introduction

You connect the ET 200AL I/O modules via the BusAdapter BA-Send 1×FC using ET-Connection.



① BusAdapter BA-Send 1×FC
② Connection element for ET-Connection bus cable

Image 3-1 BusAdapter BA-Send 1xFC

Required tools

Screwdriver with 3 to 3.5 mm blade

Required accessories

Use the bus cable for ET-Connection as connecting cable between the BusAdapter BA-Send 1xFC and the ET 200AL I/O modules.

We recommend using the stripping tool for ET-Connection (6ES7194-2KA00-0AA0) with blade cassette green (6GK1901-1B...). This guarantees fast and safe stripping.

The bus cable for ET-Connection M8, prefabricated on one side with 1 x M8 connector, 4-pole, shielded, is available in the following lengths:

- Length 2 m: 6ES7194-2LH20-0AC0
- Length 5 m: 6ES7194-2LH50-0AC0
- Length 10 m: 6ES7194-2LN10-0AC0
- Length 15 m: 6ES7194-2LN15-0AB0

Procedure

To connect the BusAdapter BA-Send 1xFC, follow these steps:

1. Strip the sheath of the bus cable at the open end as follows:

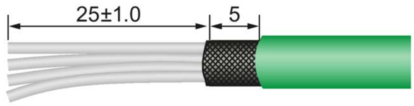


Image 3-2 Connecting cable

Use the stripping tool for ET-Connection to do this. The relevant settings are shown on the tool.

2. Pull back the locking slide of the BusAdapter BA-Send 1×FC and open the cover of the connection element.
3. Lift the cable routing up as far as it will go.
4. Insert the unstripped single cores of the bus cable (according to the imprinted color coding) into the cable routing as far as they will go and press the cable routing down as far as it will go.
5. Close the cover of the connection element and push the locking slide forward.

6. Connect and screw the BusAdapter BA-Send 1×FC to the BaseUnit BU-Send (1 screw with 0.2 Nm tightening torque.) To do this, use a screwdriver with a 3 to 3.5 mm blade.
7. Connect the M8 connector of the bus cable to the first ET 200AL I/O module (socket X30 ET-Connection IN). For more information about wiring the ET 200AL I/O module refer to the system manual of the ET 200AL distributed I/O system.

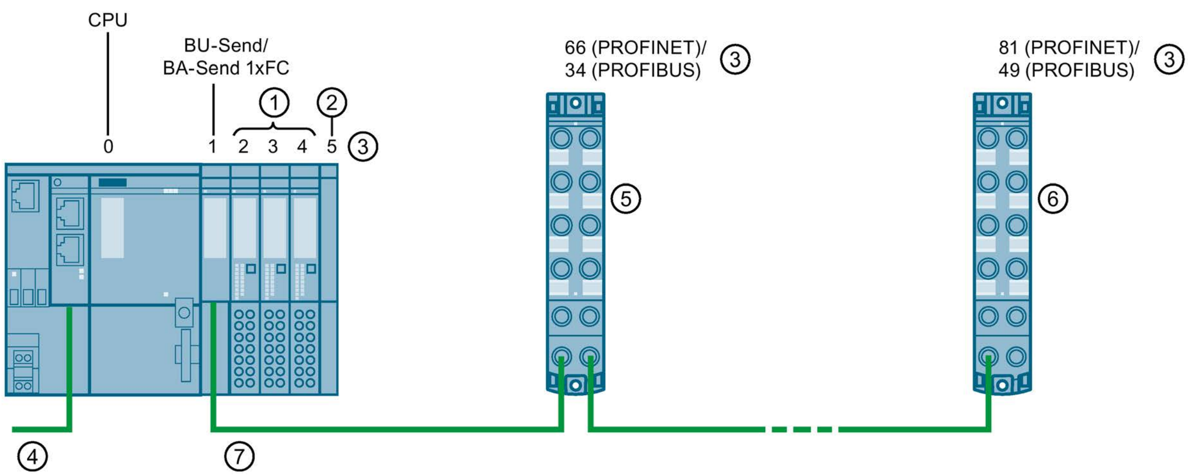
Configuring

4

Introduction

The mixed configuration allows the connection of up to 16 ET 200AL I/O modules to the ET 200SP via ET-Connection. The figure below shows the configuration of the ET-Connection and the assignment of the slots.



①	ET 200SP I/O modules	⑤	1st ET 200AL I/O module
②	ET 200SP server module	⑥	16th ET 200AL I/O module
③	Slots	⑦	ET-Connection
④	PROFINET IO		

Image 4-1 Mixed configuration

For more information about connecting the ET-Connection, supply voltages, actuators and sensors, refer to the ET 200AL system manual.

Configuration with a CPU

In a configuration with a CPU, a maximum of 2 slots can be used immediately to the right of the CPU with CM DP module or Ethernet CP. Combinations are also possible, i.e. CM DP module and one Ethernet CP or two Ethernet CPs.

BU-Send and BA-Send should always be inserted to the immediate right of the CM/CP.

Rules

Observe the following rules when configuring:

- With mixed configurations, the following maximum configuration is possible:
  - 31 (IM 155-6 DP HF and IM 155-6 PN ST)/63 (IM 155-6 PN HF and CPUs) slots for ET 200SP modules
  - 16 slots for ET 200AL I/O modules
  - 1 slot for BU-Send/BA-Send 1xFC
  - 1 slot for server module.
- The mixed configuration may contain a maximum of 31 (IM 155-6 DP HF and IM 155-6 PN ST)/63 (IM 155-6 PN HF) ET 200SP I/O modules.
- The server module can also be mounted right next to the BU-Send/BA-Send 1xFC.
- Supported functions:

Function	Mixed configuration		
	ET 200SP		ET 200AL I/O modules on ET-Connection
	IM	CPU	
Isochronous mode	⑥	--	--
Configuration control	⑥	⑥	⑥
Shared device	⑥	⑥	⑥
PROFIenergy	⑥	--	⑥
System redundancy S2	--	--	--

Configuring

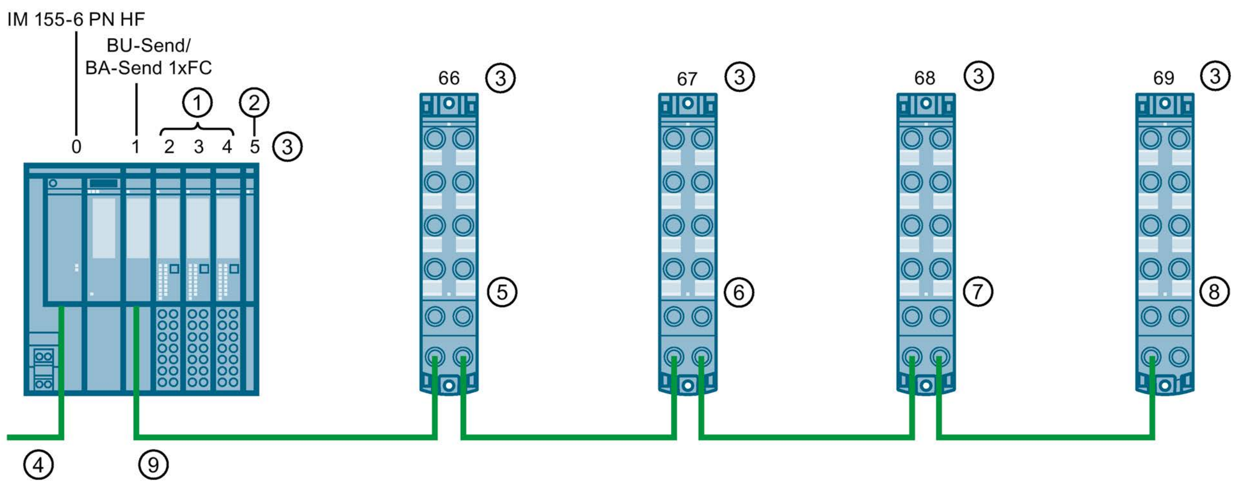
Observe the following points when configuring:

- BU-Send/BA-Send 1xFC and server module must be configured. With BU-Send/BA-Send 1xFC, no parameters are available.
- Arrangement of the modules in the configuration:
  - Configure the BU-Send/BA-Send 1xFC downstream from the interface module in slot 1. Position the ET 200SP modules behind it.
  - Configure the ET 200AL I/O modules from slot 66 (PROFINET)/67 (CPU)/34 (PROFIBUS).
- The layout of the modules represents a preset configuration and is independent of the configuration control.
- The system redundancy S2 function is not available in a mixed configuration.

Configuration example

An example of a mixed configuration is shown below:

Hardware configuration



①	ET 200SP I/O modules	⑥	2nd ET 200AL I/O module
②	ET 200SP server module	⑦	3rd ET 200AL I/O module
③	Slots	⑧	4th ET 200AL I/O module
④	PROFINET IO	⑨	ET-Connection
⑤	1st ET 200AL I/O module		

Image 4-2 Mixed configuration

Configuring configuration example

Table 4- 1 Overview

Mixed configuration	Module	Slot
ET 200SP	IM 155-6 PN HF	0
	BA-Send 1xFC	1
	DI 16×24VDC ST	2
	DI 16×24VDC ST	3
	DI 16×24VDC ST	4
	Server module	5
ET 200AL	DI 8x24VDC 8xM8	66
	DIQ 4+DQ 4x24VDC/0.5A 8xM8	67
	AI 4xU/I/RTD 4xM12	68
	CM 4xIO-Link 4xM12	69

Note

Configuration using PROFIBUS GSD file

When you use the PROFIBUS GSD file for the configuration, you must configure the gaps between the server module and the first ET 200AL I/O module with BU-Cover.

④ Article number
⑤ Functional version

Image 6-1 View of the BusAdapter BA-Send 1xFC

Properties

The module has the following technical properties:

- BusAdapter for the direct connection of ET-Connection
- Connects the interface module via ET-Connection with the ET 200AL I/O modules
- Supports all ET 200AL I/O modules

The module supports the following functions:

- Identification data I&M 0 to 3. See system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293).

Maximum configuration

- 16 ET 200AL I/O modules
- 15 m bus cable between BusAdapter BA Send and the first ET 200AL I/O module and between two ET 200AL I/O modules.
- Supported functions:

Function	**Mixed configuration**		
	ET 200SP		**ET 200AL I/O modules on ET-Connection**
	IM	**CPU**	
Isochronous mode	6	--	--
Configuration control	6	6	6
Shared device	6	6	6
PROFIenergy	6	--	6
System redundancy S2	--	--	--

Accessories

The following components must be ordered separately:

- Labeling strips
- Reference identification label
- Stripping tool for ET-Connection
- Bus cables for ET-Connection

See also

You can find more information on accessories and additional components in the Accessories/spare parts section of the ET 200AL distributed I/O system (http://support.automation.siemens.com/WW/view/en/89254965) system manual.

6.2 Pin assignment

ET-Connection with BusAdapter BA-Send 1xFC

The following table shows the signal names and the designations for the pin assignment of the BusAdapter BA-Send 1xFC.

Table of contents

1 Security information

To ensure the secure operation of products and solutions from Siemens, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

Introduction

2

The characteristics of analog-digital/digital-analog converters in analog modules are usually offset and not uniform in their slope. This means you must calibrate the characteristics to the conditions of the analog module. A general distinction is made between factory calibration and user calibration.

Factory calibration

To ensure the accuracy of an analog module, it is calibrated during production in the factory. You cannot delete or change the factory calibration. You can only read the factory calibration values.

User calibration

You can start, delete and read back a user calibration for an analog module with error-free parameter assignment at any time. User calibration is used to increase the accuracy for specific use cases with deviations that can be compensated, for example, by sensors or wiring.

Zero-Scale/Offset calibration

Zero-Scale or Offset calibration is the calibration of the zero point. Usually "0" for bipolar ranges and the low limit of the nominal range for unipolar ranges. The characteristic of the converter is offset corrected and thus shifted into the zero point.

Full-Scale/Gain/Gain calibration

Full-Scale or Gain calibration is the calibration of the end point. It is usually the high limit of the nominal range. The slope of the converter characteristic is adjusted so that it also intersects the end point.

Converter characteristic

The figure below shows the shift of the converter characteristic into the zero point on the left. The right part of the figure shows the change in the converter characteristic slope so that the converter characteristic intersects the end point.

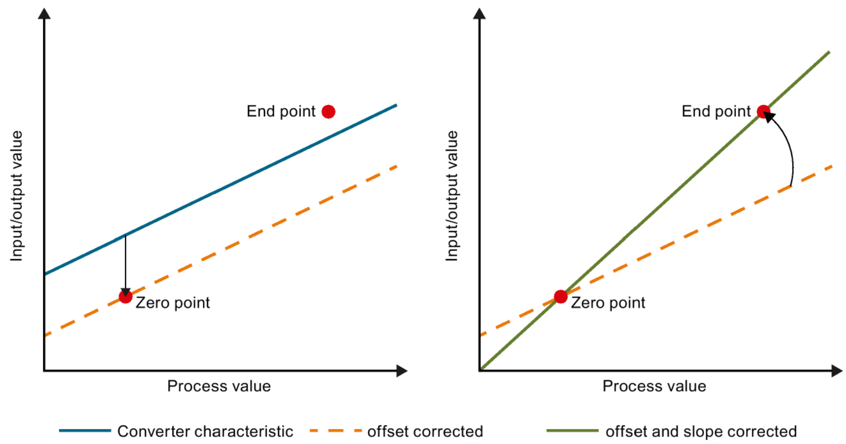

Figure 2-1 Correction of the converter characteristic

3 Requirement

The accuracy/quality of a user calibration depends on the following points:

- Stable temperature condition (e.g., 25 °C)
- The settling time of the used calibrator/measuring instrument and the analog module (e.g., for input or output modules with integrated measuring process → sigma-delta converter)
- Cables (if possible, short, shielded and grounded at one side)
- Accuracy of the used calibrator and/or measuring instrument

---

Note

Measuring accuracy

The measuring accuracy may deteriorate if the user calibration is not performed properly.

It is not immediately clear if a channel works with factory calibration values or user calibration values.

Mode of operation 4

You must perform the user calibration for each channel. To do so, always calibrate the selected channel in the set input/output range. You can start the user calibration at any time for a channel with error-free parameter assignment. After successful user calibration the newly calibrated channel works in the current input/output range with the newly determined calibration values.

4.1 Procedure

The user calibration is controlled by the data sets (DS). You must write a job data set for the analog module and receive instructions for further actions in the acknowledgment data set. This procedure is described in more detail in the section Performing user calibration (Page 21).

The figure below shows the steps required for the user calibration of an instruction to the analog module.

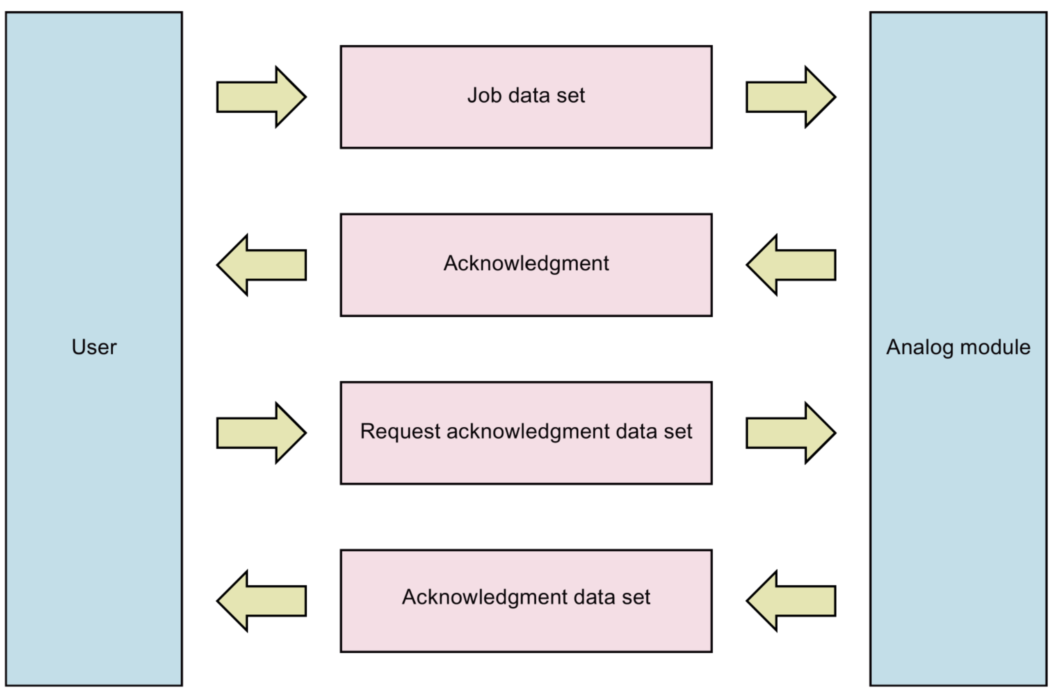

Figure 4-1 Steps in the user calibration for an instruction

The analog module saves the user calibration values. The values always apply only to the input/output range for which they were created. If the input/output range is re-parameterized, the factory calibration values are used once again. But the user calibration values still exist (see section Re-parameterization of the input/output range (Page 26)).

Each user calibration receives a time stamp (for each channel) which includes the date and time of the last user calibration of the channel. You must transfer the date and time to the analog module during calibration, because these values are not generated by the analog module.

The analog module controls the number of required calibration steps for a user calibration.

The actions which you must start or confirm during user calibration are also initiated by the analog module.

The set input/output range of a channel can only be calibrated completely during a user calibration (zero-scale and full-scale). Partial calibration is not possible (e.g., zero-scale only).

4.2 Data set structure

You can start a calibration process with the Write data set (job data set) and Read data set (acknowledgment data set) mechanisms, DS 237 for each.

The structure of the job data set and the acknowledgment data set is identical. This means the acknowledgment data set read last serves as the template for the next job data set.

Job data set and acknowledgment data set also apply to mixed modules with input and output channels. Mixed modules have an input channel and an output channel with channel number 0. To determine if you are calibrating an output channel or an input channel, the channel number for output channels generally has the offset value 40_H added to it.

4.2.1 Job data set

The following table shows the structure of the job data set.

Table 4- 1 Structure of the job data set (18 bytes long)

Byte address	Element	Value range	Format
0	Command/job ID	1: Factory calibration 2: User calibration 3: Abort, normal channel processing 4: Read calibration values 5: Restore factory calibration 6: Reset	Byte
1	Identifier	0 1	Byte
2	Channel number	00_H … $3F_H$ 40_H … $7F_H$ FF_H	Byte
3	Calibration step	FF_H FE_H … 00_H	Byte
4	Not relevant	-	Byte
5	Not relevant	-	Byte
6	Not relevant	-	Byte
7	Input/output size	0: Not relevant 1: mV 2: µA 3: - 4: Time/date 5: Ohm 6: Degrees 7: - 8: - 9: U~ (0.01 V) effective value AC 10: I~ (0.0001 A) effective value AC 11: Phi (0.01 degrees) (phase angle)	Byte
8	Substitute value behavior of inputs	0: retain last value 1: Overflow ($7FFF_H$) 2: Substitute value 3: continue to supply values*	Byte
9	Reserved	-	Byte
10 … 17	Extended Record	See section below Extended Record	

* Only for analog modules AI 4xRTD/TC 2-/3-/4-wire HF and AI 8xRTD/TC 2-wire HF

The tables below show the value ranges of the elements and description of the job data set.

Command/job ID

Table 4- 2 Command/job ID

Value range	Description
1: Factory calibration	Not relevant
2: User calibration	See section User calibration (mode = 2) (Page 28)
3: Abort, normal channel processing	See section Abort (mode = 3) (Page 46)
4: Read calibration values	See section Read calibration values (mode = 4) (Page 48)
5: Restore factory calibration	See section Restore factory calibration (mode = 5) (Page 51)
6: Reset	See section Reset (mode = 6) (Page 53)

Identifier

Table 4- 3 Identifier

Value range	Description
0	Not relevant
1	Execute

Channel number

Table 4- 4 Channel number

Value range	Description
00_H … $3F_H$	Input channels
40_H … $7F_H$	Output channels
FF_H	All channels, only permitted for command = 6 (Reset)

Calibration step

Table 4- 5 Calibration step

Value range	Description
FF_H	Start
FE_H … 00_H	Apply from last acknowledgment data set

Input/output size

Table 4- 6 Input/output size

Value range	Description
0: Not relevant	Specifies how to interpret the values as of byte 10.
1: mV	
2: µA	
3: -	
4: Time/date	
5: Ohm	
6: Degrees	
7: -	
8: -	
9: U~ (0.01 V) effective value AC	
10: I~ (0.0001 A) effective value AC	
11: Phi (0.01 degrees) (phase angle)	

Substitute value behavior of inputs

Table 4- 7 Substitute value behavior of inputs

Value range	Description
0: retain last value	Only relevant for analog input modules. Evaluated at start only.
1: Overflow ($7FFF_H$)	
2: Substitute value	
3: continue to supply values*	

* Only for analog modules AI 4xRTD/TC 2-/3-/4-wire HF and AI 8xRTD/TC 2-wire HF

Extended Record

Table 4- 8 Extended Record for input/output size = 1 (mV), 2 (μA), 5 (Ohm), 6 (Degrees)

Byte address	Element	Format	Value range	Description
10	Date1	Word	-32768 … 32767	Place before the decimal point
12	Date2	Word	-999 … 999	Places after decimal point * 1000
14	Date3	Word	Not used	
16	Substitute value	Word	Not used	

Extended Record for input/output size = 4 (Date/Time), BCD coded: See section Time stamp, date/time (Page 26)

Table 4- 9 Extended Record for input/output size = 9 (U~), 10 (I~), 11 (Phi)

Byte address	Element	Format	Value range	Description
10	Date1	Word	Not used	
12	Date2	Word	Not used	
14	Date3	Word	0 … 65535	Setpoint for calibration operating point
16	Substitute value	Word	Not used	

Table 4- 10 Extended Record for substitute value behavior of inputs = 2 (substitute value)

Byte address	Element	Format	Value range	Description
10	Date1	Word	0	Not relevant
12	Date2	Word	0	Not relevant
14	Date3	Word	0	Not relevant
16	Substitute value	Word	8000_H … $7FFF_H$	Must be within parameterized measuring range

4.2.2 Acknowledgment data set

The following table shows the structure of the acknowledgment data set.

Table 4- 11 Structure of the job or acknowledgment data set (18 bytes long)

Byte address	Element	Value range	Format
0	Command/mode	1: Factory calibration 2: User calibration 3: Abort, normal channel processing 4: Read calibration values	Byte
1	Status/error code	00_H: OK, Working 01_H: OK, Ready ≥ 10_H: Error	Byte
2	Channel number	00_H … $3F_H$ 40_H … $7F_H$ FF_H	Byte
3	Calibration step	FF_H … 00_H	Byte
4	Input/output type	00_H … $F9_H$	Byte
5	Input/output range	00_H … $F9_H$	Byte
6	User action	0: None 1: Short-circuit 2: Feed, connection 3: Measurement 4: Remove connections	Byte
7	Input/output size	0: Not relevant 1: mV 2: μA 3: Calibration values 4: Time/date 5: Ohm 6: Degrees 7: - 8: - 9: U~ (0.01 V) effective value AC 10: I~ (0.0001 A) effective value AC 11: Phi (0.01 degrees) (phase angle)	Byte
8	Calibration counter	00_H … FF_H	Byte
9	Reserved	-	Byte
10 … 17	Extended Record	See section below Extended Record	

The tables below show the value ranges of the elements and description of the acknowledgment data set.

Command/mode

Is mirrored from the command with error-free processing of the job data set.

Table 4- 12 Command/mode

Value range	Description
1: Factory calibration	Not relevant
2: User calibration	See section User calibration (mode = 2) (Page 28)
3: Abort, normal channel processing	See section Abort (mode = 3) (Page 46)
4: Read calibration values	See section Read calibration values (mode = 4) (Page 48)

Status/error code

Table 4- 13 Status/error code

Value range	Description
00_H: OK, Working	Job processing still ongoing
01_H: OK, Ready	Job processing successfully completed
≥ 10_H: Error	See section Status and error codes (Page 24)

Channel number

Table 4- 14 Channel number

Value range	Description
00_H … $3F_H$	Input channels
40_H … $7F_H$	Output channels
FF_H	All channels

Calibration step

Table 4- 15 Calibration step

Value range	Description
FF_H … 00_H	Number of calibration steps still required

Input/output type

Table 4- 16 Input/output type

Value range	Description
00_H … $F9_H$	Currently parameterized input/output type of the channel, see Parameter tables in the sections Format input type/range: Input channels (Page 55) and Format output type/range: Output channels (Page 58)

Input/output range

Table 4- 17 Input/output range

Value range	Description
00_H … $F9_H$	Currently parameterized input/output range of the channel, see Parameter tables in the sections Format input type/range: Input channels (Page 55) and Format output type/range: Output channels (Page 58)

User action

Table 4- 18 User action

Value range	Description
0: None	Indicates how to wire the terminals specified under Terminal1/Terminal2.
1: Short-circuit	
2: Feed, connection	
3: Measurement	
4: Remove connections	

Input/output size

Table 4- 19 Input/output size

Value range	Description
0: Not relevant	Specifies how to interpret the values as of byte 10. For user actions = 2 and 3 the corresponding unit is specified here.
1: mV	
2: µA	
3: Calibration values	
4: Time/date	
5: Ohm	
6: Degrees	
7: -	
8: -	
9: U~ (0.01 V) effective value AC	
10: I~ (0.0001 A) effective value AC	
11: Phi (0.01 degrees) (phase angle)	

Calibration counter

Table 4- 20 Calibration counter

Value range	Description
00_H … FF_H	Number of successful user calibrations 00_H = Factory calibration values

Extended Record

Table 4- 21 Extended Record for input/output size = 1 (mV), 2 (µA), 5 (Ω), 6 (Degrees)

Byte address	Element	Format	Value range	Description
10	Date1	Word	-32768 … 32767	Place before the decimal point
12	Date2	Word	-999 … 999	Place after decimal point * 1000
14	Date3	Word	Not used	
16	Terminal1	Byte	0 … x (0 = invalid)	Terminal at BaseUnit
17	Terminal2	Byte	0 … x (0 = invalid)	Terminal at BaseUnit

Table 4- 22 Extended Record for input/output size = 9 (U~), 10 (I~), 11 (Phi)

Byte address	Element	Format	Value range	Description
10	Date1	Double word	00_H … $FFFFFFFF_H$	Calibration register content (last calibration step executed)
14	Date2	Word	0 … 65535	Setpoint for next step
16	Terminal1	Byte	0 … x (0 = invalid)	Terminal at BaseUnit
17	Terminal2	Byte	0 … x (0 = invalid)	Terminal at BaseUnit

Extended Record for input/output size = 4 (Date/Time): See section Time stamp, date/time (Page 26)

Table 4- 23 Extended Record for input/output size = 3 (calibration values)

Byte address	Element	Format	Value range	Description
10	Date1	Word	Format 1	Offset (converter units)
12	Date2	Word	Format 2	Gain
14	Date3	Word	Module-specific Format 1 or Format 2	Add1
16	Date4	Word		Add2

The values can be output in two formats:

Format 1 (identifier = 0):

WORD, value range -32767 ... +32768

Format 2 (identifier = 1):

Value range -31.999 to +31.999

Table 4- 24 Extended Record: Places before and after the decimal point

2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}
VZ	Places before the decimal point (0 … 31)					Places after decimal point * 1000 (0 … 999)									

Format Terminal1/Terminal2:

For user actions = 1, 2, 3, 4 the terminal number of the terminal at BaseUnit are displayed here (1 … x).

5 Performing user calibration

5.1 Calibration start

You must start the user calibration using the job data set with command = 2 (user calibration) and calibration step = FF_H (Start).

An active/running calibration is displayed with Mode = 2 (user calibration) in the acknowledgment data set.

A diagnostic is also reported for analog modules with diagnostic capability:

- Analog modules with channel diagnostics signal error 31 (Channel temporarily unavailable) for the affected channel, channel fault LED lights up red, the module fault LED flashes.
- Analog modules which support the value status (QI) set QI to "BAD".

The user calibration can be started at any time. The start requires that the channel was parameterized without errors and that it is not already in another calibration mode which can be recognized by command 3 and status > 00_H in the acknowledgment data set:

- After starting the user calibration and until it is completed, only command = 2 is accepted and processed for this channel.
  All other commands result in the user calibration being aborted.
- The acknowledgment data set is generated immediately by mirroring it from the job data set and entering it in the status = 00_H (OK, Working).
- After completing the calibration step, the acknowledgment data set is updated and the status > 00_H is set:
  - The command was accepted with status = 01_H (OK, Ready). The number of steps that still have to executed is specified in the calibration step. The action that you need to execute next is specified in the user action.
  - For user action = 1 (Short-circuit), 2 (Infeed), 3 (Measuring) and 4 (Remove connections), the relevant terminals are specified in the Extended Record under Terminal1 and Terminal2 whereby Terminal1 is always the positive terminal.
  - For user action = 2 (Infeed) or 3 (Measuring) the unit is specified for measured variable (e.g., µA or mV).
  - For status > 10_H, an error was detected and calibration was aborted. In Command/Mode, "Abort, normal channel processing" is signaled. The analog module resumes the same status as before calibration was started.

5.2 Calibration sequence

Each calibration step is triggered by writing the job data set with calibration step = FF_H (for start) or FE_H … 00_H, applied from the previously signaled acknowledgment data set and identifier = 01_H.

Next the analog module has to read and evaluate the acknowledgment data set.

- For status = 00_H (OK, Working), the calibration of the analog module initiated with the job data set is still in progress.
- For status = 01_H (OK, Ready), the calibration of the analog module initiated with the job data set is complete and was processed without errors.
- For status ≥ 10_H (Error), the calibration of the analog module initiated with the job data set was not processed successfully and was acknowledged with an error. The ongoing calibration is aborted and any determined calibration values are discarded.

Note

Non-relevant elements

Elements that are not relevant for a calibration step are not taken into consideration by the module. The user calibration is not aborted by these elements.

5.3 Calibration exit

You can exit the calibration in any calibration step by means of a job data set with command = 3 (Abort, normal channel processing). Any calibration values determined until then are lost. The analog module resumes the same status as before calibration was started. If user calibration values existed before the calibration, these will become effective again after the abort. If no user calibration values existed, the factory calibration values are still in effect.

Any calibration initiated previously can also be aborted with the following actions:

- POWER OFF/POWER ON of the supply voltage
- Pulling & plugging of the analog module
- Re-parameterization of the analog module
- Re-parameterization of the analog module
- Firmware update of the analog module

5.4 Calibration completion

The last calibration step is the confirmation of the calibration or of the determined calibration values. This calibration step is initialized by the analog module for a user calibration with calibration step = 1 in the acknowledgment data set. All calibration values of the current calibration process are determined and signaled back.

Confirm the calibration values with the job data set and calibration step = 1. With input/output size = 4 (Date/Time) a time stamp in S7 BCD format is entered starting with byte 10 (see section Time stamp, Date/Time (Page 26)).

As soon as the calibration values and the time stamp of the analog module have been checked and applied, mode = 3 (normal channel processing) and status = 01_H (OK, Ready) are signaled in the acknowledgment data set. The channel number, the input/output type and the input/
output range remain the same; the remaining data equals zero.

The newly determined calibration values are now valid and in effect.

The previous user calibration values are overwritten and cannot be restored.

In case of an error in the last calibration step (e.g., error in time stamp), the corresponding error code is signaled in the status. The new calibration values are discarded.

5.5 Status and error codes

Table 5- 1 Status codes

Status code	Description
00_H	OK, Working; job in progress
01_H	OK, Ready; job executed without error
02_H … $0F_H$	Reserved

Calibration is aborted with an error if an error occurs during calibration.

Table 5- 2 Error codes

Error codes	Description	Remedy/Cause
General errors of the calibration process		
10_H	Invalid command	Correct job data set; table Command/job ID (Page 12)
11_H	Invalid channel number	Correct job data set; table Identification (Page 12)
12_H	Invalid identification	Correct job data set; table Channel number (Page 12)
13_H	Invalid calibration step	Correct job data set; table Calibration step (Page 12)
14_H	Error in input/output type or input/output range	Input/output type or input/output range cannot be scaled; see Analog Module Manual
15_H	Invalid module action	Irrelevant for user calibration
16_H	Invalid input/output size information	Extended Record, invalid content; Correct job data set (Page 11)
17_H	Reserved	–
18_H	Time stamp error (year)	Invalid time stamp; correct job data set; section Time stamp, Date/Time (Page 26)
19_H	Time stamp error (month)	
$1A_H$	Time stamp error (day)	
$1B_H$	Time stamp error (hour)	
$1C_H$	Time stamp error (minute)	
$1D_H$	Time stamp error (day of the week)	
$1E_H$	Invalid substitute value behavior of inputs	Correct job data set; table Substitute value behavior of inputs (Page 13)
$1F_H$	Substitute value out of the measuring range	

Error codes	Description	Remedy/Cause
Technology errors		
20_H	Value measured by user deviates too much from setpoint	Circuit, check measuring technique; correct job data set
21_H	Value supplied by user deviates too much from setpoint	Circuit, check infeed technique
22_H … 23_H	Reserved	–
24_H	User calibration not supported	See Analog Module Manual
25_H … $2F_H$	Reserved	–
System errors/general module errors		
30_H	Error writing to EEPROM/Flash	Replace analog module
31_H	Error in procedure	A job data set with a command other than the one active came in during the calibration process. Follow procedure; see section Example (Page 28)
32_H	Channel not parameterized	Correct configuration/parameter assignment
33_H	Reserved	–
34_H	Abort due to parameter assignment during ongoing calibration	See section Behavior with parameter assignment of analog modules during calibration (Page 27)
35_H … $3F_H$	Reserved	–
Other faults/errors		
40_H	Reserved	–
41_H	No calibration values available	No calibration values available to delete; See section Prepare factory calibration (mode = 5) (Page 51) and Reset (mode = 6) (Page 53)
42_H … FF_H	Reserved	–

5.6 Time stamp, Date/time

During user calibration, you transfer the date and time of the synchronization to the analog module in calibration step = 1 Date and time.

When reading the calibration values (command = 4), the date and time of the read calibration values are output in calibration step = 1.

Both take place with measured variable = 4 as time stamp in the acknowledgment data set as well as in the job data set as of byte 10 in S7 BCD format.

Byte address	Value	Format	Value range
10	Year	Byte	00_H = 2000, 99_H = 2099
11	Month	Byte	01_H … 12_H
12	Tag	Byte	01_H … 31_H
13	Hour	Byte	00_H … 23_H
14	Minute	Byte	00_H … 59_H
15	Second	Byte	00_H … 59_H
16	ms	Byte	00_H … 99_H
17.4 … 17.7	ms	High nibble	0_H … 9_H
17.0 … 17.3	Day of the week	Low nibble	0 = undefined 1 = Sunday 2 = Monday 3 = Tuesday 4 = Wednesday 5 = Thursday 6 = Friday 7 = Saturday

5.7 Re-parameterization of the input/output range

If you have conducted a user calibration on a channel, the user calibration values are in effect for this channel. The user calibration values always apply only to the input/output range for which they were created. If the input/output range is re-parameterized to another input/output range, the factory calibration values are used once again for this range. The user calibration values still exist.

When you start a user calibration in the new input/output range, the new calibration values are saved for this new input/output range. The user calibration values of the previous input/output range are overwritten because only one user calibration can be saved per channel.

If you do not start user calibration and switch back to the previous input/output range, the previous user calibration values will be in effect once again.

Other channel parameters (e.g., interference frequency suppression) have no effect on the validity of the calibration values.

5.8 Calibration counter

Each error-free and complete user calibration of a channel is counted. More than 255 calibration processes do not increase the calibration counter.

The current counter status (including ongoing calibration) is displayed in calibration step = 1 together with the currently determined calibration values. When you acknowledge this calibration step with the job data set, the calibration counter is saved retentively with the determined user calibration values and will be in effect.

Each command = 5 (Restore factory calibration) or 6 (Reset) deletes the calibration counter.

A re-parameterization of the input/output ranges does not delete the calibration counter.

When you start a user calibration in the new input/output range, the calibration counter is reset and starts counting from 1 again.

If you do not start user calibration and switch back to the previous input/output range, the previous user calibration values will be in effect once again.

5.9 Behavior at CPU-STOP

Reading and writing of data sets is not possible in CPU STOP.

5.10 Behavior with parameter assignment of analog modules during calibration

Each parameter data set that comes in during an ongoing user calibration results in the calibration being aborted.

The acknowledgment data set is updated with a corresponding error message.

Example 6

6.1 User calibration (mode = 2)

All processes described below are based on the initial state of the acknowledgment data set.

Byte	Element	Value
0	Mode	3: normal channel processing
1	Status/error code	> 0
2	Channel number	X
3	Calibration step	FF_H*
4	Input/output type	0
5	Input/output range	0
6	User action	0: None
7	Input/output size	0
8	Calibration counter	0
9	Reserved	0
10	Date1	0
12	Date2	0
14	Date3	0
16	Terminal1	0
17	Terminal2	0

* The calibration step can only take place immediately after run-up FF_H. After completion/abort of a calibration step, "0 = no more steps" is signaled.

Only the data necessary for the current calibration step are entered in the job/ acknowledgment data set.

- The command and the channel number must remain the same for each job data set of a calibration sequence; otherwise, the calibration is aborted.
- The calibration step must be transferred to the analog module again in each job data set according to the last acknowledgment data set. The start is an exception.
- The channel must be parameterized.
- A job data set may only be transferred to the analog module with status > 00_H.
- The current calibration step is to be executed with identifier = 1 in the job data set.

6.1.1 Example: Analog input module RTD (resistance thermometer)

6.1.1.1 Step A: Start

Job data set:

Start the user calibration with channel X. The specified substitute value behavior of the inputs and the substitute value apply to the triggered calibration and are evaluated and applied by the analog module during the initial call only.

Byte	Element	Value
0	Command	2: User calibration
1	Identifier	
2	Channel number	X
3	Calibration step	FF_H: Start
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	0: retain last value
9	Reserved	
10	Date1	
12	Date2	
14	Datem3	
16	Substitute value	

Acknowledgment data set:

The analog module acknowledges the change to user calibration (mode = 2) with channel = X and status = 00_H (OK, Working). As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data. The input/output range currently set on this channel as well as the number of required calibration steps is signaled. The analog module requests channel X in the next calibration step; short-circuit at terminals Y and Z.

Byte	Element	Value		Value
0	Mode	2: User calibration		2: User calibration
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	FF_H		**4 more steps**
4	Input/output type			09_H: RTD, 2-wire
5	Input/output range			02_H: PT100, Std.
6	User action			1: Short-circuit
7	Input/output size			
8	Calibration counter			
9	Reserved			
10	Date1			
12	Date2			
14	Date3			
16	Terminal1			Y
17	Terminal2			Z

6.1.1.2 Step B: Zero-Scale calibration

Job data set:

Acknowledge calibration step 4. The requested action (short-circuit terminals Y, Z) is finished.

Byte	Element	Value
0	Command	2: User calibration
1	Identifier	1: Execute
2	Channel number	X
3	Calibration step	4
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data.

The number of necessary calibration steps is decremented. The analog module requests channel X in the next calibration step; infeed; remove connections.

Byte	Element	Value		Value
0	Mode	2: User calibration		2: User calibration
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	4		**3 more steps**
4	Input/output type			09_H: RTD, 2-wire
5	Input/output range			02_H: PT100, Std.
6	User action			4: Remove connections
7	Input/output size			
8	Calibration counter			
9	Reserved			
10	Date1			
12	Date2			
14	Date3			
16	Terminal1			Y
17	Terminal2			Z

6.1.1.3 Step C: Intermediate step

Job data set:

Acknowledge calibration step 3. The requested action (remove connections at terminals Y, Z) is finished.

Byte	Element	Value
0	Command	2: User calibration
1	Identifier	1: Execute
2	Channel number	X
3	Calibration step	3
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data.

The number of necessary calibration steps is decremented. The analog module requests channel X in the next calibration step; infeed 390.5 Ω at terminals Y and Z.

Byte	Element	Value		Value
0	Mode	2: User calibration		2: User calibration
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	3		**2 more steps**
4	Input/output type			09_H: RTD, 2-wire
5	Input/output range			02_H: PT100, Std.

16	Terminal1			0
17	Terminal2			0

6.1.2 Example: Analog output module +/-10 V

6.1.2.1 Step A: Start

Job data set:

Start the user calibration with channel X.

Byte	Element	Value
0	Command	2: User calibration
1	Identifier	
2	Channel number	X
3	Calibration step	FF_H: Start
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

The analog module acknowledges the change to user calibration (mode = 2) with channel = X and status = 00_H (OK, Working). As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data.

The input/output range currently set on this channel as well as the number of required calibration steps is signaled.

The analog module requests channel X in the first calibration step; measuring at terminals Y and Z.

Byte	Element	Value		Value
0	Mode	2: User calibration		2: User calibration
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	FF_H		**3 more steps**
4	Input/output type			01_H: Voltage

8	Substitute value behavior	
9	Reserved	
10	Date1	15
12	Date2	600
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data.

The number of necessary calibration steps is decremented.

The analog module requests channel X in the next calibration step; measuring at terminals Y and Z.

Byte	Element	Value		Value
0	Mode	2: User calibration		2: User calibration
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	3		**2 more steps**
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			3: Measurement
7	Input/output size			1: mV
8	Calibration counter			
9	Reserved			
10	Date1			
12	Date2			
14	Date3			
16	Terminal1			Y
17	Terminal2			Z

6.1.2.3 Step C: Intermediate step

Job data set:

Acknowledge calibration step 2. The requested action (voltage measuring at terminals Y, Z) is finished. The measured voltage is transferred to the analog module in Date1 in the unit specified under measured variable. The place in front of the decimal point of the voltage in mV is entered in Date1, and the value after the decimal point of the voltage in mV multiplied by 1000 is entered in Date2. Example: 9986.3 mV.

Byte	Element	Value
0	Command	2: User calibration
1	Identifier	1: Execute
2	Channel number	X
3	Calibration step	2
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	1: mV
8	Substitute value behavior	
9	Reserved	
10	Date1	9986
12	Date2	300
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data.

The number of necessary calibration steps is decremented. The calibration values determined by the analog module are signaled (identified by measured variable = 3). The offset is in Date1, the gain in Date2, Add1 in Date3 (if present) and Add2 in Date4 (if present). The number of successful calibration processes is signaled for this input/output range in the calibration counter.

1 is not signaled back in calibration step, which means the last calibration step.

Byte	Element	Value		Value
0	Mode	2: User calibration		2: User calibration
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	2		**1 more step**
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			0: None
7	Input/output size			3: Calibration values
8	Calibration counter			X: 1 … 255
9	Reserved			
10	Date1			Offset
12	Date2			Gain
14	Date3			Add1
16	Date4			Add2

6.1.2.4 Step D: Full-Scale calibration positive

Job data set:

Acknowledge calibration step 1. The synchronization values signaled by the analog module are accepted.

You must enter the date and the time with measured variable = 4 in S7 BCD format as of Date1.

Byte	Element	Value
0	Command	2: User calibration
1	Identifier	1: Execute
2	Channel number	X
3	Calibration step	1
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	4: Date/time
8	Substitute value behavior	
9	Reserved	
10	Date1	Date and time in S7 BCD format

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready) and mode = 3 (normal channel processing), the determined calibration values and date/time are applied and saved.

0 is not signaled back in calibration step, which means no more calibration steps. Calibration complete.

Byte	Element	Value		Value
0	Mode	2: User calibration		3: normal channel processing
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	1		**0 (ready now)**
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			0
7	Input/output size			0
8	Calibration counter			0
9	Reserved			0
10	Date1			0
12	Date2			0
14	Date3			0
16	Terminal1			0
17	Terminal2			0

6.2 Abort (mode = 3)

6.2.1 User abort

Job data set:

An ongoing calibration can be aborted in any calibration step and in any state, even with status = 00_H (OK, Working), with the command = 3 (Abort, channel processing).

Byte	Element	Value
0	Command	3: Abort, channel processing
1	Identifier	
2	Channel number	X
3	Calibration step	
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready) and mode = 3 (abort, normal channel processing), the calibration of channel X is aborted. The channel has the same state as before the calibration. The input/output range currently set on the channel is signaled.

Byte	Element	Value		Value
0	Mode	3: Abort, channel processing		3: Abort, channel processing
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step			0
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			0
7	Input/output size			0
8	Calibration counter			0
9	Reserved			
10	Date1			
12	Date2			
14	Date3			
16	Terminal1			
17	Terminal2			

6.2.2 Module abort

If the analog module detects an error during a calibration process, this error aborts the calibration. The error code is signaled in the status.

See also

Calibration exit (Page 22)

6.3 Read calibration values (mode = 4)

All current calibration values of an analog module channel are read with command = 4 (Read calibration values); these are either the values from the factory calibration or the user calibration.

The command is only permitted in status > 00_H. The channel number must be specified and the calibration step must be set to FF_H (Start).

6.3.1 Step A: Start

Job data set:

Byte	Element	Value
0	Command	4: Read calibration values
1	Identifier	
2	Channel number	X
3	Calibration step	FF_H: Start
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data. Measured variable = 3 identifies the data as of Date1 as calibration values. Only the current calibration values of the specified channel are read with command = 4; these are the calibration values associated with the parameterized input/output range.

Byte	Element	Value		Value
0	Mode	4: Read calibration values		4: Read calibration values
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	FF_H		**1 more step**
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			0: None
7	Input/output size			3: Calibration values
8	Calibration counter			X: 0 … 255
9	Reserved			0
10	Date1			Offset
12	Date2			Gain
14	Date3			Add1
16	Date4			Add2

The input/output range currently set on the channel is signaled.

The offset is in Date1, the gain in Date2, Add1 in Date3 (if present) and Add2 in Date4 (if present).

The calibration counter specifies if the values are factory calibration values (calibration counter = 0) or user calibration values (calibration counter > 0). For user calibration values, the value of the calibration counter is equal to the number of successful calibration processes for this input/output range (since the last user calibration of a different input/output range).

Calibration step = 1 indicates that one more step is necessary.

6.3.2 Step B: Closure

Job data set:

Acknowledge calibration step 1.

Byte	Element	Value
0	Command	4: Read calibration values
1	Identifier	
2	Channel number	X
3	Calibration step	1
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready), the remaining data of the acknowledgment data set are valid and you can evaluate the data. Measured variable = 4 identifies the data as of Date1 Time stamp. A time stamp that matches the previously read calibration values is signaled.

Byte	Element	Value		Value
0	Mode	4: Read calibration values		3: normal channel processing
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	1		0
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			0: None
7	Input/output size			4: Date/time
8	Calibration counter			X: 0 … 255
9	Reserved			
10	Date/time			Date and time in S7 BCD format

6.4 Restore factory calibration (mode = 5)

Use command = 5 (Restore factory calibration) to undo the executed user calibration of the specified channel for the set input/output range. The analog module applies the calibration values determined at the factory which will be in effect again. Delete saved user calibration values.

If user calibration values of the channel exist which do not belong to the set input/output range, these are not deleted.

The command is only permitted in status > 00_H.

Specify the channel number and set the calibration step to FF_H (Start).

The calibration counter is set to 0 again with this command.

Job data set:

Byte	Element	Value
0	Command	5: Restore factory calibration
1	Identifier	
2	Channel number	X
3	Calibration step	FF_H
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready) and mode = 3 (normal channel processing), restoration is complete. The user calibration was deleted and the channel continues operating in the previous state with factory calibration values.

Byte	Element	Value		Value
0	Mode	5: Restore factory calibration		3: normal channel processing
1	Status/error code	00: OK, Working		01: OK, Ready
2	Channel number	X		X
3	Calibration step	FF_H		**0 (ready now)**
4	Input/output type			01_H: Voltage
5	Input/output range			02_H: 0 … 10 V
6	User action			
7	Input/output size			
8	Calibration counter			
9	Reserved			
10	Date1			
12	Date2			
14	Date3			
16	Terminal1			
17	Terminal2			

6.5 Reset (mode = 6)

Use the command = 6 (Reset) to restore the factory calibration for a channel or the entire analog module regardless of the parameter assignment of the channels.

The factory calibration of a channel is restored according to the channel number, and any saved user calibration values are deleted (even if the saved user calibration values do not belong to the currently set input/output range). With channel number FF_H, restoration takes place for all channels of the analog module.

The command is only permitted in status > 00_H. Set the calibration step to FF_H (Start). The channel or the analog module must not be parameterized.

The involved calibration counters are set to 0 again with this command.

Job data set:

Byte	Element	Value
0	Command	6: Reset
1	Identifier	
2	Channel number	X
3	Calibration step	FF_H
4	Not relevant	
5	Not relevant	
6	Not relevant	
7	Input/output size	
8	Substitute value behavior	
9	Reserved	
10	Date1	
12	Date2	
14	Date3	
16	Substitute value	

Acknowledgment data set:

As soon as the analog module signals in status = 01_H (OK, Ready) and mode = 3 (normal channel processing), reset is complete. The user calibration values were deleted. All channels involved continue operating in their previous state with factory calibration values.

Byte	Element	Value		Value
0	Mode	6: Reset		3: normal channel processing
1	Status/error code	00_H: OK, Working		01_H: OK, Ready
2	Channel number	X		X
3	Calibration step	FF_H		**0 (ready now)**

SIEMENS

SIMATIC
ET 200SP Open Controller
Product information on CPU 1515SP PC2 (F/T/TF)

Product Information

Validity

This product information supplements the documentation for the ET 200SP Open Controller CPU 1515SP PC2 (F/T/TF), edition 09/2018.

The information provided in it should be considered more up-to-date if uncertainties arise.

The described function restrictions apply **exclusively** to the Open Controller CPU 1515SP PC2 (F/T/TF) **V2.5**.

Technical update

Acronis backup is not supported

The Acronis backup is not supported in the current version – please use Image Partition Creator.

No activation of the Windows copy

If you do not have an Internet connection, you do **not** need to activate the Windows copy. There are no functional restrictions.

Display of processor temperature by SIMATIC IPC DiagBase

The **SIMATIC IPC DiagBase** software shows **only** the temperature of the CPU. The temperature of the motherboard and work memory are currently not displayed.

Changing the boot order

The boot order changes automatically when a DVD drive with USB connection is connected to the Open Controller CPU 1515SP PC2 **V2.5**.

Restrictions when using the power management function

The power management function helps to maximize the performance of your PC or to save energy. Activating the "Power saver" function may restrict the functions of the software controller.

Key combination <Ctrl+Alt+Del> during initial commissioning

To ensure that the initial initialization is complete, do **not** use the key combination <Ctrl+Alt+Del> during the initialization phase.

Restriction to one monitor

Use only **one** monitor. If several monitors are used simultaneously, undefined states may occur in the system.

Cables for connecting the DisplayPorts

Use **only** the following cables to connect the DisplayPorts:

- DisplayPort cable, length: 5 m, E74020-C AWM Style 20276, 80°C, 30 V, VW-1 (with integrated ferrite cores at both ends)
- DisplayPort cable, length: 3 m, 6AV7860-0DH30-0AA0
- DisplayPort cable, length: 5 m, 6AV7860-0DH50-0AA0

Changes to section 12.4: Mechanical and climatic environmental conditions

The tables below show the mechanical environmental conditions in the form of sinusoidal oscillations.

Table 1 Mechanical environmental conditions for BA 2×RJ45

Frequency range	
5 Hz ≤ f ≤ 8.4 Hz	3.5 mm amplitude
8.4 Hz ≤ f ≤ 150 Hz	1 g constant acceleration

Table 2 Mechanical environmental conditions for BA 2×FC

Frequency range	
5 Hz ≤ f ≤ 8.2 Hz	7.5 mm amplitude
8.2 Hz ≤ f ≤ 500 Hz	2 g constant acceleration

The following table provides information about the type and scope of the tests for environmental mechanical conditions.

Table 3 Tests for mechanical environmental conditions

Test for ...	Test standard	Comment
Vibrations	Vibration test according to IEC 60068-2-6 (sine)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. BA 2×RJ45 • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration BA 2×FC • 5 Hz ≤ f ≤ 8.2 Hz, 7.5 mm constant amplitude • 8.2 Hz ≤ f ≤ 500 Hz, 2 g constant acceleration Duration of vibration: 10 frequency sweeps per axis in each of three perpendicular axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in +/- direction in each of three perpendicular axes

Changes to section 11.5: Windows language packages

Provided language packages

- Chinese (Simplified)
- German
- English
- French
- Italian
- Spanish

Storage location of the language packages

The language packages on the restore USB stick are provided under \LanguagesPackages\.

Installation of the language packs

1. To start a console session, open the "Run" dialog, for example, with <Windows key+R>.
2. Enter the following command: pksetup.exe
3. Click "OK" to confirm.
4. The "Install or uninstall display languages" window opens.
5. Click on "Install display languages".
6. Select the display language to be installed by clicking on "Browse".
7. Navigate to the folder containing the display languages and confirm with "OK".
8. The selected language package is displayed in the "Install or uninstall display languages" window.
9. Click on "Next" and follow the instructions of the installation wizard.

Maximum current consumption

The max. current consumption is: 2.9 A

Ambient temperature during operation

A temperature range of -20° C bis 60° C is approved for operation.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual as well as the function manuals. This manual contains a description of the module-specific information. The system-related functions are described in the system manual. All system-spanning functions are described in the function manuals.

The information provided in this manual and the system manual allows you to commission the CPU 1510SP-1 PN.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe the notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

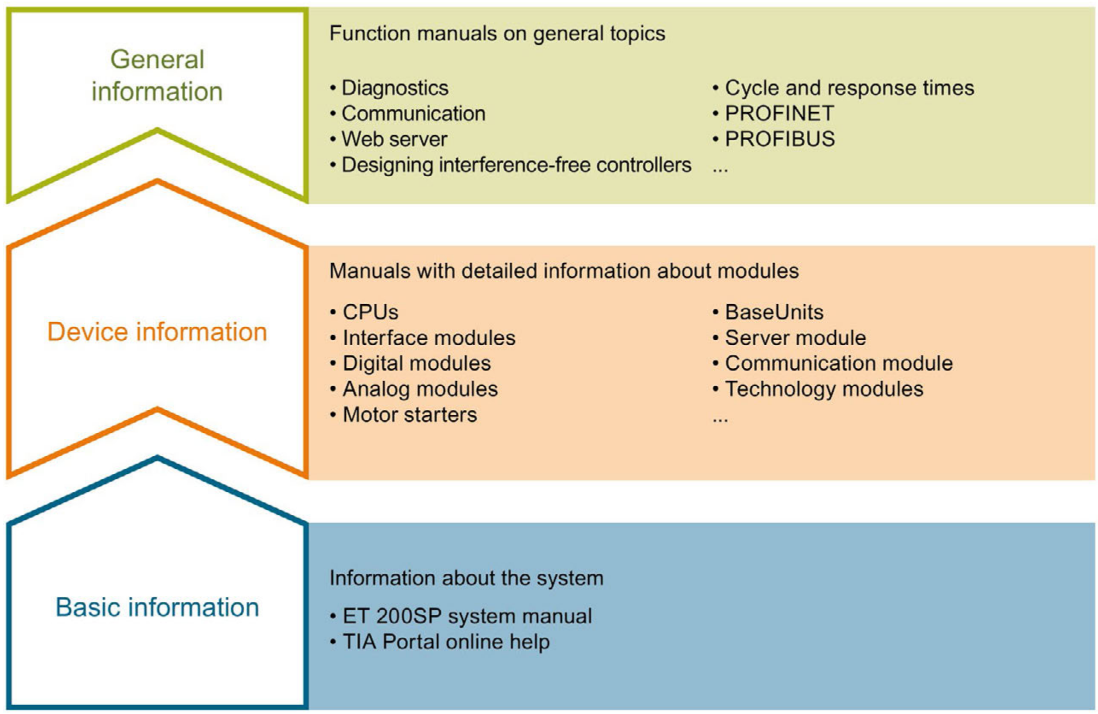
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Product overview 2

2.1 New functions in firmware version V2.0

New functions of the CPU in firmware version V2.0

This section lists the new features of the CPU with firmware version V2.0.

You can find additional information in the sections of this manual.

Table 2- 1 New functions of the CPU with firmware version 2.0 compared with firmware version V1.8

New functions	Applications	Customer benefits
OPC UA server	You realize the data communication between different systems, both within the process level and on the control and enterprise levels: • To embedded systems with controllers • To controllers with MES systems and systems of the enterprise level (ERP, asset systems) • To Siemens controllers with controllers from other manufacturers • To intelligent sensors with controllers Supported standard: OPC Data Access, DA.	OPC UA is a unified standard for data communication and is independent of any particular operating system platforms. You have integrated security mechanisms on different automation systems, for example, for data exchange, on the application level, for authentication of the user. OPC UA servers provide a large amount of data: • Values of PLC tags that clients can access • Data types of these PLC tags • Information about the OPC UA server itself and the CPU In this way, clients can gain an overview and can read and write values.
PROFINET IO		
MRPD: Media Redundancy for Planned Duplication for IRT	PROFINET IO IRT enables you to realize applications that place particularly high demands on failure safety and accuracy (isochronous).	By sending the cyclic IO data in both directions in the ring, the communication to the IO devices is maintained even when the ring is interrupted and does not result in device failure even with fast update times. You achieve higher failure safety than with MRP.
PROFINET performance upgrade	You can develop applications with high demands on speed and clock cycles. This is interesting for applications with high demands on performance.	Better utilization of the bandwidth results in short reaction times.
Limitation of the data infeed into the network	You limit the network load for standard Ethernet communication to a maximum value.	You smooth peaks in the data infeed. You share the remaining bandwidth based on requirements.

New functions	Applications	Customer benefits
Web server		
Backing up and restoring via the Web server	You can, for example, backup and restore the configuration of the CPU to the PG/PC on which the Web server is running.	You can make a backup copy of an operational project without STEP 7. In an "emergency", you can simply use an existing configuration without STEP 7, for example, during commissioning or after a program download.
Web server provides up to three project languages for comments and alarm texts	When you export your plants worldwide, for example, comments or alarm texts can be stored on the card in up to 3 languages. For example, German - author's language, English - internationally usable, Portuguese - end user's language.	You provide customers with better service.
Trace via Web server	When you enable trace functions via the Web server, you have better service support. You can send your trace recordings via Web service, for example, to your service partner.	You get plant/project information for diagnostics and maintenance requirements without STEP 7. You can provide trace recordings for each Web server. You save time in troubleshooting.
Monitoring of configured technology objects via a Web server	You can monitor statuses, errors, technology alarms and the current values of technology objects (TOs) with the Web server.	
Motion control		
Greater number of axes for Motion Control applications and new technology objects: Output cam, cam track and measuring input	Speed specification, e.g. for: • Pumps, fans, mixers • Conveyor belts • Auxiliary drives Positioning tasks, e.g.: • Lifting and vertical conveyors • Feeding and gate control • Palletizing equipment Output cams and cam tracks make other applications possible, e.g.: • Applying glue tracks • Triggering switching operations with precise positioning • Very precise processing of products on a conveyor belt Measuring inputs are used, for example: • For measuring products • For detecting the position of the product on a conveyor belt	You can implement additional Motion Control applications with a CPU. The scalable configuration limits allow you to handle all types of application. High machine speeds result in greater productivity with better accuracy.

New functions	Applications	Customer benefits
ET 200SP		
Support for ET 200AL in a central configuration	You can set up a simple connection of IP 65/67 I/O to the CPU. You can connect up to 16 ET 200AL I/O modules via a BA send module on the central bus of the ET 200SP CPU. The distance between two ET 200AL modules can be up to 15 m. You can realize the use of ET 200AL in assembly and handling engineering directly at moving parts, for example in linear axes or drag chains.	You do not have to individually run sensors or actuators at the central control cabinet to the different sections of a machine or assembly line. You save time and costs: • Through lightweight construction • Reduction of wear and exposure to vibration • Increased productivity
Increasing the address space in the station	For example, you can use up to 49 ET 200SP energy meter modules behind an ET 200SP CPU.	A larger address space of 2560 bytes (2048 bytes for ET 200SP module + 512 bytes for ET 200AL modules) is available in the station. The address space has been increased to 288 bytes per module.
Support for communications processors		
CP 1542SP-1	Flexible expansion of the ET 200SP system with an additional Ethernet interface; network separation.	
CP 1542SP-1 IRC	Seamless data recording with time stamping, support for standardized telecontrol protocols DNP3 and IEC.	
CP 1543SP-1 ISEC	With the integrated security functions firewall (Stateful Inspection) and VPN protocol (IPSec), the communications processor protects ET200SP stations and subordinate networks against unauthorized access, and employs encryption to protect data transmission against manipulation and espionage.	

2.2 Operating principle

The CPU contains the operating system and executes the user program. The user program is located on the SIMATIC memory card and is processed in the work memory of the CPU.

The PROFINET interfaces on the CPU allow simultaneous communication with PROFINET devices, PROFINET controllers, HMI devices, programming devices, other controllers and other systems. The CPU 1510SP-1 PN supports operation as an IO controller, I-device or standalone CPU.

With its optional PROFIBUS interface, CM DP, CPU 1510SP-1 PN supports the configuration of PROFIBUS networks in addition to PROFINET IO. When you use the interface as a PROFIBUS DP interface, you can configure the CPU 1510SP-1 PN as a DP master or as an intelligent DP slave (I-slave).

IO controller

CPU 1510SP-1 PN sends and receives data from the connected IO devices within a PROFINET IO system. You can operate the CPU with a maximum of 64 connected IO devices, a maximum of 64 of which use IRT (Isochronous Real Time).

I-device

The "I-device" (intelligent IO device) functionality allows you to exchange data with an IOcontroller. CPU 1510SP-1 PN thus fulfills the role of an intelligent distributed pre-processing unit for sub-processes. The I-device is connected as an IO device to a higher-level IO controller for this purpose.

Advantages:

- Interference-resistant configuration due to short signal and encoder wiring
- Reduced wiring requirements for transmission of the data via PROFINET

Standalone CPU

You can also use the CPU 1510SP-1 PN in the ET 200SP distributed I/O system as a "central system" without a higher-level controller.

DP master

To use the ET 200SP as a DP master, you need the CPU and the optional communication module, CM DP. When used as a DP master, ET 200SP exchanges data with the connected DP slaves via PROFIBUS DP.

Intelligent DP slave (I-slave)

To use the ET 200SP as an intelligent DP slave (I-slave), you need the CPU and the optional communication module, CM DP. As an I-slave, the ET 200SP CPU is connected via PROFIBUS DP to a higher-level DP master and exchanges data with it.

2.3 Properties

Article number

6ES7510-1DJ01-0AB0

View of the module

The following figure shows the CPU 1510SP-1 PN.

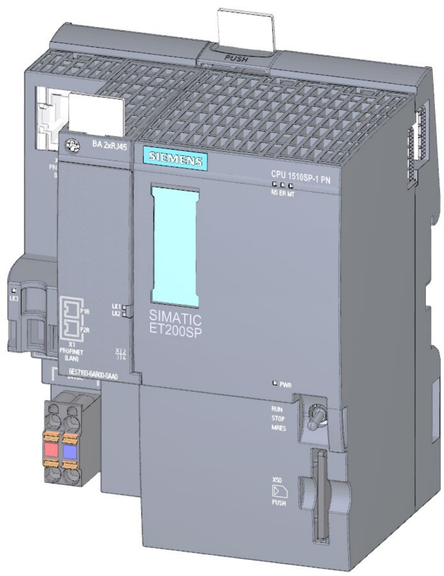


Figure 2-1 CPU 1510SP-1 PN

Properties

The CPU 1510SP-1 PN has the following technical properties:

- Communication:
  - Interfaces

    The CPU 1510SP-1 PN has a PROFINET interface (X1 P3) with an integrated 3-port switch. Port 1 and port 2 are located on the optionally pluggable BusAdapter. Port 3 is integrated in the housing of the CPU. The CPU supports the BusAdapters BA 2xRJ45 and BA 2xFC. You connect the PROFINET IO to the CPU via the BusAdapter.

    In addition to PROFINET basic functionality, the interface also supports PROFINET IO RT (real-time) and IRT (isochronous real-time). PROFINET IO communication or real-time settings can be configured. The basic functionality of PROFINET supports HMI communication, communication with the configuration system, communication with a higher-level network (backbone, router, Internet) and communication with another machine or automation cell.

    Port 1 and port 2 can also be used as ring ports for the configuration of redundant ring structures in Ethernet.

    Note

    The CPU is delivered without a BusAdapter. You can find the article numbers of the supported BusAdapters in the "Accessories/spare parts" section of the ET 200SP distributed automation system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

    The CM DP is optionally available with a PROFIBUS interface (X2). You can find additional information about this expansion module in the manual Communication module CM DP (http://support.automation.siemens.com/WW/view/en/90156526).

    You can find information about connecting the PROFINET IO BusAdapter to the CPU as well as connecting the optional PROFIBUS interface to the interface module in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).
  - OPC UA
    With OPC UA, data is exchanged via an open and vendor-neutral communication protocol. The CPU, as OPC UA server, can communicate with OPC UA clients such as HMI panels, SCADA systems, etc.

- Integrated Web server:

  A Web server is integrated in the CPU. You can read out the following information with the Web server:

  – Start page with general CPU information
  – Identification information
  – Contents of the diagnostics buffer
  – Query of module states
  – Firmware update
  – Alarms (without acknowledgment option)
  – Information about communication
  – PROFINET topology
  – Tag status, writing tags
  – Watch tables
  – Memory usage
  – User pages
  – Data logs (if used)
  – Online backup and restoration of the configuration.
  – Diagnostic information for the motion control technology objects
  – Display of trace recordings stored on the SIMATIC memory card
  – Readout service data
  – Basic Web pages
  – Display of the Web server in 3 project languages, for example, comments and message texts
  – Recipes
  – User-defined Web pages

- Integrated technology:
  - Motion Control

    The Motion Control functionality uses technology objects to support speed-controlled axes, positioning axes, synchronous axes, external encoders, cams, cam tracks and measuring inputs, as well as PLCopen blocks for programming the motion control functionality.
    You can find a detailed description of the use of Motion Control and its configuration in the S7-1500 Motion Control (http://support.automation.siemens.com/WW/view/en/109739589) function manual.
    You can also use the TIA Selection Tool (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool) or the SIZER (http://w3.siemens.com/mcms/mc-solutions/en/engineering-software/drive-design-tool-sizer/Pages/drive-design-tool-sizer.aspx) to create or configure axes.
  - Integrated closed-loop control functionality

    - PID Compact (continuous PID controller)

    - PID 3Step (step controller for integrating actuators)

    - PID Temp (temperature controller for heating and cooling with two separate actuators)
- Trace functionality:
  - Trace functionality supports you in troubleshooting and optimizing the user program, especially for motion control or closed-loop control applications. Trace only supports saves measurements on a SIMATIC memory card. You will find additional information on "Trace" in the Using the trace and logic analyzer function (http://support.automation.siemens.com/WW/view/en/64897128) function manual.
- Integrated system diagnostics:
  - The alarms for the system diagnostics are automatically created by the system and displayed on a PG/PC, HMI device or the Web server. System diagnostics information is also available when the CPU is in STOP mode.

- Integrated security:
  - Know-how protection

    The assignment of passwords protects user blocks against unauthorized access and modifications.
  - Copy protection

    Copy protection links user blocks to the serial number of the SIMATIC memory card or to the serial number of the CPU. User programs cannot run without the corresponding SIMATIC memory card or CPU.
  - Access protection

    Extended access protection provides high-quality protection against unauthorized configuration changes. You can use authorization levels to assign separate rights to different user groups.
  - Integrity protection

    The system protects the data transferred to the CPU against manipulation. The CPU detects erroneous or manipulated engineering data.

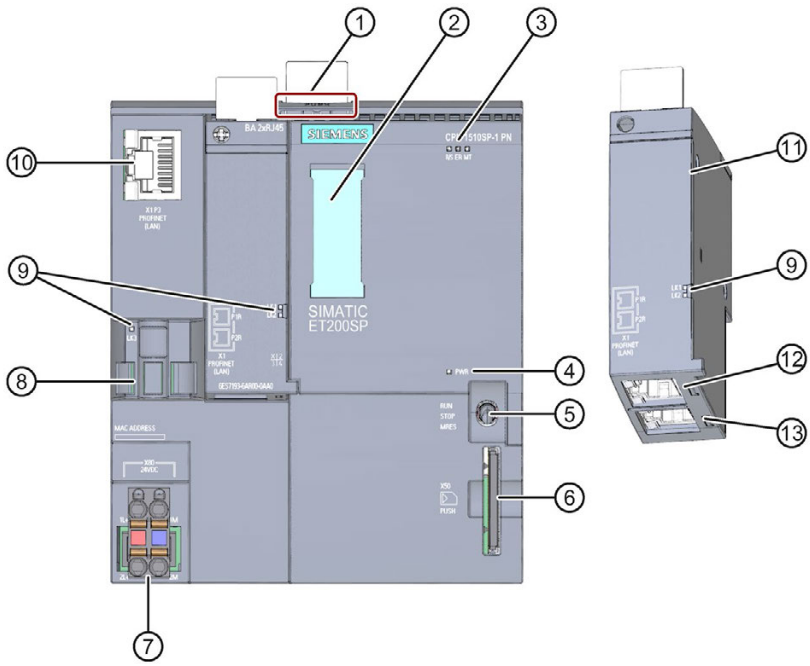
    You can find additional information on the topic of "Protection" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).
- Support for ET 200AL
  - Simple connection of IP 65/67 I/O modules to the CPU.
- Communication CPs
  - CP 1542SP-1: Flexible expansion of the ET 200SP system with an additional Ethernet interface; network separation.
  - CP 1542SP-1 IRC: Seamless data recording with time stamping, support for standardized telecontrol protocols DNP3 and IEC.
  - CP 1543SP-1 ISEC: With the integrated security functions firewall (Stateful Inspection) and VPN protocol (IPSec), the communications processor protects ET200SP stations and subordinate networks against unauthorized access, and employs encryption to protect data transmission against manipulation and espionage.
- Address space
  - A larger address space of 2560 bytes (2048 bytes for ET 200SP module + 512 bytes for ET 200AL modules) is available within the station.

- CPU 1510SP-1 PN supports the following additional functions:
  - PROFIenergy
    You can find information on the topic of "PROFIenergy" in the PROFINET function manual (https://support.industry.siemens.com/cs/ww/en/view/49948856) and in the PROFINET specification on the Internet (http://www.profibus.com).
  - Shared device
    You can find information on the topic of "Shared device" in the PROFINET function manual (https://support.industry.siemens.com/cs/ww/en/view/49948856).
  - Configuration control
    You can find information on the topic of "Configuration control" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).
  - Isochronous mode
    You can find information about the "Isochronous mode" topic in the PROFINET (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

2.4 Operating and display elements

2.4.1 Front view of the module with BusAdapter

The figure on the left shows the CPU 1510SP-1 PN including a plugged BA 2xRJ45 BusAdapter. The figure on the right shows a separate view of the BA 2xRJ45 BusAdapter.



① Mounting rail release
② Labeling strips
③ LEDs for status and error displays
④ LED for display of the supply voltage
⑤ Mode switch
⑥ Slot for the SIMATIC memory card
⑦ Connection for supply voltage (included in product package)
⑧ Cable support and attachment for port P3 of the PROFINET interface
⑨ LEDs for status displays of the PROFINET interface: LK1 and LK2 on BusAdapter, LK3 on CPU
⑩ Port P3 of the PROFINET interface: RJ45 socket
⑪ Separate view of the BusAdapter
⑫ Port P1 R of the PROFINET interface: RJ45 socket on BusAdapter BA 2×RJ45
R: Ring port for configuring a ring topology with media redundancy
⑬ Port P2 R of the PROFINET interface: RJ45 socket on BusAdapter BA 2×RJ45
R: Ring port for configuring a ring topology with media redundancy

Figure 2-2 Front view of the CPU 1510SP-1 PN with BusAdapter

2.5 Mode switch

Use the mode switch to set the CPU operating mode.

The following table shows the position of the switch and the corresponding meaning.

Table 2- 2 Mode switch settings

Position	Meaning	Explanation
RUN	RUN mode	The CPU is executing the user program.
STOP	STOP mode	The user program is not being executed.
MRES	Memory reset	Position for CPU memory reset.

Wiring

3

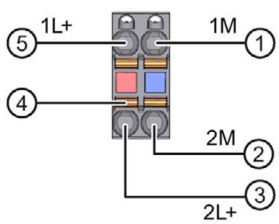
3.1 Pin assignment

This section provides information on the pin assignment of the individual interfaces and the block diagram of the CPU 1510SP-1 PN.

24 V DC supply voltage (X80)

The connector for the supply voltage is plugged in when the CPU ships from the factory.

The figure below shows the pin assignment for 24 V DC supply voltage.



① Ground of the supply voltage
② Ground of the supply voltage for loop-through (maximum of 10 A permitted)
③ +24 V DC of the supply voltage for loop-through (maximum of 10 A permitted)
④ Spring NC contacts
⑤ + 24 V DC of the supply voltage

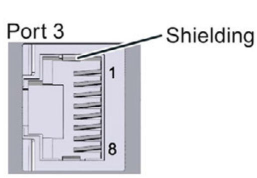
Internally jumpered:
① and ②
③ and ⑤

Figure 3-1 Supply voltage connection

PROFINET IO interface on the CPU (X1 P3)

The assignment corresponds to the Ethernet standard for an RJ45 connector.

- When autonegotiation is deactivated, the RJ45 socket is allocated as a switch (MDI-X).
- If autonegotiation is activated, then autocrossing is active and the RJ45 socket has either a device assignment (MDI) or switch assignment (MDI-X).



PROFINET IO interface on the BusAdapter BA 2xRJ45 (X1 P1 R and X1 P2 R)

The assignment at the BA 2xRJ45 BusAdapter corresponds to the Ethernet standard for an RJ45 connector.

Table 3- 1 Pin assignment PROFINET IO interface on the BusAdapter BA 2xRJ45

View	Designation
	• When autonegotiation is deactivated, the RJ45 socket is allocated as a switch (MDI-X). • If autonegotiation is activated, then autocrossing is active and the RJ45 socket has either a device assignment (MDI) or switch assignment (MDI-X).

PROFINET IO interface on the BusAdapter BA 2xFC (X1 P1 R and X1 P2 R)

The following table shows the pin assignment for the PROFINET IO interface on the BusAdapter BA 2xFC.

Table 3- 2 Pin assignment PROFINET IO interface on the BusAdapter BA 2xFC

View	Signal name		Designation
	1	TD	Transmit data +
	2	TD_N	Transmit data -
	3	RD	Receive data +
	4	RD_N	Receive data -

Reference

You can find additional information on the topics of "Connecting the CPU" and "Accessories/spare parts" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Assignment of the MAC addresses

The MAC address is a globally unique device identifier that is assigned to each PROFINET device in the factory. Its 6 bytes are divided into 3 bytes for the manufacturer ID and 3 bytes for the device ID (serial number). The front of the CPU 1510SP-1 PN is lasered with the MAC address of the PROFINET interface.

The PROFINET interface (X1) of the CPU 1510SP-1 PN has three ports. Port 3 is located on the CPU. Ports 1 and 2 are located on the optional BusAdapter. In addition to the PROFINET interface, each PROFINET port also has a separate MAC address. There is therefore a total of four MAC addresses for the CPU 1510SP-1 PN.

The MAC addresses of the PROFINET ports are needed for the LLDP protocol, for example for the neighborhood discovery function.

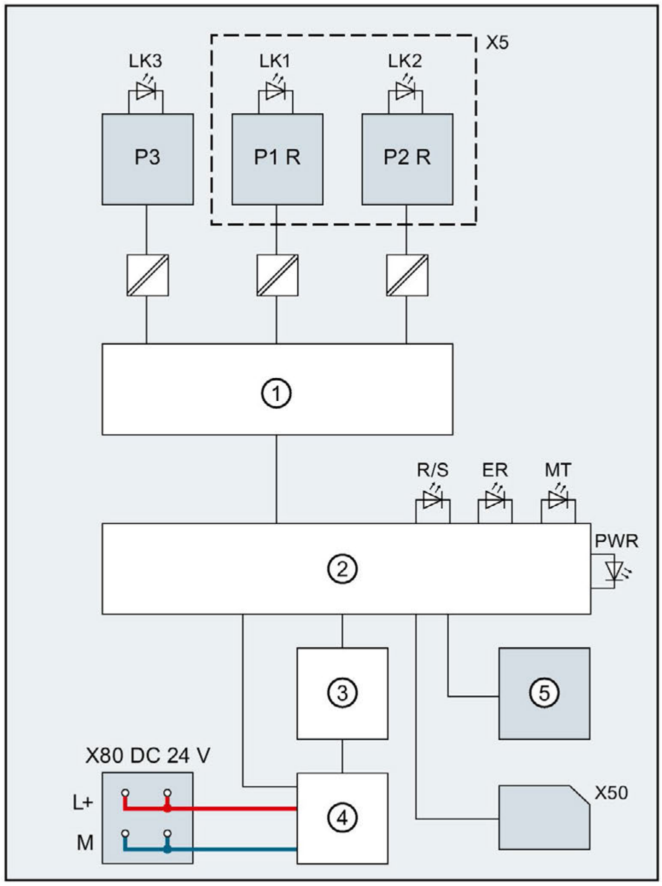
The table below shows how the MAC addresses are assigned.

Table 3- 3 Assignment of the MAC addresses

	Assignment
MAC address 1	PROFINET interface X1 • Visible in STEP 7 for accessible devices • Lasered on the front of the CPU (start of the number range)
MAC address 2	Port X1 P1 R (required for LLDP, for example)
MAC address 3	Port X1 P2 R (required for LLDP, for example)
MAC address 4	Port X1 P3 (required for LLDP, for example)

Block diagram

The following figure shows the block diagram of the CPU 1510SP-1 PN.



①	PROFINET switch	P1 R	PROFINET interface X1 Port 1
②	Electronics	P2 R	PROFINET interface X1 Port 2
③	Backplane bus interface	P3	PROFINET interface X1 Port 3
④	Internal supply voltage	L+	24 V DC supply voltage
⑤	RUN/STOP/MRES mode selector	M	Ground
X5	BusAdapter	LK1, 2, 3	LED Link TX/RX
X50	SIMATIC memory card	R/S	RUN/STOP LED (yellow/green)
X80 24 V DC	Infeed of supply voltage	ER	ERROR LED (red)
		MT	MAINT LED (yellow)
		PWR	POWER LED (green)

Figure 3-2 Block diagram of the CPU 1510SP-1 PN

Interrupts, error messages, diagnostics and system alarms

4

The status and error displays of the CPU 1510SP-1 PN are described below.

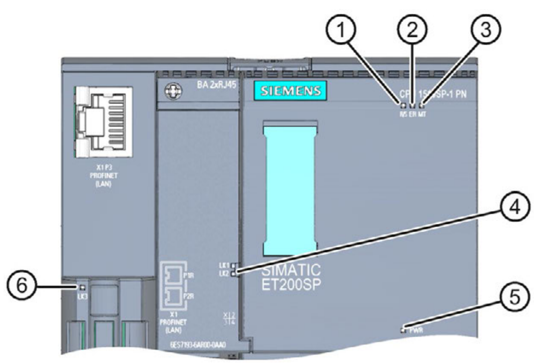
You will find additional information on "Interrupts" in the STEP 7 online help.

You can find additional information on the topics of "Diagnostics" and "System alarms" in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

4.1 Status and error display of the CPU

LED displays

The figure below shows the LED displays of the CPU 1510SP-1 PN and the BA 2xRJ45 BusAdapter.



①	RUN/STOP LED (yellow/green LED)
②	ERROR LED (red LED)
③	MAINT LED (yellow LED)
④	LINK RX/TX LED for ports X1 P1 and X1 P2 (green LEDs on BusAdapter)
⑤	POWER LED (green LED)
⑥	LINK RX/TX LED for port X1 P3 (green LED on CPU)

Figure 4-1 LED displays on the CPU and BusAdapter

Meaning of the POWER, RUN/STOP, ERROR and MAINT LEDs

CPU 1510SP-1 PN features an LED for monitoring the supply voltage of the electronics (PWR) and three LEDs for displaying the current operating and diagnostics status. The following table shows the meaning of the various combinations of colors for the POWER, RUN/STOP, ERROR and MAINT LEDs.

Table 4- 1 Meaning of the LEDs

POWER LED	RUN/STOP LED	ERROR LED	MAINT LED	Meaning
LED off	LED off	LED off	LED off	Missing or insufficient power supply on the CPU.
LED lit green	LED off	LED flashes red	LED off	An error has occurred.
LED lit green	LED lit green	LED off	LED off	CPU is in RUN mode.
LED lit green	LED lit green	LED flashes red	LED off	A diagnostics event is pending.
LED lit green	LED lit green	LED off	LED lit yellow	Maintenance demanded for the plant. The affected hardware must be checked/replaced within a short period of time. Active Force job PROFIenergy pause
LED lit green	LED lit green	LED off	LED flashes yellow	Maintenance required for the plant. The affected hardware must be checked/replaced within a foreseeable period of time. Bad configuration
LED lit green	LED lit yellow	LED off	LED flashes yellow	Firmware update successfully completed.
LED lit green	LED lit yellow	LED off	LED off	CPU is in STOP mode.
LED lit green	LED lit yellow	LED flashes red	LED flashes yellow	The program on the SIMATIC memory card is causing an error. CPU defective
LED lit green	LED flashes yellow	LED off	LED off	CPU is performing internal activities during STOP, e.g. startup after STOP. Download of the user program from the SIMATIC memory card
LED lit green	LED flashes yellow/green	LED off	LED off	Startup (transition from RUN → STOP)
LED lit green	LED flashes yellow/green	LED flashes red	LED flashes yellow	Startup (CPU booting) Test of LEDs during startup, inserting a module. LED flashing test

Meaning of the LINK LED

Each port has a LINK LED (LK1, LK2, LK3). The table below shows the various "LED scenarios" of the ports of the CPU 1510SP-1 PN.

Table 4- 2 Meaning of the LEDs

LINK LED	Meaning
□ LED off	There is no Ethernet connection between the PROFINET interface of the PROFINET device and the communication partner. No data is currently being sent/received via the PROFINET interface. There is no LINK connection.
LED flashes green	The "LED flashing test" is being performed.
■ LED lit green	There is an Ethernet connection between the PROFINET interface of your PROFINET device and a communication partner.

5 Technical specifications

	6ES7510-1DJ01-0AB0
General information	
Product type designation	CPU 1510SP-1 PN
Hardware function version	FS03
Firmware version	V2.0
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V14
Configuration control	
Via data record	Yes
Operator controls	
Mode selector	1
Supply voltage	
Type of supply voltage	24 V DC
Low limit of permitted range (DC)	19.2 V
High limit of permitted range (DC)	28.8 V
Reverse polarity protection	Yes
Power and voltage failure buffering	
Power/voltage failure buffer time	5 ms
Input current	
Current consumption (rated value)	0.6 A
Inrush current, max.	4.7 A; rated value
I^2t	0.14 A^2s
Power	
Incoming power to the backplane bus	8.75 W
Power loss	
Power loss, typ.	5.6 W
Memory	
Number of slots for SIMATIC memory card	1
SIMATIC memory card required	Yes
Work memory	
Integrated (for program)	100 KB
Integrated (for data)	750 KB
Load memory	
Plug-in (SIMATIC memory card), max.	32 GB
Buffering	
Maintenance-free	Yes

	6ES7510-1DJ01-0AB0
CPU processing times	
For bit operations, typ.	72 ns
For word operations, typ.	86 ns
For fixed-point arithmetic, typ.	115 ns
For floating-point arithmetic, typ.	461 ns
CPU blocks	
Number of elements (total)	2000; blocks (OB/FB/FC/DB) and UDTs
DB	
Number range	1 ... 60 999; divided into: Number range that can be used by user: 1 ... 59 999 and number range for DBs generated by SFC 86: 60 000 ... 60 999
Size, max.	750 KB; for absolutely addressed DBs, the max. size is 64 KB
FB	
Number range	0 ... 65 535
Size, max.	100 KB
FC	
Number range	0 ... 65 535
Size, max.	100 KB
OB	
Size, max.	100 KB
Number of free-cycle OBs	100
Number of time-of-day interrupt OBs	20
Number of time-delay interrupt OBs	20
Number of cyclic interrupt OBs	20
Number of hardware interrupt OBs	50
Number of DPV1 interrupt OBs	3
Number of isochronous mode OBs	1
Number of technology synchronous interrupt OBs	2
Number of startup OBs	100
Number of asynchronous error OBs	4
Number of synchronous error OBs	2
Number of diagnostic interrupt OBs	1
Nesting depth	
Per priority class	24
Counters, timers and their retentivity	
S7 counters	
Quantity	2048
Retentivity	
• can be set	Yes

	6ES7510-1DJ01-0AB0
IEC counters	
Quantity	Any (only limited by the work memory)
Retentivity	
• can be set	Yes
S7 timers	
Quantity	2048
Retentivity	
• can be set	Yes
IEC timers	
Quantity	Any (only limited by the work memory)
Retentivity	
• can be set	Yes
Data areas and their retentivity	
Total retentive data area (including timers, counters, bit memories), max.	128 KB; for bit memories, timers, counters, DBs and technological data (axes), usable retentive memory: 88 KB
Bit memory	
Number, max.	16 KB
Number of clock memories	8; there are 8 clock memory bits, grouped in one clock memory byte
Data blocks	
Retentivity can be set	Yes
Retentivity preset	No
Local data	
Per priority class, max.	64 KB; max. 16 KB per block
Address area	
Number of IO modules	1024; max. number of modules/submodules
I/O address area	
Inputs	32 KB; all inputs are in the process image
Outputs	32 KB; all outputs are in the process image
Of which per integrated IO subsystem	
• Inputs (volume)	8 KB
• Outputs (volume)	8 KB
Of which per CM/CP	
• Inputs (volume)	8 KB
• Outputs (volume)	8 KB
Process image partitions	
Number of process image partitions, max.	32
Address space per module	
Address space per module, max.	288 bytes; for both input and output data

	6ES7510-1DJ01-0AB0
Address space per station	
Address space per station, max.	2560 bytes; for central inputs and outputs; depending on configuration; 2048 bytes for ET 200SP modules + 512 bytes for ET 200AL modules
Hardware configuration	
Number of distributed IO systems	32; a distributed IO system is understood to mean the integration of distributed I/O via PROFINET or PROFIBUS communication modules as well as the connection of I/O via AS-i master modules or links (e.g. IE/PB link)
Number of DP masters	
Via CM	1
Number of IO controllers	
Integrated	1
Via CM	0
Rack	
Modules per rack, max.	80; CPU + 64 modules + server module (configuration width max. 1 m) + 16 ET 200AL modules
Number of rows, max.	1
PtP CM	
Number of PtP CMs	The number of PtP CMs that can be connected is only limited by the available slots
Time	
Clock	
Type	Hardware clock
Backup duration	6 wk; at 40 °C ambient temperature, typ.
Deviation per day, max.	10 s; typ.: 2 s
Operating hours counter	
Quantity	16
Time-of-day synchronization	
Supported	Yes
On DP, master	Yes; via CM DP module
On DP, slave	Yes; via CM DP module
In AS, master	Yes
In AS, slave	Yes
On Ethernet via NTP	Yes
Interfaces	
Number of PROFINET interfaces	1
Number of PROFIBUS interfaces	1; via CM DP module
With optical interface	No

	6ES7510-1DJ01-0AB0
1st interface	
Interface hardware	
Number of ports	3; 1st integrated + 2nd via BusAdapter
Integrated switch	Yes
RJ45 (Ethernet)	Yes; X1 P3; opt. X1 P1 and X1 P2 via BusAdapt-er BA 2xRJ45
BusAdapter (PROFINET)	Yes; usable BusAdapters: BA 2x RJ45, BA 2x FC
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	Yes
PROFINET IO controller	
Services	
• PG/OP communication	Yes
• S7 routing	Yes
• Isochronous mode	Yes
• Open IE communication	Yes
• IRT	Yes
• MRP	Yes; as MRP redundancy manager and/or MRP client; max. number of devices in the ring: 50
• MRPD	Yes; requirement: IRT
• PROFIenergy	Yes
• Prioritized startup	Yes; max. 32 PROFINET devices
• Number of connectable IO devices, max.	64; a total of up to 256 distributed I/O devices can be connected via AS-i, PROFIBUS or PROFINET
• of these, IO devices with IRT, max.	64
• Number of connectable IO devices for RT, max.	64
• of these, in a line topology, max.	64
• Number of IO devices that can be activat-ed/deactivated simultaneously, max.	8; in total over all interfaces
• Number of IO devices per tool, max.	8
• Update times	The minimum value of the update time also de-pends on the communication allocation setting for PROFINET IO, the number of IO devices and the amount of configured user data

	6ES7510-1DJ01-0AB0
Update time with IRT	
• With send clock of 250 µs	250 µs to 4 ms; note: with IRT with isochronous mode, the minimum update time of 625 µs of the isochronous OB is crucial
• With send clock of 500 µs	500 µs to 8 ms; note: with IRT with isochronous mode, the minimum update time of 625 µs of the isochronous OB is crucial
• With send clock of 1 ms	1 ms to 16 ms
• with send clock of 2 ms	2 ms to 32 ms
• with send clock of 4 ms	4 ms to 64 ms
• with IRT and "odd" send clock parameter assignment	Update time = set "odd" send clock (any multiple of 125 µs: 375 µs, 625 µs to 3 875 µs)
Update time with RT	
• With send clock of 250 µs	250 µs to 128 ms
• With send clock of 500 µs	500 µs to 256 ms
• With send clock of 1 ms	1 ms to 512 ms
• with send clock of 2 ms	2 ms to 512 ms
• with send clock of 4 ms	4 ms to 512 ms
PROFINET IO device	
Services	
• PG/OP communication	Yes
• S7 routing	Yes
• Isochronous mode	No
• Open IE communication	Yes
• IRT	Yes
• MRP	Yes
• MRPD	Yes; requirement: IRT
• PROFIenergy	Yes
• Shared device	Yes
• Number of IO controllers with shared device, max.	4
2nd interface	
Interface hardware	
Number of ports	1
RS 485	Yes; via CM DP module
Protocols	
PROFIBUS DP master	Yes
PROFIBUS DP slave	Yes
SIMATIC communication	Yes

	6ES7510-1DJ01-0AB0
Interface hardware	
RJ45 (Ethernet)	
100 Mbps	Yes
Autonegotiation	Yes
Autocrossing	Yes
Industrial Ethernet status LED	Yes
RS 485	
Transmission rate, max.	12 Mbps
Protocols	
Number of connections	
Number of connections, max.	96
Number of connections reserved for ES/HMI/Web	10
Number of connections via integrated interfaces	64
Number of connections per CP/CM	32
Number of S7 routing connections	16
SIMATIC communication	
S7 communication, as server	Yes
S7 communication, as client	Yes
User data per job, max.	See online help (S7 communication, user data size)
Open IE communication	
TCP/IP	Yes
• Data length, max.	64 KB
• Multiple passive connections per port, supported	Yes
ISO-on-TCP (RFC1006)	Yes
• Data length, max.	64 KB
UDP	Yes
• Data length, max.	1472 bytes
DHCP	No
SNMP	Yes
DCP	Yes
LLDP	Yes
Web server	
HTTP	Yes; standard and user-defined pages
HTTPS	Yes; standard and user-defined pages

	6ES7510-1DJ01-0AB0
PROFIBUS DP master	
Number of connections, max.	48
Services	
• PG/OP communication	Yes
• S7 routing	Yes
• Data record routing	Yes
• Isochronous mode	No
• Constant bus cycle time	No
• Number of DP slaves	125; a total of up to 256 distributed I/O devices can be connected via AS-i, PROFIBUS or PROFINET
• Activation/deactivation of DP slaves	Yes
OPC UA	
OPC UA server	Yes; Data Access (Read, Write, Subscribe), Runtime license required
• Application authentication	Yes
• Security Policies	Available Security Policies: None, Basic128Rsa15, Basic256Rsa15, Basic256Sha256
• User authentication	"Anonymous" or with user name and password
Additional protocols	
MODBUS	Yes; MODBUS TCP
Media redundancy	
Switchover time in the case of cable break, typ.	200 ms; with MRP; bumpless with MRPD
Number of devices in the ring, max.	50
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes; only with PROFINET; with a minimum OB 6x cycle of 625 µs
S7 signaling functions	
Number of stations that can be logged in for signaling functions, max.	32
Block-related alarms	Yes
Number of configurable interrupts, max.	5000
Number of simultaneously active interrupts in interrupt pool	
• Number of reserved user interrupts	300
• Number of reserved interrupts for system diagnostics	100
• Number of reserved interrupts for motion control technology objects	80

	6ES7510-1DJ01-0AB0
Test/commissioning functions	
Shared commissioning (Team Engineering)	Yes; parallel online access possible for up to 3 engineering systems
Status block	Yes; up to 8 simultaneously (in total over all ES clients)
Single-step	No
Status/modify	
Status/modify tag	Yes
Tags	Inputs/outputs, bit memory, DB, peripheral inputs/outputs, timers, counters
Number of tags, max.	
• Of which are status tags, max.	200; per job
• Of which are modify tags, max.	200; per job
Forcing	
Forcing	Yes
Forcing, tags	Peripheral inputs/outputs
Number of tags, max.	200
Diagnostics buffer	
Available	Yes
Number of entries, max.	1000
• Of which are power failure-proof	500
Traces	
Number of configurable traces	4; up to 512 KB data possible per trace
Interrupts/diagnostics/status information	
Diagnostics display LED	
RUN/STOP LED	Yes
ERROR LED	Yes
MAINT LED	Yes
Monitoring of the supply voltage (PWR LED)	Yes
Connection display LINK TX/RX	Yes
Supported technology objects	
Motion control	Yes; note: the number of axes affects the cycle time of the PLC program; selection guide via the TIA Selection Tool or SIZER
• Number of available motion control resources for technology objects (except cams)	800
• Required Motion Control resources	
– per speed-controlled axis	40
– per positioning axis	80
– per synchronous axis	160
– per external encoder	80
– per output cam	20
– per cam track	160
– per measuring input	40

	6ES7510-1DJ01-0AB0
Controller	
• PID_Compact	Yes; universal PID controller with integrated optimization
• PID_3Step	Yes; PID controller with integrated optimization for valves
• PID temp	Yes; PID controller with integrated optimization for temperature
Counting and measuring	
• High-speed counter	Yes
Standards, approvals, certificates	
Suitable for safety functions	No
Highest safety class achievable in safety mode	
Performance level according to EN ISO 13849-1:2008	None
SIL according to IEC 61508	No
Ambient conditions	
Ambient temperature during operation	
Horizontal mounting position, min.	0 °C
Horizontal mounting position, max.	60 °C
Vertical mounting position, min.	0 °C
Vertical mounting position, max.	50 °C
Ambient temperature during storage/transport	
Min.	-40 °C
Max.	70 °C
Configuring	
Programming	
Programming language	
• LAD	Yes
• FBD	Yes
• STL	Yes
• SCL	Yes
• GRAPH	Yes
Know-how protection	
User program protection	Yes
Copy protection	Yes
Block protection	Yes
Access protection	
Protection level: Write protection	Yes
Protection level: Read/write protection	Yes
Protection level: Complete protection	Yes

	6ES7510-1DJ01-0AB0
Cycle time monitoring	
Low limit	Configurable minimum cycle time
High limit	Configurable maximum cycle time

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual as well as the function manuals. This manual contains a description of the module-specific information. The system-related functions are described in the system manual. All system-spanning functions are described in the function manuals.

The information provided in this manual and the system manual allows you to commission the CPU 1512SP-1 PN.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

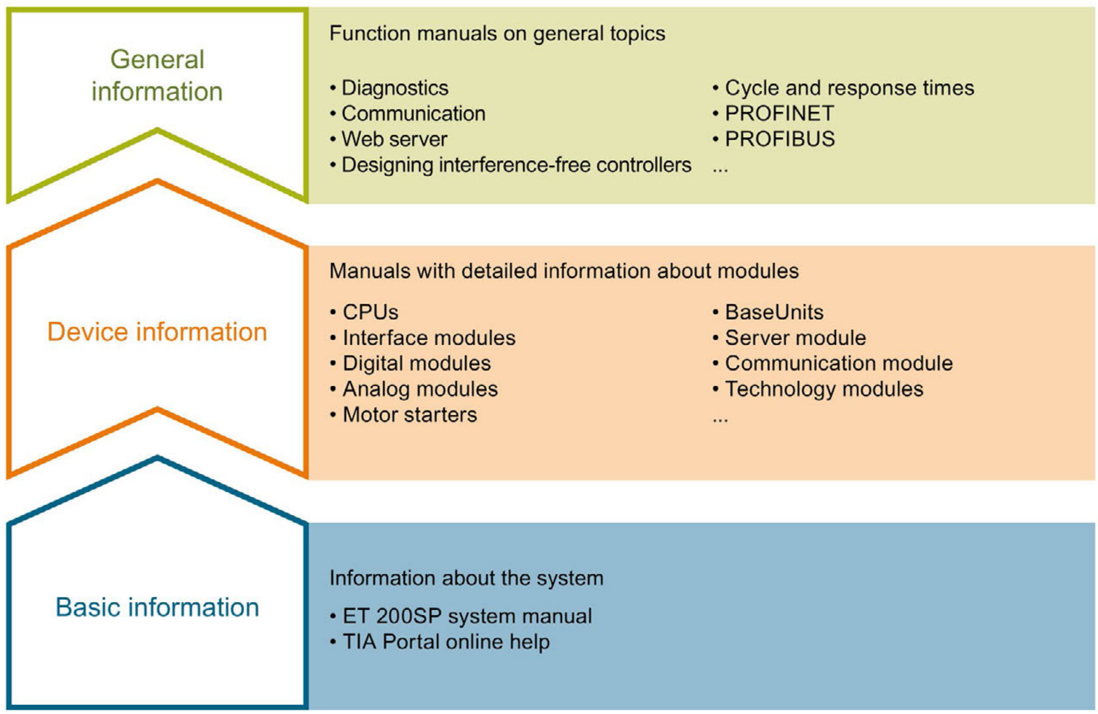
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Product overview

2

2.1 New functions in firmware version V2.0

New functions of the CPU in firmware version V2.0

This section lists the new features of the CPU with firmware version V2.0.

You can find additional information in the sections of this manual.

Table 2- 1 New functions of the CPU with firmware version 2.0 compared with firmware version V1.8

New functions	Applications	Customer benefits
OPC UA server	You realize the data communication between different systems, both within the process level and on the control and enterprise levels: • To embedded systems with controllers • To controllers with MES systems and systems of the enterprise level (ERP, asset systems) • To Siemens controllers with controllers from other manufacturers • To intelligent sensors with controllers Supported standard: OPC Data Access, DA.	OPC UA is a unified standard for data communication and is independent of any particular operating system platforms. You have integrated security mechanisms on different automation systems, for example, for data exchange, on the application level, for authentication of the user. OPC UA servers provide a large amount of data: • Values of PLC tags that clients can access • Data types of these PLC tags • Information about the OPC UA server itself and the CPU In this way, clients can gain an overview and can read and write values.
PROFINET IO		
MRPD: Media Redundancy for Planned Duplication for IRT	PROFINET IO IRT enables you to realize applications that place particularly high demands on failure safety and accuracy (isochronous).	By sending the cyclic IO data in both directions in the ring, the communication to the IO devices is maintained even when the ring is interrupted and does not result in device failure even with fast update times. You achieve higher failure safety than with MRP.
PROFINET performance upgrade	You can develop applications with high demands on speed and clock cycles. This is interesting for applications with high demands on performance.	Better utilization of the bandwidth results in short reaction times.
Limitation of the data infeed into the network	You limit the network load for standard Ethernet communication to a maximum value.	You smooth peaks in the data infeed. You share the remaining bandwidth based on requirements.

New functions	Applications	Customer benefits
Web server		
Backing up and restoring via the Web server	You can, for example, backup and restore the configuration of the CPU to the PG/PC on which the Web server is running.	You can make a backup copy of an operational project without STEP 7. In an "emergency", you can simply use an existing configuration without STEP 7, for example, during commissioning or after a program download.
Web server provides up to three project languages for comments and alarm texts	When you export your plants worldwide, for example, comments or alarm texts can be stored on the card in up to 3 languages. For example, German - author's language, English - internationally usable, Portuguese - end user's language.	You provide customers with better service.
Trace via Web server	When you enable trace functions via the Web server, you have better service support. You can send your trace recordings via Web service, for example, to your service partner.	You get plant/project information for diagnostics and maintenance requirements without STEP 7. You can provide trace recordings for each Web server. You save time in troubleshooting.
Monitoring of configured technology objects via a Web server	You can monitor statuses, errors, technology alarms and the current values of technology objects (TOs) with the Web server.	
Motion control		
Greater number of axes for Motion Control applications and new technology objects: Output cam, cam track and measuring input	Speed specification, e.g. for: • Pumps, fans, mixers • Conveyor belts • Auxiliary drives Positioning tasks, e.g.: • Lifting and vertical conveyors • Feeding and gate control • Palletizing equipment Output cams and cam tracks make other applications possible, e.g.: • Applying glue tracks • Triggering switching operations with precise positioning • Very precise processing of products on a conveyor belt Measuring inputs are used, for example: • For measuring products • For detecting the position of the product on a conveyor belt	You can implement additional Motion Control applications with a CPU. The scalable configuration limits allow you to handle all types of application. High machine speeds result in greater productivity with better accuracy.

New functions	Applications	Customer benefits
ET 200SP		
Support for ET 200AL in a central configuration	You can set up a simple connection of IP 65/67 I/O to the CPU. You can connect up to 16 ET 200AL I/O modules via a BA send module on the central bus of the ET 200SP CPU. The distance between two ET 200AL modules can be up to 15 m. You can realize the use of ET 200AL in assembly and handling engineering directly at moving parts, for example in linear axes or drag chains.	You do not have to individually run sensors or actuators at the central control cabinet to the different sections of a machine or assembly line. You save time and costs: • Through lightweight construction • Reduction of wear and exposure to vibration • Increased productivity
Increasing the address space in the station	For example, you can use up to 49 ET 200SP energy meter modules behind an ET 200SP CPU.	A larger address space of 2560 bytes (2048 bytes for ET 200SP module + 512 bytes for ET 200AL modules) is available in the station. The address space has been increased to 288 bytes per module.
BusAdapter with glass-fiber interface	You can achieve long distances (up to 3 km) between the PROFINET devices.	
Support for communications processors		
CP 1542SP-1	Flexible expansion of the ET 200SP system with an additional Ethernet interface; network separation.	
CP 1542SP-1 IRC	Seamless data recording with time stamping, support for standardized telecontrol protocols DNP3 and IEC.	
CP 1543SP-1 ISEC	With the integrated security functions firewall (Stateful Inspection) and VPN protocol (IPSec), the communications processor protects ET200SP stations and subordinate networks against unauthorized access, and employs encryption to protect data transmission against manipulation and espionage.	

2.2 Operating principle

The CPU contains the operating system and executes the user program. The user program is located on the SIMATIC memory card and is processed in the work memory of the CPU.

The PROFINET interfaces on the CPU allow simultaneous communication with PROFINET devices, PROFINET controllers, HMI devices, programming devices, other controllers and other systems. The CPU 1512SP-1 PN supports operation as an IO controller, I-device or standalone CPU.

With its optional PROFIBUS interface, CM DP, CPU 1512SP-1 PN supports the configuration of PROFIBUS networks in addition to PROFINET IO. When you use the interface as a PROFIBUS DP interface, you can configure the CPU 1512SP-1 PN as a DP master or as an intelligent DP slave (I-slave).

IO controller

CPU 1512SP-1 PN sends and receives data from the connected IO devices within a PROFINET IO system. You can operate the CPU with a maximum of 128 connected IO devices, a maximum of 64 of which use IRT (Isochronous Realtime).

I-device

The "I-device" (intelligent IO device) functionality allows you to exchange data with an IO controller. CPU 1512SP-1 PN thus fulfills the role of an intelligent distributed pre-processing unit for sub-processes. The I-device is connected as an IO device to a higher-level IO controller for this purpose.

Advantages:

- Interference-resistant configuration due to short signal and encoder wiring
- Reduced wiring requirements for transmission of the data via PROFINET

Standalone CPU

You can also use the CPU 1512SP-1 PN in the ET 200SP distributed I/O system as a "central system" without a higher-level controller.

DP master

To use the ET 200SP as a DP master, you need the CPU and the optional communication module, CM DP. When used as a DP master, ET 200SP exchanges data with the connected DP slaves via PROFIBUS DP.

Intelligent DP slave (I-slave)

To use the ET 200SP as an intelligent DP slave (I-slave), you need the CPU and the optional communication module, CM DP. As an I-slave, the ET 200SP CPU is connected via PROFIBUS DP to a higher-level DP master and exchanges data with it.

2.3 Properties

Article number

6ES7512-1DK01-0AB0

View of the module

The following figure shows the CPU 1512SP-1 PN.

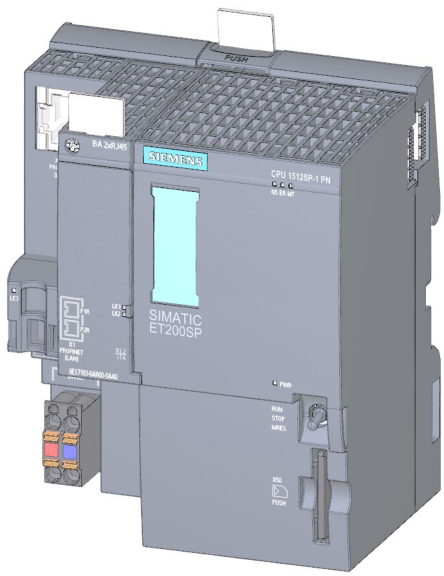


Figure 2-1 CPU 1512SP-1 PN

Properties

The CPU 1512SP-1 PN has the following technical properties:

1. Communication:
   - Interfaces

     The CPU 1512SP-1 PN has a PROFINET interface (X1 P3) with an integrated 3-port switch. Port 1 and port 2 are located on the optionally pluggable BusAdapter. Port 3 is integrated in the housing of the CPU. You connect the PROFINET IO to the CPU via the BusAdapter. You will find information on the BusAdapters supported by the CPU in section Wiring (Page 22).

     In addition to PROFINET basic functionality, the interface also supports PROFINET IO RT (real-time) and IRT (isochronous real-time). PROFINET IO communication or real-time settings can be configured. The basic functionality of PROFINET supports HMI communication, communication with the configuration system, communication with a higher-level network (backbone, router, Internet) and communication with another machine or automation cell.

     Port 1 and port 2 can also be used as ring ports for the configuration of redundant ring structures in Ethernet.

     Note

     The CPU is delivered without a BusAdapter. You can find the article numbers of the supported BusAdapters in the "Accessories/spare parts" section of the ET 200SP distributed automation system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

     The CM DP is optionally available with a PROFIBUS interface (X2). You can find additional information about this expansion module in the manual Communication module CM DP (http://support.automation.siemens.com/WW/view/en/90156526).

     You can find information about connecting the PROFINET IO BusAdapter to the CPU as well as connecting the optional PROFIBUS interface to the interface module in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).
   - OPC UA
     With OPC UA, data is exchanged via an open and vendor-neutral communication protocol. The CPU, as OPC UA server, can communicate with OPC UA clients such as HMI panels, SCADA systems, etc.

- Integrated Web server:

  A Web server is integrated in the CPU. You can read out the following information with the Web server:
  - Start page with general CPU information
  - Identification information
  - Contents of the diagnostics buffer
  - Query of module states
  - Firmware update
  - Alarms (without acknowledgment option)
  - Information about communication
  - PROFINET topology
  - Tag status, writing tags
  - Watch tables
  - Memory usage
  - User pages
  - Data logs (if used)
  - Online backup and restoration of the configuration.
  - Diagnostic information for the motion control technology objects
  - Display of trace recordings stored on the SIMATIC memory card
  - Readout service data
  - Basic Web pages
  - Display of the Web server in 3 project languages, for example, comments and message texts
  - Recipes
  - User-defined Web pages
- Integrated technology:
  - Motion Control

    The Motion Control functionality uses technology objects to support speed-controlled axes, positioning axes, synchronous axes, external encoders, cams, cam tracks and measuring inputs, as well as PLCopen blocks for programming the motion control functionality.
    You can find a detailed description of the use of Motion Control and its configuration in the S7-1500 Motion Control (http://support.automation.siemens.com/WW/view/en/109739589) function manual.
    You can also use the TIA Selection Tool (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool) or the SIZER (http://w3.siemens.com/mcms/mc-solutions/en/engineering-software/drive-design-tool-sizer/Pages/drive-design-tool-sizer.aspx) to create or configure axes.
  - Integrated closed-loop control functionality

    - PID Compact (continuous PID controller)

    - PID 3Step (step controller for integrating actuators)

    - PID Temp (temperature controller for heating and cooling with two separate actuators)

- Trace functionality:
  - Trace functionality supports you in troubleshooting and optimizing the user program, especially for motion control or closed-loop control applications. Trace only supports saves measurements on a SIMATIC memory card.
    You will find additional information on "Trace" in the Using the trace and logic analyzer function (http://support.automation.siemens.com/WW/view/en/64897128) function manual.
- Integrated system diagnostics:
  - The alarms for the system diagnostics are automatically created by the system and displayed on a PG/PC, HMI device or the Web server. System diagnostics information is also available when the CPU is in STOP mode.
- Integrated security:
  - Know-how protection

    The assignment of passwords protects user blocks against unauthorized access and modifications.
  - Copy protection

    Copy protection links user blocks to the serial number of the SIMATIC memory card or to the serial number of the CPU. User programs cannot run without the corresponding SIMATIC memory card or CPU.
  - Access protection

    Extended access protection provides high-quality protection against unauthorized configuration changes. You can use authorization levels to assign separate rights to different user groups.
  - Integrity protection

    The system protects the data transferred to the CPU against manipulation. The CPU detects erroneous or manipulated engineering data.

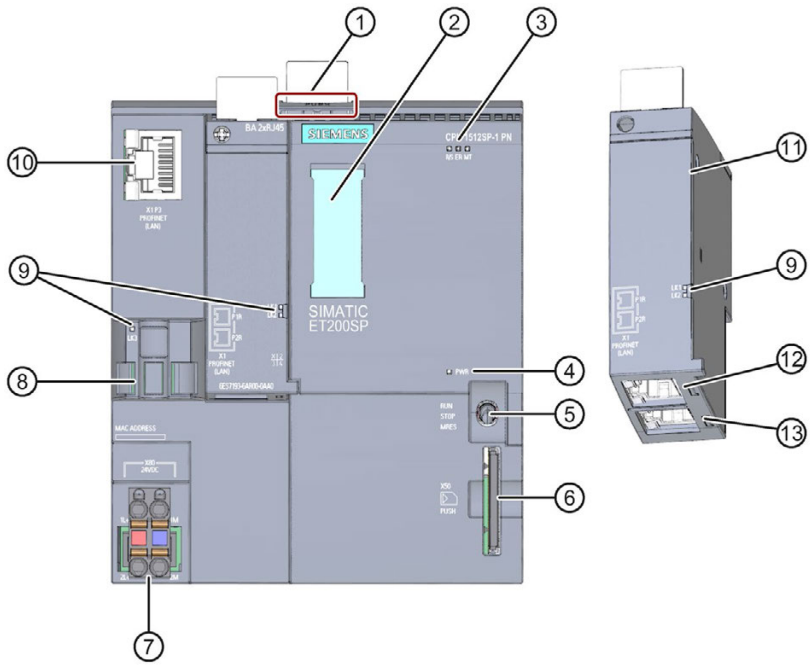
    You can find additional information on the topic of "Protection" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).
- Support for ET 200AL
  - Simple connection of IP 65/67 I/O modules to the CPU.
- Communication CPs
  - CP 1542SP-1: Flexible expansion of the ET 200SP system with an additional Ethernet interface; network separation.
  - CP 1542SP-1 IRC: Seamless data recording with time stamping, support for standardized telecontrol protocols DNP3 and IEC.
  - CP 1543SP-1 ISEC: With the integrated security functions firewall (Stateful Inspection) and VPN protocol (IPSec), the communications processor protects ET200SP stations and subordinate networks against unauthorized access, and employs encryption to protect data transmission against manipulation and espionage.

- Address space
  - A larger address space of 2560 bytes (2048 bytes for ET 200SP module + 512 bytes for ET 200AL modules) is available within the station.
- CPU 1512SP-1 PN supports the following additional functions:
  - PROFIenergy
    You can find information on the topic of "PROFIenergy" in the PROFINET function manual (https://support.industry.siemens.com/cs/ww/en/view/49948856) and in the PROFINET specification on the Internet (http://www.profibus.com).
  - Shared device
    You can find information on the topic of "Shared device" in the PROFINET function manual (https://support.industry.siemens.com/cs/ww/en/view/49948856).
  - Configuration control
    You can find information on the topic of "Configuration control" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).
  - Isochronous mode
    You can find information about the "Isochronous mode" topic in the PROFINET (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

2.4 Operating and display elements

2.4.1 Front view of the module with BusAdapter

The figure on the left shows the CPU 1512SP-1 PN including a plugged BA 2xRJ45 BusAdapter. The figure on the right shows a separate view of the BA 2xRJ45 BusAdapter.



①	Mounting rail release
②	Labeling strips
③	LEDs for status and error displays
④	LED for display of the supply voltage
⑤	Mode switch
⑥	Slot for the SIMATIC memory card
⑦	Connection for supply voltage (included in product package)
⑧	Cable support and attachment for port P3 of the PROFINET interface
⑨	LEDs for status displays of the PROFINET interface: LK1 and LK2 on BusAdapter, LK3 on CPU
⑩	Port P3 of the PROFINET interface: RJ45 socket
⑪	Separate view of the BusAdapter
⑫	Port P1 R of the PROFINET interface: RJ45 socket on BusAdapter BA 2×RJ45 R: Ring port for configuring a ring topology with media redundancy
⑬	Port P2 R of the PROFINET interface: RJ45 socket on BusAdapter BA 2×RJ45 R: Ring port for configuring a ring topology with media redundancy

Figure 2-2 Front view of the CPU 1512SP-1 PN with BusAdapter

2.5 Mode switch

Use the mode switch to set the CPU operating mode.

The following table shows the position of the switch and the corresponding meaning.

Table 2- 2 Mode switch settings

Position	Meaning	Explanation
RUN	RUN mode	The CPU is executing the user program.
STOP	STOP mode	The user program is not being executed.
MRES	Memory reset	Position for CPU memory reset.

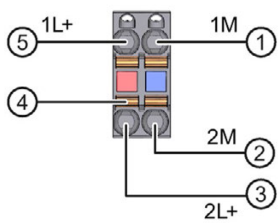
Wiring 3

This section provides information on the pin assignment of the individual interfaces and the block diagram of the CPU 1512SP-1 PN.

24 V DC supply voltage (X80)

The connector for the supply voltage is plugged in when the CPU ships from the factory.

The figure below shows the pin assignment for 24 V DC supply voltage.



① Ground of the supply voltage
② Ground of the supply voltage for loop-through (maximum of 10 A permitted)
③ +24 V DC of the supply voltage for loop-through (maximum of 10 A permitted)
④ Spring NC contacts
⑤ + 24 V DC of the supply voltage

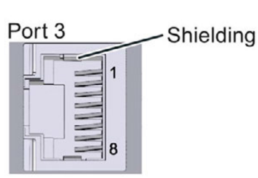
Internally jumpered:
① and ②
③ and ⑤

Figure 3-1 Supply voltage connection

PROFINET IO interface on the CPU (X1 P3)

The assignment corresponds to the Ethernet standard for an RJ45 connector.

- When autonegotiation is deactivated, the RJ45 socket is allocated as a switch (MDI-X).
- If autonegotiation is activated, then autocrossing is active and the RJ45 socket has either a device assignment (MDI) or switch assignment (MDI-X).



PROFINET IO interface on the BusAdapter BA 2xRJ45 (X1 P1 R and X1 P2 R)

The assignment at the BA 2xRJ45 BusAdapter corresponds to the Ethernet standard for an RJ45 connector.

Reference

You can find additional information on the topics of "Connecting the CPU" and "Accessories/spare parts" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Assignment of the MAC addresses

The MAC address is a globally unique device identifier that is assigned to each PROFINET device in the factory. Its 6 bytes are divided into 3 bytes for the manufacturer ID and 3 bytes for the device ID (serial number). The front of the CPU 1512SP-1 PN is lasered with the MAC address of the PROFINET interface.

The PROFINET interface (X1) of the CPU 1512SP-1 PN has three ports. Port 3 is located on the CPU. Ports 1 and 2 are located on the optional BusAdapter. In addition to the PROFINET interface, each PROFINET port also has a separate MAC address. There is therefore a total of four MAC addresses for the CPU 1512SP-1 PN.

The MAC addresses of the PROFINET ports are needed for the LLDP protocol, for example for the neighborhood discovery function.

The table below shows how the MAC addresses are assigned.

Table 3- 9 Assignment of the MAC addresses

	Assignment
MAC address 1	PROFINET interface X1 • Visible in STEP 7 for accessible devices • Lasered on the front of the CPU (start of the number range)
MAC address 2	Port X1 P1 R (required for LLDP, for example)
MAC address 3	Port X1 P2 R (required for LLDP, for example)
MAC address 4	Port X1 P3 (required for LLDP, for example)

Interrupts, error messages, diagnostics and system alarms

4

The status and error displays of the CPU 1512SP-1 PN are described below.

You will find additional information on "Interrupts" in the STEP 7 online help.

You can find additional information on the topics of "Diagnostics" and "System alarms" in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

4.1 Status and error display of the CPU

LED displays

⑤ POWER LED (green LED)
⑥ LINK RX/TX LED for port X1 P3 (green LED on CPU)

Figure 4-1 LED displays on the CPU and BusAdapter

Meaning of the POWER, RUN/STOP, ERROR and MAINT LEDs

CPU 1512SP-1 PN features an LED for monitoring the supply voltage of the electronics (PWR) and three LEDs for displaying the current operating and diagnostics status. The following table shows the meaning of the various combinations of colors for the POWER, RUN/STOP, ERROR and MAINT LEDs.

Table 4- 1 Meaning of the LEDs

POWER LED	RUN/STOP LED	ERROR LED	MAINT LED	Meaning
LED off	LED off	LED off	LED off	Missing or insufficient supply voltage on the CPU.
LED lit green	LED off	LED flashes red	LED off	An error has occurred.
LED lit green	LED lit green	LED off	LED off	CPU is in RUN mode.
LED lit green	LED lit green	LED flashes red	LED off	A diagnostics event is pending.
LED lit green	LED lit green	LED off	LED lit yellow	Maintenance demanded for the plant. The affected hardware must be checked/replaced within a short period of time. Active Force job PROFIenergy pause
LED lit green	LED lit green	LED off	LED flashes yellow	Maintenance required for the plant. The affected hardware must be checked/replaced within a foreseeable period of time. Bad configuration
LED lit green	LED lit yellow	LED off	LED flashes yellow	Firmware update successfully completed.
LED lit green	LED lit yellow	LED off	LED off	CPU is in STOP mode.
LED lit green	LED lit yellow	LED flashes red	LED flashes yellow	The program on the SIMATIC memory card is causing an error. CPU defective
LED lit green	LED flashes yellow	LED off	LED off	CPU is performing internal activities during STOP, e.g. startup after STOP. Download of the user program from the SIMATIC memory card
LED lit green	LED flashes yellow/green	LED off	LED off	Startup (transition from RUN → STOP)
LED lit green	LED flashes yellow/green	LED flashes red	LED flashes yellow	Startup (CPU booting) Test of LEDs during startup, inserting a module. LED flashing test

Meaning of the LINK LED

Each port has a LINK LED (LK1, LK2, LK3). The table below shows the various "LED scenarios" of ports for the CPU 1512SP-1 PN.

Table 4- 2 Meaning of the LEDs

LINK LED	Meaning
□ LED off	There is no Ethernet connection between the PROFINET interface of the PROFINET device and the communication partner. No data is currently being sent/received via the PROFINET interface. There is no LINK connection.
LED flashes green	The "LED flashing test" is being performed.
■ LED lit green	There is an Ethernet connection between the PROFINET interface of your PROFINET device and a communication partner.

Technical specifications 5

	6ES7512-1DK01-0AB0
General information	
Product type designation	CPU 1512SP-1 PN
Hardware function version	FS03
Firmware version	V2.0
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V14
Configuration control	
Via data record	Yes
Operator controls	
Mode selector	1
Supply voltage	
Type of supply voltage	24 V DC
Low limit of permitted range (DC)	19.2 V
High limit of permitted range (DC)	28.8 V
Reverse polarity protection	Yes
Power and voltage failure buffering	
Power/voltage failure buffer time	5 ms
Input current	
Current consumption (rated value)	0.6 A
Inrush current, max.	4.7 A; rated value
I^2t	0.14 A^2s
Power	
Incoming power to the backplane bus	8.75 W
Power loss	
Power loss, typ.	5.6 W
Memory	
Number of slots for SIMATIC memory card	1
SIMATIC memory card required	Yes
Work memory	
Integrated (for program)	200 KB
Integrated (for data)	1 MB
Load memory	
Plug-in (SIMATIC memory card), max.	32 GB
Buffering	
Maintenance-free	Yes

	6ES7512-1DK01-0AB0
CPU processing times	
For bit operations, typ.	48 ns
For word operations, typ.	58 ns
For fixed-point arithmetic, typ.	77 ns
For floating-point arithmetic, typ.	307 ns
CPU blocks	
Number of elements (total)	2000; blocks (OB/FB/FC/DB) and UDTs
DB	
Number range	1 ... 60 999; divided into: Number range that can be used by user: 1 ... 59 999 and number range for DBs generated by SFC 86: 60 000 ... 60 999
Size, max.	1 MB; for absolutely addressed DBs, the max. size is 64 KB
FB	
Number range	0 ... 65 535
Size, max.	200 KB
FC	
Number range	0 ... 65 535
Size, max.	200 KB
OB	
Size, max.	200 KB
Number of free-cycle OBs	100
Number of time-of-day interrupt OBs	20
Number of time-delay interrupt OBs	20
Number of cyclic interrupt OBs	20
Number of hardware interrupt OBs	50
Number of DPV1 interrupt OBs	3
Number of isochronous mode OBs	1
Number of technology synchronous interrupt OBs	2
Number of startup OBs	100
Number of asynchronous error OBs	4
Number of synchronous error OBs	2
Number of diagnostic interrupt OBs	1
Nesting depth	
Per priority class	24
Counters, timers and their retentivity	
S7 counters	
Quantity	2048
Retentivity	
• can be set	Yes

	6ES7512-1DK01-0AB0
IEC counters	
Quantity	Any (only limited by the work memory)
Retentivity	
• can be set	Yes
S7 timers	
Quantity	2048
Retentivity	
• can be set	Yes
IEC timers	
Quantity	Any (only limited by the work memory)
Retentivity	
• can be set	Yes
Data areas and their retentivity	
Total retentive data area (including timers, counters, bit memories), max.	128 KB; for bit memories, timers, counters, DBs and technological data (axes), usable retentive memory: 88 KB
Bit memory	
Number, max.	16 KB
Number of clock memories	8; there are 8 clock memory bits, grouped in one clock memory byte
Data blocks	
Retentivity can be set	Yes
Retentivity preset	No
Local data	
Per priority class, max.	64 KB; max. 16 KB per block
Address area	
Number of IO modules	2048; max. number of modules/submodules
I/O address area	
Inputs	32 KB; all inputs are in the process image
Outputs	32 KB; all outputs are in the process image
Of which per integrated IO subsystem	
• Inputs (volume)	8 KB
• Outputs (volume)	8 KB
Of which per CM/CP	
• Inputs (volume)	8 KB
• Outputs (volume)	8 KB
Process image partitions	
Number of process image partitions, max.	32
Address space per module	
Address space per module, max.	288 bytes; for both input and output data

	6ES7512-1DK01-0AB0
Address space per station	
Address space per station, max.	2560 bytes; for central inputs and outputs; depending on configuration; 2048 bytes for ET 200SP modules + 512 bytes for ET 200AL modules
Hardware configuration	
Number of distributed IO systems	32; a distributed IO system is understood to mean the integration of distributed I/O via PROFINET or PROFIBUS communication modules as well as the connection of I/O via AS-i master modules or links (e.g. IE/PB link)
Number of DP masters	
Via CM	1
Number of IO controllers	
Integrated	1
Via CM	0
Rack	
Modules per rack, max.	80; CPU + 64 modules + server module (configuration width max. 1 m) + 16 ET 200AL modules
Number of rows, max.	1
PtP CM	
Number of PtP CMs	The number of PtP CMs that can be connected is only limited by the available slots
Time	
Clock	
Type	Hardware clock
Backup duration	6 wk; at 40 °C ambient temperature, typ.
Deviation per day, max.	10 s; typ.: 2 s
Operating hours counter	
Quantity	16
Time-of-day synchronization	
Supported	Yes
On DP, master	Yes; via CM DP module
On DP, slave	Yes; via CM DP module
In AS, master	Yes
In AS, slave	Yes
On Ethernet via NTP	Yes
Interfaces	
Number of PROFINET interfaces	1
Number of PROFIBUS interfaces	1; via CM DP module
With optical interface	Yes; via BusAdapter
1st interface	

	6ES7512-1DK01-0AB0
Interface hardware	
Number of ports	3; 1st integrated + 2nd via BusAdapter
Integrated switch	Yes
RJ45 (Ethernet)	Yes; X1 P3; opt. X1 P1 and X1 P2 via BusAdapter BA 2xRJ45
BusAdapter (PROFINET)	Yes; usable BusAdapters: BA 2x RJ45, BA 2x FC, BA 2x SCRJ, BA SCRJ / RJ45, BA SCRJ / FC, BA 2x LC, BA LC / RJ45, BA LC / FC
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	Yes
PROFINET IO controller	
Services	
• PG/OP communication	Yes
• S7 routing	Yes
• Isochronous mode	Yes
• Open IE communication	Yes
• IRT	Yes
• MRP	Yes; as MRP redundancy manager and/or MRP client; max. number of devices in the ring: 50
• MRPD	Requirement: IRT
• PROFIenergy	Yes
• Prioritized startup	Yes; max. 32 PROFINET devices
• Number of connectable IO devices, max.	128; a total of up to 512 distributed I/O devices can be connected via AS-i, PROFIBUS or PROFINET
• of these, IO devices with IRT, max.	64
• Number of connectable IO devices for RT, max.	128
• of these, in a line topology, max.	128
• Number of IO devices that can be activated/deactivated simultaneously, max.	8; in total over all interfaces
• Number of IO devices per tool, max.	8
• Update times	The minimum value of the update time also depends on the communication allocation setting for PROFINET IO, the number of IO devices and the amount of configured user data

	6ES7512-1DK01-0AB0
Update time with IRT	
• With send clock of 250 μs	250 μs to 4 ms; note: with IRT with isochronous mode, the minimum update time of 500 μs of the isochronous OB is decisive
• With send clock of 500 μs	500 μs to 8 ms
• With send clock of 1 ms	1 ms to 16 ms
• with send clock of 2 ms	2 ms to 32 ms
• with send clock of 4 ms	4 ms to 64 ms
• with IRT and "odd" send clock parameter assignment	Update time = set "odd" send clock (any multiple of 125 μs: 375 μs, 625 μs to 3 875 μs)
Update time with RT	
• With send clock of 250 μs	250 μs to 128 ms
• With send clock of 500 μs	500 μs to 256 ms
• With send clock of 1 ms	1 ms to 512 ms
• with send clock of 2 ms	2 ms to 512 ms
• with send clock of 4 ms	4 ms to 512 ms
PROFINET IO device	
Services	
• PG/OP communication	Yes
• S7 routing	Yes
• Isochronous mode	No
• Open IE communication	Yes
• IRT	Yes
• MRP	Yes
• MRPD	Yes; requirement: IRT
• PROFIenergy	Yes
• Shared device	Yes
• Number of IO controllers with shared device, max.	4
2nd interface	
Interface hardware	
Number of ports	1
RS 485	Yes; via CM DP module
Protocols	
PROFIBUS DP master	Yes
PROFIBUS DP slave	Yes
SIMATIC communication	Yes

	6ES7512-1DK01-0AB0
Interface hardware	
RJ45 (Ethernet)	
100 Mbps	Yes
Autonegotiation	Yes
Autocrossing	Yes
Industrial Ethernet status LED	Yes
RS 485	
Transmission rate, max.	12 Mbps
Protocols	
Number of connections	
Number of connections, max.	128
Number of connections reserved for ES/HMI/Web	10
Number of connections via integrated interfaces	88
Number of connections per CP/CM	32
Number of S7 routing connections	16
SIMATIC communication	
S7 communication, as server	Yes
S7 communication, as client	Yes
User data per job, max.	See online help (S7 communication, user data size)
Open IE communication	
TCP/IP	Yes
• Data length, max.	64 KB
• Multiple passive connections per port, supported	Yes
ISO-on-TCP (RFC1006)	Yes
• Data length, max.	64 KB
UDP	Yes
• Data length, max.	1472 bytes
DHCP	No
SNMP	Yes
DCP	Yes
LLDP	Yes
Web server	
HTTP	Yes; standard and user-defined pages
HTTPS	Yes; standard and user-defined pages

	6ES7512-1DK01-0AB0
PROFIBUS DP master	
Number of connections, max.	48
Services	
• PG/OP communication	Yes
• S7 routing	Yes
• Data record routing	Yes
• Isochronous mode	No
• Constant bus cycle time	No
• Number of DP slaves	125; a total of up to 512 distributed I/O devices can be connected via AS-i, PROFIBUS or PROFINET
• Activation/deactivation of DP slaves	Yes
OPC UA	
OPC UA server	Yes; Data Access (Read, Write, Subscribe), Runtime license required
• Application authentication	Yes
• Security Policies	Available Security Policies: None, Basic128Rsa15, Basic256Rsa15, Basic256Sha256
• User authentication	"Anonymous" or with user name and password
Additional protocols	
MODBUS	Yes; MODBUS TCP
Media redundancy	
Switchover time in the case of cable break, typ.	200 ms; with MRP; bumpless with MRPD
Number of devices in the ring, max.	50
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes; only with PROFINET; with a minimum OB 6x cycle of 625 µs
S7 signaling functions	
Number of stations that can be logged in for signaling functions, max.	32
Block-related alarms	Yes
Number of configurable interrupts, max.	5000
Number of simultaneously active interrupts in interrupt pool	
• Number of reserved user interrupts	300
• Number of reserved interrupts for system diagnostics	100
• Number of reserved interrupts for motion control technology objects	80

	6ES7512-1DK01-0AB0
Test/commissioning functions	
Shared commissioning (Team Engineering)	Yes; parallel online access possible for up to 3 engineering systems
Status block	Yes; up to 8 simultaneously (in total over all ES clients)
Single-step	No
Status/modify	
Status/modify tag	Yes
Tags	Inputs/outputs, bit memory, DB, peripheral inputs/outputs, timers, counters
Number of tags, max.	
• Of which are status tags, max.	200; per job
• Of which are modify tags, max.	200; per job
Forcing	
Forcing	Yes
Forcing, tags	Peripheral inputs/outputs
Number of tags, max.	200
Diagnostics buffer	
Available	Yes
Number of entries, max.	1000
• Of which are power failure-proof	500
Traces	
Number of configurable traces	4; up to 512 KB data possible per trace
Interrupts/diagnostics/status information	
Diagnostics display LED	
RUN/STOP LED	Yes
ERROR LED	Yes
MAINT LED	Yes
Monitoring of the supply voltage (PWR LED)	Yes
Connection display LINK TX/RX	Yes
Supported technology objects	
Motion control	Yes; note: the number of axes affects the cycle time of the PLC program; selection guide via the TIA Selection Tool or SIZER
• Number of available motion control resources for technology objects (except cams)	800
• Required Motion Control resources	
– per speed-controlled axis	40
– per positioning axis	80
– per synchronous axis	160
– per external encoder	80
– per output cam	20
– per cam track	160
– per measuring input	40

	6ES7512-1DK01-0AB0
Controller	
• PID_Compact	Yes; universal PID controller with integrated optimization
• PID_3Step	Yes; PID controller with integrated optimization for valves
• PID temp	Yes; PID controller with integrated optimization for temperature
Counting and measuring	
• High-speed counter	Yes
Standards, approvals, certificates	
Suitable for safety functions	No
Highest safety class achievable in safety mode	
Performance level according to EN ISO 13849-1:2008	None
SIL according to IEC 61508	No
Ambient conditions	
Ambient temperature during operation	
Horizontal mounting position, min.	0 °C
Horizontal mounting position, max.	60 °C
Vertical mounting position, min.	0 °C
Vertical mounting position, max.	50 °C
Ambient temperature during storage/transport	
Min.	-40 °C
Max.	70 °C
Configuring

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual for the ET 200SP distributed I/O system. Functions that generally relate to the system are described in this manual.

The information contained in this product manual and the system / function manuals enable you put the CPU 1515SP PC (F) into operation.

Basic knowledge required

The system must be operated and used by qualified staff only.
The following knowledge is required:

- Installation guideline for SIMATIC ET 200SP
- Programming with STEP 7
- PC based automation with an S7-1500 software controller and with WinCC Runtime Advanced
- Basic knowledge of PC technology
- Windows Embedded Standard 7 operating system

Scope of validity of the documentation

This documentation is valid for the following devices:

ET 200SP Open Controller	Article number	
	System version WES7 E 32Bit 4GB RAM	System version WES7 P 64Bit 4GB RAM
CPU 1515SP PC	6ES7677-2AA31-0EB0	6ES7677-2AA41-0FB0

Conventions

Conventions STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**

  For answers and solutions concerning automation technology.
- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Information about third-party software updates

This product contains third-party software. Siemens accepts liability with respect to updates/patches for the third-party software only when these are distributed by Siemens in the context of a Software Update Service contract or officially approved by Siemens. Otherwise, updates/patches are installed at the user's own risk. You can find more information about our software update service offer under (http://w3.siemens.com/mcms/topics/en/simatic/licenses/software-update-service/Pages/Default.aspx).

Notes on protecting administrator accounts

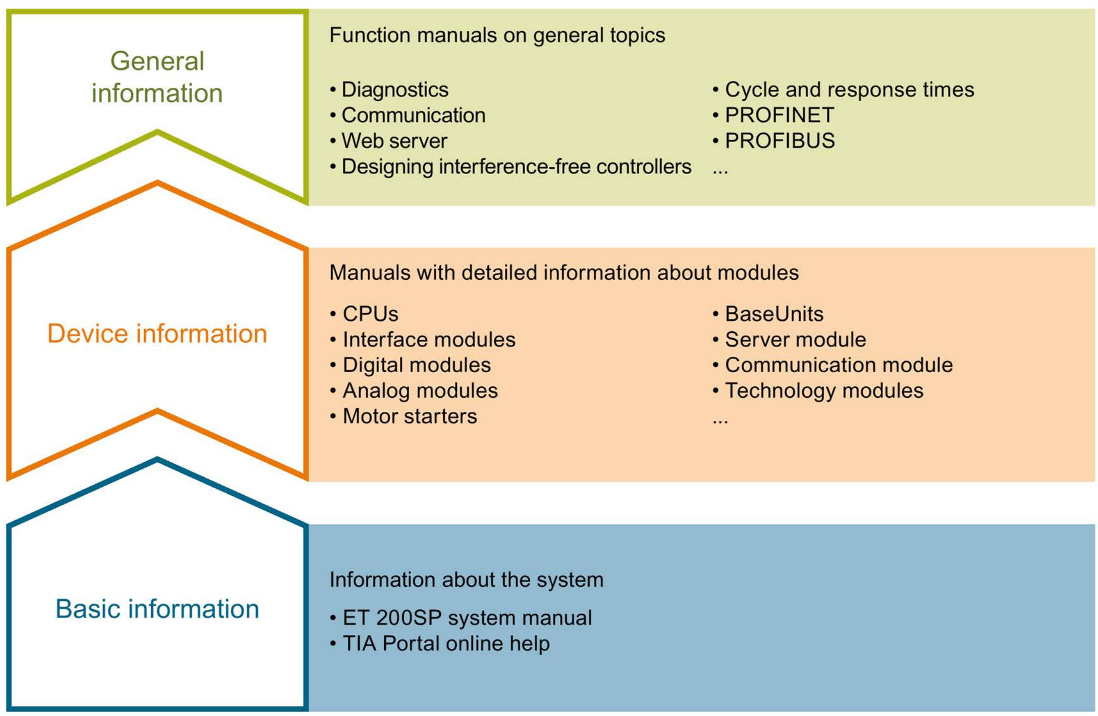
A user with administrator rights has extensive access and manipulation possibilities.

Therefore, make sure that the administrator account is adequately protected to prevent unauthorized changes. To do this, set secure passwords and use a standard user account for regular operation. Other measures, such as the use of security policies, should be applied as required.

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

1.1 Documentation on CPU 1515SP PC (F)

The following additional documentation is required for using the CPU 1515SP PC (F):

- Operating manual S7-1500 software controller (http://support.automation.siemens.com/WW/view/en/109249299)
- System manual WinCC Advanced V14 (http://support.automation.siemens.com/WW/view/en/109742297)
- System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)
- Manual Server module (http://support.automation.siemens.com/WW/view/en/63257531)

2 Safety notes

> **WARNING**
>
> **Life-endangering voltage when control cabinet is open**
>
> If the device is installed in a control cabinet, areas or components can be under life-endangering voltage when the control cabinet is open.
>
> Contact with these areas or components may lead to death through electric shock.
>
> Switch off the power before opening the control cabinet.

If the device is operated in a machine in accordance with the machinery directive, the provisions of the guideline 2006/42/EC apply.

Safe operation of a plant

> **WARNING**
>
> **Risk of fire**
>
> The device is classified for use in the area of Industrial Control Equipment as "Open Type" according to UL508. If overheating occurs, burning material may leak and cause a fire.
>
> For this reason, observe the following information:
>
> - For approval and operation in accordance with UL508, the device must be installed in a housing complying with UL508.
> - Install the device in an enclosure that meets the requirements of sections 4.6 and 4.7.3 of the standards EN 60950-1:2006 and IEC/UL/EN/DIN-EN 60950-1.

If you have questions about the validity of installation in the planned environment, please contact our service representatives.

> **NOTICE**
>
> **Protective measures**
>
> To ensure safe operation of a plant, you have to take suitable IT security measures, for example, network segmentation.
>
> Seal the cover with lead to protect the CFast card with the operating system of the CPU 1515SP PC (F) against unauthorized access.
>
> For more information on Industrial Security, refer to the Internet (http://www.siemens.com/industrialsecurity).

Repairs

WARNING

Damage caused by opening the device

Unauthorized opening of and improper repairs to the device may result in substantial damage to equipment or endanger the user.

Only authorized personnel are permitted to repair the device.

For additional information on repairs, see section Sending the device to customer service (Page 99).

ESD guidelines

Modules containing electrostatic sensitive devices (ESDs) can be identified by the following label:

Strictly follow the guidelines mentioned below when handling modules which are sensitive to ESD:

- Before working with modules with ESD, you need to ensure that you are free of electrostatic charge (e.g. by touching a grounded object).
- All devices and tools must be free of static charge.
- Always pull the mains connector and disconnect the battery before installing or removing modules which are sensitive to ESD.
- Handle modules fitted with ESDs only by their edges.
- Do not touch any connector pins or conductors on modules containing ESDs.

See also

Electromagnetic compatibility (Page 105)

2.1 Notes on use

WARNING

Hazards at an unprotected machine or plant

According to the results of a risk analysis, hazards can occur at an unprotected machine. The hazards may lead to personal injury.

According to the risk analysis, the risk of injury to persons can be countered with the following measures:

- Additional protective equipment at the machine or plant. In this case, the programming, parameter assignment and wiring of the I/O used, in particular, must be performed in accordance with the safety criteria (SIL, PL or Cat.) ascertained by means of an appropriate risk analysis.
- Use of the device for its intended purpose, which can be established by performing a functional test on the plant. This allows errors in programming, parameter assignment and wiring to be detected.
- Documentation of the test results which can be entered, if required, into the relevant safety certificates.

NOTICE

Ambient conditions

Ambient conditions for which the device is not suitable can lead to faults or damage the device.

Note the following:

- Only operate the device in enclosed areas. If you do not comply with this instruction, the warranty becomes void.
- Only operate the device in accordance with the ambient conditions given in the technical specifications.
- Protect the device from dust, moisture and heat.
- Do not expose the device to direct sunlight or other strong sources of light.
- The device must not be used in places with more difficult operating conditions through corrosive vapors or gases without taking additional protective measures, for example, supply of clean air.

Product overview

3

3.1 Fail-safe option

Areas of application

F-CPUs are mainly designed for personal and machine protection. In addition to the safety program, you can also program standard applications. You can operate the F-CPUs in safety mode or in standard mode.

Reference

Information on the use of F-CPUs in safety mode is available in the programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

You can find information on using the CPU 1505SP (F) software controller in the corresponding product manual (https://support.industry.siemens.com/cs/ww/en/view/109740725) and in the F product information (https://support.industry.siemens.com/cs/ww/en/view/109478599).

3.2 Properties

Article number

6ES7677-2xAxx-0xx0

The complete article number depends on the system version and the ordering option.

View of the module

The figure below shows the CPU 1515SP PC.

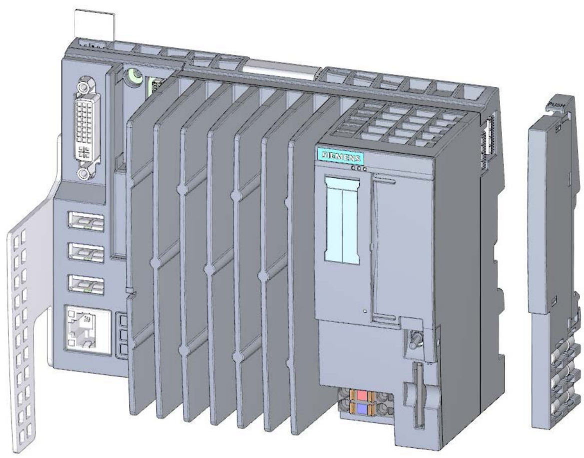


Figure 3-1 CPU 1515SP PC with supplied accessories

Properties

CPU 1515SP PC (F) is a PC based automation device in the design of the ET 200SP. It is used for control and visualization purposes. The supplied IPC DiagBase software provides basic diagnostics functions and supports you in handling the BIOS.

CPU 1515SP PC (F) has the following technical properties:

- A removable CFast card with the following pre-installations is used as storage medium:
  - Windows Embedded Standard 7 operating system
  - S7-1500 Software Controller CPU 1505SP (F)
  - Optionally with HMI: WinCC Runtime Advanced as of V14 SP1
- Interfaces
  - An interface for the exchangeable ET 200SP BusAdapters for connection of PROFINET IO (2 ports)
  - An interface for connecting devices using Industrial Ethernet (Gigabit Ethernet)
  - 3 interfaces for USB devices
  - One DVI-I interface for a monitor
  - A sealable slot for the CFast card
  - A slot for an SD/MMC card as additional optional drive
- Supply voltage 1L+ 24 V DC (SELV/PELV). The connection plug is included in the scope of delivery.
- CPU 1515SP PC (F) is designed for use in industrial environment:
  - Compact design
  - Fan-less operation
  - High robustness
- The CPU 1515SP PC (F) is approved for the degree of protection IP20 and for the installation in a control cabinet.

System versions and ordering options

CPU 1515SP PC, spare part, without CFast card, without software			6ES7677-2AA40-0AA0

3.3 Sample configuration

Configuration

CPU 1515SP PC (F) is mounted on the mounting rail according to EN 60715. A modular system is formed with ET 200SP modules in the central rack.

You can use the CPU 1515SP PC (F) as PROFINET IO controller. The PROFINET IO devices are connected with the SIMATIC BusAdapter BA 2xRJ45 via the ports of the interface X1 PN (LAN).

Devices can be connected via Industrial Ethernet using the integrated interface X2 PN/IE (LAN).

The connection to PROFIBUS can be made using the DP master module.

Sample configuration

The figure below shows an example configuration with CPU 1515SP PC (F).

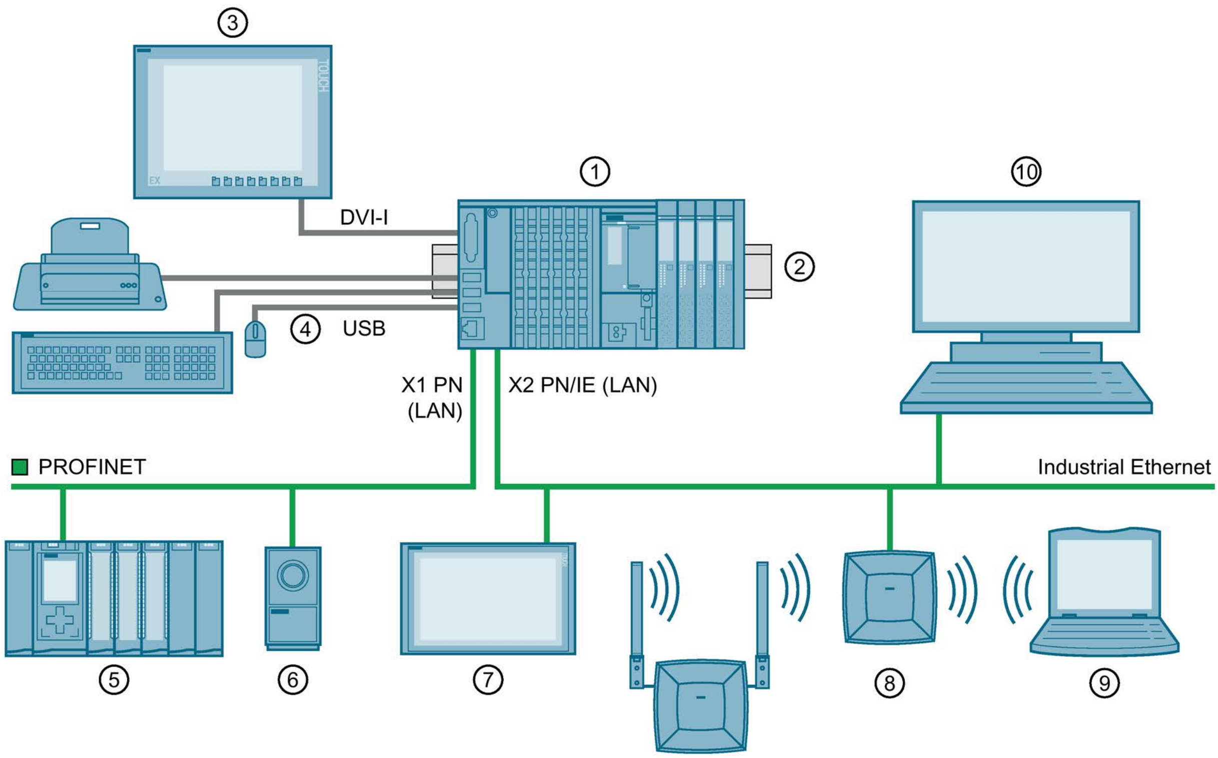

Figure 3-2 Example configuration with the CPU 1515SP PC (F)

① CPU 1515SP PC (F), I/O module, server module

3.6 Operator controls and display elements

Front view of the module

The figure below shows the operator control and connection elements of the CPU 1515SP PC (F).

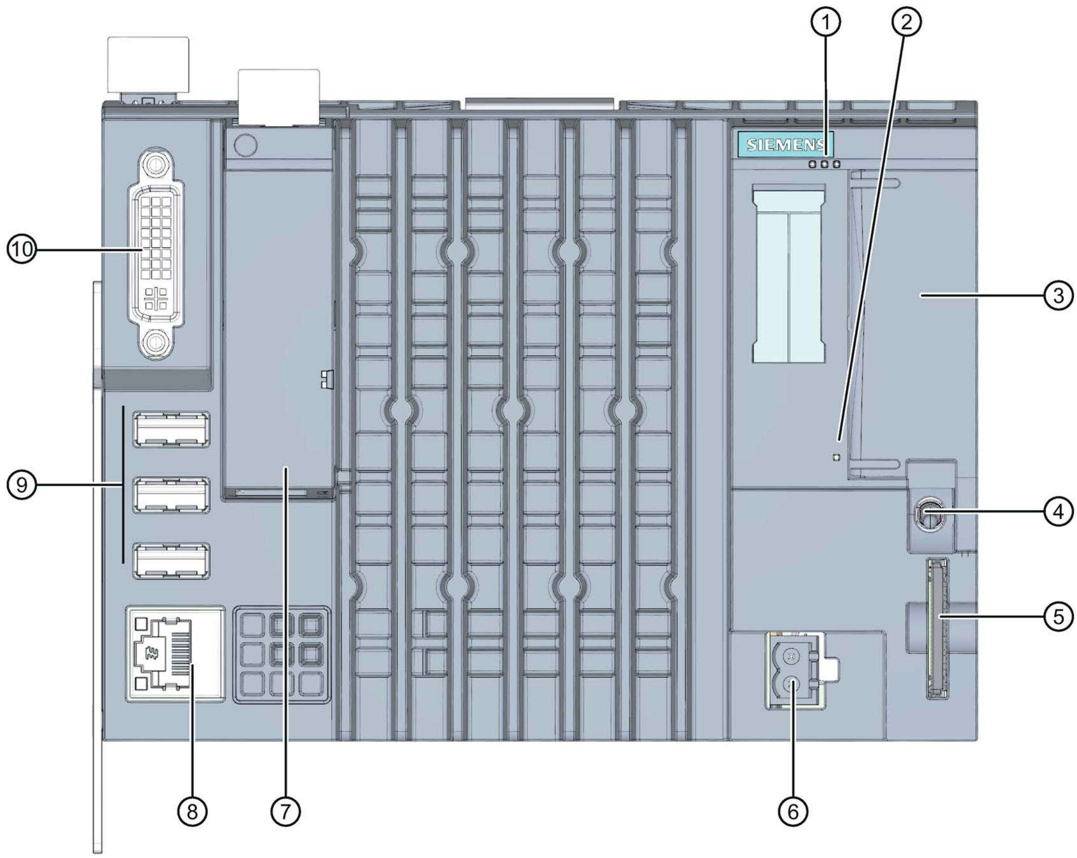

Figure 3-4 View of the CPU 1515SP PC (F)

①	LED displays for the current operating mode and diagnostic status of the CPU	
②	Power LED	
③	**X50:**	Slot for the CFast card (flash memory), sealable
④	Mode selector	
⑤	**X51:**	Slot for an optional SD/MMC card
⑥	**X80:**	Connector for 24 V DC supply voltage
⑦	**X1 PROFINET (LAN):**	Slot for BusAdapter for connection of PROFINET IO; status display for PROFINET
⑧	**X2 PN/IE (LAN):**	GbE Ethernet connection with integrated display
⑨	**X60, X61, X62:**	3 USB connections
⑩	**X70 DVI-I:**	Connection for monitor

Slot for CFast card

The operating system, Runtime software and project are installed on the supplied SIMATIC CFast card. The CFast card is the only mass storage device of the CPU 1515SP PC (F).

Note

Unauthorized access

Seal the cover of the shaft with lead to protect the CFast card with the operating system of the CPU 1515SP PC (F) against unauthorized access and manipulation.

Slot for SD/MMC card

You can use a SIMATIC SD or MMC card as additional storage drive. This drive can be used to store data via Windows, for example a backup, but not the operating system, the Runtime software or the project.

Permitted SD cards: SDHC up to 32 GB, SDXC up to 2 TB.

USB connections

Two USB high-current (500 mA) interfaces and one low-current (100 mA) interface can be used at the same time.

MAC addresses

The MAC address consists of a 3-byte manufacturer ID and a 3-byte device ID (consecutive number).

Each device is already assigned four MAC addresses in the factory. The front of the CPU 1515SP PC (F) is lasered with the MAC addresses 1 and 4. With the MAC addresses 2 and 3, the consecutive numbers are incremented. If, for example, the first MAC address is 08-00-06-6B-80-C0, the second MAC address is 08-00-06-6B-80-C1.

Table 3- 2 Assignment of the MAC addresses

	Assignment
MAC address 1	X2 PN/IE (LAN) • Visible in STEP 7 for accessible devices • Lasered on the front of the CPU (start of the number range)
MAC address 2	X1 PROFINET (LAN) • Visible in STEP 7 for accessible devices
MAC address 3	Port X1 P1 (required for LLDP, for example)
MAC address 4	Port X1 P2 R (required for LLDP, for example) • Lasered on the front of the CPU (end of the number range)

Connector for supply voltage

CPU 1515SP PC (F) has a 2-pole terminal for the power supply.

The connection plug for the supply voltage is plugged in when the CPU is shipped from the factory.

Mode selector

Use the mode selector to set the CPU operating mode.

Table 3- 3 Mode selector positions

Position	Meaning	Description
RUN	Operating mode RUN[1]	The CPU is processing the user program.
STOP	Operating mode STOP[1]	The CPU is not processing the user program. The outputs are set to a "safe" state.
MRES	Memory reset	**For active S7-1500 software controller**[2] only: CPU memory reset

1 RUN and STOP indicate the **selected** operating state. The LED displays RUN and STOP display the **actual** operating state of the CPU 1515SP PC (F).

2 See the S7-1500 software controller manual

3.7 Scope of delivery

3.7.1 Unpacking the device

When unpacking

When unpacking, make sure to check the following:

- Check packaging and contents for visible damage from transport.
- Check the delivery for completeness.
  Please inform your Siemens contact partner should you determine damages from transport or any irregularities.
- Keep the supplied documentation and licenses. They belong to the device and are the proof that you have purchased the software preinstalled on the CFast card.
  Documentation and licenses are required for initial commissioning and for any questions that arise.
- Keep the original packaging in case the device needs to be transported again.

NOTICE
Damage to the device during transport and storage If a device is transported or stored without packaging, it is unprotected from shocks, vibrations, pressure and moisture. Damaged packaging indicates that environmental conditions have already had a significant impact on the device. The device might be damaged. Do not dispose of the original packaging. Pack the device for transport and storage.

NOTICE
Damage to the device caused by condensation If the device was exposed to low temperatures or extreme variations in temperature during transport, this may cause moisture to build up on or in the device (condensation). Moisture can cause short-circuits in the electrical circuits and damage the device. Proceed as follows to avoid damage: • Store the device in dry conditions. • Make sure it adapts to room temperature before commissioning. • Do not expose the device to direct heat radiation from a heater. • If condensation has developed, wait for approximately 12 hours or until the device is completely dry before you switch it on.

WARNING

Electric shock and fire hazard from damaged device

A damaged device can carry dangerous voltage and trigger a fire in the machine or plant. A damaged device has unpredictable properties and states.

Death or severe injury could occur.

Make sure that the damaged device is not installed and commissioned accidentally. Label the damaged device correspondingly and keep it locked up. Have the device repaired without delay.

Identification data

The identification data can be used to clearly identify the device when a repair is necessary.

Make a note of the following data for your devices:

- The article number of the CPU 1515SP PC (F) is located on the order form.
- Depending on the scope of delivery, the "Certificate-of-License" is included in the license verification for the S7-1500 software controller and for WinCC Runtime Advanced V14 SP1.
- The "Microsoft Windows Product Key" can be found on the "Certificate of Authenticity" label.
- The first and the last MAC addresses are located on the device.

3.7.2 Scope of delivery - System version WES7 E 32Bit 4GB RAM

Note

The designation **CPU 1515SP PC** with the article number 6ES7677-**2AA40-0AA0** is always on the device regardless of the order option.

The following components are included in the scope of delivery of the CPU 1515SP PC:

Order option	CPU 1515SP PC	CPU 1515SP PC (spare part)
Article number	6ES7677-2AA31-0EB0	6ES7677-2AA40-0AA0

4 Installing

4.1 Basics

Introduction

The CPU 1515SP PC (F) is an open operation resource. This means that you may only install it in enclosures, cabinets or electrical operating areas. These housings, cabinets or electrical operating areas must only be accessible with a key or tool. Access may only be possible for instructed or authorized personnel.

Installation location

CPU 1515SP PC (F) must be installed in a suitable enclosure or suitable control cabinet with at least IP54 degree of protection according to EN 60529 and the ambient conditions for the operation of the equipment must be taken into consideration.

Installation position

You can install the ET 200SP distributed I/O system in any position. The preferred mounting position is horizontal mounting on a vertical wall.

The restrictions regarding ambient temperature and maximum configuration apply to the CPU 1515SP PC (F) depending on the mounting position.

> **NOTICE**
>
> **Damage to the modules**
>
> Modules can be damaged if exposed to ambient temperatures higher than permitted.
>
> The following ambient temperatures must not be exceeded during operation:
>
> - Horizontal mounting
>   - 60 °C for an installation with up to 32 I/O modules.
>   - 55 °C for an installation with up to 64 I/O modules.
> - Vertical mounting
>   - 50 °C for an installation with up to 32 I/O modules.

For more detailed information, refer to section Mechanical and climatic ambient conditions (Page 108)

Mounting rail

CPU 1515SP PC (F) is mounted on a mounting rail according to EN 60715 (35 × 7.5 mm and/or 35 × 15 mm).

You must ground the mounting rail separately in the control cabinet. Exception: If you install the rail on grounded, zinc-plated mounting plates, there is no need to ground the rail separately.

Note

If the ET 200SP distributed I/O system is exposed to vibration and shock loads, both ends of the ET 200SP system assembly must be mechanically fixed to the mounting rail (e.g using 8WA1010-1PH01 ground terminals). This measure prevents the ET 200SP from shifting to the side.

Note

If the ET 200SP distributed I/O system is exposed to high vibration and shock load, we recommend that you screw the mounting rail to the mounting surface at intervals of approx. 200 mm.

Suitable surface finishes are:

- Steel strip in accordance with Appendix A of EN 60715 or
- Tinned steel strip. We recommend the use of the mounting rails in section Accessories/spare parts (Page 133).

Note

Mounting rails of other manufacturers

If you use mounting rails from other manufacturers, ensure that they have the properties required for your climatic and mechanical ambient conditions.

Check whether the mounting rails meet the requirements for a protective conductor.

Minimum clearances

Maintain the following minimum clearances when installing or dismantling the CPU 1515SP PC (F).

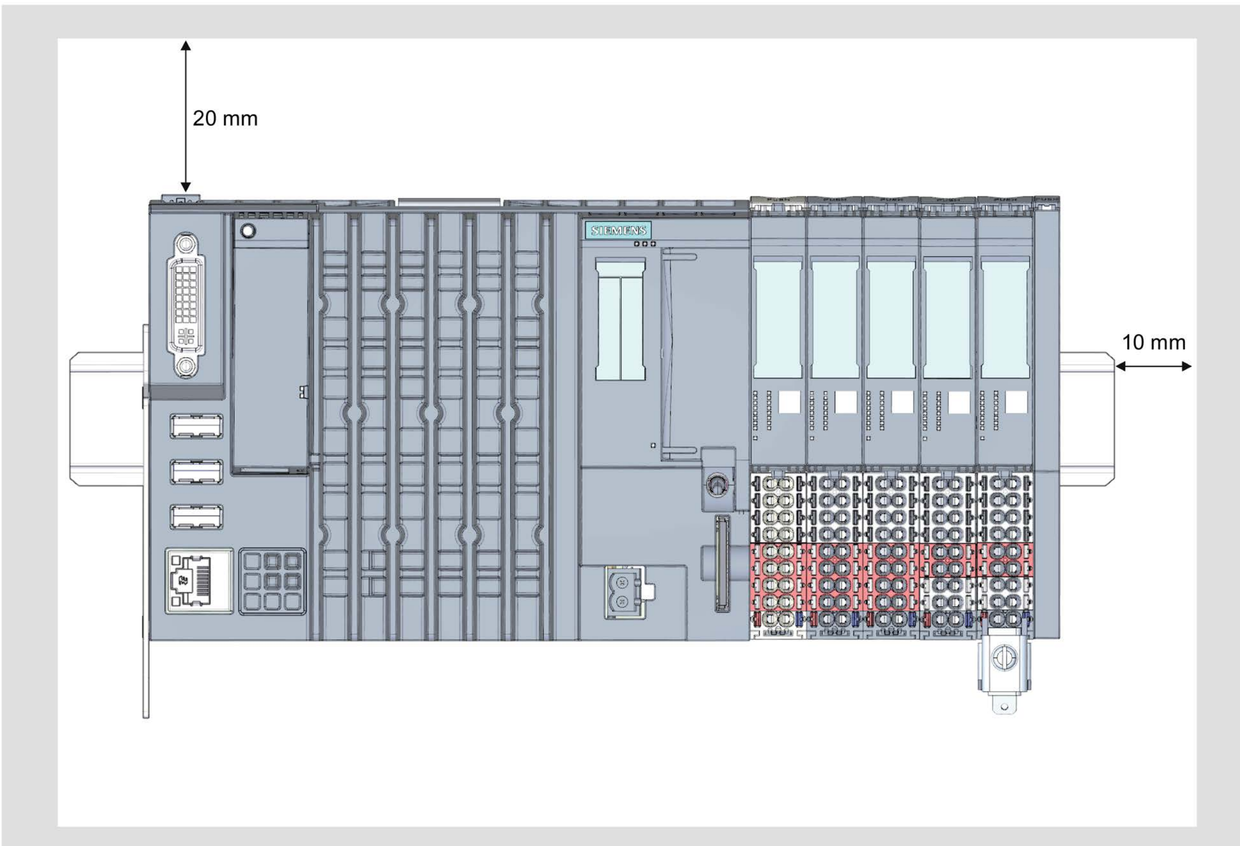

Figure 4-1 Minimum clearances

Installation rules

- After the CPU 1515SP PC (F) there is a BaseUnit BU..D with incoming supply voltage L+ (light terminal box).
- This is followed by BaseUnits BU..B (with dark-colored terminal box).
- The respective corresponding I/O modules can be connected to the BaseUnits. Suitable combinations of BaseUnits and I/O modules can be found in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/84133942).
- The server module completes the installation.

Note

Only install the CPU 1515SP PC (F) when the power supply is switched off.

4.2 Hardware configuration

Maximum mechanical configuration

As soon as one of the following rules applies, the maximum configuration has been reached:

Table 4- 1 Maximum mechanical configuration

Properties	Rule
Number of modules	• Horizontal mounting – 0 to 60 °C ambient temperature: a maximum of 32 I/O modules **and** USB load – 0 to 55 °C ambient temperature: a maximum of 64 I/O modules **and** USB load • Vertical mounting – 0 to 50 °C ambient temperature: a maximum of 32 I/O modules **and** USB load
Backplane bus length	Maximum 1 m mounting width (without CPU 1515SP PC (F), including server module)

Electrical maximum configuration

The number of operable I/O modules of a potential group is limited by the

- Power consumption of the I/O modules
- Power consumption of the components supplied via these I/O modules

The maximum current-carrying capability of the terminals on the BaseUnit L+/ground is 10 A.

USB load

In case of maximum configuration with the CPU 1515SP PC (F), the USB load must also be taken into consideration:

- Horizontal mounting
  - Ambient temperature of 0 to 60 °C with maximum 32 I/O modules **and** 3 x 100 mA USB load
  - Ambient temperature of 0 to 55 °C with maximum 64 I/O modules **and** 2 x 500 mA + 1 x 100 mA USB load
- Vertical mounting
  - Ambient temperature of 0 to 50 °C with maximum 32 I/O modules **and** 3 x 100 mA USB load

Address space

The address space is predefined. However, you can adjust the address space in the user program.

4.3 Installing CPU 1515SP PC (F)

Requirements

The mounting rail is fitted.

Required tools

3 to 3.5 mm screwdriver (only to fix the strain relief and dismantle the BusAdapter)

Fixing strain relief

Fasten the strain relief at the upper and lower left side of the CPU 1515SP PC (F) with the supplied screws.

Installing CPU 1515SP PC (F)

1. Install the CPU on the mounting rail.
2. Swivel the CPU back until you hear the mounting rail release click into place
3. To check that the CPU has correctly clicked into place, pull on the underside of the enclosure.

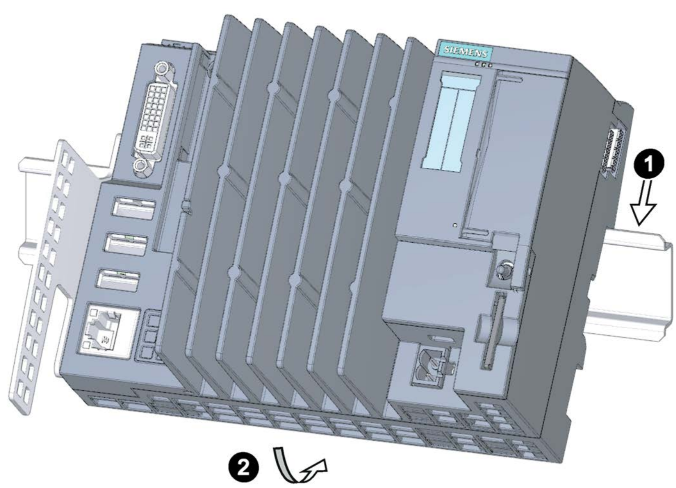

Figure 4-2 Installing CPU 1515SP PC (F)

Disassemble CPU 1515SP PC (F)

The BaseUnits with the I/O modules are located to the left of the CPU 1515SP PC (F):

1. Switch off the supply voltage on the CPU.
2. Press the mounting rail release button on the first BaseUnit and, at the same time, move the CPU in parallel to the left until it comes off the remaining the module group.

   Note: The mounting rail release button is located above the CPU.
3. While pressing the mounting rail release button on the CPU, swivel the CPU out of the mounting rail.

Note

It is not necessary to remove the BusAdapter from the CPU 1515SP PC (F).

Connection 5

5.1 Notes on connection

Note

Rules and regulations for operation

Observe the information contained in the *Wiring* section in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) and in the function manual Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566).

NOTICE
Fault caused by I/O devices The connection of I/O devices can lead to faults on the device. Injury to persons and damage to the machine or plant could result. Note the following when connecting I/O devices: • Read the documentation related to the I/O devices. Follow all instructions given in the documentation. • Only connect I/O devices which are suitable for use in industrial environments according to EN 61000-6-2/EC 61000-6-2. • You may only connect hot-plug capable I/O devices when the power supply is switched off.

Note

Feedback through USB devices

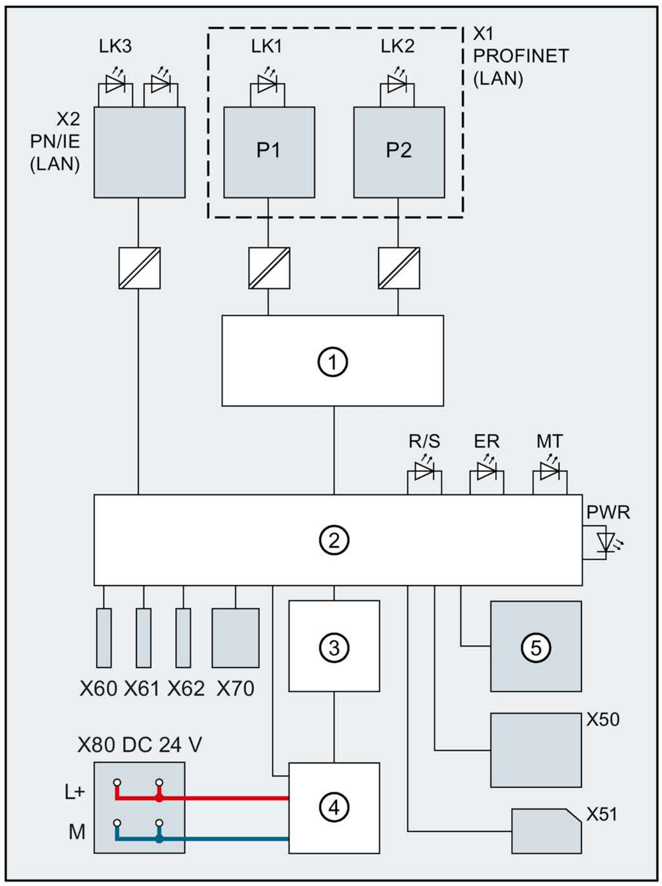
If USB devices are connected which - contrary to the USB 2.0 specification - feed voltage back to the host interface, the startup of the CPU 1515SP PC (F) is not ensured upon power-up.

Regenerative feedback is generally not permitted.

5.2 Terminal and block diagram

Block diagram

The figure below shows the block diagram of the CPU 1515SP PC (F).



①	Switch	X1 PN (LAN)	PROFINET interface X1
②	Electronics	P1	PROFINET interface X1 Port 1
③	Backplane bus interface	P2	PROFINET interface X1 Port 2
④	Internal supply voltage	L+	24 V DC supply voltage
⑤	Mode selector	M	Ground
X50	CFast card	LK1, LK2	LED Link TX/RX
X51	SD/MMC card	LK3	LED Link
X60	USB interface 2.0, 0.5 A	R/S	RUN/STOP LED (yellow/green)
X61, X62	USB interface 2.0, 0.5 A	ER	ERROR LED (red)
X70	DVI-I interface	MT	MAINT LED (yellow)
X80 24 V DC	Infeed of supply voltage	PWR	POWER LED (yellow/green)
X2 PN/IE (LAN)	Ethernet interface X2		

Figure 5-1 Block diagram for CPU 1515SP PC (F)

5.3 Electrical configuration

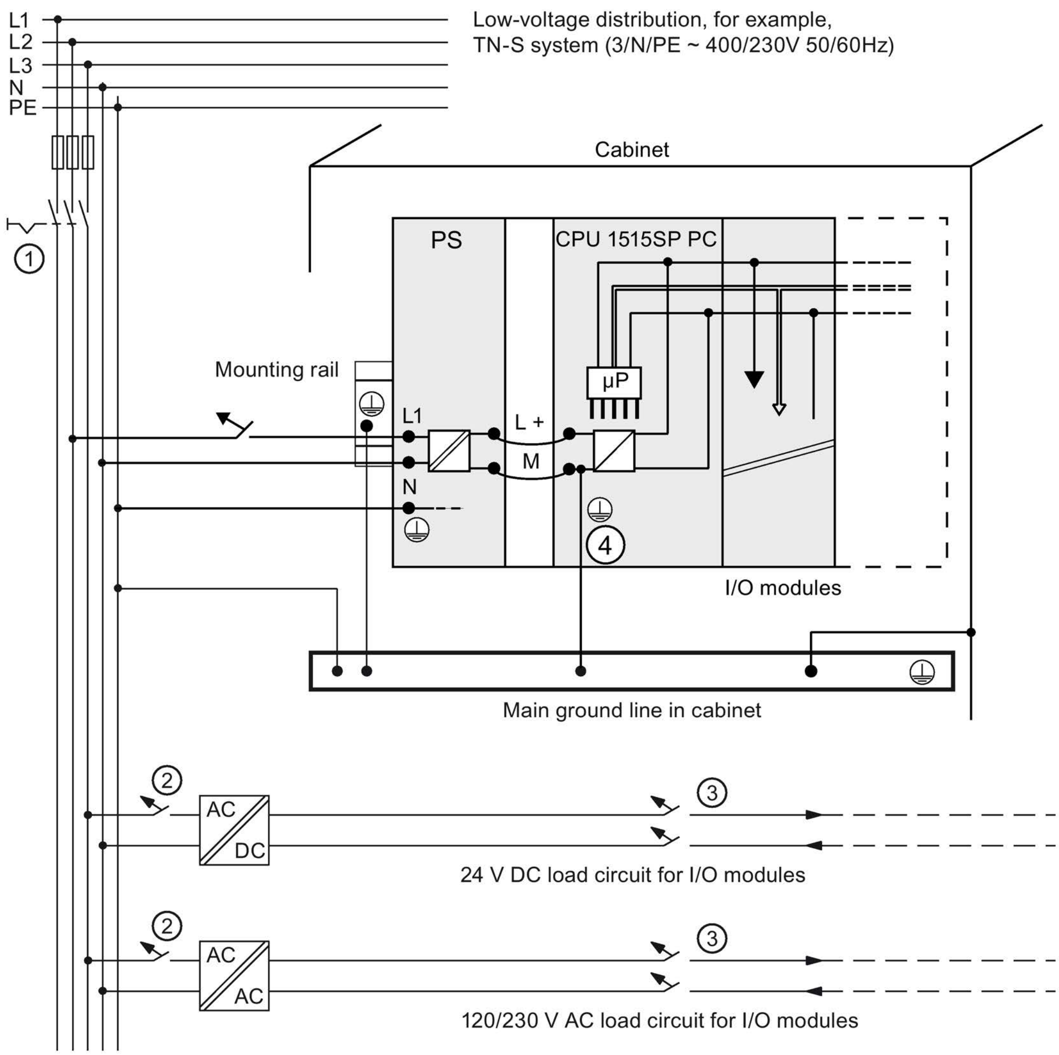
Non-isolated configuration

Note

Unlike the distribution I/O system ET 200SP, only a non-isolated configuration is possible the CPU 1515SP PC (F).

The figure below shows a CPU 1515SP PC (F) in the overall configuration with infeed from a TN-S system. The power supply supplies the CPU 1515SP PC (F) and the load circuits for the 24 V DC modules.

With the CPU 1515SP PC (F) there is a fixed connection between the ground infeed terminal and the contact springs to the mounting rail. You must ground the mounting rail separately in the control cabinet.



① Master switch
② Short-circuit and overload protection
③ Load current supply (galvanic isolation)
④ In the CPU 1515SP PC (F), this connection is automatically established.
The represented layout of the power connections does not correspond to the actual layout; it was chosen for demonstration purposes only.

Figure 5-2 Connecting the load voltage reference potential

5.4 Connecting devices to networks

The following options are available for integrating devices into existing or planned system environments and networks.

Ethernet

You can use the integrated Ethernet interface X2 PN/IE (LAN) (10/100/1000 Mbps) for communication and data exchange with automation devices, for example, SIMATIC S7. Only ASCII characters are permitted in the name of the interface X2 PN/IE (LAN) in the TIA Portal, e.g. PROFINET_2.

You need suitable software to do this: STEP 7, WinCC, SIMATIC NET.

Note

Use a Category 5e Ethernet cable (Cat-5e cable) for operation with 1000 Mbps.

PROFINET

PROFINET operation is possible via the X1 PN (LAN) interface and the approved BusAdapter.

PROFIBUS

The connection to PROFIBUS can be made using the DP master module.

5.5 Securing cables

The strain relief for connection lines prevents the USB and the PROFINET connector coming loose from the CPU 1515SP PC (F). The strain relief is included in the scope of delivery.

⚠ WARNING

Flying sparks due to loose cables

Risk of explosion in hazardous areas.

USB cables and PROFINET connectors may detach from the device in the case of strong oscillation and high vibrating loads.

Attach these cables to the strain relief of the device using cable ties.

Requirements

- The strain relief is fixed to the CPU.
- The CPU is installed.

Procedure

Secure the USB and PROFINET cables to the strain relief using cable ties.

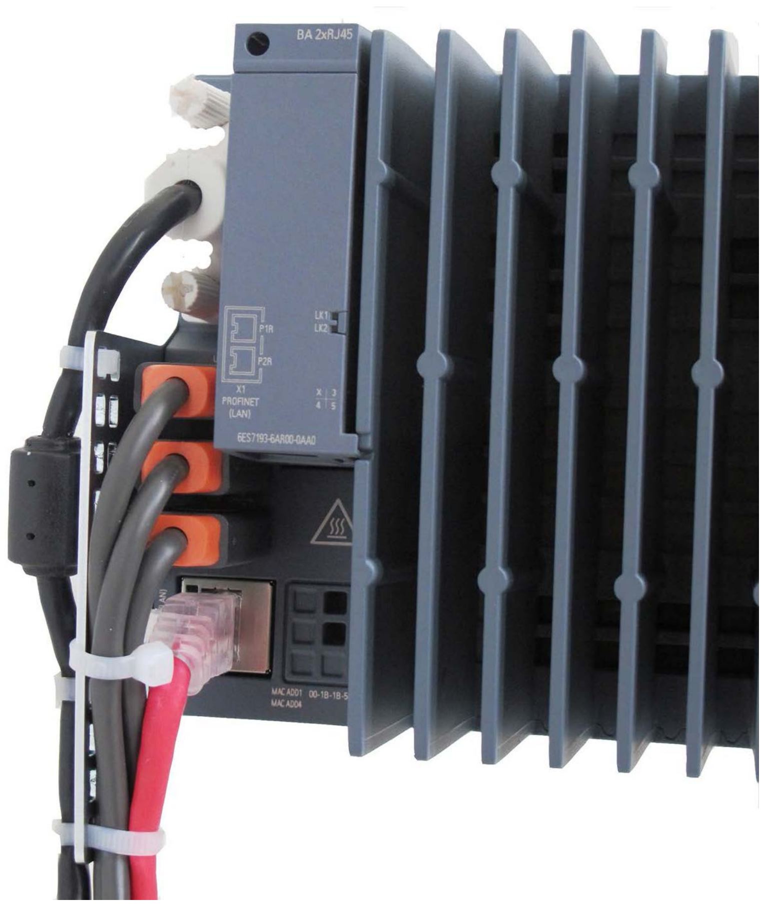


Figure 5-3 Secured cables

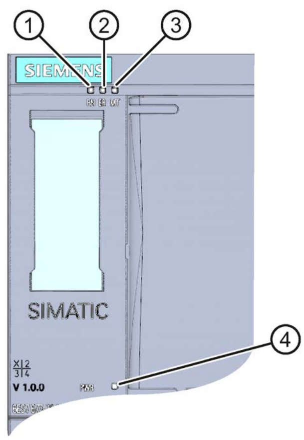
6 Diagnostics, error and system alarm

6.1 Status and error display

LED display

The figure below shows the LED displays of the CPU 1515SP PC (F).



① RUN/STOP LED (yellow/green LED)
② ERROR LED (red LED)
③ MAINT LED (yellow LED)
④ POWER LED (yellow/green LED)

Figure 6-1 LED displays of the CPU 1515SP PC (F).

Meaning of the LED displays with active software controller

CPU 1515SP PC (F) has a display of the current operating state and of the diagnostics status (three LEDs).

The following table shows the meaning of the color combinations of the LED displays in connection with the software controller.

Table 6- 1 Meaning of the LED displays

RUN/STOP LED	ERROR LED	MAINT LED	Meaning
LED off	LED off	LED off	POWER OFF Starting of the CPU 1515SP PC (F) in the "Windows only" mode No power supply. The software controller of the CPU 1515SP PC (F) has not been downloaded or the software controller of the CPU 1515SP PC (F) is in the operating state Power OFF.
LED off	LED flashes red	LED off	An error has occurred.
LED green	LED off	LED off	Software controller of the CPU 1515SP PC (F) is in RUN mode.
LED green	LED flashes red	LED off	A diagnostics event is pending.
LED green	LED off	LED lights up yellow	Maintenance demanded for the plant. The affected hardware must be exchanged within a short period.
LED green	LED off	LED flashes yellow	Maintenance required for the plant. You must exchange the affected hardware within a foreseeable period. Firmware update successfully completed
LED lights up yellow	LED off	LED off	Software controller of the CPU is in the operating state STOP.
LED lights up yellow	LED flashes red	LED flashes yellow	The user program is causing an error. CPU defective
LED flashes yellow	LED off	LED off	CPU is performing internal activities during STOP, e.g. ramp-up after STOP. Loading the user program
LED flashes yellow/green	LED off	LED off	Startup (transition from RUN → STOP)

RUN/STOP LED	ERROR LED	MAINT LED	Meaning
LED flashes yellow/green	LED flashes red	LED flashes yel- low	Startup (CPU booting)
			Test of LEDs during startup, inserting a module.
			LED flashing test

POWER LED

Table 6- 2 POWER LED

POWER LED	Meaning
LED off	No supply voltage or supply voltage too low
LED lights up yellow	Supply voltage present; running through BIOS phase; operating system is shut down
LED green	Supply voltage present; Booting or operation of the operating system

Commissioning 7

7.1 Notes on commissioning

⚠ WARNING
Improper commissioning in hazardous areas
Device failure or risk of explosion in hazardous areas. • Do not commission the device unless it is fully mounted and connected according to the specifications in the section Enhanced Write Filter (EWF) (Page 78). • Before commissioning, please consider the effects on other devices in the plant.

⚠ CAUTION
Hot surfaces
Risk of burns due to hot surfaces. During operation, only touch the device with appropriate protective gloves.

NOTICE
Condensation in the device
Damage to the device due to condensation if the temperature between transport or storage and the installation site differs by more than 20 °C (36 °F). Before commissioning the device, leave it to stand for several hours in the new environment.

NOTICE
Data loss
Data loss may occur if write filters are used incorrectly. Therefore, note the information on write filters. Two write filters are available for configuration under Windows Embedded: • Enhanced Write Filter (Page 78) • File Based Write Filter (Page 82)

7.2 Initial commissioning

Requirements

The following conditions must be met before you commission the open controller for the first time.

- CPU 1515SP PC (F) is mounted.
- The CFast card is inserted.
- No data carriers are connected via USB.
- The following hardware is available: A monitor, a USB keyboard, a USB mouse

Procedure

1. Connect a monitor via a DVI-I cable.
2. Connect a keyboard and a mouse to the CPU via USB.
3. Connect the power supply.

   → The PWR LED lights up yellow first, then green.

   → The device carries out the hardware initialization.
4. Wait until the Siemens logo disappears from the screen.
5. Follow the instructions on the screen to configure the device

NOTICE
Faulty installation If you change the default values in the BIOS Setup or switch off the device during the installation, the installation will be disrupted and the operating system will not be installed correctly. The operational reliability of the device and the plant is endangered. Do not switch of the device during the entire installation process. Do not change the default values in the BIOS Setup.

Result

- The WES7 operating system is installed.
- WES7 P: The Multitouch functions are available.
- The operating system's start screen is displayed after each startup.
- A login window appears if a password was entered during the initial commissioning.

Initial commissioning an open controller

The basic settings, user name, administrator password and IP address are prompted for during initial power-up of your CPU 1515SP PC (F). The device is then automatically set up for the operating system that is installed on the CFast card. Restart the device after the operating system has been set up.

Note

The initial commissioning is not possible with a Multitouch panel, as the Multitouch driver is only available after the installation of the operating system.

User name, computer name, password

When you enter a "User name", this is suffixed with "-PC" under "Computer name". The computer name must not exceed 15 characters.

Note

This user has administrator rights!

For security reasons, enter a password for this user (administrator).

IP address

The IP address (192.168.1.1) and the subnet mask (255.255.255.0) for the X2 interface are pre-set in the logon dialog.

You use the buttons to make your changes or to retain the pre-set values.

Note

The initial TIA Portal download must be performed using set IP address via the GB Ethernet interface X2 in order that the PROFINET interface X1 and the hardware configuration are correctly assigned.

User "Operator"

A user "Operator" with standard user rights is already created on the Windows system.

The user is in a user group "SIEMENS TIA Engineer". This grants the user the rights to use the installed SIMATIC software products.

To be able to use the CPU 1515SP PC (F) directly, the Windows "Autologon" is activated for the user "Operator". No password is preset.

Note

When you assign a password, change the entry for the Windows "Autologon" function accordingly in order that the function remains activated.

Administrator rights

You need administrator rights for the following actions:

- Back up the data in the root directory of the C partition.
- Installing the language pack

Screen resolution

In Windows Embedded Standard 7, the values that are determined for the monitor via the DVI-I interface are set for the screen resolution.

7.3 Initial configuration of an Open Controller

Creating the configuration

You have created a new project in the TIA Portal.

To create the configuration in the TIA Portal, follow these steps:

1. Double-click "Add new device" in the project tree.
2. In "PC-Systeme > SIMATIC S7 Open Controller > ET 200SP Open Controller >", select the "CPU 1515SP PC (F) (+HMI)".
3. Select the appropriate version.

   The configured Open Controller is displayed in the device view.
4. The following components can be seen in the Open Controller:
   – Onboard interface X2 (GB Ethernet Windows interface) that is assigned directly to the PC station (1 port)
   – Replaceable BusAdapter X1, which is directly assigned to the software controller (2 ports)
   – On the right side (behind the plugged modules in the rack): the configured software controller CPU 1505SP (F) and WinCC Runtime Advanced.
5. Insert the server module.
   The server module at the right end of the configuration forms the termination of the CPU with the I/O modules.

Setting the IP addresses:

In the Inspector window under "Properties":

- Onboard interface X2: the configured, specified IP address is identical with the Windows IP address that is set during the first commissioning on the open controller.
- BusAdapter X1: the configured, specified IP address is identical with the IP address that is set during the first commissioning in the panel of the software controller (display application).

Important properties of the Software Controller

Change the properties in the Inspector window under "Properties" if required:

- Selecting startup type
- System diagnostics
- Setting the storage location for retentive data
- Setting up copy protection
- Using the LEDs of the hardware
- Configuring the Web server
- Assigning interfaces for the communication

Establish HMI connection

1. Right-click the WinCC RT Advanced in the device view.
2. Start the HMI device wizard.
3. Apply all default settings.
   The wizard creates system images for you with the corresponding navigation.
4. Switch to the connection view in the network view.
5. Click on WinCC RT Advanced.
6. Drag (with mouse button pressed) from the WinCC RT Advanced software to the S7-1500 software controller (for example, CPU 1505SP).
   A network connection is established between the two devices.

Downloading the project to the target system

The complete PC station is downloaded the first time you download the configuration.

1. Select the complete PC system in the device view.
2. Click the "Download to device" button.
3. Make the following settings:
   – Type of connection
   – Specify the interface of the programming device
   – Specify the X2 interface on the Open Controller

Note

The first TIA Portal download **must** be via the "X2" interface.

Only ASCII characters are permitted in the name of the interface X2 PN/IE (LAN) in the TIA Portal, e.g. PROFINET_2.

Download and compile the project. The hardware configuration and the first download are now completed.

WinCC RT Advanced

WinCC Runtime Advanced contains all the essential functions for operator control and monitoring of machinery or plants.

Reference

For more information on WinCC RT Advanced, refer to the WinCC Advanced V14 (http://support.automation.siemens.com/WW/view/en/109742297) system manual.

7.4 Installing license keys

Licensing the software

A license key is not required to operate the S7-1500 software controller CPU 1505SP (F) V2.x. The software controller is permanently coupled to your CPU 1515SP PC (F). It is not necessary to input the key via the Automation License Manager!

WinCC RT Advanced requires a product-specific license key. This is located on the supplied USB stick.

Prior to commissioning, you must install the license key for the HMI powertags using the *Automation License Manager (ALM)*.

Perform the licensing directly via the CPU 1515SP PC (F).

Requirements

- Initial commissioning was successfully completed.
- Windows Embedded Standard 7 has started.
- The enhanced write filter **EWF** must be disabled on the CPU 1515SP PC (F).

Installing License keys with local configuration

The *Automation License Manager* is preinstalled on the CPU 1515SP PC (F).

Open the software using the icon on the desktop or a menu command.

1. In the Windows start bar, select **Start > All Programms > Siemens Automation > Automation License Manager**.
2. Follow the instructions of the *Automation License Manager*.

Using a programming device/PC to install the license keys

The *Automation License Manager* is pre-installed on a programming device / PC with STEP 7 and the CPU 1515SP PC (F).

1. Connect the CPU 1515SP PC (F) to a programming device / PC.
2. Connect the supplied USB stick to the programming device/PC.
3. Select the menu command **Start >SIMATIC >License Management > Automation License Manager**.
4. Select the menu command **Bearbeiten > Rechner verbinden** and enter the IP address of the CPU 1515SP PC (F) (default 192.168.1.1).
5. Drag the license keys from the USB stick to the system partition C: of the CPU 1515SP PC (F).

Saving and securing license keys in the case of restore and repair

---

Note

Loss of license keys

A SIMATIC license key cannot be copied or duplicated. If you drag the license keys from your USB-Stick to your CPU 1515SP PC (F), no copies are then left on the USB stick.

Secure your purchased license keys **before** restoring the delivery state (Restore) or in the case of repair. To do this, move the license keys to a USB stick and keep this stick in a safe place.

If a fault occurs with your license keys on the CPU 1515SP PC (F), contact your local Siemens representative. Make sure to have the "Certificate of License" (CoL) to hand.

Note

The EWF (Page 78) write filter serves to protect your license keys and your configuration.

Reference

For additional information on licenses, refer to the *Automation License Manager* manual. You can find the manual for the CPU 1515SP PC (F) under **Start > All Programs > Siemens Automation > Documentation** and in the Internet (http://support.automation.siemens.com/WW/view/en/56956174).

7.5 Windows Security Center

Warning from the Windows Security Center

A warning from the Windows Security Center appears when you first switch on your device. The Security Center check the status of the device with regard to the main security aspects listed below. If the Security Center finds a problem during this check, it gives recommendations on how to better protect the device.

- Firewall: The Windows firewall contributes to protecting the device by preventing the access of unauthorized users via a network or the Internet. Windows checks whether the device is protected by a software firewall.
  As delivered, the firewall is enabled.
- Antivirus software: Antivirus programs contribute to protecting the device against viruses and other security threats. Windows checks whether a comprehensive up-to-date program is used on the device.
  No antivirus software is installed as delivered.
- Automatic updates: With the help of automatic updates, Windows can routinely check for the latest major updates for the device and install these automatically. In the delivery state, this option is disabled.

Note

To keep Windows up-to-date, enable either the automatic update function of Windows or install updates manually. Before the installation, check the size of the package to be installed and decide if you need the update and if there is sufficient storage space available.

Some updates may make it necessary to use a larger CFast card or to change the partitioning. You can find information on changing the partition size in the Change partitioning (Page 85) chapter.

Configure the Security Center to suit your requirements.

7.6 Switching CPU 1515SP PC (F) on/off

Requirements

Initial commissioning was successfully completed.

Switching on the CPU 1515SP PC

1. Switch on the power supply of the CPU.

   The Boot Manager GRUB4DOS opens.

2. Select the mode in which the CPU 1515SP PC (F) should start:

   – Only with the Windows operating system.

   – With the Windows operating system and the S7-1500 software controller (default).

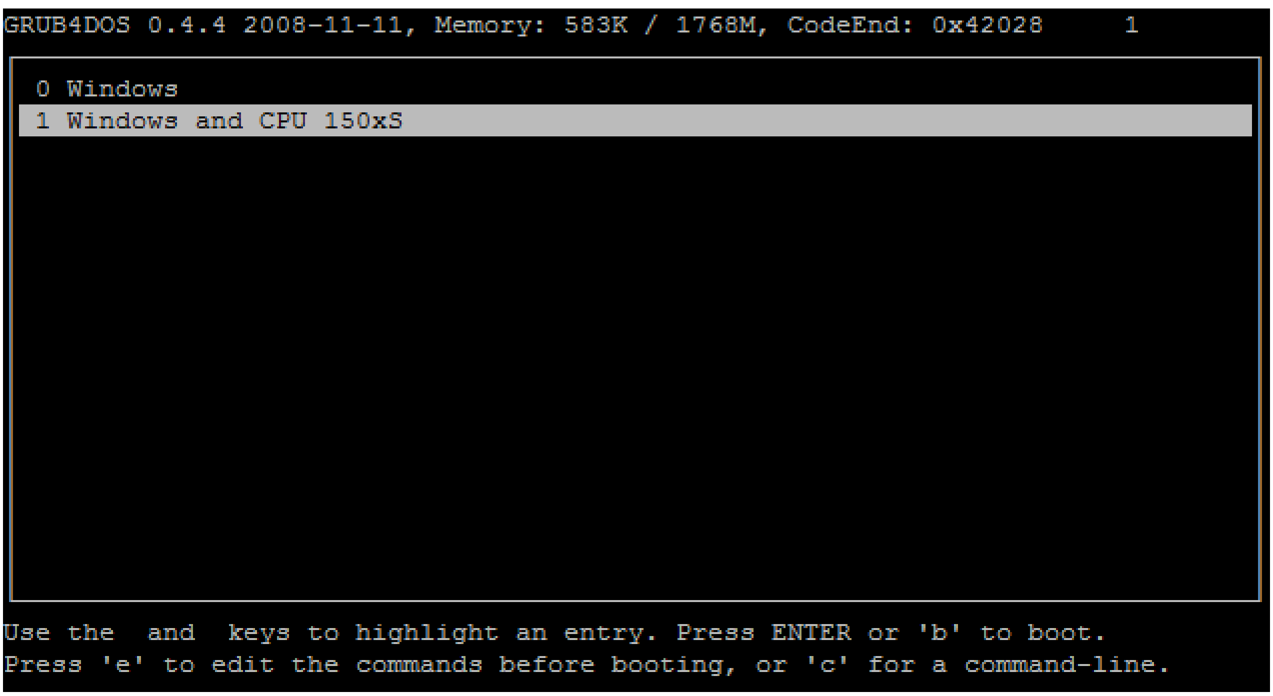


Figure 7-1 Boot Manager GRUB4DOS

Switch off CPU 1515SP PC (F)

1. To switch off the Windows function, use **StartShut down**.

   The PWR LED changes from green to yellow.

   The Windows function shuts down the Windows operating system and the S7-1500 software controller.

If the device will not be used for a longer period after the shutdown, de-energize the device.

8 Functions

8.1 Monitoring functions

Introduction

CPU 1515SP PC (F) has monitoring functions that you can use with the corresponding software. The following display, monitoring and control functions are available.

- Temperature monitoring
- Monitoring of drives with SMART functionality
- Operating hours counter (information on the total runtime)

SIMATIC IPC DiagBase

The SIMATIC IPC DiagBase software is contained in the scope of delivery of the CPU 1515SP PC (F).

With the SIMATIC IPC DiagBase software, you use the functions for local monitoring. Use the DiagBase Management Explorer application to obtain a clearer overview for monitoring. The DiagBase Alarm Manager notifies you of individual alarms.

Note

For additional information, refer to the online help for the SIMATIC IPC DiagBase software.

SIMATIC IPC DiagMonitor

The SIMATIC IPC DiagMonitor software is provided on a CD.

Potential system failures are detected and reported in good time with the diagnostics and alerting software. The software is also used for remote diagnostics.

The software contains:

- The software for the stations to be monitored
- A library for creating your own applications

Temperature monitoring

Three thermistors monitor the temperature at multiple locations of the CPU 1515SP PC (F):

- Processor temperature
- Temperature in the vicinity of the RAM ICs/blocks
- Temperature of the basic module

If one of the temperature values exceeds the set temperature threshold, the temperature monitoring triggers a temperature error. The temperature error activates the IPC DiagBase and/or IPC DiagMonitor software.

The temperature error remains stored until the temperatures fall below the temperature threshold again and it is reset using one of the following measures:

- Acknowledgment of the error message by the monitoring software
- Restart of the device

8.2 Retentive memory NVRAM

Retentive memory is non-volatile memory for saving a limited quantity of data in the event of power failure.

The data defined as retentive is stored in retentive memory. This data is retained beyond a power-off or power failure.

A corresponding function is implemented in the S7-1500 software controller to allow NVRAM to be used there. Up to 410 KB of data is backed up to non-volatile data memeory by this in the event of power failure. This function can be set on the engineering station in the TIA Portal.

8.3 BIOS description

8.3.1 Introduction

BIOS setup

The BIOS setup is located in the BIOS ROM. The information is stored to the memory of the CPU 1515SP PC (F) via the system configuration.

You can set the following using the Setup:

- The hardware configuration, for example, drive type
- The system properties
- time and date

Note

The American keyboard layout applies in the BIOS.

Changing the device configuration

The device configuration is preset for working with the supplied software.

Only change the set values if you have made technical changes to your device.

8.3.2 Starting BIOS setup

Start the setup program as follows:

1. Disconnect the device from the power supply and switch it on again (cold restart).

   The following screen appears in the default setting of the CPU 1515SP PC (F) after it is switched on:

Figure 8-1 BIOS setup

   After completion of the startup test, you have the option of starting the SETUP program.

   The following BIOS message appears:

   ```
   Press F2 go to Setup Utility
   ```

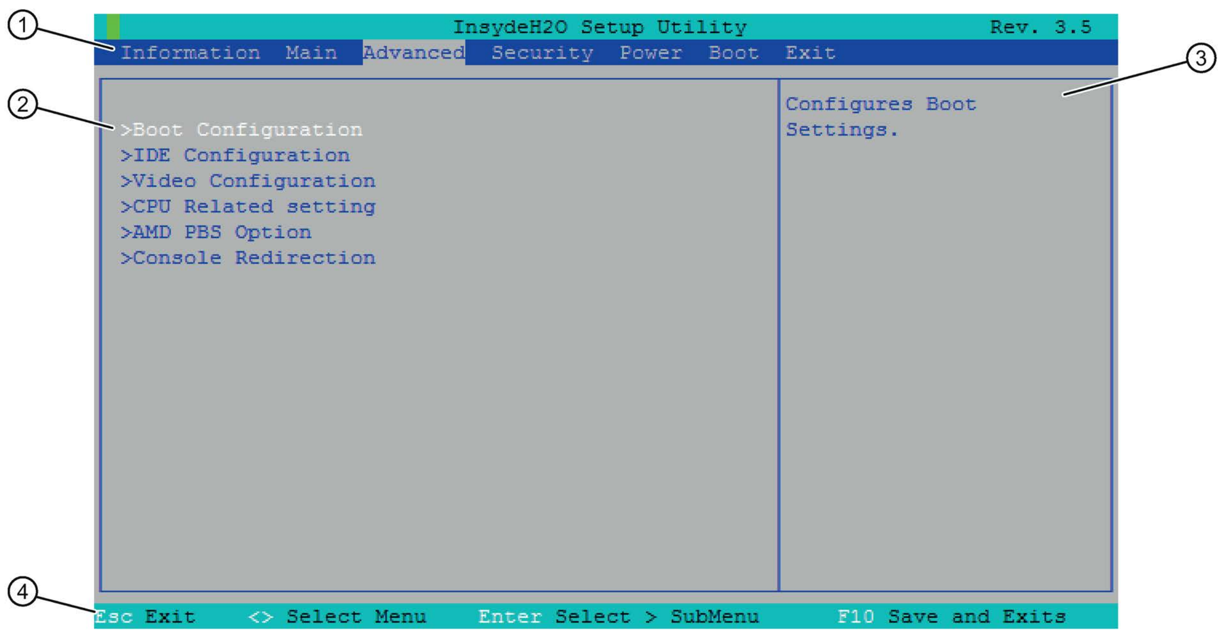
   ```
   Press F12 go to Boot Manager
   ```

2. Press the <F2> button while the message is on the screen.

8.3.3 BIOS setup menus

Overview of BIOS setup

The menus and submenus are shown on the following pages.



① Menu bar
② Selectable submenu
③ Help window
④ Operating line

Figure 8-2 Structure of the BIOS setup menus

Menu structure

In the menu bar ①, you can select between the following menu forms:
[Information] [Main] [Advanced] [Security] [Power] [Boot] [Exit].

In the main window ②, various settings are displayed or submenus selected.

In the Help window ③ of the respective menu, you can find information on the selected setup entry.

The operating line ④ contains notes on operation.

You can use the cursor keys [←] left and [→] right to switch between the menu forms.

Menu	Meaning
Information	Device-specific information, for example, product version
Main	Setting system functions
Advanced	Advanced system configuration
Security	Safety functions, for example, setting a password
Power	Determining the switch-on behavior of the device
Boot	Determining boot options, such as boot priority
Exit	Exiting and saving

8.3.3.1 Information menu

This menu shows the versions of the device-specific functions.

Keep this information at hand for Customer Support when you have technical questions regarding your system.

Example

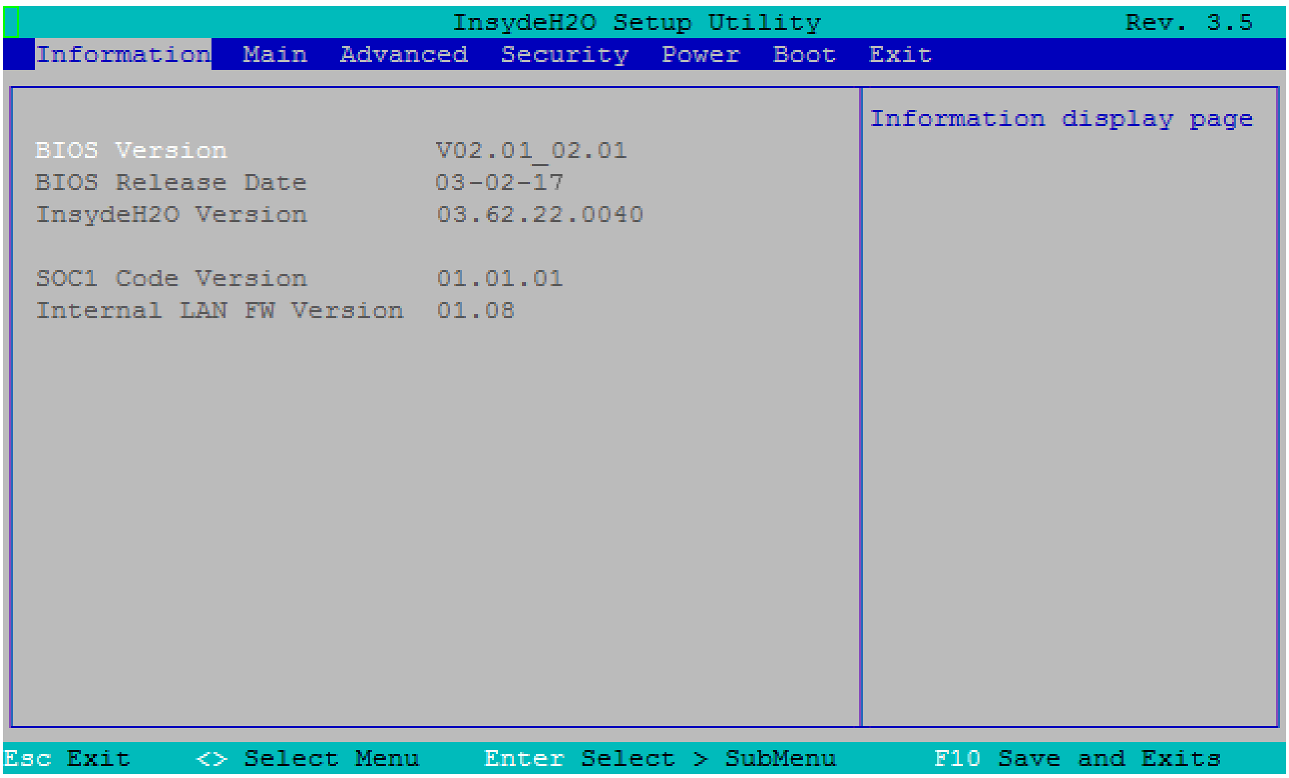


Figure 8-3 Information menu

8.3.3.2 Main menu

Settings in the Main menu

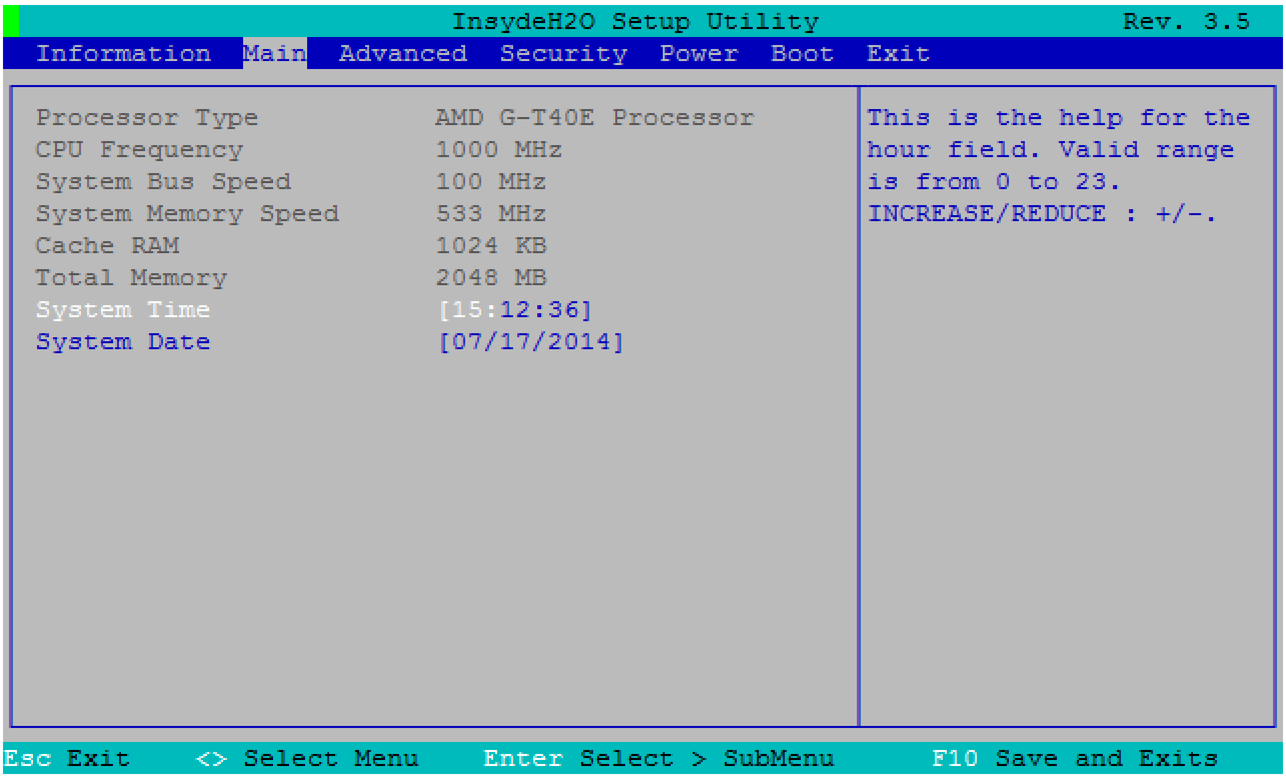

Figure 8-4 Main menu

In the Main menu, you can use the [↑] up and [↓] down arrow keys to select between the following system setting fields:

Array	Meaning
System Time	Displaying and setting the current time
System Date	Displaying and setting the current calendar date

System Time and System Date

System Time and System Date show the current values. After you have selected the corresponding field, you can change the following settings, one after the other, using the [+] and [–] keys:

- For the time of day: Hour: Minute: Second
- For the date: Month/day/year.

You can use the <ENTER> key to switch between the entries within the Date and Time fields (e.g., from hour to minute).

8.3.3.3 Advanced menu

Settings in the Advanced menu

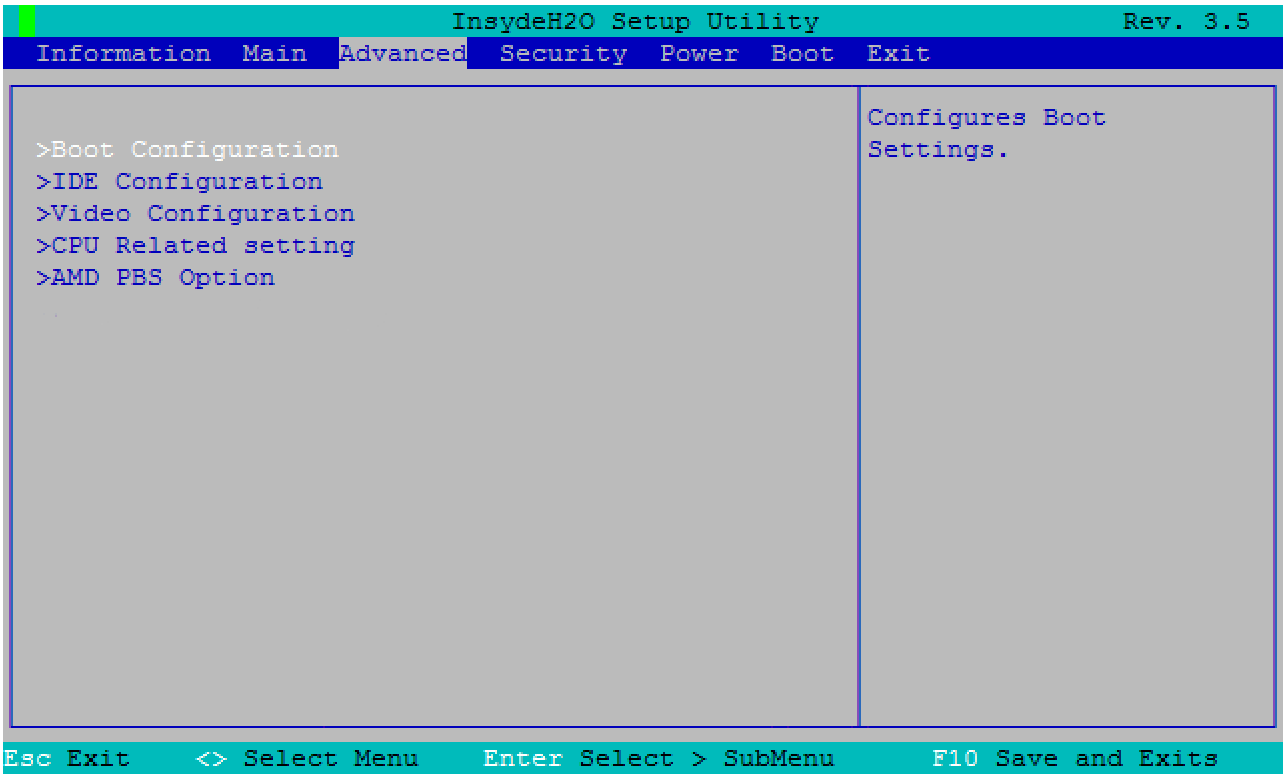

Figure 8-5 Advanced menu

Entry	Meaning
Boot Configuration	Configuring the boot settings
IDE Configuration	Configuring the devices
Video Configuration	Configuring the graphics parameters
CPU Related setting	Configuring CPU parameters
AMD PBS Option	Configuring interfaces

"IDE Configuration" submenu

Entry	Meaning
SATA configure as	Setting the SATA configuration type: IDE, LEGACY IDE, AHCI
Serial ATA Port 0	Serial ATA Port 0 device configuration

"Video Configuration" submenu

Entry	Meaning
UMA Sharing Memory Size (256 MB)	Setting the size of the work memory for the graphics processor. (Unified Memory Architecture; also Shared Memory)

"CPU Related setting" submenu

Entry	Meaning
SVM support	Enabling (Enabled) or disabling (Disabled) Secure Virtual Machine functionality .

"AMD PBS Option" submenu

Entry	Meaning
Internal LAN Controller	Integrated Ethernet interface (10/100/1000 Mbps) X2 PN/IE (LAN)
PXE Boot to INT_LAN	Enabling (Enabled) or disabling (Disabled) internal Southbridge Network Controller.

8.3.3.4 Security menu

Settings in the Security menu

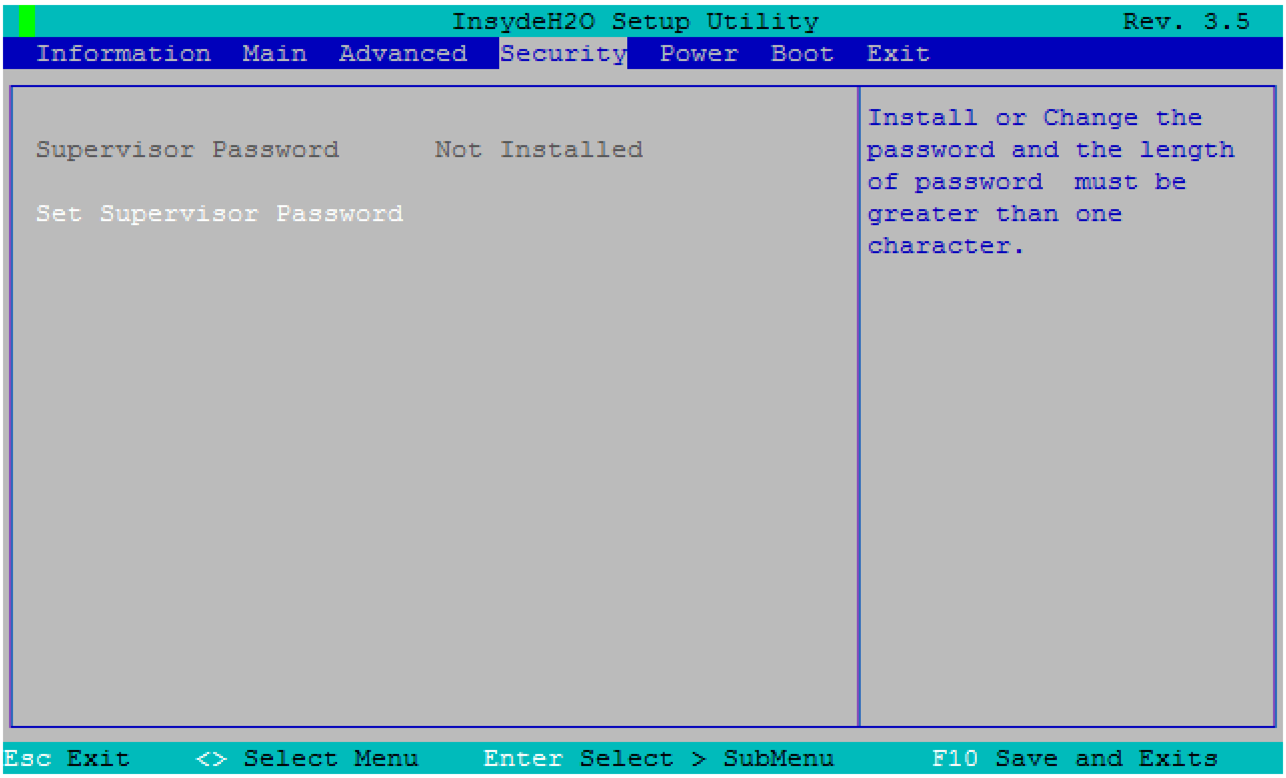

Figure 8-6 Security menu

To protect the CPU 1515SP PC (F) against unauthorized access, assign a password.

Supervisor Password	Installed	Specific setup fields, including the Supervisor password, can be modified by the user.
	Not installed	Password is disabled.
Set Supervisor Password	This field opens a dialog for assigning or changing the password.	

Note

Overwriting of the Supervisor password during a BIOS update

A BIOS update overwrites the password.

After a BIOS update, set up the password again.

8.3.3.5 Power menu

Settings in the Power menu

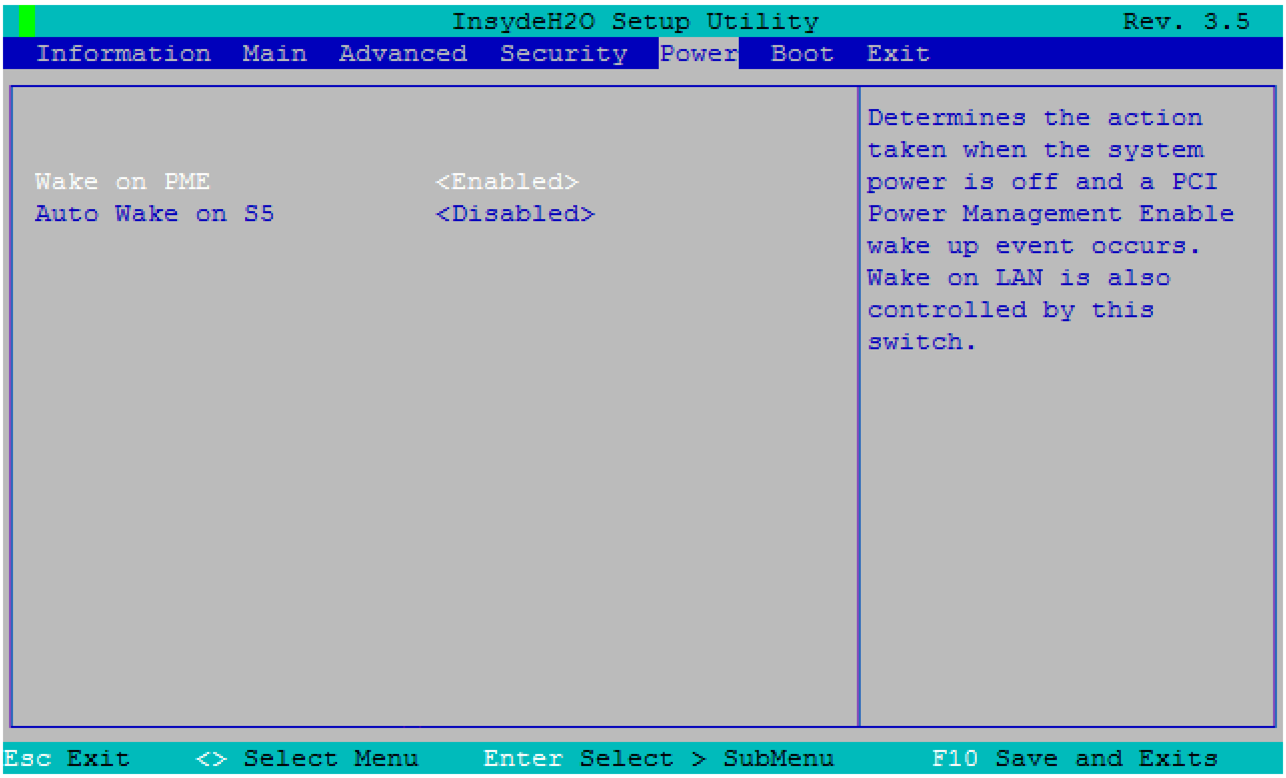

Figure 8-7 Power menu

In the Power menu, you specify the device reaction to a power failure and a Wake Event.

Entry	Meaning
Wake on PME	When activated (Enabled), the device switches itself on when a Power Management Event occurs. Otherwise, the device remains switched off.
Auto Wake on S5	When activated (Enabled), the device switches itself on when a Wake Event occurs. Otherwise, the device remains switched off.

8.3.3.6 Boot menu

Entries in the Boot menu

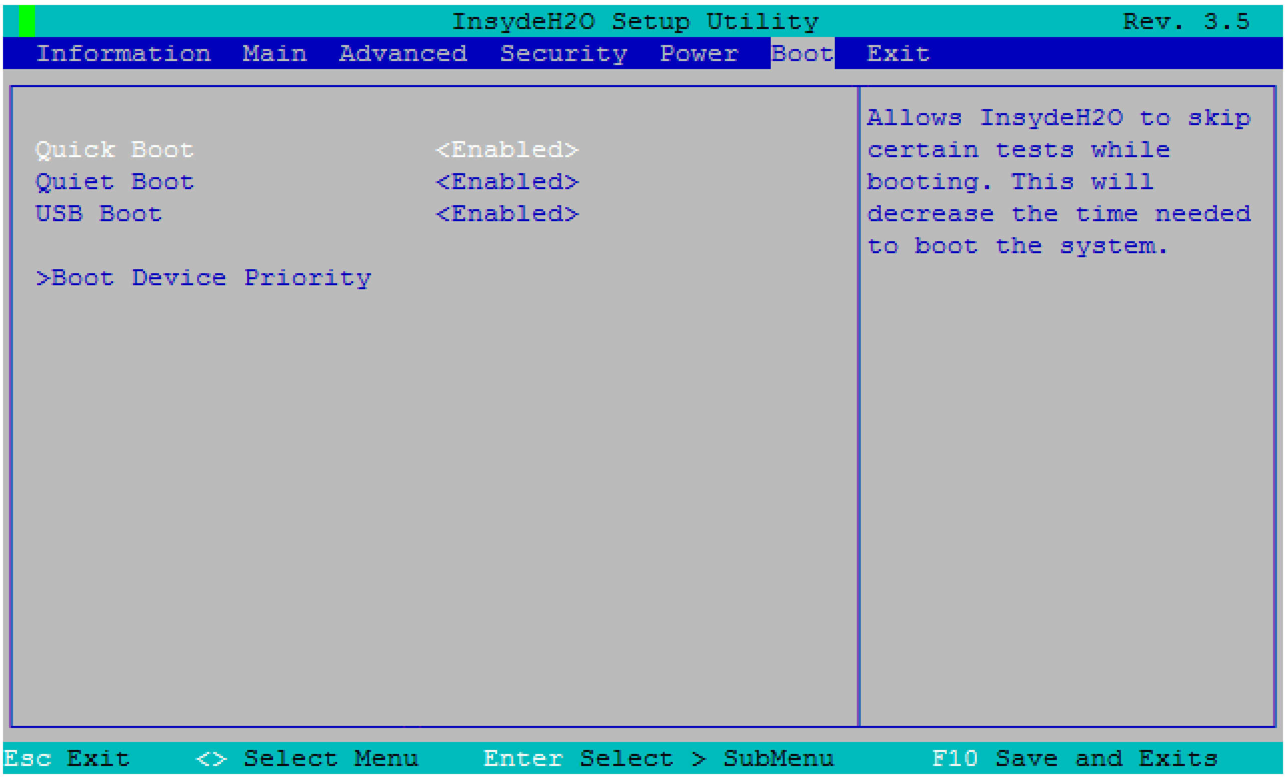

Figure 8-8 Boot menu

In this menu, you define the boot behavior of the device.

Entry	Meaning
Quick Boot	Enabling (Enabled) or disabling (Disabled). The device starts up faster when this option is enabled, because various hardware function tests are skipped.
Quiet Boot	When this option is disabled, the device boots in text mode. When it is enabled, a start screen with logo appears.
USB Boot	Booting from connected USB devices permitted/not permitted.

Boot menu > submenu "Boot Device Priority"

In this menu, you define the sequence of the boot media.

Entry	Meaning
Normal Boot Menu	Normal = boot sequence by component type Advance = individual boot sequence of all components

Boot Device Priority > submenu "Boot Type Order"

Entry	Meaning
Hard Disk Drive	Setting the boot sequence of the group of drives
USB	Setting the boot sequence of the group of USB drives
Others	Setting the boot sequence of the group Others,, e.g. Remote Boot Device

All connected boot-capable components and their boot position are displayed in this menu. The boot position of the components can be moved freely.

The component at the top (highest boot priority) is used for booting. If the component is not available, the system boots from the next component in the list.

You change the boot sequence as follows:

- Select the boot components using the keys <↑>, <↓>
- Move to the required position using the keys <+>, <–>

Note

You can start the Boot Manager by pressing the <F12> key during the boot process.
The Boot Manager shows all available boot components and boots from the device selected by the user.

"Normal Boot Menu > Advance" setting

Boot capable components which were disconnected and reconnected to the CPU 1515SP PC (F) during the boot processes, appear in first place in the BIOS in the "Advance" setting.

Boot Device Priority > submenu "Hard Disk Drive"

The size of the CFast card is displayed in this menu.

8.3.3.7 Exit menu

Settings in the Exit menu

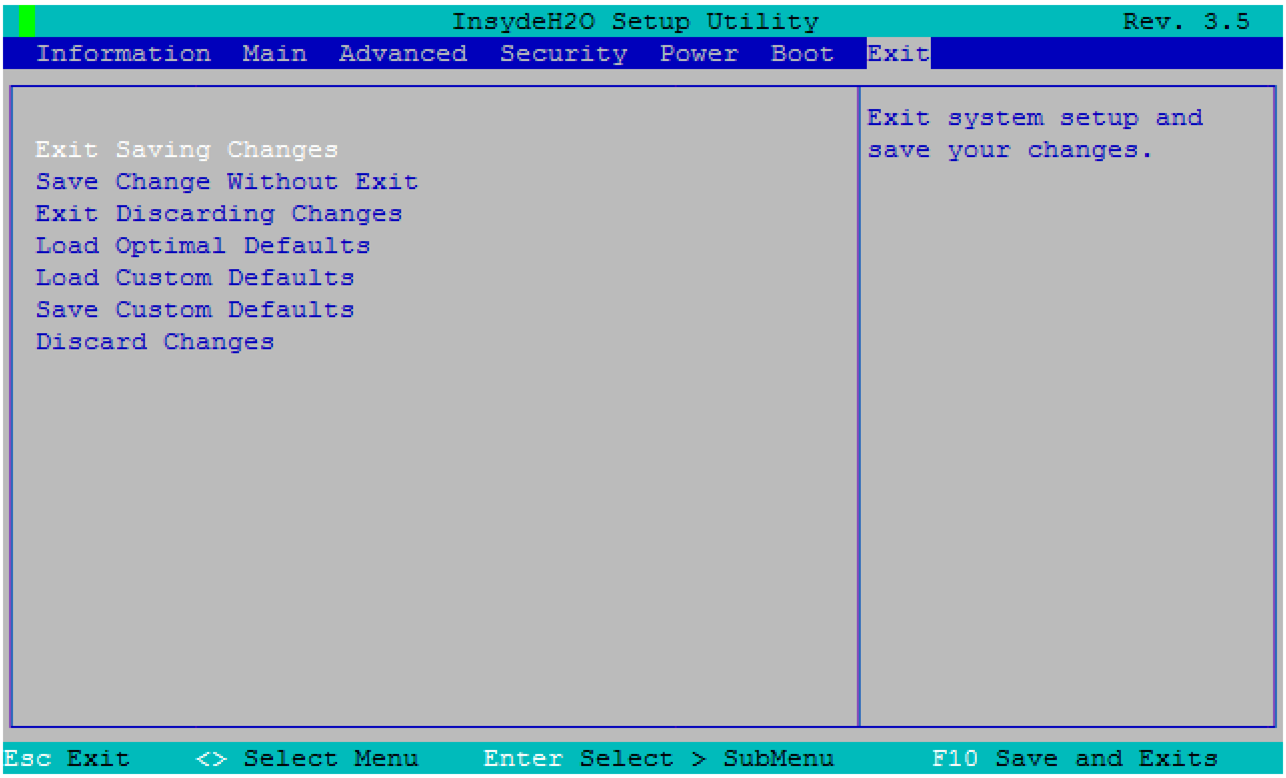

Figure 8-9 Exit menu

The setup program is always terminated via the Exit menu.

The menu is used to save or discard the changes made.

Entry	Meaning
Exit Saving Changes	Saves all changes and then starts the system with the new parameters.
Save Change Without Exit	Saves all changes
Exit Discarding Changes	Discards all changes and then restarts the system with the old parameters.
Load Optimal Defaults	Loads the optimum default values
Load Custom Defaults	Loads the default values
Safe Custom Defaults	Saves the default values
Discard Changes	Discards all changes

8.3.4 BIOS setup default settings

Documenting the device configuration

If you change the default setting of the BIOS Setup, then enter this in the following table. This will ensure that values you set will be readily available if hardware changes are made later.

We recommend that you print out the table below and keep it in a safe place after you have made your entries.

Note

The default settings in the BIOS setup depend on the ordered device configuration.

BIOS setup default settings

Menu	System parameters	Default settings	User settings
Main	System Time	hh:mm:ss	
	System Date	MM/TT/JJJJ	
Advanced > IDE Configuration	SATA configure as	LEGACY IDE	
	Serial ATA Port 0	SIMATIC IPC CFast 30	
Advanced > Video Configuration	UMA Sharing Memory Size	256 MB	
Advanced > CPU Related setting	SVM Support	Enabled	
Advanced > AMD PBS Option	Internal LAN Controller	Auto	
	PXE Boot to INT_LAN	Disabled	
Security	Supervisor Password	Not installed	
	Set Supervisor Password	Inactive (no password assigned)	
Power	Wake on PME	Enabled	
	Auto Wake on S5	Disabled	
Boot	Quick Boot	Enabled	
	Quiet Boot	Disabled	
	USB Boot	Disabled	
Boot > Boot Device Priority > Normal Boot Menu	Normal Advance	Normal	
Boot > Boot Device Priority	Boot Type Order	Hard Disk Drive	
		USB	
		Others	
	Hard Disk Drive	SIMATIC IPC CFast 8/16/30 GByte	

Menu	System parameters	Default settings	User settings
Exit	Exit Saving Change	Standard	
	Save Change Without Exit		
	Exit Discarding Changes		
	Load Optimal Defaults		
	Load Custom Defaults		
	Safe Custom Defaults		
	Discard Changes		

8.3.5 BIOS update

With the SIMATIC IPC DiagBase software (included in scope of delivery), you can perform the following actions:

- Perform a BIOS update.
- Saving and updating the current BIOS version.
- Saving the BIOS settings or loading them from another backup.

For additional information, refer to the online help for the SIMATIC IPC DiagBase software.

Requirements

- The S7-1500 software controller CPU 1505SP (F) must be in STOP mode.
- CPU 1515SP PC (F) must be started in Windows mode.

NOTICE
Malfunctions in the software controllers due to critical actions
If you perform a BIOS update during the operation of the S7-1500 software controller CPU 1505SP (F), software controller malfunctions can occur that lead to interruptions in communications and downtimes. Do not perform BIOS updates or other actions that strongly utilize the hardware resources during the operation of the CPU 1505SP (F). **Prior** to a BIOS update, switch the CPU 1505SP (F) to STOP.

Performing a BIOS update

1. Start the CPU 1515SP PC (F) in the GRUB menu in **Windows mode** (see figure (Page 58)).

   → The PWR LED lights up yellow first, then green.

   → The device carries out the hardware initialization.
2. Follow the BIOS update steps described in the help for SIMATIC IPC DiagBase.

   → The update is performed.

   → You are prompted to restart the device.
3. Us thee Windows function **Start > Shut down** to shut down the CPU 1515SP PC (F).

   → The PWR LED lights up green first, then yellow.

   → The Windows function closes the Windows operating system and the software controller.
4. Switch off the power supply at the CPU 1515SP PC (F).
5. Connect the power supply.
6. Wait until the Siemens logo disappears.

   → The CPU 1515SP PC (F) restarts.

NOTICE
Overwriting of the Supervisor password during a BIOS update A BIOS update overwrites the password. After a BIOS update, set up the password again in the Security menu under "Set Supervisor Password".

8.4 Power options

An energy diagram with the name SIMATIC on the CPU 1515SP PC (F). This ensures that the CPU does not deviate from its maximum clock rate in order not to endanger the real-time capability of the software controller.

8.5 Protective functions for data carriers

NOTICE
Data loss
The number of write cycles on CFast cards is limited due to technical reasons.
To prevent data loss, the CFast card must therefore be provided with special protection.
Use a write filter to lengthen of service life of the CFast card and avoid the CPU 1515SP PC (F).

Write filters

Two write filters are available for Windows Embedded:

- To protect an entire partition of the CFast card, use the Enhanced Write Filter EWF (Page 78).
  Unlike FBWF, you can also use EWF with compressed NTFS data systems.
- Use the File-Based Write Filter FBWF (Page 82), to update specific files dynamically.
  The FBWF can be configured more flexibly and enables direct write access without restart.

NOTICE
Data loss
If both write filters are activated, the EWF blocks direct write access of the FBWF. Data get lost after a restart of CPU 1515SP PC (F).
Activate **only one** of the two write filters per partition.

8.5.1 Enhanced Write Filter (EWF)

Purpose and function

The Enhanced Write Filter (EWF) allows you to write-protect individual partitions.

EWF is disabled by default on the CPU 1515SP PC (F).

The EWF is activated by means of the pre-installed SIMATIC IPC EWF Manager or the Windows console application ewfmgr.exe.

SIMATIC IPC EWF Manager

Start the software via **Start > All Programs > Siemens Automation > SIMATIC > EWF Manager**.

In the status bar, you can use the SIMATIC IPC EWF Manager icon to check whether the EWF is active.

Table 8- 1 Meaning of the icons

Icons	Meaning
	The partition is protected by the EWF.
	EWF is disabled for this partition.
	The EWF is currently switched off, but is activated after the restart.
	The EWF is currently active, but will be deactivated after the restart.
	The filter is active. A Commit command is executed before the next reboot.
	The filter is currently active, but is deactivated after the restart. A Commit command will also be executed before the next reboot.

The operating instructions for the SIMATIC Industrial PC: IPC EWF Manager (http://support.automation.siemens.com/WW/view/en/50867677) is available on the CPU 1515SP PC (F) under **Start > All Programs > Siemens Automation > Documents > Manuals.**

Console application ewfmgr.exe

The application is called via the Windows command line (Command Prompt).

The following functions are available, among others, for setting, switching on and switching off the EWF:

Table 8- 2 Enhanced Write Filter functions

Function	Command
Write-protect drive C: Switching on	`ewfmgr c: -enable`
Write-protect drive C: disable (modified data is accepted)	`ewfmgr c: -commitanddisable`
Modified files on drive C: Accept	`ewfmgr c: -commit`
Display information about the EWF drive	`ewfmgr c:`
Display help	`ewfmgr /h`

Note

The EWF commands for write protection become effective only after a restart.

Note

The EWF command `ewfmgr c: -commitanddisable` must not be used with the option -`Live`.

Special features when using the EWF

NOTICE
Data loss upon power failure and upon shutdown/restart
If the EWF is active, all changes made on the C drive are lost after power failure and on shutdown/restart.
Use an UPS to prevent data losses after power failure.

Back up the data in the EWF-RAM overlay to the CFast card before shutting down the CPU 1515SP PC (F). In the command line, enter the following commands:

```
ewfmgr c: -commit
```

Restart the device

Or

```
ewfmgr c: -commitanddisable
```

Restart the device
```
ewfmgr c: -enable
```
Restart the device

Note

Data loss

If EWF is active and you decline a restart after having set the -`commitanddisable` or -`commit` option, your data is lost after a power failure!

Note

Disabling automatic daylight saving changes

In systems without central time management and with activated EWF, the time is advanced or set back by one hour in the daylight saving time or standard time period each time the system performs a cold or warm restart, due to the system-specific function for automatic daylight saving changes.

Reason for this behavior: Windows Embedded Standard 7 sets a flag in a registry entry that indicates completion of the conversion to daylight saving time. Since this file is also protected against modification by the EWF, the marker is lost during the boot sequence and the adjustment is made again.

We therefore recommend that you deactivate the automatic adjustment and change the clock manually.

Proceed as follows:

1. Disable the EWF filter (`ewfmgr c: -commitanddisable`) and reboot the system.
2. Deactivate the automatic switchover in the Control Panel:
   Start > Control Panel > Date and Time > in the tab "Time Zone" clear the check mark for "Automatically adjust clock for daylight saving changes".
3. Save the change (`ewfmgr c: -commit`).
4. Switch on the EWF again (`ewfmgr c: -commitanddisable`) and reboot the system.

8.5.2 File-Based Write Filter (FBWF)

Purpose and function

The FBWF allows you to write-protect specific files and folders of a partition.

FBWF is enabled by default on the CPU 1515SP PC (F).

The FBWF is activated by means of the Windows console application fbwfmgr.exe.

NOTICE
Data loss
If both write filters are activated, the EWF blocks direct write access of the FBWF. Data get lost after a restart of CPU 1515SP PC (F). Activate **only one** of the two write filters.

Console application fbwfmgr.exe

The application is called via the Windows command line (Command Prompt).

The following functions, among others, are available for setting, switching on and switching off the FBWF:

Table 8- 3 File-Based Write Filter

Function	Command
Show FBWF status	`fbwfmgr /displayconfig`
Activate FBWF after the next restart	`fbwfmgr /enable`
Write to protected files	`fbwfmgr /commit c: \<Path>\<File Name>`
Display help	`fbwfmgr /?`
Defining exclusions:	
• Add file	`fbwfmgr /addexclusion c: \<Path>\<FileName.ext>`
• Add folder	`fbwfmgr /addexclusion c: \<Path>`
• Remove file	`fbwfmgr /removeexclusion c: \<Path>\<FileName.ext>`
• Remove folder	`fbwfmgr /removeexclusion c: \<Path>`

Note

Note:

- The correct notation is as follows:
  Drive letter: space character "\" relative file path
- The write protection commands become effective only after a restart.

Rule for exclusion list

The following sequence applies if you define exclusions for files and folders that do not yet exist:

- Defining exclusions
- Restart CPU 1515SP PC (F)
- Create file/folder

Display of the partition size with activated FBWF

The partition size displayed in the Explorer does not correspond with the actual size when the FBWF is active. The size displayed is derived from the amount of memory occupied on the partition and from memory released by the FBWF. After the maximum size of the overlay was reached, a message is output warning of insufficient space on the partition.

Reference

Additional information on FBWF is available on the Internet (http://msdn.microsoft.com/en-us/library/ff794219(v=winembedded.60).aspx).
Additional information on the topic of partitions is available in the Change partitioning (Page 85) chapter.

9 Maintenance

9.1 Backing up and restoring data

Introduction

The operating system and the Runtime software are located on the supplied Restore DVD. You can use this to restore the original software of the CPU 1515SP PC (F).

If you use functions from the Restore menu, you must acknowledge a security message. For the functions, 72 hours are available in each case. If the functions are no completed within this period, the CPU 1515SP PC (F) is automatically restarted.

Save your project to partition D: of the CFast card.

SIMATIC IPC Image & Partition Creator

You can also create your own image of your CFast card. This contains the operating system, the Runtime software and the complete project loaded from the TIA Portal.

To back up data in Windows Embedded Standard 7, we recommend the software tool SIMATIC IPC Image & Partition Creator (V3.3 or later). It provides for easy backup and fast restore of the contents of the CFAST card and of individual partitions (images).

Note

The SIMATIC Image & Partition Creator supports the X2 PN/IE (LAN) interface.

You can procure the SIMATIC IPC Image & Partition Creator:

- via the Siemens online ordering system (http://www.siemens.com/automation/mall).
- Pre-installed on the SIMATIC IPC Service USB flash drives.

For additional information, please refer to the corresponding product documentation.

SIMATIC IPC Service USB flash drive

You can use the SIMATIC IPC Service USB flash drives for data backup and restore.

You obtain these through the Siemens online ordering system (http://www.siemens.com/automation/mall).

9.2 Change partitioning

9.2.1 Partitions in the delivery state

Partitioning the CFast card

The following partitions are set up on the CFast card by default:

Partition	Name	30 GB CFast card (WES7 E 32Bit/WES7 P 64Bit)	File system
C:	SYSTEM	19.5 GB	NTFS
D:	DATA	8 GB	NTFS
-	-	0.4 GB	RAW
-	WinCCMB	0.04 GB	NTFS

Note

Partitions in Windows Embedded Standard 7

The partitions need to be set again if they are faulty or if the partitioning is to be changed.

NOTICE

CPU volume for software controller (0.4 GB RAW)

Do not change the CPU volume for software controllers.

This is the only way to ensure that the software controller continues to operate without error.

9.2.2 Change partitioning

If the capacities of the partitions are insufficient, you have the option with Windows 7 to change the size of the partitions (for example, drive C: extend and drive D: reduce).

Free space must be available in order to extend the partition. You can recognize free space by the designation "Unallocated". You may have the reduce or delete other partitions to create space.

Note

Deleting partitions

When partitions are deleted on the data on them are destroyed.

Possible reasons for an expansion of the partition size to drive C:

- Loading security updates for Windows drive C:
- Option of installing large software packages on C, if their size exceeds the available storage space.

Expand/shrink partition

To expand, for example, Partition C: at the cost of Partition D: follow these steps:

In the Windows start bar, select **Start > Control Panel > System and Security > Administrative Tools > Computer Management > Disk Management**. The "Computer Management" window opens.

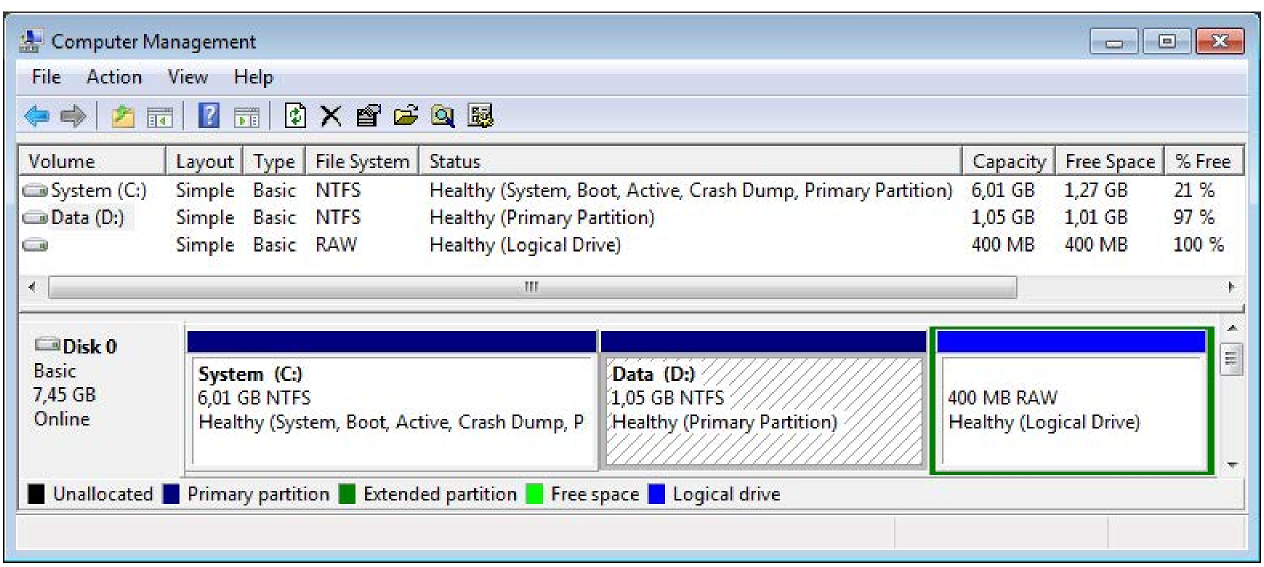

Figure 9-1 Computer Management

To expand Partition C: you must delete Partition D: first. Right-click on Partition D: and select "Delete Volume..."

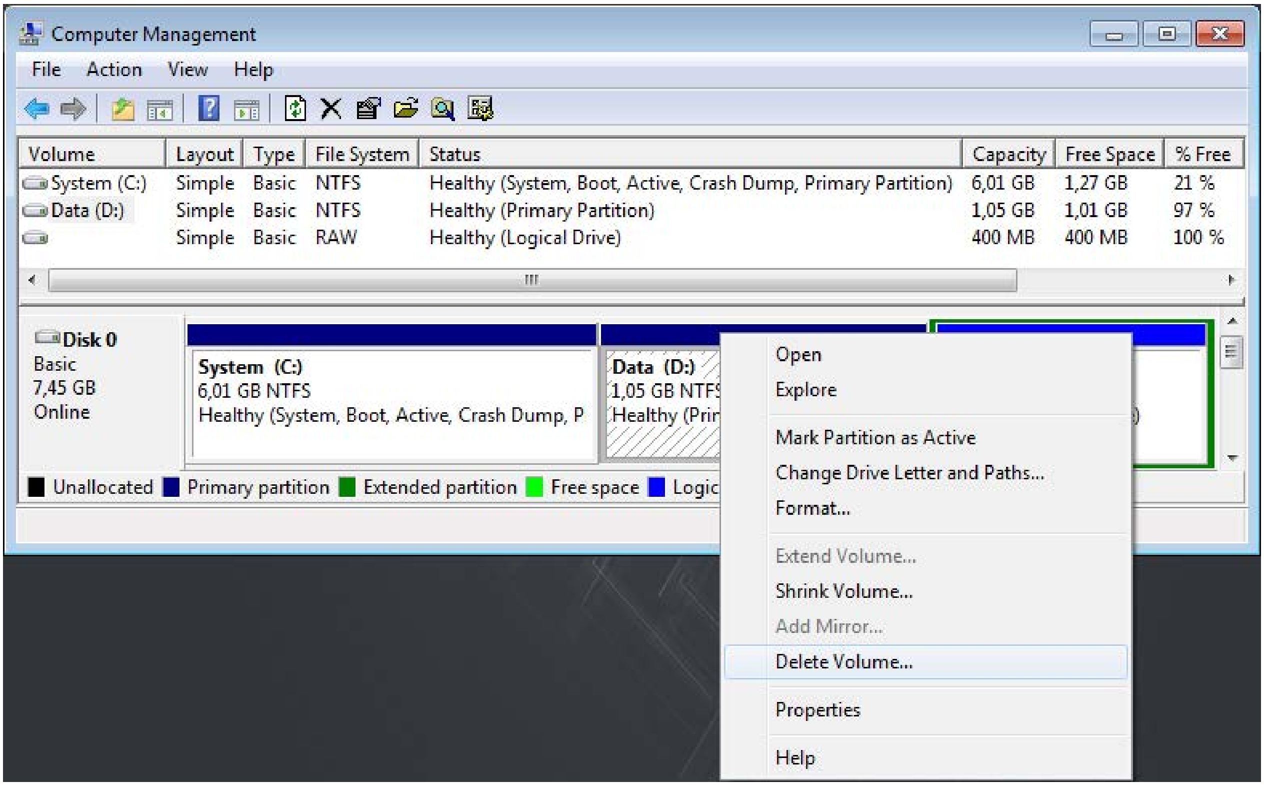

Figure 9-2 Partition D: Delete

The space which was occupied by Partition D: is now available for Partition C: .

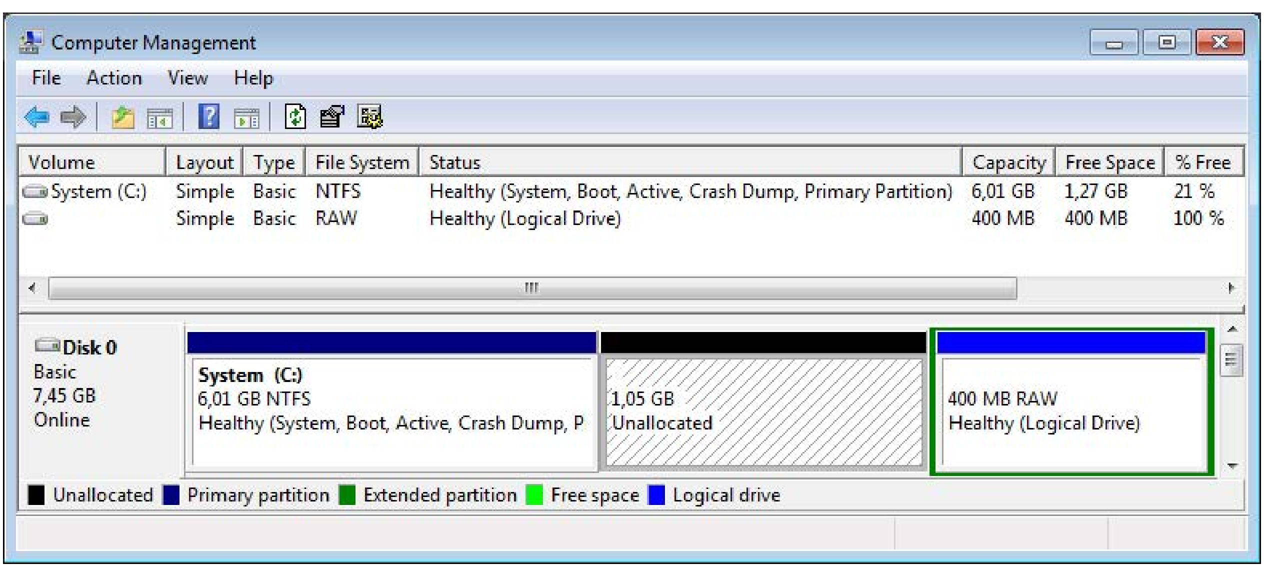

Figure 9-3 Partition D: cleared

Now right-click on Partition C: and select "Extend Volume...".

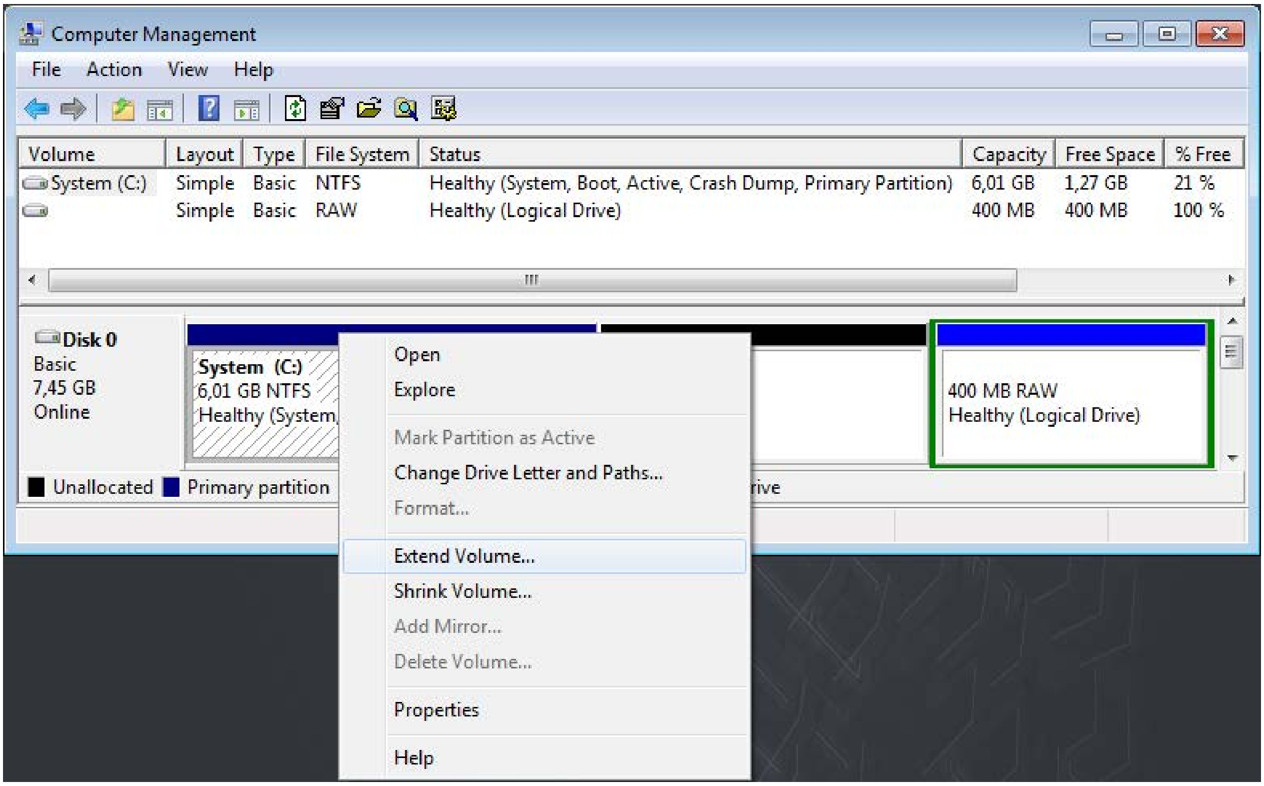

Figure 9-4 Partition C: expand

After selecting the option "Extend Volume...", the "Extend Volume Wizard" appears.

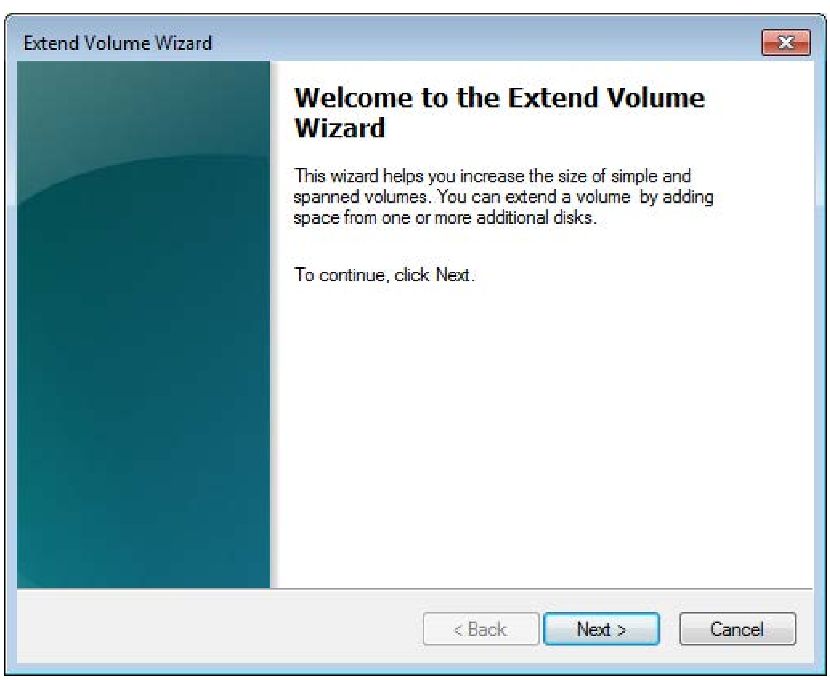

Figure 9-5 Extend Volume Wizard

In the following window you have the option to expand Partition C: by all or part of the available memory. In our example we expand Partition C: by 500 MB.

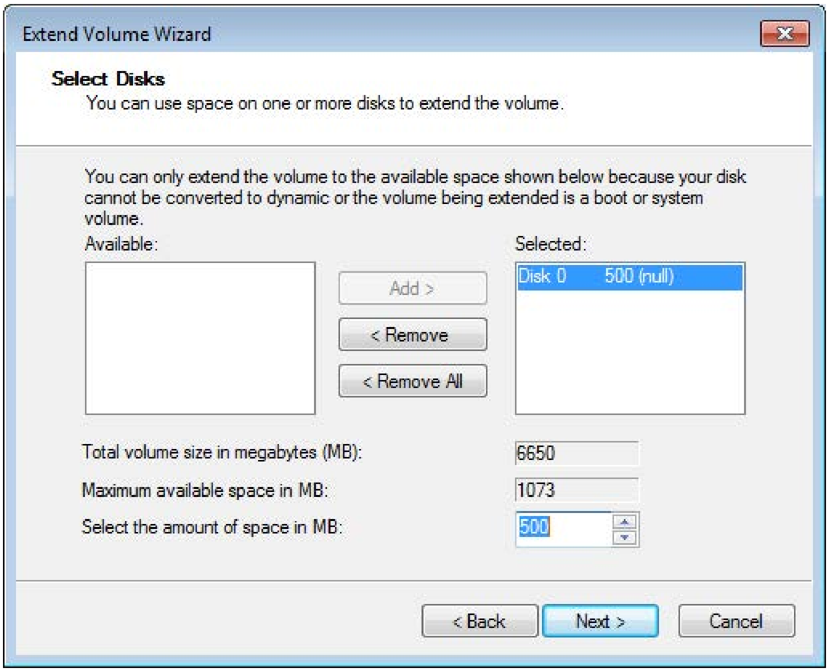

Figure 9-6 Select memory size

When you have completed the steps of the wizard, the Computer Management window shows you the new division of the partition sizes.

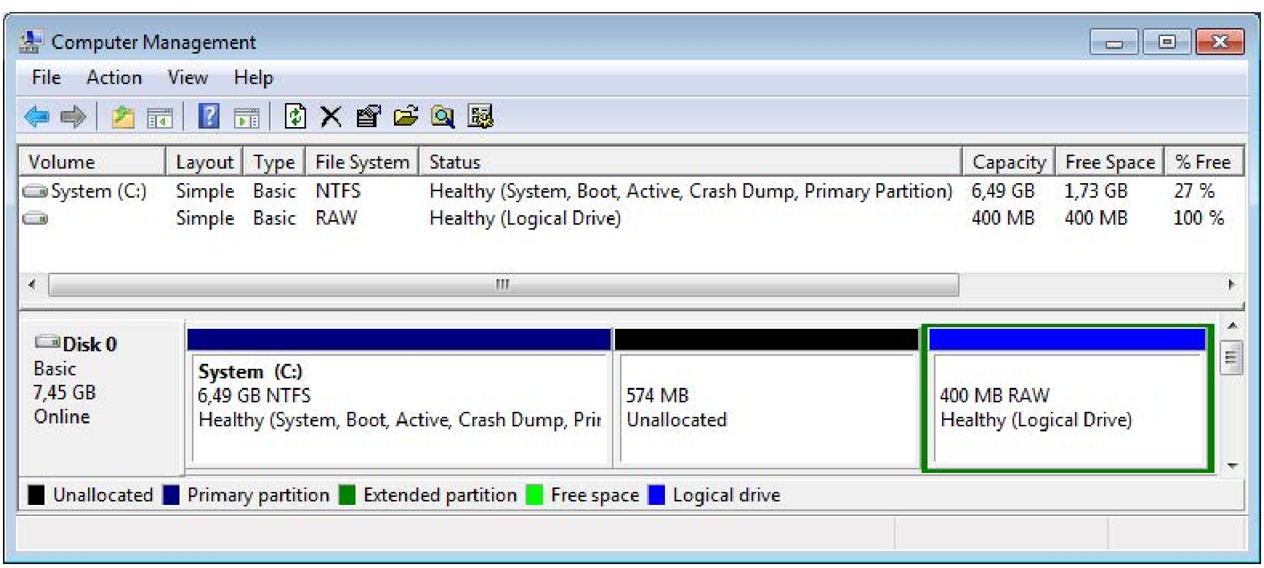

Figure 9-7 Result of the repartitioning

To reassign the unassigned memory to Partition D: right-click on the unassigned memory and select "New Simple Volume..."

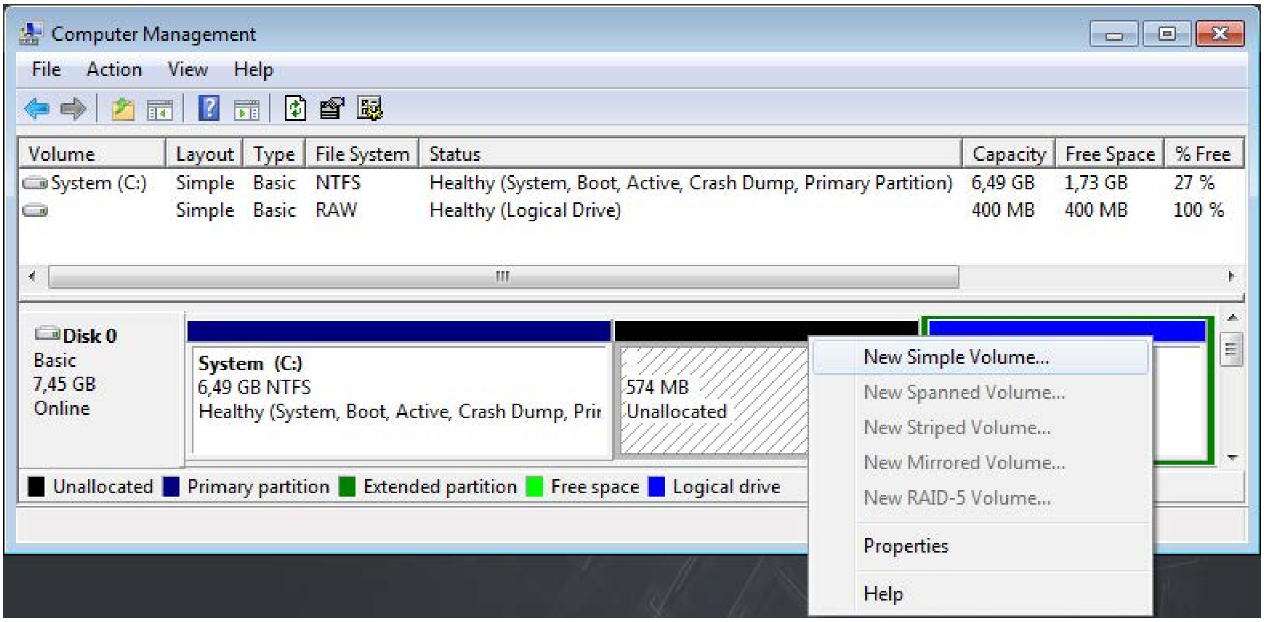

Figure 9-8 Recreate partition

After selecting the option "New Simple Volume...", the "New Simple Volume Wizard" appears. Set the required memory size there.

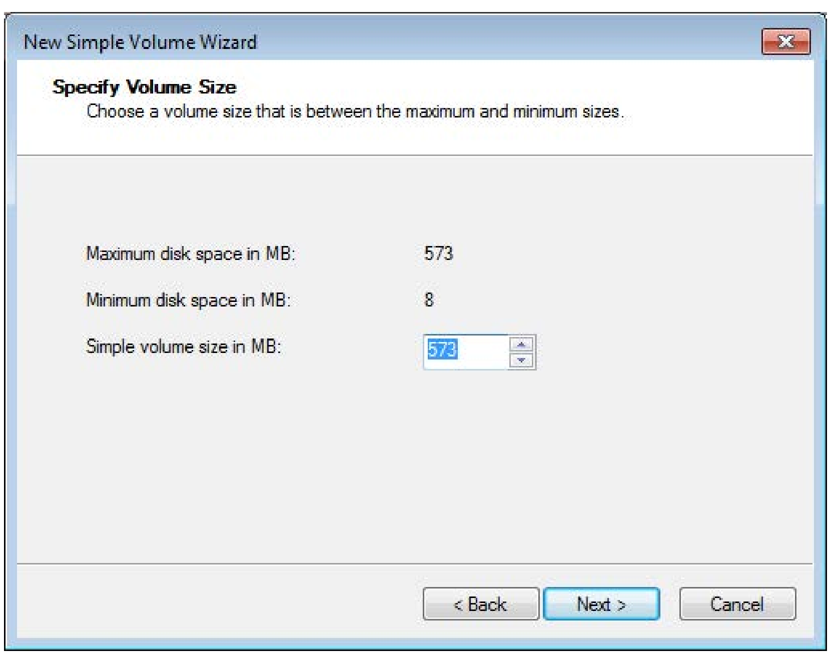

Figure 9-9 Select memory size

In the following window, select Drive D:

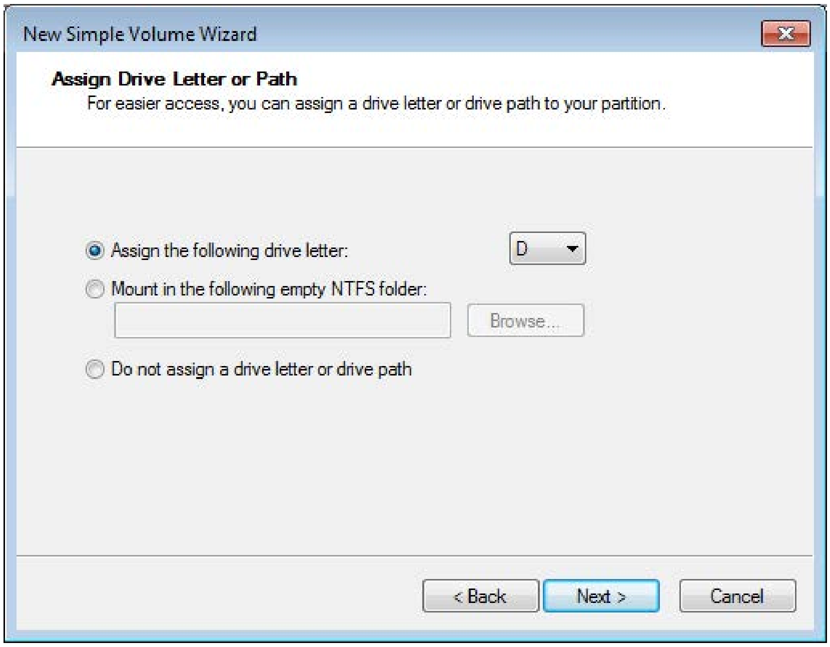

Figure 9-10 Assign drive letter

Specify the formatting for storing data on the partition.

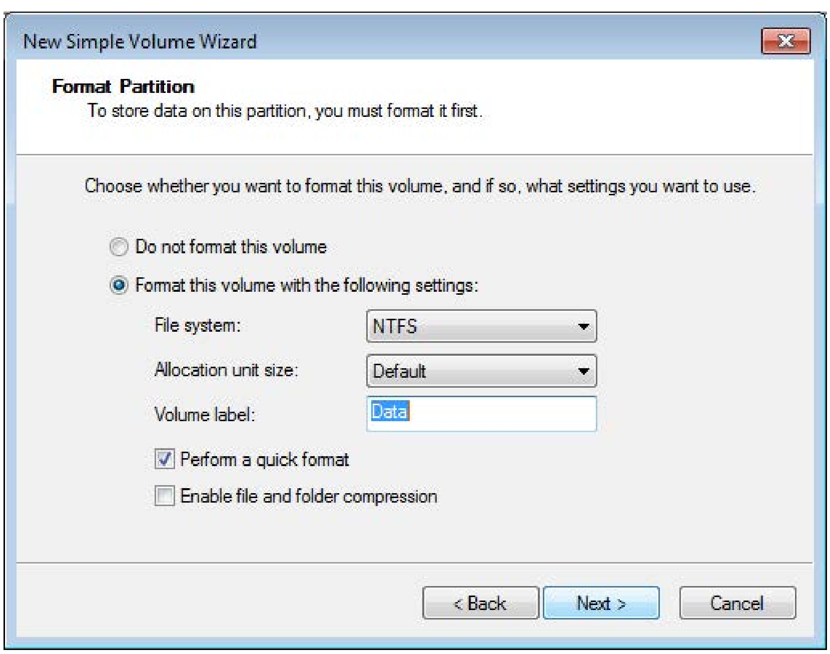

Figure 9-11 Specify formatting

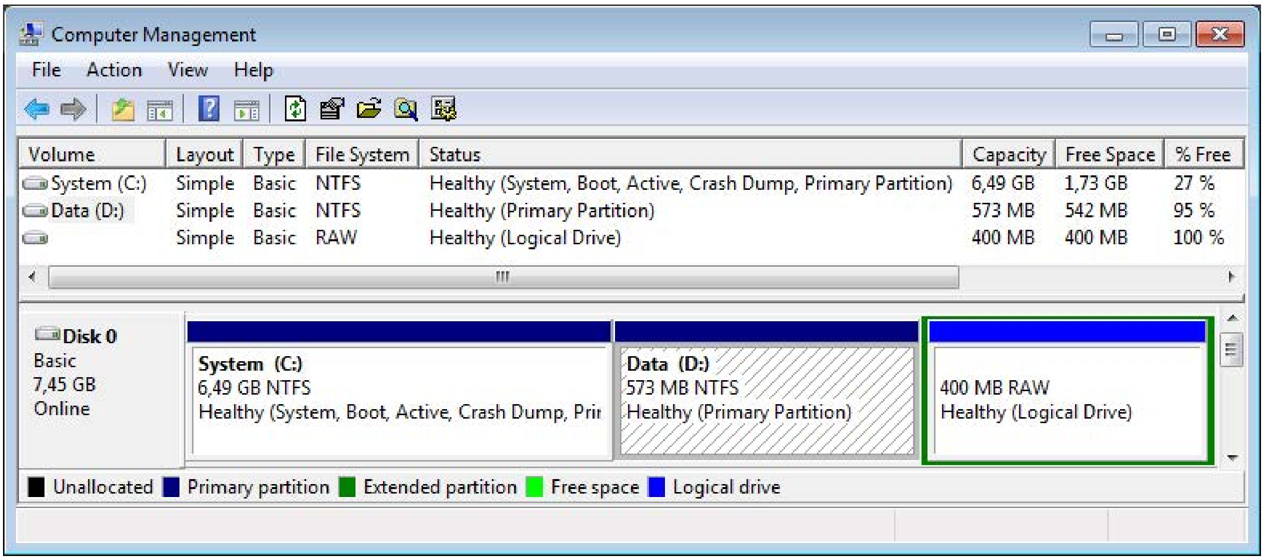
Once you have defined the formatting, an overview of your selected settings appears. Then click "Finish" to complete the process.

The "Computer Management" window now shows the new partition sizes.



9.3 Restoring the delivery state

Introduction

The entire image of your operating system and your Runtime software are located on the supplied Restore DVD. You can use the SIMATIC Restore menu to restore the original CPU 1515SP PC (F) software.

Alternatively, you can use the Restore menu to create a boot-capable USB stick to restore the original software without a DVD-ROM drive (see chapter Restoring delivery state using USB stick (Page 95)).

Note

Restoring existing system partition

If your projects are stored on partition D: you can then use the option "Restore existing system partition" to restore Partition C: with the operating system and the Runtime software, without your project data being affected.

Note

Using Multitouch panels

The restoration of the original software is not possible with a Multitouch panel, because the Multitouch driver is not available until after the installation of the operating system.

Requirements

To restore the original software of the CPU 1515SP PC (F), the following is required:

- A CFast card. Minimum size of the CFast card for the CPU 1515SP PC (F):
  - WES7 E 32Bit 4GB RAM: 8 GB
  - WES7 P 64Bit 4GB RAM: 16 GB
- A DVD drive with external power supply
- The supplied Restore DVD. Alternatively, a bootable USB stick
- A data backup

NOTICE
Data loss During restoration of the system to delivery state, the CFast card is completely erased and re-formatted, and is then loaded with the original software. All subsequently modified or added data, programs, license keys and partitions on the CFast card will be lost. Back up the data of the CPU 1515SP PC (F), after you have assigned parameters to the module and if you have made changes to the configuration.

NOTICE
Loss of license keys Back up the license keys before the restore by dragging these to your USB stick via *Automation License Manager*. After the restart of the CPU 1515SP PC (F), re-install the license keys on the device via the *Automation License Manager*.

Restore delivery state of the CPU 1515SP PC (F) with the Restore DVD

Before the restore

1. Switch off the power supply of the CPU.
2. Remove all USB devices from the CPU.
3. Connect a DVD drive with restore DVD to a USB interface of the CPU.
4. Switch on the power supply of the CPU.
   → The CPU is started.
5. Press <F12> to start the Boot Manager.
6. Select the list entry for the DVD drive in the Boot Manager.
7. After the prompt, confirm the start by pressing any key.
   → The loading process is displayed (Windows logo).
   → The SIMATIC Restore menu opens.
   – Select a language.
   – Select "CPU1515SP PC (F)" or "CPU1515SP PC (F) + HMI".
   – Select the option "Completely restore system drive".
     → The original software is restored on Partition C:, Partition D: is deleted.

After the restore

1. Exit the Restore menu.
2. Remove all USB devices.
3. Proceed as described in Initial commissioning (Page 50).

Further procedure

- Reconnect the USB devices.
- Install the license keys.

9.4 Restoring delivery state using USB stick

Introduction

You can use the Restore menu to create a bootable USB stick in order to restore the original software of the CPU 1515SP PC (F).

Use the SIMATIC IPC Service USB FlashDrive (6AV7672-8JD02-0AA0) for the creation.

Preparing bootable USB stick using PC

NOTICE
Data loss If you transfer the data from the Restore-DVD to the USB stick, all existing data on the USB stick is deleted. You should back up the data on the USB stick before you create the Restore USB stick.

Transferring Restore DVD data to the USB stick

1. Place the Restore DVD into the DVD drive of a PC.
2. Double-click the CD_Menu.exe file in the root directory of the DVD.
3. Select the option " Create USB flash drive".
4. When all the data has been transferred, remove the Restore USB stick safely from the PC.

Note

If you disturb the User-Interface window during the process (for example, by a mouse click in the window), the process continues unchanged even if no reaction is recognizable within the tool interface.

Restoring delivery state using USB stick

Before the restore

1. Switch off the power supply of the CPU.
2. Remove all USB devices from the CPU.
3. Connect the Restore USB stick directly to the CPU.
4. Switch on the power supply of the CPU.

   The CPU is started.

   The restore process starts.
5. Press <F12> to start the Boot Manager.
6. Select the list entry for the USB stick as boot medium in the Boot Manager.
7. After the prompt, confirm the start by pressing any key.

   The loading process is displayed (Windows logo).

   The SIMATIC Restore menu opens.
8. Select a language.
9. Select "CPU 1515SP PC (F)" or "CPU 1515SP PC (F) + HMI".
10. Select the option "Restore delivery state".

    The original software is restored.

After the restore

1. Exit the Restore menu.
2. Remove all USB devices.
3. Proceed as described in Initial commissioning.

9.5 Updating software

Note

If you update the software, then always start the CPU 1515SP PC (F) in the GRUB menu in Windows mode (see Figure (Page 58)).

Information on updating software can be found on the Internet (https://support.industry.siemens.com/cs/ww/en).

HMI devices

During the installation, make sure that you always use the latest drivers for the HMI devices used (SIMATIC Flat Panels).
Before you install a new driver version, you must uninstall the old driver version in order to ensure proper operation.

You can download the current driver software from SIMATIC Product Support.

9.6 Windows Embedded Standard 7

The Windows Embedded Standard 7 operating system is pre-installed on the CPU 1515SP PC (F). WES7 E 32Bit or WES7 P 64Bit are available depending on the order option.

The WES7 P version supports multi-touch functionality (gesture control).

Windows language packs

English is available as the basic language for the installation of the Windows operating system.

With the system version **WES7 P 64Bit 4GB RAM** of the CPU 1515SP PC (F), other operating system languages can be installed after the first commissioning. Note that you need administrator rights to install language packages.

The following language packages are contained on the Restore DVD in \Packages\x64\LanguagePack:

- Traditional Chinese
- Simplified Chinese
- German
- English
- French
- Italian
- Japanese
- Korean
- Russian
- Spanish

Installing languages

Use the Windows function "Start > Control Panel > Region and Language" to install a language pack. The installation takes around 45 minutes.

Updates

You can install additional updates at a later time. You can find current information on the operating system at Widows (http://www.windows.com).

9.7 Sending the device to customer service

Before sending

Note

Back up data and remove memory cards

Before you send in the CPU 1515SP PC (F) for repair:

- Create a backup of your data.
- Back up your SIMATIC license keys on a USB stick.
- Remove your SD/MMC cards.
- Remove your **CFast card**.

9.8 Removing and inserting the CFast card

Introduction

CPU 1515SP PC (F) has one slot for a CFast card. On this card, you will find the operating system, your Runtime software and, after configuration, the project.

Seal the cover for the CFast card to protect the system against unauthorized access.

You must remove the CFast card before you send in the CPU, for example, for repair.

Requirements

- CPU 1515SP PC (F) is de-energized.

Procedure – Removing the CFast card

1. Remove the seal.
2. Open the cover, using a screwdriver if necessary.
3. Press onto the CFast card.
   The card is pressed out of the slot.
4. Pull the card out of the slot.
   To do this, grip the rib on the underside of the memory card.

Procedure – Inserting the CFast card

1. Open the cover of the slot, using a screwdriver if necessary.
2. Insert the CFast card into the slot.
3. Press the CFast card into the slot.

   The CFast card is properly inserted if the cover can be closed without any resistance.
4. Close the cover.

NOTICE
Unauthorized access Seal the cover with lead to protect the CFast card with the operating system of the CPU 1515SP PC (F) against unauthorized access.

Technical data 10

10.1 Standards and approvals

Introduction

The general technical specifications cover the following:

- The standards and test values which the CPU 1515SP PC (F) complies with and fulfils.
- The test criteria according to which the CPU 1515SP PC (F) was tested.

Currently valid markings and approvals

Note

The currently valid markings and approvals are printed on the CPU 1515SP PC (F).

Safety information

WARNING

Risk of personal injury and damage to property.

In potentially explosive atmospheres, injury to persons and material damage may occur if you disconnect plug-in connections during operation of an ET 200SP.

Always switch off the power to the ET 200SP when disconnecting plug-in connections in potentially explosive atmospheres.

WARNING

Flying sparks due to loose cables

Risk of explosion in hazardous areas.

USB cables and PROFINET connectors may detach from the device in the case of strong oscillation and high vibrating loads.

Attach these cables to the strain relief of the device using cable ties.

WARNING
Explosion hazard
If you replace components, compliance with Class I, DIV. 2 can become invalid.

WARNING
Area of application
This device is only suitable for use in Class I, Div. 2, Group A, B, C, D, or in non-hazardous areas.

CE marking

The CPU 1515SP PC (F) meets the requirements and protection targets of the following EC guidelines and complies with the harmonized European standards (EN) for programmable logic controllers published in the official gazettes of the European Community:

- 2006/95/EC "Electrical equipment designed for use within certain voltage limits" (Low-Voltage Directive)
- 2004/108/EC "Electromagnetic Compatibility" (EMC Directive)
- 94/9/EC "Equipment and protective systems intended for use in potentially explosive atmospheres" (Explosion Protection Directive)

The EC declarations of conformity are available for the responsible authorities at:

Siemens AG
Digital Factory

Factory Automation
DF FA AS DH AMB
Postfach 1963
D-92209 Amberg

These are also available for download on the Customer Support Internet pages, keyword "Declaration of Conformity".

cULus approval

Underwriters Laboratories Inc., complying with

- UL 508 (Industrial Control Equipment)
- CSA C22.2 No. 142 (Process Control Equipment)

OR

cULus HAZ. LOC. approval

HAZ. LOC.

Underwriters Laboratories Inc., complying with

- UL 508 (Industrial Control Equipment)
- CSA C22.2 No. 142 (Process Control Equipment)
- ANSI/ISA 12.12.01
- CSA C22.2 No. 213 (Hazardous Location)

APPROVED for use in
Class I, Division 2, Group A, B, C, D Tx;

CSA C22.2 No. 61010-1
APPROVED for use in Class I, Division 2, Group A, B, C, D Tx;
Class I, Zone 2, Group IIC Tx

ATEX approval

in accordance with EN 60079-15 (Electrical apparatus for potentially explosive atmospheres; Type of protection "n") and EN 60079-0 (Electrical apparatus for potentially explosive gas atmospheres - Part 0: General Requirements)

II 3 G Ex nA IIC Tx Gc
DEKRA 12ATEX0038X

IECEx approval

According to IEC 60079-15 (Explosive atmospheres - Part 15: Equipment protection by type of protection "n") and IEC 60079-0 (Explosive atmospheres - Part 0: Equipment - General requirements)

IECEx Ex nA IIC Tx Gc
IECEx DEK 13.0011X

Marking for Australia and New Zealand

or

The ET 200SP distributed I/O system meets the requirements of the standard AS/NZS CISPR 16.

Korea Certificate KCC-REM-S49-ET200SP

Note that this device corresponds to limit class A in terms of the emission of radio frequency interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

IEC 61131

The CPU 1515SP PC (F) with the S7-1500 software controller CPU 1505SP (F) meets the requirements and criteria of the standard IEC 61131-2 (programmable logic controllers, part 2: Equipment requirements and tests).

PROFINET standard

The ET 200SP distributed I/O system is based on the standard IEC 61158 Type 10.

PROFIBUS standard

The ET 200SP distributed I/O system is based on the standard IEC 61158 Type 3.

IO-Link standard

The ET 200SP distributed I/O system is based on the standard IEC 61131-9.

Use in industrial environments

SIMATIC products are designed for use in industry.

Table 10- 1 Use in industrial environments

Area of application	Interference emission requirements	Interference immunity requirements
Industry	EN 61000-6-4: 2011	EN 61000-6-2: 2005

Use in residential areas

Note

The ET 200SP is intended for use in industrial areas; use in residential areas may have an impact on radio/TV reception.

If you want to use the ET 200SP in residential areas, you must ensure that its radio frequency interference emission complies with limit class B in accordance with EN 55011.

Suitable measures for achieving RF interference level Class B include, for example:

- Installation of the CPU 1515SP PC (F). in grounded control/switch cabinets
- Use of filters in the supply lines

Reference

The certificates for the markings and approvals can be found on the Internet under Service&Support (http://www.siemens.com/automation/service&support).

10.2 Electromagnetic compatibility

Definition

Electromagnetic compatibility (EMC) is the ability of an electrical installation to function satisfactorily in its electromagnetic environment without interfering with that environment.

Among other things, CPU 1515SP PC (F) also meets the requirements of the EMC legislation for the European single market. The prerequisite for this is that the CPU 1515SP PC (F) complies with the requirements and guidelines relating to electrical equipment.

EMC according to NE 21

The CPU 1515SP PC does not meet the EMC specifications of the NAMUR guideline NE21.

The CPU 1515SP PC meets the EMC specifications according to IEC 61131-2 and IEC 61000-6-2.

Pulse-shaped disturbance

The following table shows the electromagnetic compatibility of the CPU 1515SP PC (F) with regard to pulse-shaped interference.

Table 10- 2 Pulse-shaped disturbance

Pulse-shaped disturbance	**Test voltage**	**corresponds to degree of se-verity**
Electrostatic discharge according to IEC 61000-4-2.	Air discharge: ±8 kV Contact discharge ± 4 kV	3 3
Burst pulses (high-speed transient disturbance) according to IEC 61000-4-4.	2 kV (power supply cable) 2 kV (signal cable > 30 m) 1 kV (signal cable < 30 m)	3 3
High-energy single pulse (surge) according to IEC 61000-4-5 External protective circuit required (see function manual Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566))		3
• asymmetric coupling	2 kV (power supply cable) DC with protective elements 2 kV (signal cable/data cable only > 30 m), possibly with protective elements	
• symmetric coupling	1 kV (power supply cables) DC with protective elements 1 kV (signal cable/data cable only > 30 m), possibly with protective elements	

Sinusoidal disturbance

The following table shows the electromagnetic compatibility of the CPU 1515SP PC (F) with regard to sinusoidal interference.

- RF radiation

Table 10- 3 Sinusoidal disturbance variables with RF radiation

RF radiation according to IEC 61000-4-3/NAMUR 21 Electromagnetic RF field, amplitude-modulated		corresponds to degree of severity
80 to 1000 MHz; 1.0 to 2.0 GHz	2.0 GHz to 2.7 GHz	3
10 V/m	3 V/m	
80% AM (1 kHz)		

- RF coupling

Table 10- 4 Sinusoidal disturbance variables with RF coupling

RF coupling according to IEC 61000-4-6	corresponds to degree of severity
(10 kHz) 150 kHz to 80 MHz	3
10 V_{rms} unmodulated	
80% AM (1 kHz)	
150 Ω source impedance	

Emission of radio interference

Interference emission of electromagnetic fields according to EN 55016: Limit class A, group 1 (measured at a distance of 10 m).

Table 10- 5 Interference emission of electromagnetic fields according to EN 55016

Frequency	Emitted interference
30 MHz to 230 MHz	< 40 dB (μV/m)Q
230 MHz to 1000 MHz	< 47 dB (μV/m)Q

Interference emission via the AC power supply according to EN 55016: Limit value class A, Group 1.

Table 10- 6 Interference emission via the AC power supply according to EN 55016

Frequency	Emitted interference
0.15 to 0.5 MHz	<79 dB (μV) Q <66 dB (μV) M
0.5 to 30 MHz	<73 dB (μV) Q <60 dB (μV) M

10.3 Shipping and storage conditions

Introduction

The CPU 1515SP PC (F) exceeds requirements in terms of shipping and storage conditions according to IEC 61131-2. The following information applies to modules that are shipped and/or stored in their original packaging.

Table 10- 7 Shipping and storage conditions for modules

Type of condition	Permissible range
Free fall (in shipping package)	≤1 m
Temperature	From -40 °C to +70 °C
Barometric pressure	1080 hPa to 660 hPa (corresponds to an altitude of -1000 m to 3500 m)
Relative humidity	5% to 95%, without condensation
Sinusoidal vibrations according to IEC 60068-2-6	5 - 8.4 Hz: 3.5 mm 8.4 - 500 Hz: 9.8 m/s^2
Shock according to IEC 60068-2-27	250 m/s^2, 6 ms, 1000 shocks

10.4 Mechanical and climatic ambient conditions

Note

Restrictions

Deviating from the ambient conditions for the ET 200SP distributed I/O system, the following restrictions apply to the CPU 1515SP PC (F):

- Mechanical ambient conditions:
  - 2 g constant acceleration when using the BusAdapter BA 2×FC
- Ambient temperature:
  - 0 to 60 °C for horizontal installation with maximum 32 I/O modules
  - 0 to 55 °C for horizontal installation with maximum 64 I/O modules
  - 0 to 50 °C for vertical installation with maximum 32 I/O modules

Operating conditions

CPU 1515SP PC (F) is designed for stationary use in weather-proof locations. The operating conditions exceed the requirements according to DIN IEC 60721-3-3:

- Class 3M3 (mechanical requirements)
- Class 3K3 (climatic requirements)

Mechanical ambient conditions

The table below shows the mechanical ambient conditions in the form of sinusoidal oscillations.

Table 10- 8 Mechanical ambient conditions

Frequency band	CPU 1515SP PC (F)
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration
10 ≤ f ≤ 60 Hz	0.35 mm amplitude
60 ≤ f ≤ 1000 Hz	• 1 g constant acceleration (with BusAdapter BA 2×RJ45) • 2 g constant acceleration (with BusAdapter BA 2×FC)

Test of mechanical ambient conditions

The table below provides important information with respect to the type and scope of the test of ambient mechanical conditions.

Table 10- 9 Test of mechanical ambient conditions

Condition tested	Test Standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (sine)	Type of oscillation: Frequency sweeps with a rate of change of 1 octave/minute. BA 2×RJ45 • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration BA 2×FC • 10 Hz ≤ f ≤ 60 Hz, 0.35 mm constant amplitude • 60 Hz ≤ f ≤ 1000 Hz, 2 g constant acceleration Duration of vibration: 10 frequency sweeps per axis in each of 3 vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of 3 vertically aligned axes

Climatic ambient conditions

You may use the CPU 1515SP PC (F) under the following climatic, ambient conditions.

Table 10- 10 Climatic ambient conditions

Ambient conditions	Permissible range	Comments
Temperature: Horizontal mounting position:	• from 0 to 60 °C	For configuration with 32 I/O modules and 3 x 100 mA USB load
	• from 0 to 55 °C	For configuration with 64 I/O modules and 2 x 500 mA + 1 x 100 mA USB load
Vertical installation:	• 0 to 50 °C	For configuration with 32 I/O modules and 3 x 100 mA USB load
Permitted temperature change	10 K/h	-
Relative humidity	from 10 to 95%	Without condensation, corresponds to relative humidity (RH) class 2 according to IEC 61131 part 2
Barometric pressure	1080 hPa to 795 hPa	Corresponds to an altitude of -1000 m to 2000 m
Concentration of pollutants	SO_2: <0.5 ppm; RH <60 %, no condensation H_2S: <0.1 ppm; RH <60 %, no condensation	-
	ISA-S71.04 severity level G1; G2; G3	-

10.5 Information on insulation, protection class, degree of protection and rated voltage

Insulation

The insulation is designed according to the requirements of EN 61131-2: 2007.

Note

For modules with 24 V DC supply voltage, the electrical isolation is designed for max. 60 V AC / 75 V DC and basic insulation is designed according to EN 61131-2: 2007.

Pollution degree/overvoltage category according to IEC 61131

- Pollution degree 2
- Overvoltage category: II

Protection class according to IEC 61131-2:2007

CPU 1515SP PC (F) fulfils the protection class I and contains parts of protection class II and III.

The grounding of the mounting rail must meet the requirements for functional earth FE.

The installation location (e.g. enclosure, control cabinet) must have a protective conductor connection that meets the standard to maintain protection class I.

Degree of protection IP20

Degree of protection IP20 according to IEC 60529, i.e.:

- Protection against contact with standard probe
- Protection against foreign objects with diameters in excess of 12.5 mm
- No protection against water

Rated voltage for operation

CPU 1515SP PC (F) works with the rated voltage and corresponding tolerances listed in the following table.

Table 10- 11 Rated voltage for operation

Rated voltage	Tolerance range
24 V	19.2 to 28.8 V DC [1]
	18.5 to 30.2 V DC [2]

[1] Static value: Creation as functional extra-low voltage with safe electrical isolation in accordance with IEC 60364-4-41

[2] Dynamic value: including ripple, for example, with three-phase bridge rectification

10.6 Use of the ET 200SP in zone 2 potentially explosive atmospheres

See product information Use of subassemblies/modules in a Zone 2 Hazardous Area (http://support.automation.siemens.com/WW/view/en/19692172).

10.7.8 S7-1500 Software Controller CPU 1505SP (F)

CPU 1505SP (F) is a PC-based controller of the SIMATIC S7-1500 Software Controller family. For more information about the CPU 1505SP (F), refer to the corresponding manual at (https://support.industry.siemens.com/cs/ww/en/view/109740725). For the CPU 1505SP F, also note the information in the F product information at (https://support.industry.siemens.com/cs/ww/en/view/109478599).

Technical specifications

You can find all technical specifications on CPU 1505SP with the article number 6ES7672-5DC01-0YA0 under (https://support.industry.siemens.com/cs/ww/en/pv/6ES7672-5DC01-0YA0/td). You can find all technical specifications on CPU 1505SP F with the article number 6ES7672-5SC01-0YA0 under (https://support.industry.siemens.com/cs/ww/en/pv/6ES7672-5SC01-0YA0/td).

10.8 Dimension drawings

10.8.1 CPU 1515SP PC (F)

This section contains a dimension drawing of the module mounted on a mounting rail. Always observe the specified dimensions for installation in cabinets.

Dimension drawings of the CPU 1515SP PC (F).

• Length: 830 mm	6ES5710-8MA31
• Length: 2000 mm	6ES5710-8MA41
SIMATIC IPC CFast cards	
• CFast 4 GB Industrial Grade	6ES7648-2BF10-0XG10
• CFast 8 GB Industrial Grade	6ES7648-2BF10-0XH10
• CFast 16 GB Industrial Grade	6ES7648-2BF10-0XJ10
• CFast 30 GB Industrial Grade	6ES7648-2BF10-0XK10

Online catalog

Additional article numbers can be found on the Internet in the online catalog and online ordering system (http://www.siemens.com/automation/mall).

Abbreviations

B

Abbreviation	Term	Meaning
AC	Alternating current	Alternating current
ALM	Automation License Manager	Tool for managing license keys in STEP 7
BIOS	Basic Input Output System	Basic Input Output System. A set of important software routines used after the startup of the CPU to load the operating system and to provide the routines for data exchange between hardware components.
CE	Communauté Européenne	CE label
CFast	CompactFlash ATA Serial Transfer	Memory card
CoA	Certificate of Authenticity	Certificate of Authenticity, label with Microsoft Windows "Product Key"
CoL	Certificate of License	Certificate of License for the SIMATIC software loaded
DC	Direct Current	DC current
DVD	Digital Versatile Disc	Digital storage medium with high memory capacity.
DVI-I	Digital Visual Interface	Interface for transfer of image and video data for DVI-I monitors.
ESD	Components sensitive to electrostatic charge	
EN	European standard	
EWF	Enhanced Write Filter	Enhanced write filter
FBWF	File Based Write Filter	File based write filter
GbE	Gigabit Ethernet	
GRUB / GRUB4DOS	GRand Unified Bootloader	Boot Manager
HMI	Human Machine Interface	User interface
IEC	International Electronical Commission	
IM	Interface module	The interface module connects the ET 200SP distributed I/O system with the IO controller and exchanges data with the I/O modules via the backplane bus.
LAN	Local Area Network	Computer network that is limited to a local area.
LED	Light Emitting Diode	Light emitting diode
LLDP	Link Layer Discovery Protocol	Protocol that enables the exchange of information between adjacent devices.
MMC	Multi Media Card	Memory card
NTFS	New Technology File System	File system that offers targeted access protection at the file level.
NVRAM	Non-Volatile Random-Access Memory	Non-volatile data memory that is RAM-based, the data content of which is retained without external power supply.
PC	Personal Computer	

Abbreviation	Term	Meaning
PELV	Protective Extra Low Voltage	PELV, previously called "extra low voltage with safe isolation", is a protective measure against electrical shock. See EN 50178.
PN	PROFINET	
PG	Programming device	Compact programming device which meets the special requirements of industry. The PG is fully equipped for programming SIMATIC PLCs.
PS	Power supply	Power supply
PT	Power Tags	Process tags; tags enable data exchange between the components of an automation process, for example, between the HMI device and the controller.
RAM	Random Access Memory	Main or work memory of a computer with direct access, allowing read access to data and editing.
RT	Runtime	
SD	Secure Digital card	Memory card
SELV	Safety Extra Low Voltage	Safety extra-low voltage; protective measure in which circuits with a rated voltage of up to 50 V AC or 120 V DC are operated ungrounded and feeds from circuits with a higher voltage are separated from these by, for example, a safety transformer.
UL	Underwriters Laboratories Inc.	
USB	Universal Serial Bus	Serial bus system for connecting a computer to external devices.

Troubleshooting

C

Problem	Possible cause	Remedy
CPU 1515SP PC (F) is not working.	CPU 1515SP PC (F) is not supplied with current.	Check the power supply.
CPU 1515SP PC (F) does not start.	Feedback through USB devices.	Use USB devices that comply with the USB 2.0 specification.
Windows no longer boots.	Settings in the BIOS setup are not correct. Windows clock is set incorrectly.	Check the settings in the BIOS setup menu Boot.
Time and/or date of the CPU 1515SP PC (F) do not match.	CPU 1515SP PC (F) was not connected for more than 6 weeks.	Correct the settings in the BIOS setup menu Main or in Windows.
USB device is not working.	USB power supply is overloaded.	Use an external power supply for the USB device (see section Application planning (Page 37).

Glossary

Cold restart

A startup procedure commencing when the CPU is switched on. Upon a cold restart, the system typically performs some basic hardware checks and then loads the operating system from the hard disk into the work memory.

Controller

Integrated hardware and software controlling the operation of a specific internal or I/O device (e.g. keyboard controller).

Device configuration

The device configuration of a PC/programming device includes information on the features and options of the PC/programming device such as memory configuration, drive types, monitor, network address etc. The data is stored in a configuration file and is used by the operating system to load the corresponding device drivers or assign device parameters.

Drivers

Program sections of the operating system. They convert data from the user programs to the specific formats required by the I/O devices (e.g. hard disks, monitors, printers).

Enhanced Write Filter (EWF)

Configurable write filter making it possible to boot Windows Embedded Standard from write-protected media (e.g. from CD-ROM), to write-protect individual partitions and to adapt file system performance to the user's requirements (e.g. when using CFast cards).

Ethernet

Local network (bus structure for text and data communication with a data transmission rate of 10/100/1000 Mbps.

File-Based Write Filter (FBWF)

Configurable write filter making it possible to write-protect individual files.

Image

An image is a copy of hard-disk partitions, for example, which is stored as backup in a file so that it can be restored if necessary.

Interface

- Connection between individual hardware elements such as PCs, programming device, printer or screen by means of physical plug-in connections (cables).
- Connection between different programs to allow them to be used together.

LAN

Local Area Network: LAN refers to a local network consisting of a group of computers and other devices which are distributed over a relatively restricted area and connected through communication lines. The devices connected to a LAN are referred to as nodes. The purpose of networks is the shared use of files, printers or other resources.

License key

The license key is the electronic license stamp of a license. Siemens AG provides a license key for software that is protected by licensing laws.

Operating system

Generic term which describes all functions for controlling and monitoring user program execution and distribution of system resources to the user programs as well as maintenance of the operating mode in cooperation with the hardware.

Power options

The power options can be used to reduce the power consumption of the computer while still keeping it ready for immediate use. In Windows via **Start** > **Control Panel** > **Hardware and Sound** > **Power Options**.

Restart

The restart of the company that is already in operation using, for example, the <Ctrl+Alt+Del> shortcut without switching off the power supply.

Restore DVD

You use the Restore DVD to reset your system partition or the entire hard disk to the delivery state in the event of an error. The DVD contains all the image files required and is bootable.

ROM

Read Only Memory. ROM refers to a read-only memory where each memory location can be addressed individually. The stored programs or data are hard-coded and are preserved even in the event of a power failure.

S.M.A.R.T

Self-Monitoring, Analysis and Reporting Technology (SMART or S.M.A.R.T.) is an industry standard for storage media. It provides for permanent monitoring of relevant parameters and thus early recognition of pending defects.

SATA

Serial ATA. An interface for hard disk drives and optical drives with serial data transfer.

SETUP (BIOS setup)

A program used to determine information on the device configuration. The device configuration of the CPU 1515SP PC (F) is pre-set. Changes must be made whenever a memory expansion, new modules or drives are to be activated.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Introduction 1

Purpose of the documentation

These operating instructions supplement the system manual ET 200SP distributed I/O system. Functions that generally relate to the system are described in this manual.

The information provided in these operating instructions and in the system/function manuals supports you in commissioning the CPU 1515SP PC2.

Basic knowledge required

The system must be operated and used by qualified staff only.
The following knowledge is required:

- Installation guideline for SIMATIC ET 200SP
- Totally Integrated Automation Portal, in particular:
  - Hardware configuration with *hardware and network editor*
  - Communication between CPUs
- PC based automation with an S7-1500 software controller and with WinCC Runtime Advanced
- Basic knowledge of fail-safe automation systems
- Basic knowledge of PC technology
- Windows 10 IoT Enterprise operating system (64-bit)

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

"CPU1515SP PC2 T" means that the respective section applies **only** to the "CPU 1515SP PC2 T".

"CPU1515SP PC2 F" means that the respective section applies **only** to the "CPU 1515SP PC2 F".

"CPU1515SP PC2 TF" means that the respective section applies **only** to the "CPU 1515SP PC2 TF".

"CPU 1515SP PC2" also includes "CPU1 515SP PC2 F", "CPU 1515SP PC2 T" and "CPU 1515SP PC2 TF".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Scope of validity of the documentation

This documentation is valid for the following products:

ET 200SP Open Controller	Article number
Standard CPU	
• CPU 1515SP PC2 basic device	6ES7677-2DB40-0AA0
• CPU 1515SP PC2	6ES7677-2DB42-0GB0
• CPU 1515SP PC2 + HMI 128PT	6ES7677-2DB42-0GK0
• CPU 1515SP PC2 + HMI 512PT	6ES7677-2DB42-0GL0
• CPU 1515SP PC2 + HMI 2048PT	6ES7677-2DB42-0GM0
Fail-safe CPUs

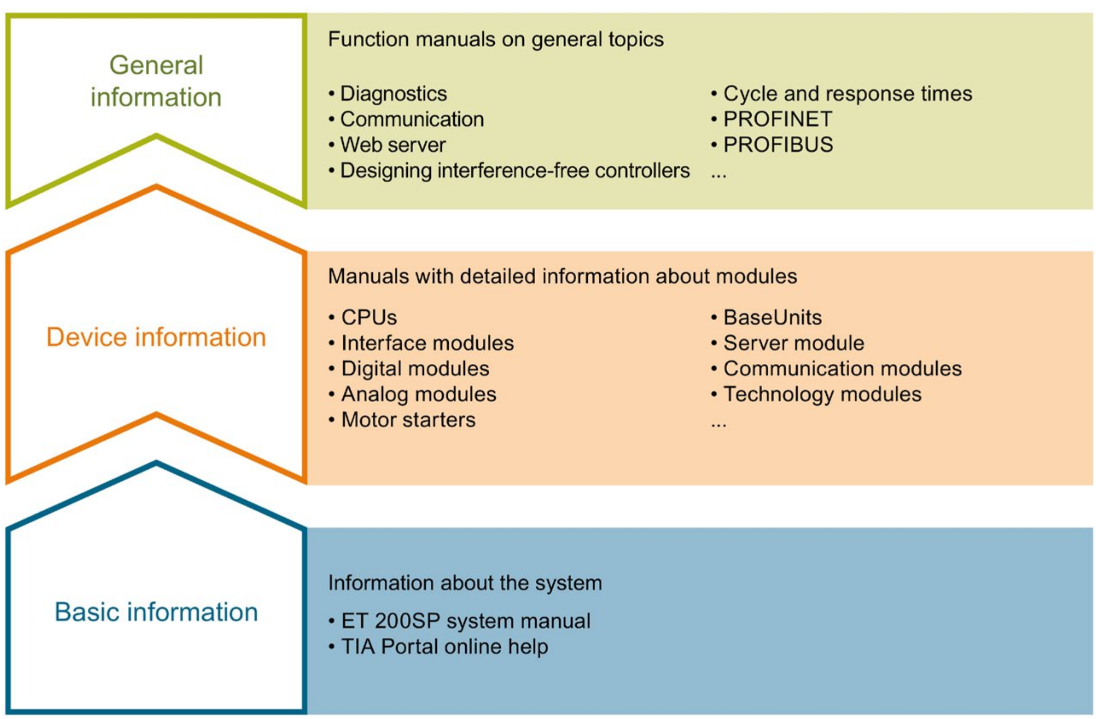
1.1 Documentation on CPU 1515SP PC2

The following additional documentation is required to use the CPU 1515SP PC2:

- Operating instructions CPU 1505SP (F/T/TF), CPU 1507S (F) Version 2.5 (http://support.automation.siemens.com/WW/view/en/109740725)
- STEP 7 and WinCC Engineering V15 system manual (https://support.industry.siemens.com/cs/ww/en/view/109755202)
- ET 200SP distributed I/O system manual (http://support.automation.siemens.com/WW/view/en/58649293)
- ET 200SP server module manual (http://support.automation.siemens.com/WW/view/en/63257531)
- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)
- SIMATIC S7-1200/S7-1500 F-CPUs (http://support.automation.siemens.com/WW/view/en/109478599)

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet.

1.2 Information about third-party software updates

This product contains third-party software. Siemens accepts liability with respect to updates/patches for the third-party software only when these are distributed by Siemens in the context of a Software Update Service contract or officially approved by Siemens. Otherwise, updates/patches are installed at the user's own risk. You can find more information about our software update service offer under (http://w3.siemens.com/mcms/topics/en/simatic/licenses/software-update-service/Pages/Default.aspx).

1.3 Notes on protecting administrator accounts

A user with administrator rights has extensive access and manipulation possibilities.

Therefore, make sure that the administrator account is adequately protected to prevent unauthorized changes. To do this, set secure passwords and use a standard user account for regular operation. Other measures, such as the use of security policies, should be applied as required.

Safety information 2

2.1 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

2.2 General safety instructions

WARNING
Life-endangering voltage when control cabinet is open
If the device is installed in a control cabinet, areas or components can be under life-endangering voltage when the control cabinet is open.
Contact with these areas or components may lead to death through electric shock.
Switch off the power before opening the control cabinet.

If the device is operated in a machine in accordance with the machinery directive, the provisions of the guideline 2006/42/EC apply.

Safe operation of a plant

NOTICE
Protective measures
To ensure safe operation of a plant, you have to take suitable IT security measures, for example, network segmentation.
Seal the cover to protect the CFast card with the operating system of the CPU 1515SP PC2 from unauthorized access.
For more information on Industrial Security, refer to the Internet (http://www.siemens.com/industrialsecurity).

If you have questions about whether it is permissible to install the device in the planned environment, please contact your service representative.

Repairs

WARNING
Damage caused by opening the device
Unauthorized opening of and improper repairs to the device may result in substantial damage to equipment or endanger the user.
Only authorized personnel are permitted to repair the device.

You can find more information on the repair in the section Sending device in for repair (Page 63).

ESD guidelines

Modules containing electrostatic sensitive devices (ESDs) can be identified by the following label:

Strictly follow the guidelines mentioned below when handling modules which are sensitive to ESD:

- Before working with modules with ESD, you need to ensure that you are free of electrostatic charge (e.g. by touching a grounded object).
- All devices and tools must be free of static charge.
- Always pull the mains connector and disconnect the battery before installing or removing modules which are sensitive to ESD.
- Handle modules fitted with ESDs only by their edges.
- Do not touch any connector pins or conductors on modules containing ESDs.

2.3 Notes on use

WARNING

Hazards at an unprotected machine or plant

According to the results of a risk analysis, hazards can occur at an unprotected machine. The hazards may lead to personal injury.

According to the risk analysis, the risk of injury to persons can be countered with the following measures:

- Additional protective equipment at the machine or plant. In this case, the programming, parameter assignment and wiring of the I/O used, in particular, must be performed in accordance with the safety criteria (SIL, PL or Cat.) ascertained by means of an appropriate risk analysis.
- Use of the device for its intended purpose, which can be established by performing a functional test on the plant. This allows errors in programming, parameter assignment and wiring to be detected.
- Documentation of the test results which can be entered, if required, into the relevant safety certificates.

NOTICE

Ambient conditions

Ambient conditions for which the device is not suitable can lead to faults or damage the device.

Note the following:

- Only operate the device in enclosed areas. If you do not comply with this instruction, the warranty becomes void.
- Only operate the device in accordance with the ambient conditions given in the technical specifications.
- Protect the device from dust, moisture and heat.
- Do not expose the device to direct sunlight or other strong sources of light.
- The device must not be used in places with more difficult operating conditions through corrosive vapors or gases without taking additional protective measures, for example, supply of clean air.

Areas of application 3

3.1 Areas of application of fail-safe CPUs

Areas of application

F-CPUs are mainly designed for personal and machine protection. In addition to the safety program, you can also program standard applications. You can operate the F-CPUs in safety mode or in standard mode.

Reference

Information on the use of F-CPUs in safety mode is available in the programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

You can find information on using the CPU 1505SP (F) Software Controller in the associated manual (https://support.industry.siemens.com/cs/ww/en/view/109740725) and in the F-product information (https://support.industry.siemens.com/cs/ww/en/view/109478599).

3.2 Areas of application of technology CPUs

Areas of application

Areas of application of T-CPUs are motion control applications such as gearing and camming as well as control of kinematics. Due to the supported technology functions, the S7-1500T CPUs are suitable for controlling packaging machines, converting applications, assembly automation, etc.

You can operate the TF-CPUs in safety mode or in standard mode.

Reference

You can find information on using the T-CPUs in the function manual SIMATIC S7-1500T Motion Control (http://support.automation.siemens.com/WW/view/en/109749263).

You can find information on using the T-CPUs in the function manual SIMATIC S7-1500T kinematics functions (http://support.automation.siemens.com/WW/view/en/109749264).

You can find information on using the F-CPUs and TF-CPUs in safety mode in the product information for SIMATIC S7-1200/S7-1500 F-CPUs (http://support.automation.siemens.com/WW/view/en/109478599).

Product overview

4

4.1 Field of application

Article number

The article number depends on the pre-installed S7-1500 Software Controller and HMI Runtime.

You can find an overview of the article numbers in the section Scope of validity of the documentation (Page 6).

View of the module

The following figure shows the CPU 1515SP PC2:

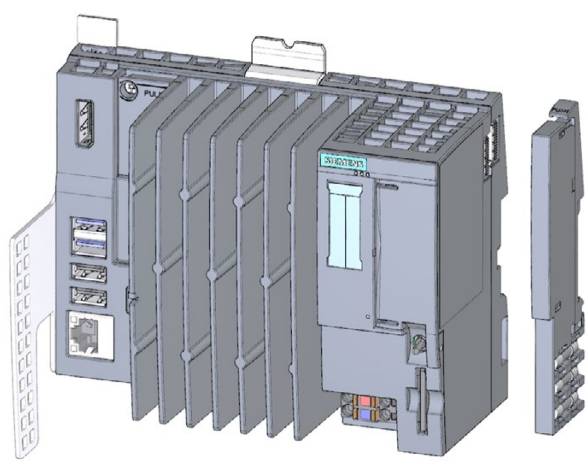


Figure 4-1 CPU 1515SP PC2 with supplied accessories

4.2 Characteristics

The CPU 1515SP PC2 is a PC-based automation device in the design of the ET 200SP. It is used for control and visualization purposes. The supplied IPC DiagBase software provides basic diagnostics functions and supports you in handling the BIOS.

General characteristics

- A removable CFast card with the following pre-installations is used as storage medium:
  - Windows 10 IoT Enterprise operating system (64-bit)
  - S7-1500 Software Controller CPU 1505SP, CPU 1505SP F, CPU 1505SP T, CPU 1505SP TF
  - Optionally with HMI: WinCC Runtime Advanced as of V15
- Interfaces:
  - An interface for the exchangeable ET 200SP BusAdapters for connection of PROFINET IO (2 ports) Accessories/spare parts (Page 123)
  - An interface for connecting devices using Industrial Ethernet (Gigabit Ethernet)
  - 4 interfaces for USB devices (2 x USB 3.0 and 2 x USB 2.0)
  - A DisplayPort interface (DPP) for a monitor
  - A sealable slot for the CFast card
  - A slot for an SD/MMC card as additional optional drive
- Supply voltage 1L+ 24 V DC (SELV/PELV). The connection plug is included in the scope of delivery.
- The CPU 1515SP PC2 is suitable for use in industrial environments:
  - Compact design
  - Fan-less operation
  - High robustness
- The CPU 1515SP PC2 complies with IP 20 degree of protection and is intended for installation in a control cabinet.

Additional information

You can find more information on the system versions and ordering options in the section Scope of validity of the documentation (Page 6).

4.3 Sample configuration

Configuration

The CPU 1515SP PC2 is mounted on a mounting rail according to EN 60715. A modular system is formed with ET 200SP modules in the central rack. You can also expand the CPU 1515SP PC2 with fail-safe I/O modules.

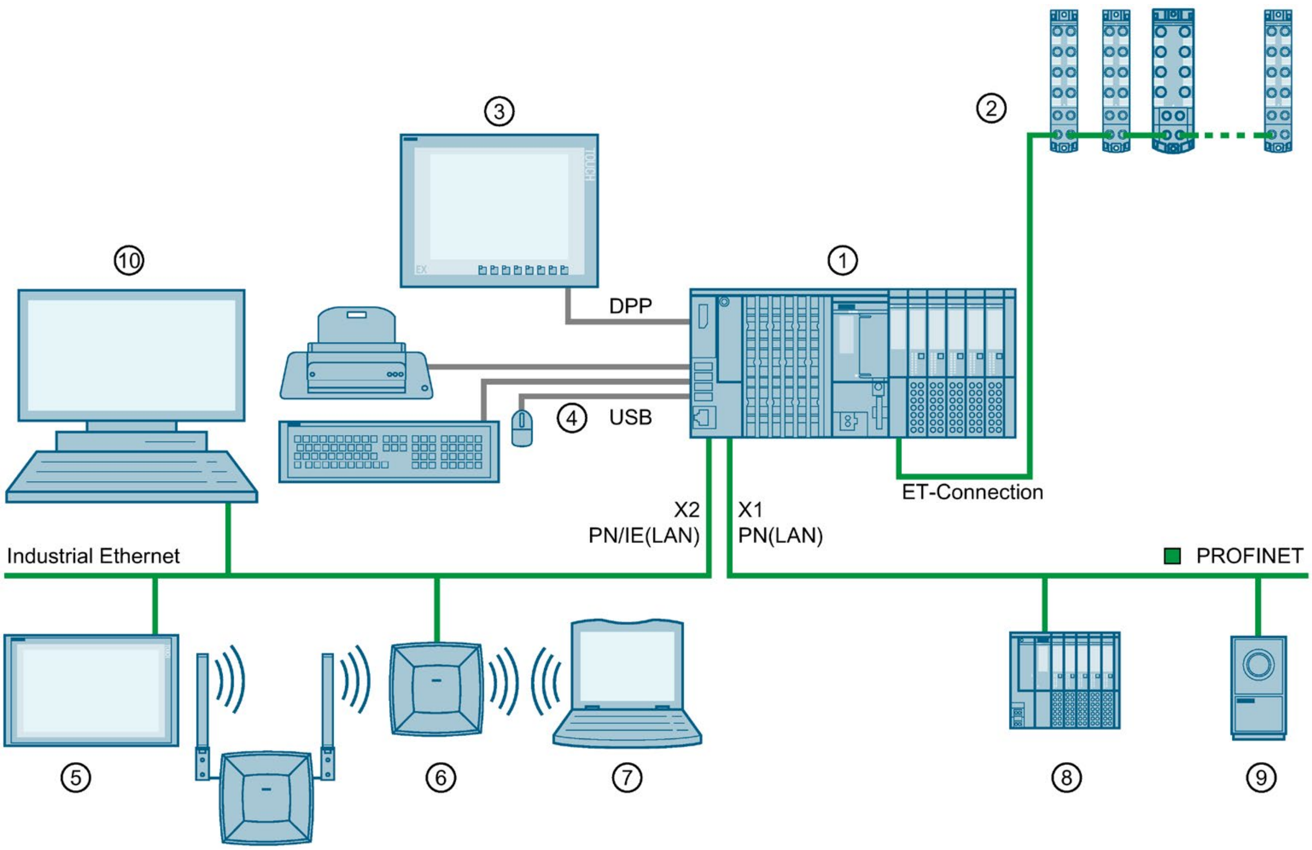
You can use the CPU 1515SP PC2 as PROFINET IO controller. The PROFINET IO devices are connected via the ports of the X1 PN(LAN) interface using a SIMATIC BusAdapter.

Devices can be connected via Industrial Ethernet using the integrated interface X2 PN/IE(LAN).

The connection to PROFIBUS can be made using the DP master module.

Sample configuration

The following figure shows a sample configuration with the CPU 1515SP PC2:



①	CPU 1515SP PC2, I/O modules, server module, BusAdapter
②	ET 200AL modules with ET-Connection
③	Flat Panel - Wide Screen Display
④	USB devices: Keyboard, mouse, printer ...
⑤	Industrial Thin Client ITC
⑥	SCALANCE W786
⑦	Field PG
⑧	PROFINET IO device
⑨	Camera
⑩	PC/Programming device

Figure 4-2 Configuration example with the CPU 1515SP PC2

Reference

You can find more information about configuring the ET 200AL modules in the system manual ET 200AL distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/89254965).

4.4 Components

Components of the CPU 1515SP PC2

The following table provides an overview of the components of the CPU 1515SP PC2:

Table 4- 1 Components of the CPU 1515SP PC2

Component	Function	Figure
Mounting rail in accordance with EN 60715	The mounting rail is the rack for the CPU 1515SP PC2.	
CPU 1515SP PC2	CPU with strain relief and white reference labels	
Component	Function	Figure
BusAdapter	The BusAdapter allows free selection of the connection technology for PROFINET IO. The following versions are available for CPU 1515SP PC2: • For standard RJ45 connector (BA 2×RJ45) ① • For direct connection of the bus cable (BA 2×FC) ② • For POF/PCF fiber-optic cable (BA 2xSCRJ) ③ • As media converter for POF/PCF fiber-optic cable ⇔ standard RJ45 connector (BA SCRJ/RJ45) ④ • As media converter for POF/PCF fiber-optic cable ⇔ direct connection of the bus cable (BA SCRJ/FC) ⑤ • For glass fiber-optic cable (BA 2xLC) ⑥ • As media converter for glass fiber-optic cable ⇔ standard RJ45 connector (BA LC/RJ45) ⑦ • As media converter for glass fiber-optic cable ⇔ direct connection of the bus cable (BA LC/FC) ⑧		For mixed configuration with an ET 200AL , you require the BusAdapter BA-Send 1xFC ① (plugged into the BaseUnit BU-Send). Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1xFC.	Server module	The server module completes the configuration of the CPU 1515SP PC2 with I/O modules. The server module is included in the CPU's scope of delivery.	
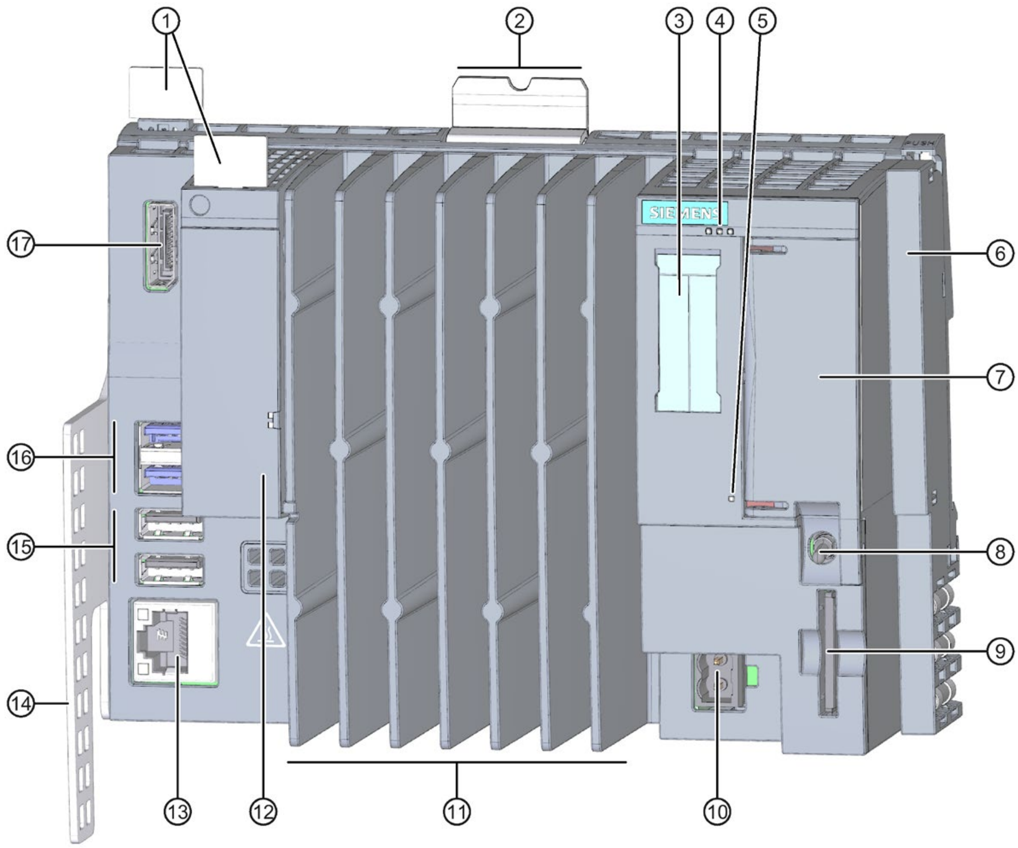
4.5 Operator controls and connection elements

View of the module

The following figure shows the operator controls and connection elements of the CPU 1515SP PC2:



①	Reference identification labels	
②	Mounting rail release	
③	Labeling strips	
④	LEDs for the current operating state and diagnostic status of the CPU 1505SP	
⑤	Power LED	
⑥	Server module	
⑦	X50:	Slot for the CFast card (flash memory), sealable
⑧	Mode selector	
⑨	X51:	Slot for an optional SD/MMC card
⑩	X80:	Connector for 24 V DC supply voltage
⑪	Cooling fins	
⑫	X1 PROFINET (LAN):	Slot for BusAdapter for connection of PROFINET IO; Status display for PROFINET
⑬	X2 PN/IE(LAN):	GbE Ethernet connection with integrated display
⑭	Strain relief	
⑮	X62, X63:	2 x USB 2.0 ports
⑯	X60, X61:	2 x USB 3.0 ports
⑰	X70:	DisplayPort interface (DPP)

Figure 4-3 View of the CPU 1515SP PC2

Slot for CFast card

The operating system, Runtime software and project are installed on the supplied SIMATIC CFast card. The CFast card is the only mass storage device of the CPU 1515SP PC2.

Note

Unauthorized access

Seal the cover of the slot to protect the CFast card with the operating system of the CPU 1515SP PC2 from unauthorized access and manipulation.

Slot for SD/MMC card

You can use a SIMATIC SD or MMC card as additional storage drive. This drive can be used to store data via Windows, for example a backup, but not the operating system, the Runtime software or the project.

Permitted SD cards: SDHC up to 32 GB, SDXC up to 2 TB.

USB connections

- 2 x USB 3.0 with I_{max} = 1 A per interface
- 2 x USB 2.0 with I_{max} = 0.5 A per interface

MAC addresses

The MAC address consists of a 3-byte manufacturer ID and a 3-byte device ID (consecutive number).

Each device is already assigned four MAC addresses in the factory. The front of the CPU 1515SP PC2 is lasered with the MAC address 1 and 4. With the MAC addresses 2 and 3, the consecutive numbers are incremented. If, for example, the first MAC address is 08-00-06-6B-80-C0, the second MAC address is 08-00-06-6B-80-C1.

Table 4- 2 Assignment of the MAC addresses

	Assignment
MAC address 1	X2 PN/IE(LAN) • Visible in STEP 7 for accessible devices • Lasered on the front of the CPU (start of the number range)
MAC address 2	X1 PROFINET (LAN) • Visible in STEP 7 for accessible devices
MAC address 3	Port X1 P1 (required for LLDP, for example)
MAC address 4	Port X1 P2 R (required for LLDP, for example) • Lasered on the front of the CPU (end of the number range)

Connector for supply voltage

The CPU 1515SP PC2 is equipped with a 2-pin connection terminal for the power supply.

The connection plug for the supply voltage is plugged in when the CPU is shipped from the factory.

Mode selector

Use the mode selector to set the CPU operating mode.

Table 4- 3 Mode selector positions

Position	Meaning	Description
RUN	Operating mode RUN[1]	The CPU is processing the user program.
STOP	Operating mode STOP[1]	The CPU is not processing the user program. The outputs are set to a "safe" state.
MRES	Memory reset	**For active S7-1500 software controller**[2] only: CPU memory reset

1 RUN and STOP indicate the **selected** operating state. The RUN and STOP LEDs indicate the **actual** operating mode of the CPU 1515SP PC2.

2 See manual S7-1500 Software Controller CPU 1505SP (F), CPU 1507S (F) Version 2

4.6 Scope of delivery

Note

The device always comes with the **CPU 1515SP PC2** label with article number 6ES7677-2DB40-0AA0, regardless of the order options.

The following components are included in the scope of delivery of the CPUs:

- CPU 1515SP PC2 basic device
- Strain relief with fixing screws
- Server module
- CFast card with the following pre-installations:
  - Windows 10 IOT Enterprise operating system (64-bit)
  - S7-1500 Software Controller CPU 1505SP
  - Optional **only** for CPU 1515SP PC2/CPU 1515SP PC2 F: WinCC RT Advanced as of V15
- Restore USB stick for image restore
- Windows-Certificate of Authenticity (CoA)
- Certificate of License (CoL)
- **Only** for CPU 1515SP PC2 (F) with HMI and CPU 1515SP PC2 T/ TF**:** USB stick with SIMATIC license keys
- Product information

Application planning 5

5.1 Basics

Introduction

The CPU 1515SP PC2 is open equipment. This means you may only set up the CPU in enclosures, cabinets or electrical equipment rooms and in a dry environment (IP20 degree of protection). The housings, cabinets and electrical operating rooms must guarantee protection against electric shock and spread of fire. The requirements regarding mechanical strength must also be observed. The housings, cabinets, and electrical operating rooms must not be accessible without a key or tool. Access may only be possible for instructed or authorized personnel.

Installation location

Install the CPU 1515SP PC2 in a suitable enclosure/control cabinet with at least IP54 degree of protection according to EN 60529 and take into consideration the ambient conditions for operating the devices.

Installation position

You can install the ET 200SP distributed I/O system in any position. The preferred mounting position is horizontal mounting on a vertical wall.

Depending on the mounting position, restrictions on ambient temperature and maximum configuration apply to the CPU 1515SP PC2.

> **NOTICE**
>
> **Damage to the modules**
>
> Modules can be damaged if exposed to ambient temperatures higher than permitted.
>
> The following ambient temperatures must not be exceeded during operation:
>
> - Horizontal mounting
>   60 °C for an installation with up to 32 I/O modules.
>   55 °C for an installation with up to 64 I/O modules.
> - Vertical mounting
>   50 °C for an installation with up to 32 I/O modules.

Additional information can be found in the section Mechanical and climatic environmental conditions (Page 74).

5.2 Unpacking the device

When unpacking

When unpacking, make sure to check the following:

- Check packaging and contents for visible damage from transport. Damaged or incomplete devices should never be commissioned.
- Check the delivery for correctness and completeness.
  Please inform your Siemens contact partner should you notice any irregularities.
- Keep the supplied documentation and licenses. They belong to the device and are the proof that you have purchased the software preinstalled on the CFast card. Documentation and licenses are required for initial commissioning and for any questions that arise.
- Keep the original packaging in case the device needs to be transported again.
- Note the identification data (Page 30) of the device.

NOTICE
Damage to the device during transport and storage If a device is transported or stored without packaging, it is unprotected from shocks, vibrations, pressure and moisture. Damaged packaging indicates that environmental conditions have already had a significant impact on the device. The device might be damaged. Do not dispose of the original packaging. Pack the device for transport and storage.

NOTICE
Damage to the device caused by condensation If the device was exposed to low temperatures or extreme variations in temperature during transport, this may cause moisture to build up on or in the device (condensation). Please note the specified mechanical and climatic ambient conditions (Page 74). Moisture can cause short-circuits in the electrical circuits and damage the device. Proceed as follows to avoid damage: • Store the device in dry conditions. • Make sure it adapts to room temperature before commissioning. • Do not expose the device to direct heat radiation from a heater. • If condensation has developed, wait until the device is completely dry before you switch it on.

WARNING
Electric shock and fire hazard from damaged device
A damaged device can carry dangerous voltage and trigger a fire in the machine or plant. A damaged device has unpredictable properties and states.
Death or severe injury could occur.
Make sure that the damaged device is not installed and commissioned accidentally. Label the damaged device correspondingly and keep it locked up. Have the device repaired without delay.

5.3 Identification data

The identification data can be used to clearly identify the device when a repair is necessary.

Note the following data:

- Printed on the nameplate of the device, please find the following information:
  - Article number
  - Serial number
  - The first and the last MAC address
- Depending on the scope of delivery, the "Certificate-of-License" is provided as proof of license. This document is valid for the following product:
  - S7-1500 Software Controller CPU 1505SP
  - S7-1500 Software Controller CPU 1505SP F/T/TF
  - WinCC Runtime Advanced V15
- The "Microsoft Windows Product Key" can be found on the "Certificate of Authenticity" label.

5.4 Installation location

Introduction

Install the CPU 1515SP PC2 in a suitable housing/control cabinet with sufficient mechanical strength, fire protection and at least IP54 degree of protection according to EN 60529, and take into consideration the ambient conditions for operating the devices.

Mounting rail

You must ground the mounting rail separately in the control cabinet. Exception: If you install the rail on grounded, zinc-plated mounting plates, there is no need to ground the rail separately.

Note

If the ET 200SP distributed I/O system is exposed to vibration and shock loads, both ends of the ET 200SP system assembly must be mechanically fixed to the mounting rail (e.g using 8WA1010-1PH01 ground terminals). This measure prevents the ET 200SP from shifting to the side.

Note

If the ET 200SP distributed I/O system is exposed to high vibration and shock load, we recommend that you screw the mounting rail to the mounting surface at intervals of approx. 200 mm.

Suitable surface finishes are:

- Steel strip in accordance with Appendix A of EN 60715 or
- Tinned steel strip. We recommend the use of the mounting rails in section (Page 123).

Note

Mounting rails of other manufacturers

If you use mounting rails from other manufacturers, ensure that they have the properties required for your climatic and mechanical ambient conditions.

Minimum clearances

Make sure to maintain the following minimum clearances when installing the CPU 1515SP PC2.

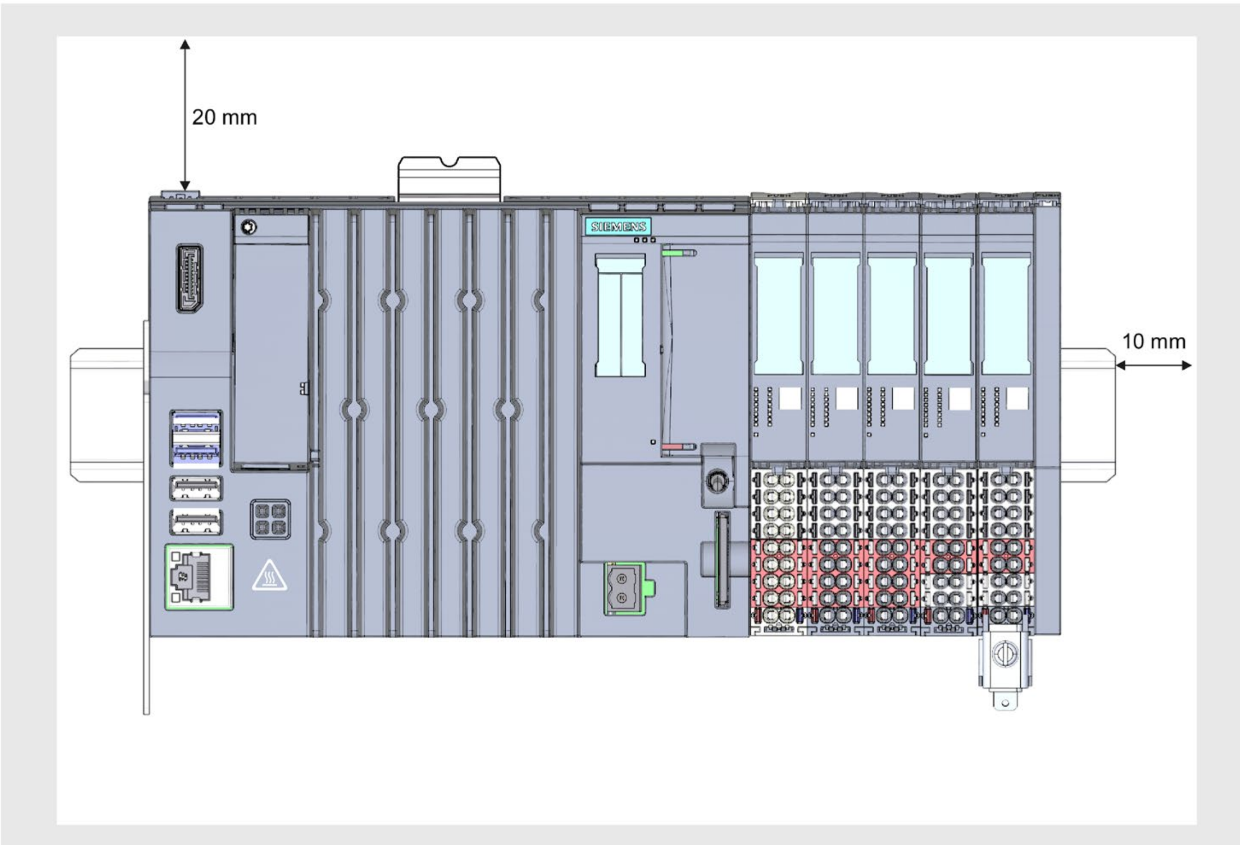


Figure 5-1 Minimum clearances

Installation rules

- After the CPU 1515SP PC2, there is a BaseUnit BU..D with incoming supply voltage L+ (light-colored terminal box).
- This is followed by BaseUnits BU..B (with dark-colored terminal box).
- The respective corresponding I/O modules can be connected to the BaseUnits. Suitable combinations of BaseUnits and I/O modules can be found in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/84133942).
- The server module completes the installation.

Note

Install the CPU 1515SP PC2 only with disconnected supply voltage.

5.5 Hardware configuration

As soon as one of the following rules applies, the maximum configuration has been reached.

Maximum mechanical configuration

Backplane bus length: Maximum 1 m mounting width (without CPU 1515SP PC2, including server module)

Electrical maximum configuration

The number of operable I/O modules of a potential group is limited by the

- Power consumption of the I/O modules
- Power consumption of the components supplied via these I/O modules

The maximum current-carrying capability of the terminals on the BaseUnit L+/ground is 10 A.

USB load

When using the CPU 1515SP PC2 with the maximum configuration, the USB load must also be considered:

- Horizontal mounting
  - Ambient temperature of 0 to 60 °C with maximum 32 I/O modules **and** 4 x low-current (500 mA) USB load
  - Ambient temperature of 0 to 55 °C with maximum 64 I/O modules **and** 2 x high-current (900 mA) + 2 x low-current (500 mA) USB load
- Vertical mounting
  - Ambient temperature of 0 to 50 °C with maximum 32 I/O modules **and** 4 x low-current (500 mA) USB load

Address space

The address space is predefined. However, you can adjust the address space in the user program.

Installation 6

6.1 Installing the device

Requirements

The mounting rail is fitted.

Required tools

3 to 3.5 mm screwdriver (only to fix the strain relief and dismantle the BusAdapter)

Fixing strain relief

Fix the strain relief to the top and bottom of the left-hand side of the CPU 1515SP PC2 with the supplied screws.

Installing the CPU 1515SP PC2

1. Install the CPU on the mounting rail.
2. Swivel the CPU back until you hear the mounting rail release click into place
3. To check that the CPU has correctly clicked into place, pull on the underside of the enclosure.

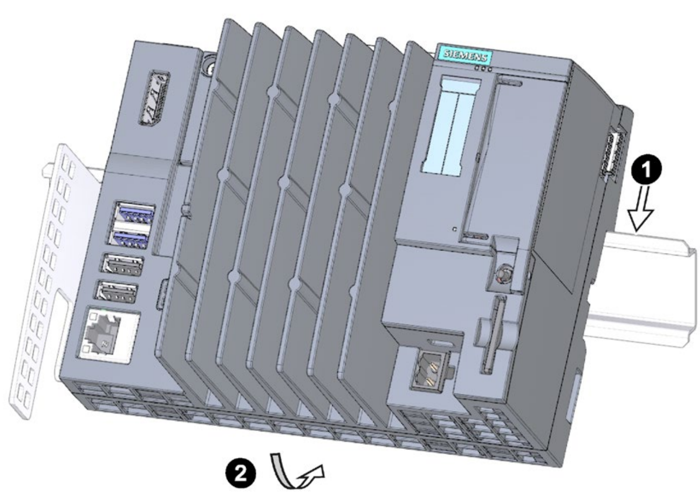

Figure 6-1 Installing the CPU 1515SP PC2

Uninstalling the CPU 1515SP PC2

The BaseUnits with the I/O modules are located to the right of the CPU 1515SP PC2:

1. Switch off the supply voltage on the CPU.
2. Press the mounting rail release button on the first BaseUnit and, at the same time, move the CPU parallel to the left until it comes off the rest of the module group.

   Note: The mounting rail release button is located above the CPU.
3. While pressing the mounting rail release button on the CPU, swivel the CPU out of the mounting rail.

Note

It is not necessary to remove the BusAdapter from the CPU 1515SP PC2.

---

7 Wiring

7.1 Notes on connection

Note

Rules and regulations for operation

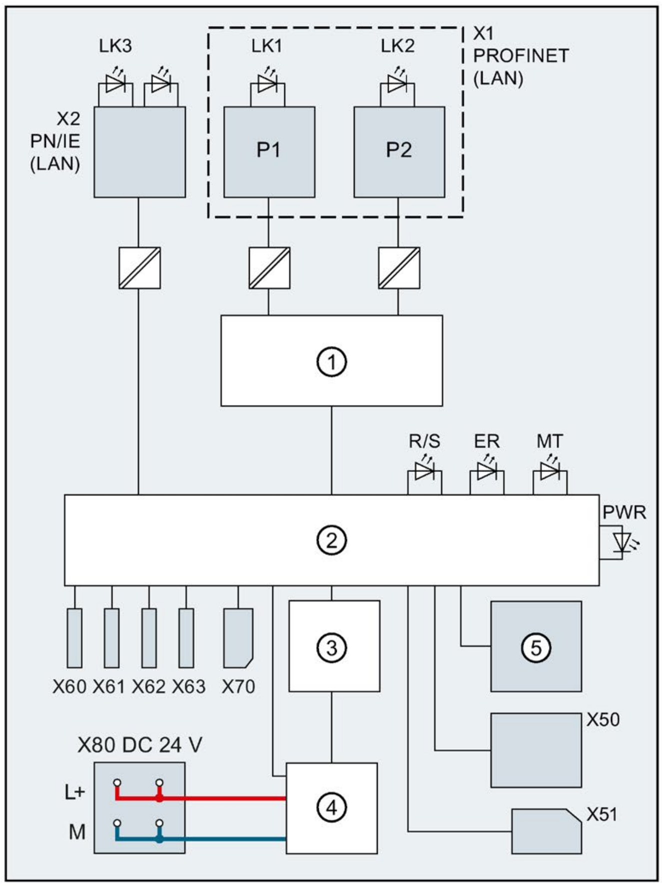
Observe the information contained in the *Wiring* section in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/84133942) and in the function manual Designing interference-free controllers function manual (http://support.automation.siemens.com/WW/view/en/59193566).

NOTICE
Risk of hazardous system states
If you remove and insert I/O devices with the supply voltage switched on, this can result in hazardous system states.
Injury to persons and damage to the machine or plant could result.
Therefore, I/O devices can only be inserted and removed when the supply voltage is switched off.
Only connect I/O devices which are suitable for use in industrial environments according to EN 61000-6-2 / IEC 61000-6-2.

7.2 Terminal and block diagram

Block diagram

The following figure shows the block diagram for the CPU 1515SP PC2.



①	Switch	X1 PN(LAN)	PROFINET interface X1
②	Electronics	P1	PROFINET interface X1 Port 1
③	Backplane bus interface	P2	PROFINET interface X1 Port 2
④	Internal supply voltage	L+	24 V DC supply voltage
⑤	Mode selector	M	Ground
X50	CFast card	LK1, LK2	LED Link TX/RX
X51	SD/MMC card	LK3	LED Link
X60, X61	USB 3.0 interfaces, max. 0.9 A	R/S	RUN/STOP LED (yellow/green)
X62, X63	USB 2.0 interfaces, max. 0.5 A	ER	ERROR LED (red)
X70	DPP interface	MT	MAINT LED (yellow)
X80 24 V DC	Infeed of supply voltage	PWR	POWER LED (yellow/green)
X2 PN/IE(LAN)	Ethernet interface X2		

Figure 7-1 Block diagram for the CPU 1515SP PC2

7.3 Electrical configuration

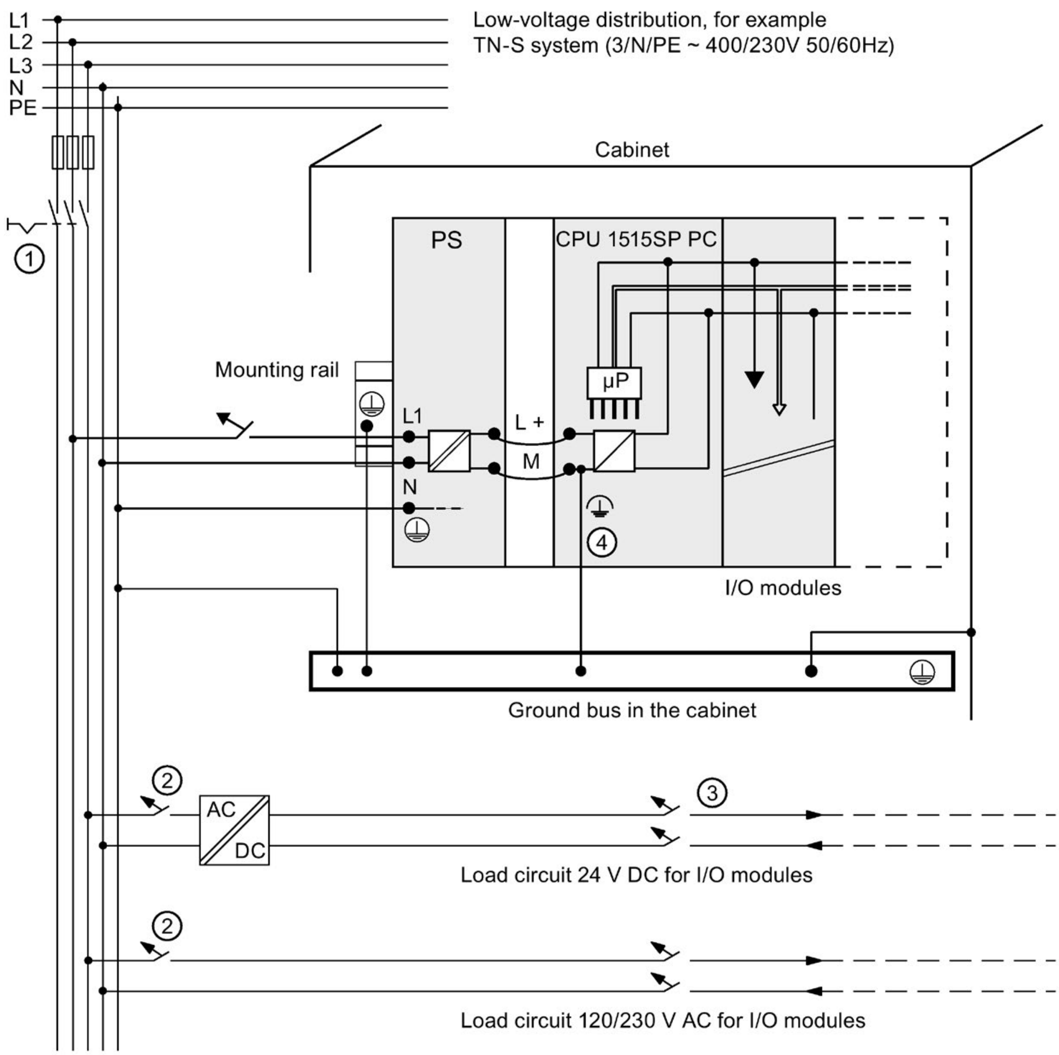
Non-isolated configuration

Note

Unlike the ET 200SP distributed I/O system, the CPU 1515SP PC2 can only be operated with a non-isolated configuration.

The following figure shows the overall configuration of a CPU 1515SP PC2 with power supply from a TN-S system. The power supply supplies the CPU 1515SP PC2 and the load circuit for the 24 V DC modules.

For the CPU 1515SP PC2, there is a fixed connection between the ground infeed terminal and the contact springs to the mounting rail. You must ground the mounting rail separately in the control cabinet.



① Master switch

② Short-circuit and overload protection

③ Load current supply (galvanic isolation)

④ This connection is established automatically with the CPU 1515SP PC2.

The represented layout of the power connections does not correspond to the actual layout; it was chosen for demonstration purposes only.

Figure 7-2 Connecting the load voltage reference potential

7.4 Connecting devices to networks

The following options are available for integrating devices into existing or planned system environments and networks.

Ethernet

You can use the integrated Ethernet interface X2 PN/IE(LAN) (10/100/1000 Mbps) for communication and data exchange with automation devices, for example, SIMATIC S7. Only ASCII characters are permitted in the name of the X2 PN/IE(LAN) interface in the TIA Portal, e.g. PROFINET_2.

You need suitable software to do this: STEP 7, WinCC, SIMATIC NET.

Note

Use a Category 5e Ethernet cable (Cat-5e cable) for operation with 1000 Mbps.

PROFINET

PROFINET operation is possible via the X1 PN(LAN) interface and the approved BusAdapter.

PROFIBUS

The connection to PROFIBUS can be made using the DP master module.

7.5 Securing cables

The strain relief for connecting cables prevents the USB cables and PROFINET connectors detaching from the CPU 1515SP PC2. The strain relief is included in the scope of delivery.

⚠ WARNING
Flying sparks due to loose cables
Risk of explosion in hazardous areas.
USB cables and PROFINET connectors may detach from the device in the case of strong oscillation and high vibrating loads.
Attach these cables to the strain relief of the device using cable ties.

Requirements

- The strain relief is fixed to the CPU.
- The CPU is installed.

Procedure

Secure the USB and PROFINET cables to the strain relief using cable ties.

Figure 7-3 Secured cables

Commissioning 8

8.1 Notes on commissioning

WARNING

Improper commissioning in hazardous areas

Device failure or risk of explosion in hazardous areas.

- Do not commission the device unless it is fully mounted and connected according to the specifications in the section Wiring (Page 36).
- Before commissioning, please consider the effects on other devices in the plant.

NOTICE

Condensation in the device

Damage to the device due to condensation if the temperature between transport or storage and the installation point differs.

Before commissioning the device, leave it to stand until it is dry.

NOTICE

Data loss

Data loss may occur if write filters are used incorrectly.

Therefore, note the information on write filters.

The following configurable write filter is available under Windows 10:

- Unified Write Filter (UWF) (Page 57)

8.2 Basic commissioning procedure

Step	Execution	Section
1	Requirements	8.2.1 (Page 43)
2	Preparing commissioning	8.2.2 (Page 43)
3	Commissioning procedure	8.2.3 (Page 43)

8.2.1 Requirements

The following requirements must be met before you commission the Open Controller for the first time:

- The CPU 1515SP PC2 is mounted.
- The supplied CFast card is inserted.
- No data carriers are connected via USB.

8.2.2 Preparing commissioning

Procedure

When the requirements are met, proceed as follows with the commissioning:

1. Connect a monitor using a DisplayPort cable.
2. Connect a keyboard and a mouse to the CPU via USB.

Result

The Open Controller is prepared for commissioning.

8.2.3 Commissioning procedure

When you start up your CPU 1515SP PC2 for the first time, basic settings and the administrator password are queried. The device is then automatically set up for the operating system that is installed on the CFast card. Restart the device after the operating system has been set up.

Note

The initial commissioning is not possible with a Multitouch panel, as the Multitouch driver is only available after the installation of the operating system.

Procedure

When the requirements (Page 43) are met and the preparations for commissioning (Page 43) are complete, proceed as follows with the commissioning:

1. Connect the power supply.

   → The PWR LED lights up yellow first, then green.

   → The device carries out the hardware initialization.
2. Wait until the Siemens logo disappears from the screen.
3. Follow the instructions on the screen to configure the device:
   – Set <Language>, <Country/region>, <App language>, <Keyboard layout>, <Time zone for>
   – Accept license conditions
   – Setting the account
4. Finally, you will be prompted to restart the device.

> **NOTICE**
>
> **Faulty installation**
>
> If you change the device during the installation, the installation will be disrupted and the operating system will not be installed correctly. The operational reliability of the device and the plant is endangered.
>
> Do **not** switch off the device during the entire installation process.

Information on users/user groups in Windows

A user "Operator" with standard user rights is already created on the Windows system.

The user is in a user group "SIEMENS TIA Engineer". This grants the user the rights to use the installed SIMATIC software products.

To use the CPU 1515SP PC2 directly, the Windows "Autologon" function is enabled for the "Operator" user. No password is preset.

Note

When you assign a password, change the entry for the "Autologon" function accordingly using the Windows user administration.

Result

- The Windows 10 IOT Enterprise operating system (64-bit) is installed.
- The "Operator" user is logged on automatically.
- The software controller and WinCC Runtime Advanced, if required, are ready for use.
- For administrative purposes, the "Operator" user can be logged off and the administrator created during commissioning can be logged on.
- The operating system's start screen is displayed after each startup.

8.3 Initial commissioning an open controller

Step	Execution	Section
1	Creating the configuration of the Open Controller	8.3.1 (Page 45)
2	Setting the IP address	8.3.2 (Page 46)
3	Changing the properties of the Software Controller	8.3.3 (Page 46)
4	Establishing the HMI connection	8.3.4 (Page 47)
5	Downloading a project to the target system	8.3.5 (Page 47)
6	Transferring the license key	8.3.6 (Page 48)
7	Switching the Open Controller on/off	8.3.7 (Page 50)

8.3.1 Creating the configuration of the Open Controller

Requirements

The following requirements must be met before you can create the configuration of the Open Controller:

- TIA Portal V15 + HSP 0269 **or** TIA Portal ≥ V15 SP1 must be installed.
- You have started the TIA Portal and created a new project.

Creating the configuration

To create the configuration in the TIA Portal, follow these steps:

1. Double-click "Add new device" in the project tree.
2. Select "PC systems > SIMATIC S7 Open Controller > ET 200SP Open Controller >".
3. Select the required device.
4. Select the desired version and click "OK".
   The configured Open Controller is displayed in the device view.
5. The following interfaces can be seen in the Open Controller:
   – Onboard interface X2 (GB Ethernet Windows interface) that is assigned directly to the PC station (1 port)
   – Exchangeable BusAdapter that is assigned directly to the Software Controller (2 ports)
6. The following preconfigured components can be seen in the device view:
   – **CPU 1515SP PC2 / CPU 1515SP PC2 F/T/TF:** CPU 1505SP (F/T/TF) Software Controller
   – **CPU 1515SP PC2 + HMI / CPU 1515SP PC2 F + HMI:** CPU 1505SP (F) Software Controller and WinCC Runtime Advanced
7. Insert the server module from the hardware catalog.
   The server module forms the termination of the CPU with the I/O modules. If no server module is configured, the server module is added automatically during compiling.

8.3.2 Setting the IP address

Set the IP address as follows:

- BusAdapter [X1]: The configured IP address becomes effective on the Open Controller after a download. To go online via the [X1] interface, the configured address must match the [X1] address entered in the panel of the software controller.
- Onboard interface [X2]: The configured IP address should be identical to the Windows IP address of the Open Controller.

8.3.3 Changing the properties of the S7-1500 Software Controller

Information on the property of the CPU is available in the Inspector window under "Properties". You can change these properties if required.

8.3.4 Establishing the HMI connection

Procedure

The WinCC RT software is integrated in the SIMATIC HMI devices (e.g. Basic/Comfort/Mobile Panel) and permits data exchange over HMI connections.

No HMI connection exists between the WinCC RT Advanced software and the S7-1500 Software Controller at the time of the configuration.

To establish a HMI connection between the WinCC RT Advanced software on the S7-1500 Software Controller, proceed as follows:

1. In the network view, switch to "Connections".
2. Click on WinCC RT Advanced.
3. Draw a line from the WinCC RT Advanced software to the S7-1500 Software Controller (e.g. CPU 1505SP) while keeping the mouse button pressed.

A network connection is established between the two devices.

Reference

You can find additional information on configuring an HMI connection in the TIA Portal online help or in the STEP 7 and WinCC Engineering V15 (https://support.industry.siemens.com/cs/ww/en/view/109755202) system manual.

8.3.5 Downloading a project to the target system

Key statement

To set up your automation system, you need to download the project data you generated offline to the connected devices. This project data is generated, for example when configuring hardware, networks, and connections or when programming the user program or when creating recipes. The first time you download, the entire project data is downloaded. During later download operations, only changes are downloaded.

Proceed as follows to download the configuration:

1. Select the complete PC system in the device view.
2. Right-click on the PC system.
3. Select the option you require in the "Download to device" menu command.

Note

Note that the options available to you always depend on the selected device.

4. Select the interfaces with which you want to establish the online connection to the device. You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command.

   Note

   The first TIA Portal download **must** be via the "X2" interface.

   Only ASCII characters are permitted in the name of the X2 PN/IE(LAN) interface in the TIA Portal, e.g. PROFINET_2.

   ---

5. Download and compile the project.

The hardware configuration and the first download are now completed.

Reference

Additional information on the possible options for downloading is available in the online help of the TIA Portal.

8.3.6 Transferring license keys

Licensing the software

For the following products, you need to transfer the product-specific license key with the *Automation License Manager (ALM)* before commissioning:

- WinCC RT Advanced incl. PowerTag
- CPU 1505SP T/TF

Note

No license key is required to operate the S7-1500 Software Controller CPU 1505SP (F) V2.x.

Requirements

- Initial commissioning was successfully completed.
- Windows 10 IoT Enterprise (64-bit) has been started.
- The extended write filter **UWF must be deactivated** on the CPU 1515SP PC2.

Transferring license keys with local configuration

The *Automation License Manager* is pre-installed on the CPU 1515SP PC2.

Open the software using the icon on the desktop or a menu command.

1. In the Windows start bar, select **Start > Siemens Automation > Automation License Manager**.
2. Follow the instructions of the *Automation License Manager*.

Transferring license keys via programming device/PC

The *Automation License Manager* is pre-installed on a programming device/PC with STEP 7 and the CPU 1515SP PC2.

1. Connect the CPU 1515SP PC2 to a programming device/PC.
2. Connect the supplied USB stick to the programming device/PC.
3. Select the menu command **Start > Siemens Automation > Automation License Manager**.
4. Select the menu command **Edit > Connect computer** and enter the IP address of the CPU 1515SP PC2.
5. if the option "Forbid license keys transfer from local computer" is disabled on the source computer, drag the license keys from the USB stick to the system partition C: of the CPU 1515SP PC2.

Backing up license keys for restore and repair

Note

Loss of license keys

A SIMATIC license key cannot be copied or duplicated. No more license key copies exist on the USB stick once you have dragged the license keys from the USB stick to your CPU 1515SP PC2.

Secure your purchased license keys **before** restoring the delivery state (Restore) or in the case of repair. To do this, move the license keys to a USB stick and keep this stick in a safe place.

If an error occurs on your license keys on the CPU 1515SP PC2, please contact your Siemens representative. Make sure to have the "Certificate of License" (CoL) to hand.

Reference

For additional information on licenses, refer to the *Automation License Manager* manual. You can find the manual on the CPU 1515SP PC2 under **Start > All Programs > Siemens Automation > Documentation** and on the Internet (http://support.automation.siemens.com/WW/view/en/56956174).

You can find more information on the UWF write filter in the section: Protective function for data carriers (Page 57).

8.3.7 Switching the Open Controller on/off

Requirements

Initial commissioning was successfully completed.

Switching on the CPU 1515SP PC2

Proceed as follows to switch on the CPU 1515SP PC2:

1. Switch on the power supply of the CPU.

   The Boot Manager GRUB2DOS starts.

2. Select the mode in which the CPU 1515SP PC2 should start:
   – Default: with the Windows operating system and the S7-1500 software controller
   – Only with the Windows operating system (e.g. with updates)

Switching off the CPU 1515SP PC2

Proceed as follows to switch off the CPU 1515SP PC2:

1. Use the Windows function **Start > Power > Shut down** to switch off.

   The PWR LED changes from green to yellow.

   The Windows function shuts down the Windows operating system and the S7-1500 software controller.

If the device will not be used for a longer period after the shutdown, de-energize the device.

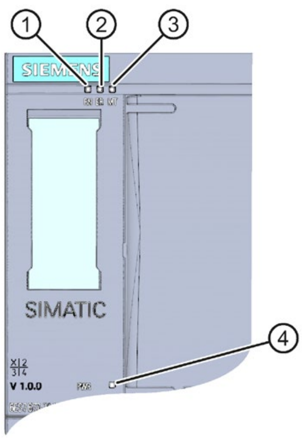
Interrupt, error and system messages

9

9.1 Status and error display

LED display

The following figure shows the LED displays of the CPU 1515SP PC2.



① RUN/STOP LED (yellow/green LED)
② ERROR LED (red LED)
③ MAINT LED (yellow LED)
④ POWER LED (yellow/green LED)

Figure 9-1 LEDs of the CPU 1515SP PC2

Meaning of the LED displays with active S7-1500 Software Controller

The CPU 1515SP PC2 has three LEDs to indicate the current operating state and diagnostics status.

The following table shows the meaning of the color combinations of the LED displays in connection with the S7-1500 Software Controller.

Table 9- 1 Meaning of the LED displays

RUN/STOP LED	ERROR LED	MAINT LED	Meaning
LED off	LED off	LED off	POWER OFF Starting of the CPU 1515 SP PC2 in "Windows only" mode No power supply. Software Controller of the CPU 1515SP PC2: • is not downloaded • is in the operating state Power OFF Use of the hardware LEDs was disabled (configuration via TIA Portal).
LED off	LED flashes red	LED off	An error has occurred.
LED green	LED off	LED off	Software Controller of the CPU 1515SP PC2 is in RUN mode.
LED green	LED flashes red	LED off	A diagnostics event is pending.
LED green	LED off	LED lights up yellow	Maintenance demanded for the plant. The affected hardware must be exchanged within a short period.
LED green	LED off	LED flashes yellow	Maintenance required for the plant. You must exchange the affected hardware within a foreseeable period. Firmware update successfully completed

RUN/STOP LED	ERROR LED	MAINT LED	Meaning
LED lights up yellow	LED off	LED off	Software controller of the CPU is in the operating state STOP.
LED lights up yellow	LED flashes red	LED flashes yellow	The user program is causing an error.
LED flashes yellow	LED off	LED off	CPU is performing internal activities during STOP, e.g. ramp-up after STOP. Loading the user program
LED flashes yellow/green	LED off	LED off	Startup (transition from STOP → RUN)
LED flashes yellow/green	LED flashes red	LED flashes yellow	Startup (CPU booting) Test of LEDs during startup, inserting a module. LED flashing test
LED flashes green	LED flashes red	LED flashes red	CPU defective

POWER LED

Table 9- 2 POWER LED

POWER LED	Meaning
LED off	No supply voltage or supply voltage too low
LED lights up yellow	Supply voltage present; running through BIOS phase; operating system is shut down
LED green	Supply voltage present; Booting or operation of the operating system

Functions 10

10.1 Monitoring functions

10.1.1 Requirements

Introduction

The CPU 1515SP PC2 has monitoring functions that you can use with the corresponding monitoring software.
The following display, monitoring and control functions are available:

- Temperature monitoring
- Monitoring of drives with S.M.A.R.T. functionality
- Operating hours counter (information on the total runtime)
- HW LED status display (RUN/STOP, ERROR, MAINT)

Monitoring software

- **SIMATIC IPC DiagBase**

  The SIMATIC DiagBase software is included in the scope of delivery of the CPU 1515SP PC2.

  Use the DiagBase Management Explorer application to obtain a clearer overview for monitoring. The DiagBase Alarm Manager notifies you of individual alarms.

  Note

  For additional information, refer to the online help for the SIMATIC IPC DiagBase software.

- **SIMATIC IPC DiagMonitor**

  The SIMATIC DiagMonitor software is provided on a CD. You can find the order number of the license in the section Accessories/Spare parts (Page 123).

  Potential system failures are detected and reported in good time with the diagnostics and alerting software. The software is also used for remote diagnostics.

  The software contains:

  – The software for the stations to be monitored

  – A library for creating your own applications

10.1.2 Temperature monitoring

Three temperature sensors monitor the temperature at different locations of the CPU 1515SP PC2:

- Processor temperature
- Temperature in the vicinity of the RAM ICs/blocks
- Temperature of the basic module

If one of the temperature values exceeds the set temperature threshold, the temperature monitoring triggers a temperature error. The temperature error activates the IPC DiagBase and/or IPC DiagMonitor software.

The temperature error remains stored until the temperatures fall below the temperature threshold again and it is reset using one of the following measures:

- Acknowledgment of the error message by the monitoring software
- Restart of the device

10.1.3 Monitoring drives

The **S.M.A.R.T. function** is a monitoring function of storage media. With this function, different parameters are queried in order to detect possible defects at an early stage. This information is shown to the user with corresponding software.

10.1.4 Operating hours counter

You can use an operating hours counter for a variety of applications:

- For calculating the operating time of the CPU
- For calculating the operating time of controlled equipment

You can find more information about the operating hours counter in the "Operating hours counter" group in the "Diagnostics" folder of the Online and Diagnostics view in the TIA Portal.

10.2 Retentive memory NVRAM

Retentive memory is non-volatile memory for saving a limited quantity of data in the event of power failure.

The data defined as retentive is stored in retentive memory. This data is retained beyond a power-off or power failure.

A corresponding function is implemented in the S7-1500 software controller to allow NVRAM to be used there. This saves up to 410 KB of data in non-volatile data memory in the case of power failure. This function can be set on the engineering station in the TIA Portal.

10.3 BIOS setup

BIOS setup

The boot order can be set using the BIOS Setup.

Changing the device configuration

The device configuration is preset for working with the supplied software.

Only change the set values if you have made technical changes to your device.

10.4 Power options

A power plan with the name SIMATIC S7 is set as default on the CPU 1515SP PC2. This ensures that the CPU does not deviate from its maximum clock rate in order not to endanger the real-time capability of the software controller.

10.5 "Unified Write Filter (UWF)" write filter

General information on the UWF write filter

The Unified Write Filter (UWF) is a configurable write filter which provides the CFast cards with a write protection.

External removable media such as USB sticks and other flash drives that are recognized as removable media by the operating system are not supported.

NOTICE
Data loss on CFast cards The number of write cycles on CFast cards is limited due to technical reasons. To prevent data loss, the CFast card must therefore be provided with special protection. Use the UWF write filter to extend the service life of the CFast card and to avoid a possible failure of the CPU 1515SP PC2.

Note

Write protection is deactivated in the delivery state!

Note that the work memory is reduced when UWF is activated.

NOTICE
Risk of data loss when UWF is activated If UWF is activated, all changes made to data carriers which are write protected by the UWF after the boot operation may be lost when the device is shut down. Proceed as follows to prevent this situation: • Make changes to data carriers only when write protection is disabled.

Reference

You can find additional information on the UWF write filter on the Internet in the online help for Microsoft® Windows® 10.

Maintenance 11

11.1 Backing up and restoring data

Introduction

The operating system and the Runtime software are located on the supplied restore USB stick. You can use the USB stick to restore the delivery state of the CPU 1515SP PC2.

If you use functions from the Restore menu, you must acknowledge a security message. For the functions, 72 hours are available in each case. If the functions are not completed within this time period, CPU 1515SP PC2 is automatically restarted without a further prompt.

If you want to back up your projects, save them to the D: partition of the CFast card.

SIMATIC IPC Image & Partition Creator

You can also create your own image of your CFast card. This contains the operating system, the Runtime software and the complete project loaded from the TIA Portal.

We recommend the SIMATIC IPC Image & Partition Creator (≥ V3.5) software tool to back up data under Windows. It provides for easy backup and fast restore of the contents of the CFAST card and of individual partitions (images).

Note

Data can only be backed up to a network drive with the SIMATIC IPC Image & Partition Creator software using the X2 PN/IE(LAN) interface.

You can procure the SIMATIC IPC Image & Partition Creator:

- Via the Siemens online ordering system.
- Pre-installed on the SIMATIC IPC Service USB flash drives.

For additional information, please refer to the corresponding product documentation.

SIMATIC IPC Service USB flash drive

You can use the SIMATIC IPC Service USB flash drives for data backup and restore.

You obtain these through the Siemens online ordering system.

11.2 Partitions in the delivery state

Partitioning the CFast card

The following partitions are set up on the CFast card by default:

Partition	Name	30 GB CFast card	File system
C:	SYSTEM	19.5 GB	NTFS
D:	DATA	8 GB	NTFS
-	-	0.4 GB	RAW
-	WinCCMB	0.04 GB	NTFS

Note

Partitions under Windows 10 IoT Enterprise (64-bit)

The partitions need to be set again if they are faulty or if the partitioning is to be changed.

NOTICE

CPU volume for S7-1500 Software Controller (0.4 GB RAW)

Do not change the CPU volume for software controllers.

This is the only way to ensure that the software controller continues to operate without error.

11.3 Restoring the delivery state

Introduction

The entire image of your operating system and your Runtime software are located on the supplied restore USB stick. You can use the SIMATIC restore menu to restore the delivery state of the CPU 1515SP PC2.

Note

Restoring existing system partition

If your projects are stored on partition D: you can use the "Restore existing system partition" option to restore partition C: with the operating system and the Runtime software, without your project data being affected.

Note

Using Multitouch panels

The restoration of the original software is not possible with a Multitouch panel, because the Multitouch driver is not available until after the installation of the operating system.

Requirements

To restore the original software of the CPU 1515SP PC2, the following is required:

- the supplied CFast card
- the supplied restore USB stick

NOTICE

Data loss

During restoration of the system to delivery state, the CFast card is completely erased and re-formatted, and is then loaded with the original software. All subsequently modified or added data, programs, license keys and partitions on the CFast card will be lost.

Back up the data of the CPU 1515SP PC2 after you have assigned parameters to the module and if you have made changes to the configuration.

NOTICE

Loss of license keys

Back up the license keys before the restore by dragging these to your USB stick via *Automation License Manager*.

After the restart of the CPU 1515SP PC2, transfer the license keys back to the device via the *Automation License Manager*.

Restoring the delivery state of the CPU 1515SP PC2 with restore USB stick

Before the restore

1. Connect a monitor and a keyboard to the CPU.
2. Switch off the power supply of the CPU.
3. Remove all USB drives from the CPU.
4. Connect the restore USB stick to a USB port.
5. Switch on the power supply of the CPU.
   → The CPU is started.
6. Press <Esc> to start the Boot Manager.
7. Select the list entry for the USB stick in the Boot Manager.
8. After the prompt, confirm the start by pressing any key.
   → The loading process is displayed (Windows logo).
   → The SIMATIC Restore menu opens.
   – Select a language.
   – Select "CPU 1515SP PC2 (F/T/TF)" or "CPU 1515SP PC2 (F) + HMI".
   – Select the option "Completely restore system drive".
     → The original software is restored on Partition C:, Partition D: is deleted.

After the restore

1. Exit the Restore menu.
2. Remove the restore USB stick.
3. Proceed as described in Initial commissioning.

Further procedure

- Re-connect any other required USB devices.
- Transfer the license keys.

11.4 Updating software

Note

When you update software (such as Windows, drivers, BIOS, etc.), always start the CPU 1515SP PC2 in the GRUB menu in Windows mode.

Information on updating software for the respective product can be found on the Internet (https://support.industry.siemens.com/cs/ww/en).

HMI devices

During the installation, make sure that you always use the latest drivers for the HMI devices used (SIMATIC Flat Panels).
Before you install a new driver version, you must uninstall the old driver version in order to ensure proper operation.

You can download the current driver software from SIMATIC Product Support.

11.5 Windows 10 IoT Enterprise (64-bit)

The Windows 10 IoT Enterprise operating system (64-bit) is pre-installed on the CPU 1515SP PC2.

Windows language packs

English and German are available as the basic language for the installation of the Windows operating system.

After initial commissioning of the CPU 1515SP PC2, additional operating system languages can be installed. Note that you need administrator rights to install language packages.

The following language packs are contained on the restore USB stick under \Packages\x64\LanguagePack:

- Traditional Chinese
- Simplified Chinese
- German
- English
- French
- Italian
- Spanish

Installing languages

Use the Windows function "Start > Settings > Speech Recognition, Region, Date > Languages" to install a language pack.

Updates

You can install additional updates at a later time. You can find current information on the operating system at Widows (http://www.windows.com).

Note

In the delivery state, partitions are set up on drive C: and D: on the CFast card with free memory. See section Partitions in the delivery state (Page 59).

Make sure that sufficient free memory space is available on your CFast card for the installation of updates.

11.6 Sending the device to customer service

Before sending

Before you send in the CPU 1515SP PC2 for repair:

- Create a backup of your data.
- Back up your SIMATIC license keys on a USB stick.
- Remove your SD/MMC cards.
- Remove your **CFast card**.

Sending in the device

- Pack the device in its original packaging.
- Enclose identification data (Page 30).
- Send to your Siemens contact partner.

11.7 Removing and inserting the CFast card

Introduction

The CPU 1515SP PC2 has a slot for a CFast card. On this card, you will find the operating system, your Runtime software and, after configuration, the project.

Seal the cover for the CFast card to protect the system against unauthorized access.

You must remove the CFast card before you send in the CPU, for example, for repair.

Requirements

- The CPU 1515SP PC2 is disconnected from the power supply.

Procedure – Removing the CFast card

1. Remove the seal.
2. Open the cover, using a screwdriver if necessary.
3. Press onto the CFast card.
   The card is pressed out of the slot.
4. Pull the card out of the slot.
   To do this, grip the rib on the underside of the memory card.

Procedure – Inserting the CFast card

1. Open the cover of the slot, using a screwdriver if necessary.
2. Insert the CFast card into the slot.
3. Press the CFast card into the slot until it clicks into place.

   The CFast card is properly inserted if the cover can be closed without any resistance.
4. Close the cover.

NOTICE
Unauthorized access Seal the cover to protect the CFast card with the operating system of the CPU 1515SP PC2 from unauthorized access.

11.8 Recycling and disposal

For ecologically sustainable recycling and disposal of your old device, contact a certificated disposal service for electronic scrap or dispose of the device in accordance with the regulations in your country.

12 Technical specifications

12.1 Standards and approvals

Introduction

The general technical specifications cover the following:

- The standards and test values that the CPU 1515SP PC2 complies with and fulfills.
- The test criteria according to which the CPU 1515SP PC2 was tested.

Currently valid markings and approvals

Note

Information for CPU 1515SP PC2

The currently valid markings and approvals are printed on the CPU 1515SP PC2.

Safety information

WARNING
Risk of personal injury and damage to property.
In hazardous areas, there is a risk of injury or damage if you disconnect any connectors while the CPU 1515SP PC2 is in operation.
Always de-energize the CPU 1515SP PC2 operated in such areas before you disconnect the connectors.

WARNING
Flying sparks due to loose cables
Risk of explosion in hazardous areas.
USB cables and PROFINET connectors may detach from the device in the case of strong oscillation and high vibrating loads.
Attach these cables to the strain relief of the device using cable ties.

WARNING
Explosion hazard
If you replace components, compliance with Class I, DIV. 2 can become invalid.

WARNING
Area of application
This device is only suitable for use in Class I, Div. 2, Group A, B, C, D, or in non-hazardous areas.

CE marking

The CPU 1515SP PC2 meets the requirements and safety objectives of the following guidelines and complies with the harmonized European standards (EN) for programmable logic controllers published in the official journals of the European Community:

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
- 2014/34/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (Explosion Protection Directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
- 2006/42/EC "Machinery Directive" for fail-safe modules

The conformity declaration certificates are available for the responsible authorities and are kept at the following address:

Siemens AG
Digital Factory
Factory Automation
DF FA AS SYS
P.O. Box 1963
D-92209 Amberg, Germany

They are also available for download on the Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/) web pages, keyword "Declaration of Conformity".

cULus approval

Underwriters Laboratories Inc., complying with

- UL 508 (Industrial Control Equipment)
- CSA C22.2 No. 142 (Process Control Equipment)

OR

cULus HAZ. LOC. approval

HAZ. LOC.

Underwriters Laboratories Inc., complying with

IECEx DEK 13.0011X

RCM (C-Tick) Declaration of conformity for Australia/New Zealand

CPU 1515SP PC2 meets the requirements of the standard EN 61000-6-4:2007 + A1:2011.

Korea Certificate KCC-REM-S49-ET200SP

Note that this device corresponds to limit class A in terms of the emission of radio frequency interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

IEC 61131

The CPU 1515SP PC2 with the S7-1500 Software Controller CPU 1505SP (F/T/TF) fulfills the requirements and criteria of the IEC 61131-2 standard (programmable logic controllers, Part 2: Equipment requirements and tests).

PROFINET standard

CPU 1515SP PC2 is based on standard IEC 61158 Type 10.

PROFIBUS standard

CPU 1515SP PC2 is based on standard IEC 61158 Type 3.

IO-Link standard

CPU 1515SP PC2 is based on standard IEC 61131-9.

Use in industrial environments

CPU 1515SP PC2 is designed for use in industrial environments. It meets the following standards for this type of use:

- Requirements on interference emission EN 61000-6-4: 2007 + A1: 2011
- Requirements on immunity EN 61000-6-2: 2005

Use in mixed areas

Under certain circumstances, you can use the CPU 1515SP PC2 in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact on residents.

If you want to use the CPU 1515SP PC2 in mixed areas, you must ensure that its radio frequency interference emission complies with the limit classes of the EN 61000-6-3 generic standard. Suitable measures for observing these limits for use in a mixed area are, for example:

- Installation of the CPU 1515SP PC2 in grounded control cabinets
- Use of noise filters in the supply cables

An individual acceptance test is also required.

Use in residential areas

Note

CPU 1515SP PC2 not intended for use in residential areas

CPU 1515SP PC2 is not intended for use in residential areas. Using the CPU 1515SP PC2 in residential areas can affect radio and television reception.

Reference

The certificates for the markings and approvals can be found on the Internet under Service&Support (http://www.siemens.com/automation/service&support).

12.2 Electromagnetic compatibility

Definition

Electromagnetic compatibility (EMC) is the ability of an electrical installation to function satisfactorily in its electromagnetic environment without interfering with that environment.

The CPU 1515SP PC2 meets the requirements of the EMC legislation for the European single market, among other requirements. The prerequisite for this is that the CPU 1515SP PC2 complies with the specifications and guidelines relating to electrical configuration.

EMC according to NE 21

The CPU 1515SP PC2 meets the EMC specifications of NAMUR guideline NE 21.

Pulse-shaped disturbance

The following table shows the electromagnetic compatibility of the CPU 1515SP PC2 with regard to pulse-shaped disturbances.

Table 12- 1 Pulse-shaped disturbance

Pulse-shaped disturbance	**Test voltage**	**corresponds to degree of severity**
Electrostatic discharge according to IEC 61000-4-2.	Air discharge: ±8 kV Contact discharge ± 4 kV	3 3
Burst pulses (high-speed transient disturbance) according to IEC 61000-4-4.	±2 kV (power supply lines) ±2 kV (signal lines > 30 m) ±1 kV (signal lines < 30 m)	3 3
High-energy single pulse (surge) according to IEC 61000-4-5 External protective circuit required (see function manual Designing interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566))		3
• asymmetric coupling	±2 kV (power supply lines) DC with protective elements ±2 kV (signal/data line only > 30 m), with protective elements	
• symmetric coupling	±1 kV (power supply lines) DC with protective elements ±1 kV (signal/data line only > 30 m), with protective elements	

Sinusoidal disturbance

The following table shows the electromagnetic compatibility of the CPU 1515SP PC2 with regard to sinusoidal disturbances.

- RF radiation

Table 12- 2 Sinusoidal disturbance variables with RF radiation

RF radiation according to IEC 61000-4-3/NAMUR 21 Electromagnetic RF field, amplitude-modulated		corresponds to degree of severity
80 to 1000 MHz; 1.0 to 2.0 GHz	2.0 GHz to 6.0 GHz	3
10 V/m	3 V/m	
80% AM (1 kHz)		

- RF coupling

Table 12- 3 Sinusoidal disturbance variables with RF coupling

RF coupling according to IEC 61000-4-6	corresponds to degree of severity
(10 kHz) 150 kHz to 80 MHz	3
10 V_{rms} unmodulated	
80% AM (1 kHz)	
150 Ω source impedance	

Emission of radio interference

Interference emission of electromagnetic fields in accordance with IEC61000-6-4 (measured at a distance of 10 m).

Table 12- 4 Interference emission of electromagnetic fields

Frequency	Emitted interference
30 MHz to 230 MHz	< 40 dB (μV/m)Q
230 MHz to 1000 MHz	< 47 dB (μV/m)Q

Emission of interference via AC supply voltage in accordance with EN 55016.

Table 12- 5 Interference emission via the AC power supply

Frequency	Emitted interference
0.15 to 0.5 MHz	<79 dB (μV) Q <66 dB (μV) M
0.5 to 30 MHz	<73 dB (μV) Q <60 dB (μV) M

12.3 Shipping and storage conditions

Introduction

The CPU 1515SP PC2 exceeds the requirements of IEC 61131-2 in terms of shipping and storage conditions. The following information applies to modules that are shipped and/or stored in their original packaging.

Table 12- 6 Shipping and storage conditions for modules

Type of condition	Permissible range
Free fall (in shipping package)	≤1 m
Temperature	From -40 °C to +70 °C
Barometric pressure	from 1140 hPa to 660 hPa (corresponds to an altitude of -1000 m to 3500 m)
Relative humidity	5% to 95%, without condensation
Sinusoidal vibrations according to IEC 60068-2-6	5 - 8.4 Hz: 3.5 mm 8.4 - 500 Hz: 9.8 m/s²
Shock according to IEC 60068-2-27	250 m/s², 6 ms, 1000 shocks

12.4 Mechanical and climatic ambient conditions

Note

Restrictions

In contrast to the ambient conditions for the ET 200SP distributed I/O system, the following restrictions apply to the CPU 1515SP PC2:

- Mechanical ambient conditions:
  - 2 g constant acceleration when using the BusAdapter BA 2×FC
- Ambient temperature:
  - 0 to 60 °C for horizontal installation with maximum 32 I/O modules
  - 0 to 55 °C for horizontal installation with maximum 64 I/O modules
  - 0 to 50 °C for vertical installation with maximum 32 I/O modules

---

Operating conditions

The CPU 1515SP PC2 is suitable for use in weather-proof, fixed locations. The operating conditions are based on the requirements of DIN IEC 60721-3-3:

- Class 3M3 (mechanical requirements)
- Class 3K3 (climatic requirements)

Mechanical ambient conditions

The table below shows the mechanical ambient conditions in the form of sinusoidal oscillations.

Table 12- 7 Mechanical ambient conditions

Frequency band	CPU 1515SP PC2
$5 \leq f \leq 8.4$ Hz	3.5 mm amplitude
$8.4 \leq f \leq 150$ Hz	1 g constant acceleration
$10 \leq f \leq 60$ Hz	0.35 mm amplitude
$60 \leq f \leq 1000$ Hz	• 1 g constant acceleration (with BusAdapter BA 2×RJ45) • 2 g constant acceleration (with BusAdapter BA 2×FC)

Test of mechanical ambient conditions

The table below provides important information with respect to the type and scope of the test of ambient mechanical conditions.

Table 12- 8 Test of mechanical ambient conditions

Condition tested	Test Standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (sine)	Type of oscillation: Frequency sweeps with a rate of change of 1 octave/minute. BA 2×RJ45 • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration BA 2×FC • 10 Hz ≤ f ≤ 60 Hz, 0.35 mm constant amplitude • 60 Hz ≤ f ≤ 1000 Hz, 2 g constant acceleration Duration of vibration: 10 frequency sweeps per axis in each of 3 vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of 3 vertically aligned axes

Climatic ambient conditions

You can use the CPU 1515SP PC2 under the following climatic ambient conditions:

Table 12- 9 Climatic ambient conditions

Ambient conditions	Permissible range	Comments
Temperature: Horizontal mounting position:	• from 0 to 60 °C	For configuration with 32 I/O modules
	• from 0 to 55 °C	For configuration with 64 I/O modules
Vertical installation:	• 0 to 50 °C	For configuration with 32 I/O modules
Permitted temperature change	10 K/h	-
Relative humidity	from 10 to 95%	Without condensation
Barometric pressure	From 1140 to 795 hPa	Corresponds to an altitude of -1000 m to 2000 m
Concentration of pollutants	ANSI/ISA-71.04 severity level G1; G2; G3	-

12.5 Information on insulation, protection class, degree of protection and rated voltage

Insulation

The insulation is designed according to the requirements of EN 61131-2: 2007.

Note

In the case of modules with 24 V DC (SELV/PELV) supply voltage, galvanic isolations are tested with 707 V DC (type test).

Note

The ground/minus pole of the 24 V DC power supply is connected via the device with functional ground (FE).

Pollution degree / overvoltage category according to IEC 61131

- Pollution degree 2
- Overvoltage category: II

Protection class in accordance with IEC 61131-2:2007

The distributed I/O system ET 200SP fulfills protection class I and includes parts of protection class II and III. The CPU 1515SP PC2 is a part of protection class III.

The grounding of the mounting rail must meet the requirements for functional earth FE.

The installation location (e.g. enclosure, control cabinet) must have a protective conductor connection that meets the standard to maintain protection class I.

Degree of protection IP20

Degree of protection IP20 according to IEC 60529, i.e.:

- Protection against contact with standard probe
- Protection against foreign objects with diameters in excess of 12.5 mm
- No protection against water

Rated voltage for operation

The CPU 1515SP PC2 works with the rated voltage and corresponding tolerances listed in the following table.

Table 12- 10 Rated voltage for operation

Rated voltage	Tolerance range
24 V DC	19.2 to 28.8 V DC [1]

[1] Static value: Creation as functional extra-low voltage with safe electrical isolation in accordance with IEC 60364-4-41

12.6 Use of the ET 200SP in zone 2 potentially explosive atmospheres

See product information Use of subassemblies/modules in a Zone 2 Hazardous Area (http://support.automation.siemens.com/WW/view/en/19692172).

12.7 Module data

12.7.1 Technical specifications of CPU 1515SP PC2 - basic device

Technical specifications

The following table shows the technical specifications as of 08/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7677-2DB40-0AA0/td).

• RJ 45 (Ethernet)	Yes; Via BusAdapter BA 2x RJ45
– Transmission rate, max.	100 Mbit/s
– Industrial Ethernet status LED	Yes
2. Interface	
Interface types	
• Number of ports	1
• RJ 45 (Ethernet)	Yes; Integrated
– Transmission rate, max.	1 000 Mbit/s
– Industrial Ethernet status LED	No
3. Interface	
Interface types	
• RS 485	Yes
RS 485	
• Transmission rate, max.	12 Mbit/s
Interrupts/diagnostics/status information	
Diagnostics indication LED	
• RUN/STOP LED	Yes
• ERROR LED	Yes
• MAINT LED	Yes
Ambient conditions	
Ambient temperature during operation	
• min.	0 °C
• max.	Up to 60 °C with max. 32 ET 200SP modules and 3x 100 mA USB load; up to 55 °C with max. 64 ET 200SP modules and 2x max. 500 mA and 1x max. 100 mA USB load
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C; With max. 32 ET 200SP modules and 3x 100 mA USB load

Article number	6ES7677-2DB42-0GB0
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	70 °C
Operating systems	
Operating systems	Windows 10 IoT Enterprise LTSB 2016 (64-bit) MUI
Peripherals/Options	
Peripherals	
• SD card	Optionally for additional mass storage
Dimensions	
Width	160 mm
Height	117 mm
Depth	75 mm
Weights	
Weight, approx.	0.83 kg

12.7.3 Technical specifications of CPU 1515SP PC2 + HMI 128PT

Technical specifications

The following table shows the technical specifications as of 08/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7677-2DB42-0GK0/td).

Article number	6ES7677-2DB42-0GK0
General information	
Product type designation	CPU 1515SP PC2 + HMI 128
HW functional status	FS01
Firmware version	V2.5
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15 with HSP 269
Installed software	
• Visualization	WinCC Runtime Advanced V15
• Control	S7-1500 Software Controller CPU 1505SP
Control elements	
Mode selector switch	1
Supply voltage	
Type of supply voltage	24 V DC
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Mains buffering	
• Mains/voltage failure stored energy time	5 ms
Input current	
Current consumption (rated value)	1.8 A; Full processor load, incl. ET 200SP modules and using USB
Current consumption (in no-load operation), typ.	0.5 A
I^2t	0.426 $A^2 \cdot s$; with starting current inrush
Power	
Active power input, max.	43 W; incl. ET 200SP modules and using USB
Infeed power to the backplane bus	8.75 W
Power loss	
Power loss, typ.	16 W
Processor	
Processor type	Intel Atom E3940, 1.6 GHz, 4 cores

Article number	6ES7677-2DB42-0GK0
Memory	
Type of memory	DDR3L
Main memory	8 GB RAM
CFast memory card	Yes; 30 GB flash memory
SIMATIC memory card required	No
Flash Disk	30 GB
Work memory	
• integrated (for program)	1 Mbyte
• integrated (for data)	5 Mbyte
• integrated (for CPU function library of CPU Runtime)	10 Mbyte
Load memory	
• integrated (on PC mass storage)	320 Mbyte
Backup	
• with UPS	Yes; all memory areas declared retentive
• with non-volatile memory	Yes
Hardware configuration	
Integrated power supply	Yes
Number of DP masters	
• Via CM	1
Rack	
• Modules per rack, max.	64; CPU 1515SP PC + 64 modules + server module
• Number of lines, max.	1
Time of day	
Clock	
• Type	Hardware clock
• Backup time	6 wk; At 40 °C ambient temperature, typically
• Deviation per day, max.	10 s; Typ.: 2 s
Interfaces	
Number of industrial Ethernet interfaces	2
Number of PROFINET interfaces	1
Number of PROFIBUS interfaces	1
Number of RS 485 interfaces	1; Via CM DP module
Number of USB interfaces	4; 2x USB 2.0, 2x USB 3.0 on front side
Number of SD card slots	1
Video interfaces	
• Graphics interface	1x DisplayPort

Article number	6ES7677-2DB42-0GK0
1. Interface	
Interface types	
• Number of ports	2
• integrated switch	Yes
• RJ 45 (Ethernet)	Yes; Via BusAdapter BA 2x RJ45
– Transmission rate, max.	100 Mbit/s
– Industrial Ethernet status LED	Yes
2. Interface	
Interface types	
• Number of ports	1
• RJ 45 (Ethernet)	Yes; Integrated
– Transmission rate, max.	1 000 Mbit/s
– Industrial Ethernet status LED	No
3. Interface	
Interface types	
• RS 485	Yes
RS 485	
• Transmission rate, max.	12 Mbit/s
Interrupts/diagnostics/status information	
Diagnostics indication LED	
• RUN/STOP LED	Yes
• ERROR LED	Yes
• MAINT LED	Yes
Ambient conditions	
Ambient temperature during operation	
• min.	0 °C
• max.	Up to 60 °C with max. 32 ET 200SP modules and 3x 100 mA USB load; up to 55 °C with max. 64 ET 200SP modules and 2x max. 500 mA and 1x max. 100 mA USB load
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C; With max. 32 ET 200SP modules and 3x 100 mA USB load
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	70 °C

12.7.8 Technical specifications of CPU 1515SP PC2 F + HMI 512PT

Technical specifications

The following table shows the technical specifications as of 08/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7677-2SB42-0GL0/td).

Article number	6ES7677-2SB42-0GL0
General information	
Product type designation	CPU 1515SP PC2 F + HMI 512
HW functional status	FS01
Firmware version	V2.5
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15 with HSP 269
Installed software	
• Visualization	WinCC Runtime Advanced V15
• Control	S7-1500 Software Controller CPU 1505SP F
Control elements	
Mode selector switch	1
Supply voltage	
Type of supply voltage	24 V DC
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Mains buffering	
• Mains/voltage failure stored energy time	5 ms
Input current	
Current consumption (rated value)	1.8 A; Full processor load, incl. ET 200SP modules and using USB
Current consumption (in no-load operation), typ.	0.5 A
I^2t	0.426 $A^2 \cdot s$; with starting current inrush
Power	
Active power input, max.	43 W; incl. ET 200SP modules and using USB
Infeed power to the backplane bus	8.75 W
Power loss	
Power loss, typ.	16 W
Processor	
Processor type	Intel Atom E3940, 1.6 GHz, 4 cores

Article number	6ES7677-2SB42-0GL0
Memory	
Type of memory	DDR3L
Main memory	8 GB RAM
CFast memory card	Yes; 30 GB flash memory
SIMATIC memory card required	No
Flash Disk	30 GB
Work memory	
• integrated (for program)	1.5 Mbyte
• integrated (for data)	5 Mbyte
• integrated (for CPU function library of CPU Runtime)	10 Mbyte
Load memory	
• integrated (on PC mass storage)	320 Mbyte
Backup	
• with UPS	Yes; all memory areas declared retentive
• with non-volatile memory	Yes
Hardware configuration	
Integrated power supply	Yes
Number of DP masters	
• Via CM	1
Rack	
• Modules per rack, max.	64; CPU 1515SP PC + 64 modules + server module
• Number of lines, max.	1
Time of day	
Clock	
• Type	Hardware clock
• Backup time	6 wk; At 40 °C ambient temperature, typically
• Deviation per day, max.	10 s; Typ.: 2 s
Interfaces	
Number of industrial Ethernet interfaces	2
Number of PROFINET interfaces	1
Number of PROFIBUS interfaces	1
Number of RS 485 interfaces	1; Via CM DP module
Number of USB interfaces	4; 2x USB 2.0, 2x USB 3.0 on front side
Number of SD card slots	1
Video interfaces	
• Graphics interface	1x DisplayPort

Article number	6ES7677-2SB42-0GL0
1. Interface	
Interface types	
• Number of ports	2
• integrated switch	Yes
• RJ 45 (Ethernet)	Yes; Via BusAdapter BA 2x RJ45
– Transmission rate, max.	100 Mbit/s
– Industrial Ethernet status LED	Yes
2. Interface	
Interface types	
• Number of ports	1
• RJ 45 (Ethernet)	Yes; Integrated
– Transmission rate, max.	1 000 Mbit/s
– Industrial Ethernet status LED	No
3. Interface	
Interface types	
• RS 485	Yes
RS 485	
• Transmission rate, max.	12 Mbit/s
Interrupts/diagnostics/status information	
Diagnostics indication LED	
• RUN/STOP LED	Yes
• ERROR LED	Yes
• MAINT LED	Yes
Ambient conditions	
Ambient temperature during operation	
• min.	0 °C
• max.	Up to 60 °C with max. 32 ET 200SP modules and 3x 100 mA USB load; up to 55 °C with max. 64 ET 200SP modules and 2x max. 500 mA and 1x max. 100 mA USB load
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C; With max. 32 ET 200SP modules and 3x 100 mA USB load
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	70 °C

Weight, approx.	0.83 kg

12.7.9 Technical specifications of CPU 1515SP PC2 F + HMI 2018PT

Technical specifications

The following table shows the technical specifications as of 08/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7677-2SB42-0GM0/td).

Article number	6ES7677-2SB42-0GM0
General information	
Product type designation	CPU 1515SP PC2 F + HMI 2048
HW functional status	FS01
Firmware version	V2.5
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15 with HSP 269
Installed software	
• Visualization	WinCC Runtime Advanced V15
• Control	S7-1500 Software Controller CPU 1505SP F
Control elements	
Mode selector switch	1
Supply voltage	
Type of supply voltage	24 V DC
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Mains buffering	
• Mains/voltage failure stored energy time	5 ms
Input current	
Current consumption (rated value)	1.8 A; Full processor load, incl. ET 200SP modules and using USB
Current consumption (in no-load operation), typ.	0.5 A
I^2t	0.426 $A^2 \cdot s$; with starting current inrush
Power	
Active power input, max.	43 W; incl. ET 200SP modules and using USB
Infeed power to the backplane bus	8.75 W
Power loss	
Power loss, typ.	16 W
Processor	
Processor type	Intel Atom E3940, 1.6 GHz, 4 cores

Article number	6ES7677-2SB42-0GM0
Memory	
Type of memory	DDR3L
Main memory	8 GB RAM

12.7.12 S7-1500 Software Controller CPU 1505SP (F/T/TF)

The CPU 1505SP (F/T/TF) is a PC-based controller of the SIMATIC S7-1500 Software Controller family. You can find additional information about the CPU 1505SP (F/T/TF) in the relevant manual (https://support.industry.siemens.com/cs/ww/en/view/109740725). For the CPU 1505SP (F/T/TF), please also note the information in the F product information (https://support.industry.siemens.com/cs/ww/en/view/109478599).

Technical specifications

You can find technical specifications of CPU 1505SP with the article number 6ES7672-5DC11-0YA0 on the Internet under the following link (https://support.industry.siemens.com/cs/ww/en/pv/6ES7672-5DC11-0YA0/td).

You can find technical specifications of CPU 1505SP F with the article number 6ES7672-5SC11-0YA0 on the Internet under the following link (https://support.industry.siemens.com/cs/ww/en/pv/6ES7672-5SC11-0YA0/td).

You can find technical specifications of CPU 1505SP T with the article number 6ES7672-5VC11-0YA0 on the Internet under the following link (https://support.industry.siemens.com/cs/ww/en/pv/6ES7672-5VC11-0YA0/td).

You can find all technical specifications of CPU 1505SP TF with the article number 6ES7672-5W11-0YA0 on the Internet under the following link (https://support.industry.siemens.com/cs/ww/en/pv/6ES7672-5WC11-0YA0/td).

Dimension drawings 13

13.1 CPU 1515SP PC2

This section contains a dimension drawing of the module mounted on a mounting rail. Always observe the specified dimensions for installation in cabinets.

Table 14- 1 Accessories for CPU 1515SP PC2

Description	Article number
BusAdapter/media converter; 1 unit	
• BA 2×FC (PROFINET BusAdapter with FastConnect Ethernet connection)	6ES7193-6AF00-0AA0
• BA 2xLC (BusAdapter 2x LC glass fiber-optic connectors, for PROFINET)	6ES7193-6AG00-0AA0
• BA LC/RJ45 (media converter glass fiber-optic/CU 1x LC FO connector 1x RJ45 connector for PROFINET)	6ES7193-6AG20-0AA0
• BA LC/FC (media converter glass fiber-optic/CU 1x LC FO connector and 1x FastConnect (FC) connector for PROFINET)	6ES7193-6AG40-0AA0
• BA 2xSCRJ (BusAdapter 2 SCRJ FO connectors, for PROFINET)	6ES7193-6AP00-0AA0
• BA SCRJ/RJ45 (media converter fiber-optic CU 1x SCRJ FO connector and 1x RJ45 connector for PROFINET)	6ES7193-6AP20-0AA0
• BA SCRJ/FC (media converter fiber-optic CU 1x SCRJ FO connector and 1x FastConnect (FC) connector for PROFINET)	6ES7193-6AP40-0AA0
• BA 2×RJ45 (PROFINET BusAdapter with standard Ethernet socket)	6ES7193-6AR00-0AA0
• BA-Send 1xFC (1x FastConnect connector for ET-Connection)	6ES7193-6AS00-0AA0
Server module; 1 unit	6ES7193-6PA00-0AA0
Strain relief for CPU 1515SP PC2	A5E32291462
SIMATIC IPC Service USB flash drive 8 GB (SLC), pre-installed BIOS-MANAGER V3.3, Image/Partition Creator V3.3 and installation CD	6AV7672-8JD01-0AA0
SIMATIC IPC Service USB flash drive 16 GB, USB3.0, pre-installed BIOS-MANAGER V3.3, Image/Partition Creator V3.4 and installation CD	6AV7672-8JD02-0AA0
SIMATIC IPC DiagMonitor software	6ES7648-6CA05-0YX0
SIMATIC PC, DisplayPort according to DVI-I for onboard graphics	6ES7648-3AF00-0XA0
Reference identification label, sheet with 16 labels, 10 units	6ES7193-6LF30-0AW0
Mounting rails, tin-plated steel strip	
• Length: 483 mm	6ES5710-8MA11
• Length: 430 mm	6ES5710-8MA21
• Length: 830 mm	6ES5710-8MA31
• Length: 2000 mm	6ES5710-8MA41

Online catalog

Additional article numbers can be found on the Internet in the online catalog and online ordering system (http://www.siemens.com/automation/mall).

Appendix

A

A.1 Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

A.2 Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet.

See also

Industry Mall (https://mall.industry.siemens.com)

A.3 Troubleshooting

Problem	Possible cause	Remedy
CPU 1515SP PC2 does not work.	CPU 1515SP PC2 is not supplied with power.	Check the power supply.
Time and/or date of the CPU 1515SP PC2 not correct.	CPU 1515SP PC2 was not connected for more than 6 weeks.	Check the settings in Windows.
USB device is not working.	USB power supply is overloaded.	Use an external power supply for the USB device (see section Application planning (Page 33)).

List of abbreviations

B

B.1 Abbreviations

Abbreviation	Term	Meaning
AC	Alternating current	Alternating current
ALM	Automation License Manager	Tool for managing license keys in STEP 7
BIOS	Basic Input Output System	Basic Input Output System. A set of important software routines used after the startup of the CPU to load the operating system and to provide the routines for data exchange between hardware components.
CE	Communauté Européenne	CE label
CFast	CompactFlash ATA Serial Transfer	Memory card
CoA	Certificate of Authenticity	Certificate of Authenticity, label with Microsoft Windows "Product Key"
CoL	Certificate of License	Certificate of License for the SIMATIC software loaded
DC	Direct current	DC current
DPP	Dual-mode DisplayPort	Interface for transfer of image and video data for monitors
ESD	Components sensitive to electrostatic charge	
EN	European standard	
GbE	Gigabit Ethernet	
GRUB / GRUB2DOS	GRand Unified Bootloader	Boot Manager
HMI	Human Machine Interface	User interface
IEC	International Electrotechnical Commission	
IM	Interface module	The interface module connects the ET 200SP distributed I/O system with the IO controller and exchanges data with the I/O modules via the backplane bus.
LAN	Local Area Network	Computer network that is limited to a local area.
LED	Light Emitting Diode	Light emitting diode
LLDP	Link Layer Discovery Protocol	Protocol that enables the exchange of information between adjacent devices.
MMC	Multi Media Card	Memory card
NTFS	New Technology File System	File system that offers targeted access protection at the file level.
NVRAM	Non-Volatile Random-Access Memory	Non-volatile data memory that is RAM-based, the data content of which is retained without external power supply.
PC	Personal computer	
PELV	Protective Extra Low Voltage	PELV, previously called "extra low voltage with safe isolation", is a protective measure against electrical shock. See EN 50178.
PN	PROFINET	

Abbreviation	Term	Meaning
PG	Programming device	Compact programming device which meets the special requirements of industry. The PG is fully equipped for programming SIMATIC PLCs.
PS	Power supply	Power supply
PT	Power Tags	Process tags; tags enable data exchange between the components of an automation process, for example, between the HMI device and the controller.
RAM	Random Access Memory	Main or work memory of a computer with direct access, allowing read access to data and editing.
RT	Runtime	
SD	Secure Digital card	Memory card
SELV	Safety Extra Low Voltage	Safety Extra Low Voltage; electrical circuit in which the voltage cannot exceed 30 V AC (RMS), 42.4 V AC peak or 60 V DC under NORMAL CONDITIONS and CONDITIONS OF A SINGLE FAULT, including ground faults in other circuits.
UL	Underwriters Laboratories Inc.	
UWF	Unified Write Filter	Configurable write protection under Windows 10, for protection of data carriers (for example, CFast card, internal USB drives, etc.)"Unified Write Filter (UWF)" write filter (Page 57)
USB	Universal Serial Bus	Serial bus system for connecting a computer to external devices.

Glossary

Cold restart

A startup procedure commencing when the CPU is switched on. Upon a cold restart, the system typically performs some basic hardware checks and then loads the operating system from the hard disk into the work memory.

Controller

Integrated hardware and software controlling the operation of a specific internal or I/O device (e.g. keyboard controller).

Device configuration

The device configuration of a PC/programming device includes information on the features and options of the PC/programming device such as memory configuration, drive types, monitor, network address etc. The data is stored in a configuration file and is used by the operating system to load the corresponding device drivers or assign device parameters.

Drivers

Program sections of the operating system. They convert data from the user programs to the specific formats required by the I/O devices (e.g. hard disks, monitors, printers).

Ethernet

Local network (bus structure) for text and data communication with a data transmission rate of 10/100/1000 Mbps.

Image

An image is a copy of hard-disk partitions, for example, which is stored as backup in a file so that it can be restored if necessary.

Interface

- Connection between individual hardware elements such as PCs, programming device, printer or screen by means of physical plug-in connections (cables).
- Connection between different programs to allow them to be used together.

LAN

Local Area Network: LAN refers to a local network consisting of a group of computers and other devices which are distributed over a relatively restricted area and connected through communication lines. The devices connected to a LAN are referred to as nodes. The purpose of networks is the shared use of files, printers or other resources.

License key

The license key is the electronic license stamp of a license. Siemens AG provides a license key for software that is protected by licensing laws.

Operating system

Generic term which describes all functions for controlling and monitoring user program execution and distribution of system resources to the user programs as well as maintenance of the operating mode in cooperation with the hardware.

Power options

The power options can be used to reduce the power consumption of the computer while still keeping it ready for immediate use. In Windows via **Start** > **Control Panel** > **Hardware and Sound** > **Power Options**.

Restart

The restart of the company that is already in operation using, for example, the <Ctrl+Alt+Del> shortcut without switching off the power supply.

Restore USB stick

You use the Restore USB stick to reset your system partition or the entire hard disk to the delivery state in the event of an error. The USB stick contains all the necessary image files and is bootable.

ROM

Read Only Memory. ROM refers to a read-only memory where each memory location can be addressed individually. The stored programs or data are hard-coded and are preserved even in the event of a power failure.

S.M.A.R.T

Self-Monitoring, Analysis and Reporting Technology (SMART or S.M.A.R.T.) is an industry standard for storage media. It provides for permanent monitoring of relevant parameters and thus early recognition of pending defects.

SATA

Serial ATA. An interface for hard disk drives and optical drives with serial data transfer.

SETUP (BIOS setup)

A program used to determine information on the device configuration. The device configuration of the CPU 1515SP PC2 is preset. Changes must be made whenever a memory expansion, new modules or drives are to be activated.

SIEMENS

SIMATIC S7-1200/S7-1500 F-CPUs

Produktinformation

Security-Hinweise

Siemens bietet Produkte und Lösungen mit Industrial Security-Funktionen an, die den sicheren Betrieb von Anlagen, Systemen, Maschinen und Netzwerken unterstützen.

Um Anlagen, Systeme, Maschinen und Netzwerke gegen Cyber-Bedrohungen zu sichern, ist es erforderlich, ein ganzheitliches Industrial Security-Konzept zu implementieren (und kontinuierlich aufrechtzuerhalten), das dem aktuellen Stand der Technik entspricht. Die Produkte und Lösungen von Siemens formen einen Bestandteil eines solchen Konzepts.

Die Kunden sind dafür verantwortlich, unbefugten Zugriff auf ihre Anlagen, Systeme, Maschinen und Netzwerke zu verhindern. Diese Systeme, Maschinen und Komponenten sollten nur mit dem Unternehmensnetzwerk oder dem Internet verbunden werden, wenn und soweit dies notwendig ist und nur wenn entsprechende Schutzmaßnahmen (z. B. Firewalls und/oder Netzwerksegmentierung) ergriffen wurden.

Weiterführende Informationen zu möglichen Schutzmaßnahmen im Bereich Industrial Security finden Sie unter (https://www.siemens.com/industrialsecurity).

Die Produkte und Lösungen von Siemens werden ständig weiterentwickelt, um sie noch sicherer zu machen. Siemens empfiehlt ausdrücklich, Produkt-Updates anzuwenden, sobald sie zur Verfügung stehen und immer nur die aktuellen Produktversionen zu verwenden. Die Verwendung veralteter oder nicht mehr unterstützter Versionen kann das Risiko von Cyber-Bedrohungen erhöhen.

Um stets über Produkt-Updates informiert zu sein, abonnieren Sie den Siemens Industrial Security RSS Feed unter (https://www.siemens.com/industrialsecurity).

Inhalt

Einleitung

Diese Produktinformation enthält wichtige Informationen zu den im Absatz "Geltungsbereich" genannten F-CPUs. Die Produktinformation ist Bestandteil des gelieferten Produkts. Die in dieser Produktinformation enthaltenen Aussagen sind in Zweifelsfällen als aktueller anzusehen.

Geltungsbereich

Die Aussagen in dieser Produktinformation sind für die nachfolgend aufgezählten F-CPUs gültig:

F-CPUs S7-1200	F-CPUs S7-1500		
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1511(T)F-1 PN • CPU 1513F-1 PN • CPU 1515(T)F-2 PN • CPU 1516(T)F-3 PN/DP • CPU 1517(T)F-3 PN/DP • CPU 1518F-4 PN/DP • CPU 1518F-4 PN/DP (MFP/ODK)	• CPU 1510SP F-1 PN • CPU 1512SP F-1 PN • CPU 1516proF-2 PN	S7-1500 F Software Controller • CPU 1505SP (T)F • CPU 1507S F • CPU 1508S F

Einsatzgebiete

Haupteinsatzgebiete der F-CPUs S7-1200/1500 sind Personen- und Maschinenschutz und Brennersteuerungen. Neben dem Sicherheitsprogramm können Sie auch Standard-Anwendungen programmieren.

Die F-CPUs S7-1200/1500 können Sie im Sicherheitsbetrieb oder im Standardbetrieb betreiben.

Für den Sicherheitsbetrieb ist das installierte Optionspaket *STEP 7 Safety* notwendig. Ohne installiertes Optionspaket *STEP 7 Safety* können Sie die F-CPUs S7-1200/1500 im Standard-Betrieb einsetzen. Im Standardbetrieb verhalten sich F-CPUs S7-1200/1500 wie Standard-CPUs S7-1200/1500.

Informationen zum Einsatz der F-CPUs S7-1200/1500 im Sicherheitsbetrieb erhalten Sie im Programmier- und Bedienhandbuch "SIMATIC Safety - Projektieren und Programmieren (http://support.automation.siemens.com/WW/view/de/54110126)".

Informationen zum Einsatz der F-CPUs S7-1200 im Standardbetrieb erhalten Sie im Systemhandbuch "S7-1200 Automatisierungssystem (https://support.industry.siemens.com/cs/ww/de/view/109478121)".

Informationen zum Einsatz der F-CPUs S7-1500 im Standardbetrieb erhalten Sie in den jeweiligen Gerätehandbüchern der Standard-CPUs S7-1500 und den Standard-T-CPUs S7-1500 unter den folgenden Links:

- CPUs 151x (http://support.automation.siemens.com/WW/view/de/67295862/133300)
- CPUs 151xT (https://support.industry.siemens.com/cs/ww/de/ps/22057/man)
- CPUs 151xSP (http://support.automation.siemens.com/WW/view/de/90466439/133300)
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/de/ps/13906/man)
- S7-1500 Software Controller (http://support.automation.siemens.com/WW/view/de/109740725)

Die aktuelle Firmware für die jeweilige F-CPU finden Sie mit einer Suche nach Downloads mit der jeweiligen Artikelnummer im Industy Online Support (https://support.industry.siemens.com).

Hinweis

Beachten Sie anwendungsspezifische Anforderungen z. B. zur Netzausfallüberbrückung bei Netzteilen/Netzgeräten.

PFD_{avg}-, PFH-Werte für F-CPUs

Nachfolgend finden Sie die Versagenswahrscheinlichkeitswerte (PFD_{avg}-, PFH-Werte) für die oben genannten F-CPUs bei einer Gebrauchsdauer von 20 Jahren und bei einer Reparaturzeit von 100 Stunden:

Betrieb im geringen Anforderungsmodus low demand mode **gemäß IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Betrieb im häufigen Anforderungs- oder kontinuierlichen Modus** high demand/continuous mode **gemäß IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09

Überblick über den Arbeitsspeicher der F-CPUs im Vergleich mit den Standard-CPUs

CPU	Arbeitsspeicher	F-CPU	Arbeitsspeicher
CPU 1212C DC/DC/DC CPU 1212C DC/DC/Rly	75 kbyte	CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly	100 kbyte
CPU 1214C DC/DC/DC CPU 1214C DC/DC/Rly	100 kbyte	CPU 1214FC DC/DC/DC CPU 1214FC DC/DC/Rly	125 kbyte
CPU 1215C DC/DC/DC CPU 1215C DC/DC/Rly	125 kbyte	CPU 1215FC DC/DC/DC CPU 1215FC DC/DC/Rly	150 kbyte
CPU 1511-1 PN	150 kbyte	CPU 1511F-1 PN	225 kbyte
CPU 1511T-1 PN	225 kbyte	CPU 1511TF-1 PN	225 kbyte
CPU 1513-1 PN	300 kbyte	CPU 1513F-1 PN	450 kbyte
CPU 1515-1 PN	500 kbyte	CPU 1515F-1 PN	750 kbyte
CPU 1515T-1 PN	750 kbyte	CPU 1515TF-1 PN	750 kbyte
CPU 1516-3 PN/DP	1 Mbyte	CPU 1516F-3 PN/DP	1,5 Mbyte

CPU	Arbeitsspeicher	F-CPU	Arbeitsspeicher
CPU 1516T-3 PN/DP	1,5 Mbyte	CPU 1516TF-3 PN/DP	1,5 Mbyte
CPU 1517-3 PN/DP	2 Mbyte	CPU 1517F-3 PN/DP	3 Mbyte
CPU 1517T-3 PN/DP	3 Mbyte	CPU 1517TF-3 PN/DP	3 Mbyte
CPU 1518-4 PN/DP (MFP/ODK)	4 Mbyte	CPU 1518F-4 PN/DP (MFP/ODK)	6 Mbyte
CPU 1510SP-1 PN	100 kbyte	CPU 1510SP F-1 PN	150 kbyte
CPU 1512SP-1 PN	200 kbyte	CPU 1512SP F-1 PN	300 kbyte
CPU 1516pro-2 PN	1 Mbyte	CPU 1516proF-2 PN	1,5 Mbyte
CPU 1505SP (T)	1 Mbyte	CPU 1505SP (T)F	1,5 Mbyte
CPU 1507S	5 Mbyte	CPU 1507S F	7,5 Mbyte
CPU 1508S	10 Mbyte	CPU 1508S F	12,5 Mbyte

Unterstützung von PROFIsafe V2

Schnittstellen, die PROFINET IO unterstützen, unterstützen auch PROFIsafe V2.

Einschränkung bei den Anweisungen "CREAT_DB" und "DELETE_DB"

F-DBs können weder erzeugt noch gelöscht werden.

Einschränkung bei den Anweisungen "READ_DBL" und "WRIT_DBL"

Die Zieladresse darf nicht auf einen F-DB zeigen.

Einschränkung bei der Projektierung des Remanenzverhaltens von Datenbausteinen

Die Projektierung der Remanenz von Datenbausteinen wird für F-DBs nicht unterstützt. D. h., bei NETZ-AUS/EIN und Neustart (STOP-RUN) der F-CPU sind die Aktualwerte der F-DBs nicht remanent. Die F-DBs erhalten die Anfangswerte aus dem Ladespeicher.

In F-DBs ist für alle Variablen das Kontrollkästchen "Remanenz" gegraut dargestellt.

Konfigurationssteuerung (Optionenhandling) auf einer F-CPU S7-1200

Die Konfigurationssteuerung (Optionenhandling) auf einer F-CPU S7-1200 ist mit zentralen Modulen unter folgender Einschränkung möglich:

- Die fehlersicheren Module S7-1200 dürfen nicht getauscht werden und müssen auch immer an Ihrem projektierten Steckplatz physikalisch gesteckt werden.

Platzieren Sie die fehlersicheren Module S7-1200 direkt neben der F-CPU. Platzieren Sie die Standard-Module rechts neben den fehlersicheren Modulen S7-1200.

Vorgehen zum Laden einer Projektierung für Firmware < V2.0 für F-CPUs S7-1500

Wenn Sie eine F-CPU S7-1500 mit einer Projektierung für Firmware ab V2.0 mit projektierter Schutzstufe "Vollzugriff inkl. Fail-safe (kein Schutz)" geladen haben und nun eine Projektierung für Firmware <= V1.8 auf diese F-CPU laden wollen, müssen Sie Folgendes beachten:

Beim Laden der Projektierung mit Firmware <= V1.8 auf die F-CPU wird das Passwort abgefragt und als ungültig erkannt.

Als Abhilfe formatieren Sie die SIMATIC Memory Card wie in der Online-Hilfe zu STEP 7 unter "Eine S7-1500-Memory Card formatieren" beschrieben. Anschließend können Sie die Projektierung für Firmware <= V1.8 auf die F-CPU laden.

Einsatz von Taktsynchronalarm-(F-)OBs

Die Anzahl der verwendbaren Taktsynchronalarm-(F-)OBs ist von der eingesetzten F-CPU abhängig. Informationen dazu erhalten Sie in den technischen Daten der CPU.

Überschreitet die Summe der Taktsynchronalarm-OBs und des Taktsynchronalarm-F-OBs die in den technischen Daten der CPU angegebene Anzahl, ist das Laden des Standard-Anwenderprogramms im RUN nicht mehr möglich.

Display (bei F-CPUs S7-1500 mit Display bzw. Panel)

F-CPUs S7-1500 mit Display zeigen Ihnen im Menü "Übersicht" unter "Fehlersicher" Folgendes an:

- Sicherheitsbetrieb aktiviert/deaktiviert
- F-Gesamtsignatur
- Letzte fehlersichere Änderung
- Die Version von *STEP 7 Safety*, mit der das Sicherheitsprogramm übersetzt wurde.
- Informationen zu den F-Ablaufgruppen
  - Name der F-Ablaufgruppe
  - F-Ablaufgruppen-Signatur
  - Aktuelle Zykluszeit
  - Max. Zykluszeit
  - Aktuelle Laufzeit
  - Max. Laufzeit

Für jede F-Peripherie wird Ihnen unter "Fehlersichere Parameter" Folgendes angezeigt:

- F-Parameter-Signatur (mit Adresse)
- Sicherheitsbetrieb
- F-Überwachungszeit
- F-Quelladresse
- F-Zieladresse

Im Menü "Einstellungen" unter "Schutz" wird der folgende zusätzliche Menüpunkt angezeigt:

- F-Passwort freigeben/sperren

Der schreibende Zugriff auf F-Bausteine ist nicht zulässig.

Hinweis

Das Steuern von fehlersicheren Ein-/Ausgängen kann zum STOP der F-CPU führen.

Hinweis

Bei der Display-Firmware V2.5 wird nach dem Laden von Programmänderungen das Display für wenige Minuten nicht aktualisiert und ist nicht bedienbar, anschließend startet das Display neu.

Webserver

Die F-CPUs S7-1200/1500 zeigt Ihnen auf der Startseite des Webservers Folgendes an:

- Sicherheitsbetrieb aktiviert/deaktiviert
- F-Gesamtsignatur
- Letzte fehlersichere Änderung
- Die Version von *STEP 7 Safety*, mit der das Sicherheitsprogramm übersetzt wurde.
- Informationen zu den F-Ablaufgruppen
  - Name der F-Ablaufgruppe
  - F-Ablaufgruppen-Signatur
  - Aktuelle Zykluszeit
  - Max. Zykluszeit
  - Aktuelle Laufzeit
  - Max. Laufzeit

Für jede F-Peripherie wird Ihnen auf der Webseite "Baugruppenzustand" im Reiter "Fehlersicherheit" Folgendes angezeigt:

- F-Parameter-Signatur (mit Adresse)
- Sicherheitsbetrieb
- F-Überwachungszeit
- F-Quelladresse
- F-Zieladresse

Der schreibende Zugriff auf F-Bausteine ist nicht zulässig.

Hinweis

Das Steuern von fehlersicheren Ein-/Ausgängen kann zum STOP der F-CPU führen.

Die folgenden Punkte betreffen den S7-1500 F Software Controller

Der S7-1500 F Software Controller ist eine fehlersichere Software-CPU, die auf den folgenden Geräten zum Einsatz kommt:

S7-1500 F Software Controller	Gerät
CPU 1505SP (T)F	• CPU 1515SP PC
CPU 1507S F	• IPC 2x7E* • IPC 4x7D* • IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**
CPU 1508S F	• IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**

* Nur einsetzbar, wenn NVRAM vorhanden (wird automatisch zugewiesen)

** Nur einsetzbar mit PROFIBUS- bzw. PROFINET-Schnittstelle und, wenn NVRAM vorhanden (wird automatisch zugewiesen)

Die in der obigen Tabelle genannten Geräte reagieren beim Einsatz des S7-1500 F Software Controllers und *STEP 7 Safety* auch bei erhöhter elektromagnetischer Störbeeinflussung fehlersicher. Spezielle Typprüfungen im Hinblick auf funktionale Sicherheit sind daher für diese Geräte - im Gegensatz zur F-Peripherie - nicht erforderlich. Beachten Sie jedoch im Hinblick auf Verfügbarkeit anwendungsspezifische Anforderungen, insbesondere die Normen zur Brennersteuerung.

Der im Lieferumfang enthaltene gelbe Aufkleber mit dem TÜV SÜD-Prüfzeichen für funktionale Sicherheit ist ausschließlich für die Verwendung im Zusammenhang mit den S7-1500 F Software Controllern bestimmt (nicht im Lieferumfang der Download-Version). Den Aufkleber können Sie zur Kennzeichnung der Hardware verwenden, auf der der S7-1500 F Software Controller installiert wurde. Wenn Sie den S7-1500 F Software Controller deinstallieren, müssen Sie den Aufkleber entfernen.

Sichern und Wiederherstellen

Das Sichern und Wiederherstellen von Projektdaten wird nicht unterstützt.

Passwörter für Schutzstufen

Die PC Station unterscheidet nicht zwischen den beiden Passwörtern der Schutzstufen "Vollzugriff inkl. Fail-safe (kein Schutz)" und "Vollzugriff (kein Schutz)". Der S7-1500 F Software Controller unterscheidet zwischen den beiden Passwörtern der Schutzstufen "Vollzugriff inkl. Fail-safe (kein Schutz)" und "Vollzugriff (kein Schutz)".

Anweisung ENDIS_PW

Beim Einsatz der Anweisung ENDIS_PW auf einem IPC können Sie sich von Ihrem System aussperren, weil ein IPC keinen Betriebsartenschalter besitzt. Als Abhilfe können Sie sinngemäß vorgehen wie in der Online-Hilfe zur Anweisung ENDIS_PW unter "Ungewolltes Aussperren bei einer S7-1200-CPU verhindern" beschrieben.

Für PC-Stationen bis einschließlich V2.0 gilt: Wenn es zu einer ungewollten Aussperrung gekommen ist, dann können Sie die Sperre nur durch deinstallieren und installieren des S7-1500 F Software Controllers aufheben.

Für PC-Station ab V2.1 gilt: Mitglieder der Windowsbenutzergruppe "Failsafe Operators" können mit der Funktion "Delete Configuration" die Aussperrung umgehen.

Hinweis

Der Windowsbenutzer "Jedermann" wird nicht berücksichtigt, wenn er in der Windowsbenutzergruppe "Failsafe Operators" ist.

Funktionalität TPM

Die Funktionalität TPM darf für S7-1500 F Software Controller nicht genutzt werden, da dies zu einem STOP führen kann.

Nutzung von EWF bzw. UWF und dem EWF- bzw. UWF-Manager

Sie dürfen EWF bzw. UWF und den EWF- bzw. UWF-Manager nicht für das CPU-Volume anwählen.

Weitere Besonderheiten

⚠ WARNUNG
Sie müssen den Zugang für den S7-1500 F Software Controller durch einen Zugangsschutz auf Personen begrenzen, die zum Installieren bzw. Deinstallieren der Software des S7-1500 F Software Controllers berechtigt sind.

Hinweis

Bei einem S7-1500 F Software Controller mit einer PC-Station Version bis einschließlich V2.1 wird die Funktion "Delete Configuration" am PC-Station Panel nur angeboten, wenn an der F-CPU kein Zugriffsschutz (kein Schutz) eingerichtet ist.

Bei einer PC-Station ab V2.2 wird geprüft, ob der Windowsbenutzer Mitglied der Windowsbenutzergruppe "Failsafe Operators" ist. Wenn der eingeloggte Windowsbenutzer Mitglied der Gruppe ist, kann er die Funktion "Delete Configuration" auch beim gesetzten F-Passwort ausführen. Wenn der eingeloggte Windowsbenutzer nicht Mitglied der Gruppe ist, verhält sich die PC-Station wie bis V2.1.

Hinweis

Wenn der S7-1500 F Software Controller mit einem Zugriffsschutz versehen ist, wird dieser mit "Delete Configuration" nicht gelöscht und bleibt erhalten.

Hinweis

Benötigte BIOS-Version für CPU 1505SP F kleiner V2.5

Für den Einsatz der CPU 1505SP F benötigen Sie mindestens die BIOS-Version V2.00_02.01.

Hinweis

Der CPU-Takt darf sich im RUN nicht ändern, da dies zu einem STOP führen würde. Dies können Sie durch das Deaktivieren der Energiesparfunktion verhindern.

Hinweis

Zuweisung der PROFIsafe-Adressen für F-Module am PROFIBUS an IPCs mit S7-1500 F Software Controller kleiner V2.5

Wenn Sie PROFIsafe-Adressen F-Modulen zuweisen wollen, die über PROFIBUS an einem IPC mit einem S7-1500 F Software Controller betrieben werden, dann weisen Sie die PROFIsafe-Adressen den F-Modulen zu und führen Sie anschließend ein Netzaus/Netzein der PROFIBUS-Station durch.

Hinweis

Sicherheitsprogramm laden bzw. Sicherheitsbetrieb aktivieren für S7-1500 F Software Controller kleiner V2.5

Schließen Sie nach dem Laden des Sicherheitsprogramms bzw. nach dem Aktivieren des Sicherheitsbetriebs das Panel und öffnen Sie es wieder, damit die Anzeige im Panel aktualisiert wird.

Hinweis

Wenn Sie bei einem S7-1500 F Software Controller mit Version 2.0 ein Update auf eine Version > 2.0 durchführen, wird, wenn sich bereits ein Sicherheitsprogramm auf dem S7-1500 F Software Controller befindet, der Wert "Letzte fehlersichere Änderung" auf den Installationszeitpunkt gesetzt.

Hinweis

Die Funktionalität "Konfigurationsdatei Export" setzt das Optionspaket *STEP 7 Safety* ab V15 und einen S7-1500 F Software Controller ab V2.5 voraus.

SIEMENS

SIMATIC S7-1200/S7-1500 F-CPUs

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Content

Introduction

This Product Information contains important information on the F-CPUs specified in the section "Scope of validity". The Product Information is part of the product supplied. The information in this Product Information should be considered more up-to-date than other documentation if uncertainties arise.

Scope of validity

The statements in this product information apply to the F-CPUs listed below:

S7-1200 F-CPUs	S7-1500 F-CPUs		
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1511(T)F-1 PN • CPU 1513F-1 PN • CPU 1515(T)F-2 PN • CPU 1516(T)F-3 PN/DP • CPU 1517(T)F-3 PN/DP • CPU 1518F-4 PN/DP • CPU 1518F-4 PN/DP (MFP/ODK)	• CPU 1510SP F-1 PN • CPU 1512SP F-1 PN • CPU 1516proF-2 PN	S7-1500 F-Software Controller • CPU 1505SP (T)F • CPU 1507S F • CPU 1508S F

A5E35635424-AG, 11/2018

Areas of application

Main areas of application of the S7-1200/1500 F-CPUs are personal and machine safety and burner controls. In addition to the safety program, you can also program standard applications.

You can operate the S7-1200/1500 F-CPUs in safety or standard mode.

The installed *STEP 7 Safety* optional package is required for safety mode. If the *STEP 7 Safety* optional package is not installed, you can use the S7-1200/S7-1500 F-CPUs in standard mode. In standard mode, S7-1200/1500 F-CPUs behave like standard S7-1200/1500 CPUs.

Additional information on using the S7-1200/1500 F-CPUs in safety mode is available in the programming and operating manual "SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)".

Additional information on using the S7-1200 F-CPUs in standard mode is available in the "S7-1200 Programmable controller (https://support.industry.siemens.com/cs/ww/en/view/109478121)" system manual.

Additional information on using the S7-1500 F-CPUs in standard mode is available in the relevant manuals for the S7-1500 and the standard-T-CPUs S7-1500 at the following links:

- CPUs 151x (http://support.automation.siemens.com/WW/view/en/67295862/133300)
- CPUs 151xT (https://support.industry.siemens.com/cs/ww/en/ps/22057/man)
- CPUs 151xSP (http://support.automation.siemens.com/WW/view/en/90466439/133300)
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/ps/13906/man)
- S7-1500 Software Controller (http://support.automation.siemens.com/WW/view/en/109740725)

You can find the latest firmware for the relevant F-CPU by searching for downloads with the respective article number in the Industry Online Support (https://support.industry.siemens.com).

Note

Observe any application-specific requirements, for example on mains buffering for power supplies/power packs.

PFD_{avg} and PFH values for F-CPUs

Below are the probability of failure on demand values (PFD_{avg}, PFH values) for the above-named F-CPUs with a service life of 20 years and an MTTR of 100 hours:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**

CPU 1518-4 PN/DP (MFP/ODK)	4 MB	CPU 1518F-4 PN/DP (MFP/ODK)	6 MB
CPU 1510SP-1 PN	100 KB	CPU 1510SP F-1 PN	150 KB
CPU 1512SP-1 PN	200 KB	CPU 1512SP F-1 PN	300 KB
CPU 1516pro-2 PN	1 MB	CPU 1516proF-2 PN	1.5 MB
CPU 1505SP (T)	1 MB	CPU 1505SP (T)F	1.5 MB
CPU 1507S	5 MB	CPU 1507S F	7.5 MB
CPU 1508S	10 MB	CPU 1508S F	12.5 MB

Support of PROFIsafe V2

Interfaces that support PROFINET IO also support PROFIsafe V2.

Restriction with "CREAT_DB" and "DELETE_DB" instructions

F-DBs can neither be created nor deleted.

Restriction with "READ_DBL" and "WRIT_DBL" instructions

The destination address must not point to an F-DB.

Restrictions when configuring the retentive behavior of data blocks

The configuration of the retentive behavior of data blocks is not supported for F-DBs. This means that the actual values of the F-DBs will not be retentive in the event of Power OFF/ON and Restart (STOP-RUN) of the F-CPU. The F-DBs retain the initial values from the load memory.

The "Retain" check box is grayed-out for all tags in F-DBs.

Configuration control (option handling) on an S7-1200 F-CPU

Configuration control (option handling) on an S7-1200 F-CPU is possible with central modules subject to the following limitation:

- The fail-safe S7-1200 modules cannot be swapped and must also always be physically inserted into their configured slot.

Position the fail-safe S7-1200 modules directly next to the F-CPU. Position the standard modules on the right next to the fail-safe S7-1200 modules.

Procedure for loading a configuration for firmware < V2.0 for S7-1500 F-CPUs

If you have loaded an S7-1500 F-CPU with a configuration for firmware as of V2.0 with configured protection level "Full access with fail-safe (no protection)" and you now want to load a configuration for firmware <= V1.8 to this F-CPU, you must observe the following:

When the configuration with firmware <= V1.8 is loaded to the F-CPU, you will be prompted to enter the password and the entered password will be identified as invalid.

As a remedy, format the SIMATIC Memory Card as described in the online help for STEP 7 under "Formatting an S7-1500 memory card". You can then load the configuration for firmware <= V1.8 to the F-CPU.

Use of isochronous mode interrupt (F-)OBs

The number of isochronous mode interrupt (F-)OBs depends on the F-CPU used. You can obtain information in the technical specification of the CPU.

If the sum of the isochronous mode interrupt OBs and the isochronous mode interrupt F-OBs exceeds the number specified in the technical specifications of the CPU, it is no longer possible to load the standard user program in RUN.

Display (for S7-1500 F-CPUs with display or panel)

S7-1500 F-CPUs with display show you the following in the "Overview" menu under "Fail-safe":

- Safety mode activated/deactivated
- Collective F-signature
- Last fail-safe change
- Version of *STEP 7 Safety* with which the safety program was compiled.
- Information on the F-runtime groups
  - Name of F-runtime group
  - F-runtime groups signature
  - Current cycle time
  - Max. cycle time
  - Current runtime
  - Max. runtime

The following is displayed for each F-I/O under "Fail-safe parameters":

- F-parameter signature (with addresses)
- Safety mode
- F-monitoring time
- F-source address
- F-destination address

The following additional menu command is displayed in the "Settings" menu under "Protection":

- Enable/disable F-password

Write access to F-blocks is not permitted.

Note

Controlling fail-safe inputs/outputs can result set the F-CPU to STOP.

Note

With the display firmware V2.5, the display is not refreshed and cannot be operated for a few minutes after loading program changes. Afterwards, the display restarts.

Web server

S7-1200/1500 F-CPUs show you the following on the start page of the Web server:

- Safety mode activated/deactivated
- Collective F-signature
- Last fail-safe change
- Version of *STEP 7 Safety* with which the safety program was compiled.
- Information on the F-runtime groups
  - Name of F-runtime group
  - F-runtime groups signature
  - Current cycle time
  - Max. cycle time
  - Current runtime
  - Max. runtime

The following is displayed for each F-I/O on the "Module information" web page in the "Fail-safe" tab:

- F-parameter signature (with addresses)
- Safety mode
- F-monitoring time
- F-source address
- F-destination address

Write access to F-blocks is not permitted.

Note

Controlling fail-safe inputs/outputs can result set the F-CPU to STOP.

The following points relate to the S7-1500 F-Software Controller

The S7-1500 F-Software Controller is a fail-safe software CPU that is used on the following devices.

S7-1500 F-Software Controller	Device
CPU 1505SP (T)F	• CPU 1515SP PC
CPU 1507S F	• IPC 2x7E* • IPC 4x7D* • IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**
CPU 1508S F	• IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**

* Can only be used when NVRAM is present (to be automatically allocated)

** Can only be used with PROFIBUS or PROFINET interface and when NVRAM is present (to be automatically allocated)

The devices specified in the table above react in a fail-safe manner when the S7-1500 F-Software Controller and *STEP 7 Safety* are used, even in the case of elevated electromagnetic interference. Special type tests for functional safety are therefore not required for these devices – in contrast to F-I/O. With regard to availability, however, you must observe the application-specific requirements, especially the standards for burner control.

The yellow adhesive label with the TÜV SÜD test mark for functional safety included in the scope of delivery is exclusively intended for use in connection with S7-1500 F-Software Controllers (not included in the download version of the product package). You can use the adhesive label to mark the hardware on which the S7-1500 F-Software Controller is installed. You must remove the adhesive label when you uninstall the S7-1500 F-Software Controller.

Backup and restore

Backup and restoration of project data is not supported.

Passwords for protection levels

The PC station does not distinguish between the two passwords of protection levels "Full access with fail-safe (no protection)" and "Full access (no protection)". The S7-1500 F-Software Controller distinguishes between the two passwords of protection levels "Full access with fail-safe (no protection)" and "Full access (no protection)".

ENDIS_PW instruction

When the ENDIS_PW instruction is used on an IPC, you can be locked out of your system because an IPC has no mode selector. As a remedy, you can follow a procedure similar to that described in the online help for the ENDIS_PW instruction under "Preventing unintentional lockout of an S7-1200 CPU".

The following applies for PC stations up to and including V2.0: If an unintentional lockout occurs, you can remedy this only by uninstalling and installing the S7-1500 F-Software Controller.

The following applies for PC stations as of V2.1: Members of the Windows "Failsafe Operators" user group can bypass the lockout using the "Delete Configuration" function.

Note

The Windows user "Everyone" is not taken into consideration if it is in the "Failsafe Operators" Windows user group.

TPM functionality

The TPM functionality cannot be used for S7-1500 F-Software Controllers because it could result in a STOP.

Using EWF or UWF and the EWF or UWF Manager

You cannot select EWF or UWF and the EWF or UWF Manager for the CPU volume.

Other particularities

⚠WARNING
You must limit access for the S7-1500 F-Software Controller through access protection to persons who are authorized to install or uninstall the software of the S7-1500 F-Software Controller.

Note

With an S7-1500 F-Software Controller with a PC station up to and including V2.1, the "Delete Configuration" function is only offered on the PC-station panel when no access protection (no protection) is set up on the F-CPU.

With a PC station as of V2.2, it is checked whether the Windows user is a member of the "Failsafe Operators" Windows user group. If the logged-on Windows user is a member of the group, he can execute the "Delete Configuration" function even when the F-password is set. If the logged-on Windows user is not a member of the group, the PC station behaves as up to V2.1.

Note

If the S7-1500 F-Software Controller features an access protection, this is not deleted with "Delete Configuration" and is retained.

Note

Required BIOS version for CPU 1505SP F prior to V2.5

For use of the CPU 1505SP F, you require BIOS version V2.00_02.01 or higher.

Note

The CPU clock must not be changed in RUN because this would result in a STOP. You can prevent this by disabling the energy-saving function.

Note

Assignment of PROFIsafe addresses for F-modules via PROFIBUS on IPCs with S7-1500 F Software Controller prior to V2.5

If you want to assign PROFIsafe addresses for F-modules that are being operated via PROFIBUS on an IPC with an S7-1500 F-Software Controller, assign the PROFIsafe addresses to the F-modules and then perform a power on/power off of the PROFIBUS station.

Note

Loading the safety program or activating safety mode for S7-1500 F Software Controller prior to V2.5

After loading the safety program or activating safety mode, close the panel and then open it again to update the display on the panel.

Note

If you execute an update for a S7-1500 F Software Controller with V2.0 to a version > 2.0, the value "Last fail-safe change" is set to the time of installation if a safety program is already installed on the S7-1500 F-Software Controller.

Note

The "Configuration file export" functionality requires the *STEP 7 Safety* add-on package as of V15 and an S7-1500 F Software Controller prior to V2.5.

SIEMENS

SIMATIC S7-1200/S7-1500 CPU F

Information produit

Notes relatives à la sécurité

Siemens commercialise des produits et solutions comprenant des fonctions de sécurité industrielle qui contribuent à une exploitation sûre des installations, solutions, machines, équipements et réseaux.

Pour garantir la sécurité des installations, systèmes, machines et réseaux contre les cybermenaces, il est nécessaire d’implémenter (et de préserver) un concept de sécurité industrielle global et de pointe. Les produits et solutions de Siemens constituent une partie de ce concept.

Il incombe aux clients d’empêcher tout accès non autorisé à leurs installations, systèmes, machines et réseaux. Ces systèmes, machines et composants doivent uniquement être connectés au réseau d’entreprise ou à Internet si et dans la mesure où cela est nécessaire et seulement si des mesures de protection adéquates (ex: pare-feux et/ou segmentation du réseau) ont été prises.

Pour plus d’informations sur les mesures de protection pouvant être mises en œuvre dans le domaine de la sécurité industrielle, rendez-vous sur (https://www.siemens.com/industrialsecurity).

Les produits et solutions Siemens font l’objet de développements continus pour être encore plus sûrs. Siemens recommande vivement d’effectuer des mises à jour dès que celles-ci sont disponibles et d’utiliser la dernière version des produits. L’utilisation de versions qui ne sont plus prises en charge et la non-application des dernières mises à jour peut augmenter le risque de cybermenaces pour nos clients.

Pour être informé des mises à jour produit, abonnez-vous au flux RSS Siemens Industrial Security à l’adresse suivante (https://www.siemens.com/industrialsecurity).

Contenu

Introduction

Cette Information produit contient des indications importantes concernant les CPU F citées au paragraphe "Domaine de validité". L'Information produit fait partie de la livraison du produit. Les informations contenues dans cette information produit prévalent en cas de doute sur celles d'autres documents.

Domaine de validité

Les informations contenues dans cette Information produit s'appliquent aux CPU F suivantes :

CPU F S7-1200	CPU F S7-1500		
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1511(T)F-1 PN • CPU 1513F-1 PN • CPU 1515(T)F-2 PN • CPU 1516(T)F-3 PN/DP • CPU 1517(T)F-3 PN/DP • CPU 1518F-4 PN/DP • CPU 1518F-4 PN/DP (MFP/ODK)	• CPU 1510SP F-1 PN • CPU 1512SP F-1 PN • CPU 1516proF-2 PN	Contrôleur logiciel S7-1500 F • CPU 1505SP (T)F • CPU 1507S F • CPU 1508S F

Champs d'application

Les principaux champs d'application des CPU F S7-1200/1500 sont la sécurité des personnes et des machines ainsi que la commande de brûleurs. Outre le programme de sécurité, vous pouvez programmer des applications standard.

Vous pouvez exploiter les CPU F S7-1200/1500 en mode de sécurité ou en mode standard.

L'installation du logiciel optionnel *STEP 7 Safety* est requise pour le mode de sécurité. Si le logiciel optionnel *STEP 7 Safety* n'est pas installé, vous pouvez utiliser les CPU F S7-1200/1500 en mode standard. En mode standard, les CPU F S7-1200/1500 ont le même comportement que les CPU S7-1200/1500 standard.

Pour plus d'informations sur l'utilisation des CPU F S7-1200/1500 en mode de sécurité, référez-vous au manuel de programmation et d'utilisation "SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)".

Pour plus d'informations sur l'utilisation des CPU F S7-1200 en mode standard, référez-vous au manuel système "Système d'automatisation S7-1200 (https://support.industry.siemens.com/cs/ww/fr/view/109478121)".

Pour plus d'informations sur l'utilisation des CPU F S7-1500 en mode standard, référez-vous aux manuels des CPU standard S7-1500 et des CPU T standard S7-1500 respectifs sous les liens internet suivants :

- CPU 151x (http://support.automation.siemens.com/WW/view/fr/67295862/133300)
- CPUs 151xT (https://support.industry.siemens.com/cs/ww/de/fr/22057/man)
- CPU 151xSP (http://support.automation.siemens.com/WW/view/fr/90466439/133300)
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/fr/ps/13906/man)
- Contrôleur logiciel S7-1500 (http://support.automation.siemens.com/WW/view/fr/109740725)

Vous trouverez le firmware actuel de la CPU F concernée en parcourant les téléchargements avec le n° d'article respectif sur le portail Industry Online Support (https://support.industry.siemens.com).

Remarque

Tenez compte des exigences spécifiques à une application, p. ex. l'immunité aux microcoupures pour les blocs d'alimentation.

Valeurs PFD_{avg}, PFH pour les CPU F

Vous trouverez ci-dessous les valeurs de la probabilité de défaillance (valeurs PFD_{avg}, PFH) pour les CPU F précitées avec un temps de mission de 20 ans et une durée de panne de 100 heures :

Fonctionnement en mode demande faible low demand mode **selon la norme CEI 61508:2010 :** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Fonctionnement en mode demande élevé / mode continu** high demand/continuous mode **selon la norme CEI 61508:2010 :** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09

Aperçu de la mémoire de travail des CPU F, comparaison avec les CPU standard

CPU	Mémoire de travail	CPU F	Mémoire de travail
CPU 1212C DC/DC/DC CPU 1212C DC/DC/Rly	75 Ko	CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly	100 Ko
CPU 1214C DC/DC/DC CPU 1214C DC/DC/Rly	100 Ko	CPU 1214FC DC/DC/DC CPU 1214FC DC/DC/Rly	125 Ko
CPU 1215C DC/DC/DC CPU 1215C DC/DC/Rly	125 Ko	CPU 1215FC DC/DC/DC CPU 1215FC DC/DC/Rly	150 Ko
CPU 1511-1 PN	150 Ko	CPU 1511F-1 PN	225 Ko
CPU 1511T-1 PN	225 Ko	CPU 1511TF-1 PN	225 Ko
CPU 1513-1 PN	300 Ko	CPU 1513F-1 PN	450 Ko
CPU 1515-1 PN	500 Ko	CPU 1515F-1 PN	750 Ko
CPU 1515T-1 PN	750 Ko	CPU 1515TF-1 PN	750 Ko

CPU	Mémoire de travail	CPU F	Mémoire de travail
CPU 1516-3 PN/DP	1 Mo	CPU 1516F-3 PN/DP	1,5 Mo
CPU 1516T-3 PN/DP	1,5 Mo	CPU 1516TF-3 PN/DP	1,5 Mo
CPU 1517-3 PN/DP	2 Mo	CPU 1517F-3 PN/DP	3 Mo
CPU 1517T-3 PN/DP	3 Mo	CPU 1517TF-3 PN/DP	3 Mo
CPU 1518-4 PN/DP (MFP/ODK)	4 Mo	CPU 1518F-4 PN/DP (MFP/ODK)	6 Mo
CPU 1510SP-1 PN	100 Ko	CPU 1510SP F-1 PN	150 Ko
CPU 1512SP-1 PN	200 Ko	CPU 1512SP F-1 PN	300 Ko
CPU 1516pro-2 PN	1 Mo	CPU 1516proF-2 PN	1,5 Mo
CPU 1505SP (T)	1 Mo	CPU 1505SP (T)F	1,5 Mo
CPU 1507S	5 Mo	CPU 1507S F	7,5 Mo
CPU 1508S	10 Mo	CPU 1508S F	12,5 Mo

Prise en charge de PROFIsafe V2

Les interfaces qui prennent en charge PROFINET IO prennent également en charge PROFIsafe V2.

Restriction pour les instructions "CREAT_DB" et "DELETE_DB"

Les blocs de données F ne peuvent être ni générés ni effacés.

Restriction pour les instructions "READ_DBL" et "WRIT_DBL"

L’adresse de destination ne peut pas être celle d’un bloc de données F (DB F).

Restriction lors de la configuration du comportement rémanent des blocs de données

La configuration de la rémanence des blocs de données F n’est pas prise en charge. Ainsi, les valeurs effectives des DB F ne sont pas rémanentes après une mise hors tension puis sous tension et un redémarrage (STOP-RUN) de la CPU F. Les DB F prennent les valeurs initiales de la mémoire de chargement.

La case à cocher "Rémanence" est grisée pour toutes les variables dans les DB F.

Commande de configuration (gestion des options) sur une CPU F S7-1200

La commande de configuration (gestion des options) sur une CPU F S7-1200 est possible avec des modules centralisés avec les restrictions suivantes :

- Les modules de sécurité S7-1200 ne doivent pas être échangés et doivent toujours être enfichés à l'emplacement qui a été configuré pour eux.

Placez les modules de sécurité S7-1200 directement à côté de la CPU F. Placez les modules standard à droite à côté des modules de sécurité S7-1200.

Marche à suivre pour charger une configuration pour un firmware de version antérieure à la V2.0 pour des CPU F S7-1500

Si vous avez chargé une CPU F S7-1500 avec une configuration pour firmware à partir de la version V2.0 avec le niveau de protection "Accès complet, y compris failsafe (pas de protection)" configuré et que vous souhaitez charger une configuration pour un firmware de version antérieure à la version V1.8 sur cette CPU F, vous devez tenir compte de ce qui suit :

Lors du chargement de la configuration avec un firmware de version antérieure à la version V1.8 sur la CPU F, le mot de passe est demandé et détecté comme incorrect.

Pour remédier à ce problème, formatez la carte mémoire SIMATIC en suivant la description de l'aide en ligne de STEP 7 sous "Formater une carte mémoire S7-1500". Vous pouvez ensuite charger la configuration pour le firmware de version antérieure à la version V1.8 sur la CPU F.

Utilisation des OB (F) d'alarme d'isochronisme

Le nombre d'OB (F) d'alarme d'isochronisme qu'il est possible d'utiliser est fonction de la CPU F mise en œuvre. Pour plus d'informations à ce sujet, référez-vous aux caractéristiques techniques de la CPU.

Si la somme des OB d'alarme d'isochronisme et des OB F d'alarme d'isochronisme dépasse le nombre spécifié dans les caractéristiques techniques de la CPU, il n'est plus possible de charger le programme utilisateur standard en RUN.

Écran (pour les CPU F S7-1500 avec écran ou panneau)

Les CPU F S7-1500 avec écran affichent les indications suivantes dans le menu "Vue d'ensemble", sous "De sécurité" :

- Mode de sécurité activé/désactivé
- Signature globale
- Dernière modification de sécurité
- La version de *STEP 7 Safety* avec laquelle le programme de sécurité a été compilé.
- Informations sur les groupes d'exécution F
  - Nom du groupe d'exécution F
  - Signature de groupe d'exécution F
  - Temps de cycle actuel
  - Temps de cycle max.
  - Temps d'exécution actuel
  - Temps d'exécution max.

Vous avez les indications suivantes sous "Paramètres de sécurité" pour chaque périphérie de sécurité :

- Signature de paramètres F (avec adresse)
- Mode de sécurité
- Temps de surveillance F
- Adresse source F
- Adresse cible F

La commande de menu supplémentaire suivante s'affiche dans le menu "Paramètres", sous "Protection".

- Verrouiller/déverrouiller le mot de passe F

L'accès en écriture aux blocs F n'est pas autorisé.

Remarque

La commande d'entrées /sorties de sécurité entraîne l'arrêt de la CPU F.

Remarque

Après un chargement des modifications du programme, le rafraîchissement de l'écran avec la version de firmware V2.5 est retardé de quelques minutes et l'écran n'est pendant ce temps pas utilisable, puis l'écran redémarre.

Serveur Web

Les CPU F S7-1200/1500 vous fournissent les indications suivantes sur la page d'accueil du serveur Web :

- Mode de sécurité activé/désactivé
- Signature globale F
- Dernière modification de sécurité
- La version de *STEP 7 Safety* avec laquelle le programme de sécurité a été compilé.
- Informations sur les groupes d'exécution F
  - Nom du groupe d'exécution F
  - Signature de groupe d'exécution F
  - Temps de cycle actuel
  - Temps de cycle max.
  - Temps d'exécution actuel
  - Temps d'exécution max.

L'onglet "Sécurité en cas de défaut" sur la page Web "Etat du module" vous fournit les informations suivantes pour chaque périphérie de sécurité :

- Signature de paramètres F (avec adresse)
- Mode de sécurité
- Temps de surveillance F
- Adresse source F
- Adresse cible F

L'accès en écriture aux blocs F n'est pas autorisé.

Remarque

La commande d'entrées /sorties de sécurité entraîne l'arrêt de la CPU F.

Les points suivants concernent le contrôleur logiciel S7-1500 F

Le contrôleur logiciel S7-1500 F est une CPU logicielle de sécurité qui est utilisée sur les appareils suivants :

Contrôleur logiciel S7-1500 F	Appareil
CPU 1505SP (T)F	• CPU 1515SP PC
CPU 1507S F	• IPC 2x7E* • IPC 4x7D* • IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**
CPU 1508S F	• IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**

* Utilisable seulement lorsqu'une NVRAM est présente (affectation automatique)

** Utilisable seulement avec interface PROFIBUS ou PROFINET et si une NVRAM est présente (affectation automatique)

Les appareils présentés dans le tableau ci-dessus réagissent de manière sûre lors de l'utilisation du contrôleur logiciel S7-1500 F et de *STEP 7 Safety*, y compris en cas d'importantes interférences électromagnétiques. C'est pourquoi des essais de sécurité spéciaux ne sont pas nécessaires pour ces appareils. Seule la périphérie de sécurité doit être soumise à un examen correspondant. Tenez compte cependant des exigences spécifiques d'une application, notamment des normes relatives à la commande de brûleurs concernant la disponibilité.

L'étiquette jaune fournie à la livraison et qui porte la marque d'homologation du TÜV SÜD pour la sécurité fonctionelle est prévue exclusivement pour l'utilisation de contrôleurs logiciels S7-1500 F (ne fait pas partie de la livraison en cas de téléchargement). Vous pouvez utiliser l'étiquette pour identifier le matériel sur lequel a été installé le contrôleur logiciel S7-1500 F. Si vous désinstallez le contrôleur logiciel S7-1500 F, vous devez retirer l'étiquette.

Sauvegarde et restauration

La sauvegarde et la restauration de données de projet ne sont pas prises en charge.

Mots de passe pour les niveaux de protection

La station PC ne fait pas la différence entre les deux mots de passe des niveaux de protection "Accès complet, y compris failsafe (pas de protection)" et "Accès complet (pas de protection)". Le contrôleur logiciel S7-1500 F ne fait pas la différence entre les deux mots de passe des niveaux de protection "Accès complet, y compris failsafe (pas de protection)" et "Accès complet (pas de protection)".

Instruction ENDIS_PW

Lors de l'utilisation de l'instruction ENDIS_PW sur un IPC, vous pouvez perdre tout accès à votre système puisqu'un IPC ne possède pas de sélecteur de mode. Pour remédier à ce problème, vous pouvez suivre ce qui est décrit dans l'aide en ligne à propos de l'instruction ENDIS_PW sous "Éviter le blocage involontaire pour une CPU S7-1200".

Pour les stations PC jusqu'à la version V2.0 : Si un blocage involontaire se produit, vous ne pouvez procéder au déblocage qu'en désinstallant et installant le contrôleur logiciel S7-1500 F.

Pour la station PC à partir de la V2.1 : Les membres du groupe d'utilisateurs Windows "Failsafe Operators" peuvent utiliser la fonction "Delete Configuration" pour éviter le blocage.

Remarque

L'utilisateur Windows "Tout le monde" n'est pas pris en compte s'il appartient au groupe d'utilisateurs Windows "Failsafe Operators".

Fonction TPM

La fonction TPM ne peut pas être utilisée pour le contrôleur logiciel S7-1500 F, sous peine de provoquer un ARRÊT.

Utilisation du EWF ou UWF et du gestionnaire EWF ou UWF

Vous ne devez pas sélectionner EWF ou UWF et le gestionnaire EWF ou UWF pour le volume de la CPU.

Particularités supplémentaires

⚠ATTENTION
Une sécurité d'accès vous permet de restreindre le droit d'accès au contrôleur logiciel S7-1500 F à un cercle de personnes qui seront alors les seules à avoir le droit d'installer ou de désinstaller le logiciel du contrôleur logiciel S7-1500 F.

Remarque

Dans le cas d'un contrôleur logiciel S7-1500 F jusqu'à V2.1 comprise, la fonction "Delete Configuration" n'est proposée sur le panneau de commande de la station PC que si aucune protection d'accès n'est configurée sur la CPU F (pas de protection).

Dans le cas d'une station PC à partir de V2.2, une vérification est effectuée pour déterminer si l'utilisateur est membre du groupe d'utilisateurs Windows "Failsafe Operators". Si l'utilisateur Windows est membre du groupe, il peut également exécuter la fonction "Delete Configuration" en ayant entré le mot de passe F. Si l'utilisateur Windows identifié n'est pas membre du groupe, la station PC se comporte comme les versions jusqu'à V2.1.

Remarque

Si le contrôleur logiciel S7-1500 F est pourvu d'une protection d'accès, cette dernière n'est pas supprimée avec "Delete Configuration", elle est conservée.

Remarque

Version BIOS requise pour la CPU 1505SP F inférieure à V2.5

Pour pouvoir utiliser la CPU 1505SP F, il vous faut au moins la version V2.00_02.01 du BIOS.

Remarque

L'horloge de la CPU ne doit pas être modifiée en mode MARCHE, sous peine de provoquer un ARRÊT. Vous pouvez empêcher cela en désactivant la fonction d'économie d'énergie.

Remarque

Affectation d'adresses PROFIsafe à des modules F avec PROFIBUS sur des IPC avec contrôleur logiciel S7-1500 F de version inférieure à V2.5.

Si vous voulez affecter des adresses PROFIsafe à des modules de sécurité qui fonctionnent avec PROFIBUS sur un IPC avec un contrôleur logiciel S7-1500 F, attribuez les adresses PROFIsafe aux modules F puis effectuez une mise hors tension puis une mise sous tension de la station PROFIBUS.

Remarque

Charger le programme de sécurité ou activer le mode de sécurité pour le contrôleur logiciel S7-1500 F de version inférieure à V2.5.

Après avoir chargé le programme de sécurité ou activé le mode de sécurité, fermez le panneau de commande et ouvrez-le de nouveau pour actualiser l'affichage.

Remarque

Lors de la mise à jour d'un contrôleur logiciel S7-1500 F version 2.0 à une version > 2.0, la valeur "Dernière modification de sécurité" est mise sur le dernier événement d'installation si le programme de sécurité se trouve déjà sur le contrôleur logiciel S7-1500 F.

Remarque

La fonctionnalité "Exportation du fichier de configuration" requiert le pack logiciel *STEP 7 Safety* à partir de la version V15 et la version S7-1500 F Software Controller à partir de V2.5.

SIEMENS

SIMATIC S7-1200/S7-1500 CPU F

Información del producto

Información de seguridad

Siemens ofrece productos y soluciones con funciones de seguridad industrial con el objetivo de hacer más seguro el funcionamiento de instalaciones, sistemas, máquinas y redes.

Para proteger las instalaciones, los sistemas, las máquinas y las redes de amenazas cibernéticas, es necesario implementar (y mantener continuamente) un concepto de seguridad industrial integral que sea conforme a la tecnología más avanzada. Los productos y las soluciones de Siemens constituyen únicamente una parte de este concepto.

Los clientes son responsables de impedir el acceso no autorizado a sus instalaciones, sistemas, máquinas y redes. Dichos sistemas, máquinas y componentes solo deben estar conectados a la red corporativa o a Internet cuando y en la medida que sea necesario y siempre que se hayan tomado las medidas de protección adecuadas (p. ej. uso de cortafuegos y segmentación de la red).

Para obtener información adicional sobre las medidas de seguridad industrial que podrían ser implementadas, por favor visite (https://www.siemens.com/industrialsecurity).

Los productos y las soluciones de Siemens están sometidos a un desarrollo constante con el fin de mejorar todavía más su seguridad. Siemens recomienda expresamente realizar actualizaciones en cuanto estén disponibles y utilizar únicamente las últimas versiones de los productos. El uso de versiones anteriores o que ya no se soportan puede aumentar el riesgo de amenazas cibernéticas.

Para mantenerse informado de las actualizaciones de productos, recomendamos que se suscriba al Siemens Industrial Security RSS Feed en (https://www.siemens.com/industrialsecurity).

Contenido

Introducción

Esta información de producto contiene datos importantes sobre las CPU F mencionadas en el apartado "Ámbito de validez". La información de producto forma parte del producto suministrado. En caso de duda, el contenido de esta información del producto prevalece sobre lo indicado en otras fuentes.

Ámbito de validez

El contenido de esta información del producto es válido para las CPU F que se indican a continuación:

CPU F S7-1200	CPU F S7-1500		
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1511(T)F-1 PN • CPU 1513F-1 PN • CPU 1515(T)F-2 PN • CPU 1516(T)F-3 PN/DP • CPU 1517(T)F-3 PN/DP • CPU 1518F-4 PN/DP • CPU 1518F-4 PN/DP (MFP/ODK)	• CPU 1510SP F-1 PN • CPU 1512SP F-1 PN • CPU 1516proF-2 PN	Controladores por software S7-1500 F • CPU 1505SP (T)F • CPU 1507S F • CPU 1508S F

A5E35635424-AG, 11/2018

Campos de aplicación

Los principales campos de aplicación de las CPU F S7-1200/1500 son la protección de personas y máquinas así como el control de quemadores. Además del programa de seguridad, también se pueden programar aplicaciones estándar.

Las CPU F S7-1200/1500 se pueden utilizar en modo de seguridad o en modo estándar.

Para el modo de seguridad es necesario que esté instalado el paquete opcional *STEP 7 Safety*. Si no está instalado el paquete opcional *STEP 7 Safety*, puede utilizar las CPU F S7-1200/1500 en modo estándar. En el modo estándar, las CPU F S7-1200/1500 se comportan como CPU estándar S7-1200/1500.

Encontrará información sobre el uso de las CPU F S7-1200/1500 en modo de seguridad en el manual de programación y de manejo "SIMATIC Safety: Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)" (en inglés).

Encontrará información sobre el uso de las CPU F S7-1200 en modo estándar en el manual de sistema "Sistema de automatización S7-1200 (https://support.industry.siemens.com/cs/ww/es/view/109478121)".

Encontrará información sobre el uso de las CPU F S7-1500 en modo estándar en los respectivos manuales de producto de las CPU estándar S7-1500 y CPU T estándar S7-1500, en los enlaces siguientes:

- CPU 151x (http://support.automation.siemens.com/WW/view/es/67295862/133300)
- CPU 151xT (https://support.industry.siemens.com/cs/ww/es/ps/22057/man)
- CPU 151xSP (http://support.automation.siemens.com/WW/view/es/90466439/133300)
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/es/ps/13906/man)
- Controladores por software S7-1500 (http://support.automation.siemens.com/WW/view/es/109740725)

Encontrará el firmware actual para la CPU en cuestión si busca descargas con la referencia correspondiente en el Industry Online Support (https://support.industry.siemens.com).

Nota

Tenga en cuenta los requisitos específicos de la aplicación, p. ej., en lo que respecta al tiempo de regulación por pérdida de alimentación en el caso de fuentes de alimentación o generadores de alta tensión.

Valores PFD_{avg}, PFH para CPU F

A continuación se ofrecen los valores de probabilidad de fallo (valores PFD_{avg}, PFH) para las CPU antes mencionadas con una vida útil de 20 años y un tiempo de reparación de 100 horas:

Funcionamiento en modo de baja demanda low demand mode **según IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Funcionamiento en modo de demanda alta o continua** high demand/continuous mode **según IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09

Comparativa de la memoria de trabajo de las CPU F frente a la de las CPU estándar

CPU	Memoria de trabajo	CPU F	Memoria de trabajo
CPU 1212C DC/DC/DC CPU 1212C DC/DC/Rly	75 kbytes	CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly	100 kbytes
CPU 1214C DC/DC/DC CPU 1214C DC/DC/Rly	100 kbytes	CPU 1214FC DC/DC/DC CPU 1214FC DC/DC/Rly	125 kbytes
CPU 1215C DC/DC/DC CPU 1215C DC/DC/Rly	125 kbytes	CPU 1215FC DC/DC/DC CPU 1215FC DC/DC/Rly	150 kbytes
CPU 1511-1 PN	150 kbytes	CPU 1511F-1 PN	225 kbytes
CPU 1511T-1 PN	225 kbytes	CPU 1511TF-1 PN	225 kbytes
CPU 1513-1 PN	300 kbytes	CPU 1513F-1 PN	450 kbytes
CPU 1515-1 PN	500 kbytes	CPU 1515F-1 PN	750 kbytes
CPU 1515T-1 PN	750 kbytes	CPU 1515TF-1 PN	750 kbytes

CPU	Memoria de trabajo	CPU F	Memoria de trabajo
CPU 1516-3 PN/DP	1 Mbyte	CPU 1516F-3 PN/DP	1,5 Mbytes
CPU 1516T-3 PN/DP	1,5 Mbytes	CPU 1516TF-3 PN/DP	1,5 Mbytes
CPU 1517-3 PN/DP	2 Mbytes	CPU 1517F-3 PN/DP	3 Mbytes
CPU 1517T-3 PN/DP	3 Mbytes	CPU 1517TF-3 PN/DP	3 Mbytes
CPU 1518-4 PN/DP (MFP/ODK)	4 Mbytes	CPU 1518F-4 PN/DP (MFP/ODK)	6 Mbytes
CPU 1510SP-1 PN	100 kbytes	CPU 1510SP F-1 PN	150 kbytes
CPU 1512SP-1 PN	200 kbytes	CPU 1512SP F-1 PN	300 kbytes
CPU 1516pro-2 PN	1 Mbyte	CPU 1516proF-2 PN	1,5 Mbytes
CPU 1505SP (T)	1 Mbyte	CPU 1505SP (T)F	1,5 Mbytes
CPU 1507S	5 Mbytes	CPU 1507S F	7,5 Mbytes
CPU 1508S	10 Mbytes	CPU 1508S F	12,5 Mbytes

Soporte de PROFIsafe V2

Las interfaces que soportan PROFINET IO también soportan PROFIsafe V2.

Restricción con las instrucciones "CREAT_DB" y "DELETE_DB"

Los bloques de datos F no se pueden crear ni eliminar.

Restricción con las instrucciones "READ_DBL" y "WRIT_DBL"

La dirección de destino no debe apuntar a un bloque de datos F.

Restricción en la configuración del comportamiento remanente de bloques de datos

No se puede configurar la remanencia de bloques de datos F. Esto significa que en caso de Power Off/On y rearranque (STOP-RUN) de la CPU F, los valores actuales de los bloques de datos F no son remanentes. Los bloques de datos F contienen los valores iniciales de la memoria de carga.

La casilla de verificación "Remanencia" de los bloques de datos F se visualiza en gris para todas las variables.

Control de configuración (configuración futura) en una CPU F S7-1200

El control de configuración (configuración futura) en una CPU F S7-1200 se puede realizar con módulos centrales con la siguiente restricción:

- Los módulos de seguridad S7-1200 no puede cambiarse y deben estar siempre físicamente enchufados en el slot que tienen configurado.

Coloque los módulos de seguridad S7-1200 directamente junto a la CPU F. Coloque los módulos estándar a la derecha de los módulos de seguridad S7-1200.

Procedimiento para cargar una configuración para firmware < V2.0 en CPU F S7-1500

Si ha cargado en una CPU F S7-1500 una configuración para el firmware V2.0 o sup. con el nivel de protección configurado "Acceso completo incl. de seguridad (sin protección)" y ahora quiere cargar una configuración para firmware <= V1.8 en esta CPU F, deberá tener en cuenta lo siguiente:

Cuando se carga la configuración con firmware <= V1.8 en la CPU F la contraseña se consulta y se reconoce como no válida.

Para solucionarlo, formatee la SIMATIC Memory Card como se describe en la ayuda en pantalla de STEP 7, en "Formatear una S7-1500 Memory Card". A continuación puede cargar la configuración para firmware <= V1.8 en la CPU F.

Uso de OB (de seguridad) de alarma de sincronismo

El número de OB (de seguridad) de sincronismo depende de la CPU de seguridad utilizada. Encontrará información al respecto en los datos técnicos de la CPU.

Si la suma de los OB de sincronismo y del OB F de sincronismo excede el número indicado en los datos técnicos de la CPU, ya no será posible cargar el programa de usuario estándar en RUN.

Display (en CPU F S7-1500 con display o panel)

Las CPU F S7-1500 con display muestran lo siguiente en el menú "Vista general", bajo "Seguridad":

- Modo de seguridad activado/desactivado
- Firma general F
- Última modificación de seguridad
- La versión de *STEP 7 Safety* con la que se ha compilado el programa de seguridad.
- Información sobre los grupos de ejecución F
  - Nombre del grupo de ejecución F
  - Firma del grupo de ejecución F
  - Tiempo de ciclo actual
  - Tiempo de ciclo máx.
  - Tiempo de ejecución actual
  - Tiempo de ejecución máx.

Para cada periferia F, en "Parámetros de seguridad" se muestra lo siguiente:

- Firma de parámetros F (con dirección)
- Modo de seguridad
- Tiempo de vigilancia F
- Dirección de origen F
- Dirección de destino F

En el menú "Ajustes", dentro de "Protección", se muestra la siguiente opción de menú adicional:

- Habilitar/bloquear contraseña F

No está permitido el acceso de escritura a los bloques F.

Nota

El control de entradas y salidas de seguridad puede producir un STOP de la CPU F.

Nota

Con el firmware V2.5 del display, tras cargar los cambios en el programa no se actualiza durante algunos pocos minutos el display y no puede manejarse, seguidamente se reinicia el display.

Servidor web

Las CPU S7-1200/1500 muestran lo siguiente en la página de inicio del servidor web:

- Modo de seguridad activado/desactivado
- Firma general F
- Última modificación de seguridad
- La versión de *STEP 7 Safety* con la que se ha compilado el programa de seguridad.
- Información sobre los grupos de ejecución F
  - Nombre del grupo de ejecución F
  - Firma del grupo de ejecución F
  - Tiempo de ciclo actual
  - Tiempo de ciclo máx.
  - Tiempo de ejecución actual
  - Tiempo de ejecución máx.

Para cada periferia F, la página web "Información del módulo" muestra lo siguiente en la pestaña "Fail-safe":

- Firma de parámetros F (con dirección)
- Modo de seguridad
- Tiempo de vigilancia F
- Dirección de origen F
- Dirección de destino F

No está permitido el acceso de escritura a los bloques F.

Nota

El control de entradas y salidas de seguridad puede producir un STOP de la CPU F.

Los puntos siguientes afectan al controlador por software S7-1500 F

El controlador por software S7-1500 F Software Controller es una CPU por software de seguridad que se utiliza en los siguientes equipos:

Controladores por software S7-1500 F	Equipo
CPU 1505SP (T)F	• CPU 1515SP PC
CPU 1507S F	• IPC 2x7E* • IPC 4x7D* • IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**
CPU 1508S F	• IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**

* Posible solo si se dispone de NVRAM (se asigna de forma automática)

** Solo puede utilizarse con interfaz PROFINET y PROFIBUS y, si hay NVRAM (se asigna de forma automática)

Los equipos indicados en la tabla anterior reaccionan de forma segura cuando se utiliza el controlador por software S7-1500 F Software Controller y *STEP 7 Safety* incluso bajo fuertes perturbaciones electromagnéticas. Así pues, para estos equipos no son necesarios ensayos de tipo especiales por lo que respecta a la seguridad funcional, a diferencia de lo que ocurre con la periferia F. Sin embargo, en lo que se refiere a la disponibilidad de los requisitos específicos de las aplicaciones deben tenerse en cuenta especialmente las normas sobre control de quemadores.

La etiqueta adhesiva amarilla con el sello TÜV SÜD de seguridad funcional que se incluye en el paquete de suministro está prevista exclusivamente para el uso con los controladores por software S7-1500 F (no se incluye en la versión de descarga). Puede emplear la etiqueta para marcar el hardware en el que se ha instalado el controlador por software S7-1500 F. Si desinstala el controlador por software S7-1500 F Software Controller, deberá retirar la etiqueta.

Copia de seguridad y restauración

No se soporta la copia de seguridad y restauración de datos de proyecto.

Contraseñas para niveles de protección

La estación PC no hace distinción entre las dos contraseñas de los niveles de protección "Acceso completo incl. de seguridad (sin protección)" y "Acceso completo (sin protección)". El controlador por software S7-1500 F sí hace distinción entre las dos contraseñas de los niveles de protección "Acceso completo incl. de seguridad (sin protección)" y "Acceso completo (sin protección)".

Instrucción ENDIS_PW

En caso de utilizar la instrucción ENDIS_PW en un IPC puede verse bloqueado por parte del sistema porque un IPC no dispone de selector de modo. Para solucionarlo puede proceder de forma análoga a como se indica en el apartado "Impedir el bloqueo no intencionado en una CPU S7-1200" de la ayuda en pantalla para la instrucción ENDIS_PW.

Para las estaciones de PC hasta la versión V2.0 vale lo siguiente: Si se ha producido un bloqueo no intencionado, solo puede anular el bloqueo desinstalando e instalando de nuevo el controlador por software S7-1500 F.

Para la estación de PC a partir de la versión V2.1 vale lo siguiente: Los miembros del grupo de usuarios de Windows "Failsafe Operators" pueden omitir el bloqueo con la función "Delete Configuration".

Nota

El usuario de Windows "Cualquiera" no se tiene en cuanta si forma parte del grupo de usuarios de Windows "Failsafe Operators".

Funcionalidad TPM

La funcionalidad TPM no puede utilizarse para el controlador por software S7-1500 F porque podría dar lugar a un STOP.

Uso de EWF o UWF y el EWF o UWF-Manager

No está permitido seleccionar el EWF o UWF y el EWF o UWF Manager para el volumen de la CPU.

Otras particularidades

⚠ ADVERTENCIA
Debe utilizar una protección de acceso para limitar el acceso al controlador por software S7-1500 F a aquellas personas autorizadas para instalar o desinstalar el software del controlador por software S7-1500 F.

Nota

En un controlador por software S7-1500 F con una estación PC hasta la versión V2.1, la función "Delete Configuration" solo estará disponible en el panel de la estación PC si en la CPU F no se ha configurado ninguna protección de acceso (sin protección).

En una estación PC a partir de la versión V2.2 se comprueba si el usuario de Windows es miembro del grupo de usuarios de Windows "Failsafe Operators". Si el usuario de Windows registrado es miembro del grupo, puede ejecutar la función "Delete Configuration" incluso si se ha definido la contraseña F. Si el usuario de Windows que ha iniciado sesión no es miembro del grupo, la estación PC se comportará como hasta la versión V2.1.

Nota

Si el controlador por software S7-1500 F dispone de protección de acceso, esta no se borra con "Delete Configuration", sino que se mantiene.

Nota

Versión necesaria de la BIOS para CPU 1505SP F anterior a la versión V2.5

Para el uso de la CPU 1505SP F se necesita la versión BIOS V2.00_02.01 o superior.

Nota

El ciclo de la CPU no se puede modificar en RUN, ya que provocaría un STOP. Puede evitarlo desactivando la función de ahorro de energía.

Nota

Asignación de las direcciones PROFIsafe para módulos F conectados a PROFIBUS en IPC con controladores por software S7-1500 F anteriores a la versión V2.5

Si desea asignar direcciones PROFIsafe a módulos F conectados mediante PROFIBUS a un IPC con un controlador por software S7-1500 F, asigne las direcciones PROFIsafe a los módulos F y a continuación realice un Power Off/On de la estación PROFIBUS.

Nota

Cargar el programa de seguridad o activar el modo de seguridad para controladores por software S7-1500 F anteriores a la versión V2.5

Después de cargar el programa de seguridad o de activar el modo de seguridad, cierre el panel y ábralo de nuevo para que se actualice la imagen en el panel.

Nota

Si en S7-1500 F Software Controller con versión 2.0 se actualiza a una versión > 2.0 y este controlador ya contiene un programa de seguridad, el valor "Última modificación de seguridad" se ajustará a la hora de la instalación.

Nota

La funcionalidad "Archivo de configuración exportación" requiere el paquete opcional *STEP 7 Safety* a partir de la versión V15 y un controlador por software S7-1500 F a partir de la versión V2.5.

Informazioni sul prodotto

Indicazioni di sicurezza

Siemens commercializza prodotti e soluzioni dotati di funzioni Industrial Security che contribuiscono al funzionamento sicuro di impianti, soluzioni, macchine e reti.

La protezione di impianti, sistemi, macchine e reti da minacce cibernetiche, richiede l'implementazione e la gestione continua di un concetto globale di Industrial Security che corrisponda allo stato attuale della tecnica. I prodotti e le soluzioni Siemens costituiscono parte integrante di questo concetto.

E' responsabilità dei clienti prevenire accessi non autorizzati ai propri impianti, sistemi, macchine e reti. Tali sistemi, macchine e componenti dovrebbero essere connessi unicamente a una rete aziendale o a internet se e nella misura in cui detta connessione sia necessaria e solo quando siano attive appropriate misure di sicurezza (ad es. firewall e segmentazione della rete).

Per ulteriori informazioni relative a misure di Industrial Security implementabili potete visitare il sito (https://www.siemens.com/industrialsecurity).

I prodotti e le soluzioni Siemens vengono costantemente perfezionati per incrementarne la sicurezza. Siemens raccomanda espressamente che gli aggiornamenti dei prodotti siano effettuati non appena disponibili e che siano utilizzate le versioni più aggiornate. L'utilizzo di versioni di prodotti non più supportate ed il mancato aggiornamento degli stessi incrementa il rischio di attacchi cibernetici.

Per essere informati sugli update dei prodotti, potete iscrivervi a Siemens Industrial Security RSS Feed al sito (https://www.siemens.com/industrialsecurity).

Contenuto

Introduzione

Le presenti Informazioni sul prodotto contengono importanti avvertenze sulle CPU F trattate al paragrafo Ambito di validità. Le informazioni sul prodotto sono parte integrante del prodotto oggetto della fornitura e hanno, in caso di dubbio, priorità su qualsiasi altra affermazione.

Ambito di validità

Le affermazioni contenute nella presente informazioni sul prodotto hanno validità per le CPU F elencate nel seguito:

CPU F S7-1200	CPU F S7-1500		
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1511(T)F-1 PN • CPU 1513F-1 PN • CPU 1515(T)F-2 PN • CPU 1516(T)F-3 PN/DP • CPU 1517(T)F-3 PN/DP • CPU 1518F-4 PN/DP • CPU 1518F-4 PN/DP (MFP/ODK)	• CPU 1510SP F-1 PN • CPU 1512SP F-1 PN • CPU 1516proF-2 PN	S7-1500 F Software Controller • CPU 1505SP (T)F • CPU 1507S F • CPU 1508S F

Campi di impiego

I principali campi di impiego delle CPU F S7-1200/1500 consistono nella protezione del personale e delle macchine nonché nel comando di bruciatori. Oltre al programma di sicurezza si possono programmare anche applicazioni standard.

Le CPU F S7-1200/1500 possono essere impiegate sia nel funzionamento di sicurezza, sia nel funzionamento standard.

Per il funzionamento di sicurezza è richiesta l'installazione del pacchetto opzionale *STEP 7 Safety*. In assenza del pacchetto opzionale *STEP 7 Safety* installato, le CPU F S7-1200/1500 possono essere impiegate nel funzionamento standard. Nel funzionamento standard le CPU F S7-1200/1500 si comportano come le CPU S7-1200/1500.

Informazioni sull'impiego delle CPU F S7-1200/1500 nel funzionamento di sicurezza sono reperibili nel Manuale di programmazione e d'uso SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)

Informazioni sull'impiego delle CPU F S7-1200 nel funzionamento standard sono reperibili nel Manuale di sistema "Sistema di automazione S7-1200 (https://support.industry.siemens.com/cs/ww/it/view/109478121)".

Informazioni sull'impiego delle CPU F S7-1500 nel funzionamento standard sono reperibili nei rispettivi manuali del prodotto delle CPU standard S7-1500 e delle T-CPU standard S7-1500 accessibili dai seguenti link:

- CPU 151x (http://support.automation.siemens.com/WW/view/it/67295862/133300)
- CPU 151xT (https://support.industry.siemens.com/cs/ww/it/ps/22057/man)
- CPU 151xSP (http://support.automation.siemens.com/WW/view/fr/90466439/133300)
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/it/ps/13906/man)
- S7-1500 Software Controller (http://support.automation.siemens.com/WW/view/it/109740725)

La ricerca dei firmware aggiornati, disponibili per il download, delle rispettive CPU F, avviene alla sezione Industy Online Support (https://support.industry.siemens.com) indicando il numero dell'articolo interessato.

Nota

Osservare i requisiti specifici dell'applicazione per quanto concerne ad es. il superamento di cadute di rete negli alimentatori o nelle apparecchiature di rete.

Valori PFD_{avg} e PFH nelle CPU F

Nel seguito sono riportati i valori inerenti le probabilità di guasto (valori PFD_{avg} e PFH) per le CPU F sopra indicate, riferiti ad una durata di utilizzo ventennale e a interventi di riparazione pari a 100 ore:

Funzionamento a bassa richiesta della funzione di sicurezza low demand mode **ai sensi della Norma IEC 61508:2010:** PFD_{avg} = Average probability of a dangerous failure on demand	**Funzionamento ad alta richiesta o modalità continua** high demand/continuous mode **ai sensi della Norma IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09

Confronto della memoria di lavoro delle CPU F rispetto alle CPU standard.

CPU	Memoria di lavoro	CPU F	Memoria di lavoro
CPU 1212C DC/DC/DC CPU 1212C DC/DC/Rly	75 kbyte	CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly	100 kbyte

CPU 1508S	10 Mbyte	CPU 1508S F	12,5 Mbyte

Supporto di PROFIsafe V2

Le interfacce che supportano PROFINET IO supportano anche PROFIsafe V2.

Limitazione per le istruzioni "CREAT_DB" e "DELETE_DB"

I DB F non possono essere creati né cancellati.

Limitazione per le istruzioni "READ_DBL" e "WRIT_DBL"

L'indirizzo di destinazione non può puntare a un DB F.

Limitazione per la progettazione del comportamento di ritenzione dei blocchi dati

La progettazione della ritenzione dei blocchi dati non è supportata per i DB F. In altri termini, in caso di RETE OFF/ON e nuovo avvio (STOP-RUN) della CPU F, i valori attuali dei DB F non sono a ritenzione. I DB F ricevono i valori iniziali dalla memoria di caricamento.

Nei DB F la casella di controllo "Ritenzione" è grigia per tutte le variabili.

Controllo di configurazione (ampliamenti futuri) in una CPU F S7-1200

Il controllo di configurazione (ampliamenti futuri) nelle CPU F S7-1200 con moduli centrali può essere effettuato con le seguenti limitazioni:

- I moduli fail safe S7-1200 non devono essere scambiati e devono essere sempre fisicamente inseriti nel posto connettore appositamente previsto.

Collocare i moduli fail safe S7-1200 direttamente a fianco della CPU F. Collocare i moduli standard a destra accanto ai moduli fail safe S7-1200.

Procedura di caricamento delle progettazione del firmare < V2.0 per le CPU F S7-1500

Se una CPU F S7-1500 è stata caricata con una progettazione per firmware a partire da V2.0, con livello di protezione "Accesso completo incl. fail safe (senza protezione)", e successivamente, nella stessa CPU, si intende caricare una nuova progettazione per firmware <= V1.8, osservare quanto segue:

La password richiesta ed inserita al momento del caricamento della progettazione con firmware <= V1.8, nella CPU F, viene segnalata come non valida.

Per ovviare a quest'inconveniente formattare la SIMATIC Memory Card come descritto nella Guida in linea a STEP 7, alla sezione "Formattazione di una S7-1500-Memory Card". In seguito è possibile caricare la progettazione per il firmware <= V1.8 nella CPU F.

Impiego di OB (F): Allarme di sincronismo di clock

Il numero degli OB (F) utilizzabili dipende dalla CPU F impiegata. Per informazioni sull'argomento consultare i dati tecnici della CPU.

Se la somma degli OB di allarme di sincronismo di clock e degli OB F di allarme di sincronismo di clock supera il numero indicato nei dati tecnici della CPU, non sarà più possibile caricare in RUN il programma utente standard.

Display (nelle CPU F S7-1500 con display o pannello operatore)

Nel menu "Sommario" delle CPU F S7-1500 con display, alla voce "Fail safe", viene visualizzato quanto segue:

- Funzionamento di sicurezza attivato/disattivato
- Codice generale F
- Ultima modifica fail-safe
- La versione con *STEP 7 Safety*, con la quale è stato compilato il programma di sicurezza.
- Informazioni sui gruppo di esecuzione F
  - Nome del gruppo di esecuzione F
  - Firma dei gruppi di esecuzione F
  - Tempo di ciclo attuale
  - Tempo di ciclo max.
  - Tempo di esecuzione attuale
  - Tempo di esecuzione max.

Alla voce "Parametri fail-safe" viene visualizzato quanto segue per ogni periferia F:

- Codice parametri F (con indirizzo)
- Funzionamento di sicurezza
- Tempo di controllo F
- Indirizzo di origine F
- Indirizzo di destinazione F

Inoltre, nel menu "Impostazioni", alla voce "Protezione", viene visualizzata la seguente voce di menu:

- Abilita/inibisci password F

L'accesso in scrittura ai blocchi F non è consentito.

Nota

Il comando di ingressi e uscite fail-safe può causare uno STOP della CPU F.

Nota

Con il firmare del display V2.5, dopo il caricamento delle modifiche del programma il display non viene aggiornato per alcuni minuti e non può essere utilizzato. Successivamente viene riavviato.

Server web

Sulla pagina iniziale del server web delle CPU F S7-1200/1500 è visualizzato quanto segue:

- Funzionamento di sicurezza attivato/disattivato
- Codice generale F
- Ultima modifica fail-safe
- La versione con *STEP 7 Safety*, con la quale è stato compilato il programma di sicurezza.
- Informazioni sui gruppo di esecuzione F
  - Nome del gruppo di esecuzione F
  - Firma dei gruppi di esecuzione F
  - Tempo di ciclo attuale
  - Tempo di ciclo max.
  - Tempo di esecuzione attuale
  - Tempo di esecuzione max.

Sulla pagina web "Stato dell'unità", nella scheda "Fail safe", per ogni periferia F viene visualizzato quanto segue:

- Codice parametri F (con indirizzo)
- Funzionamento di sicurezza
- Tempo di controllo F
- Indirizzo di origine F
- Indirizzo di destinazione F

L'accesso in scrittura ai blocchi F non è consentito.

Nota

Il comando di ingressi e uscite fail-safe può causare uno STOP della CPU F.

I punti elencati nel seguito interessano l'S7-1500 F Software Controller

L'S7-1500 F Software Controller è una CPU software fail safe che trova impiego nei seguenti dispositivi:

S7-1500 F Software Controller	Dispositivo
CPU 1505SP (T)F	• CPU 1515SP PC
CPU 1507S F	• IPC 2x7E* • IPC 4x7D* • IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**
CPU 1508S F	• IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**

* Impiegabile soltanto con disponibilità NVRAM (assegnazione automatica)

* Impiegabile soltanto con interfaccia PROFIBUS o PROFINET e con disponibilità NVRAM (assegnazione automatica)

Con l'impiego dell'S7-1500 F Software Controller e di *STEP 7 Safety*, i dispositivi elencati nella tabella in alto mantengono il comportamento fail safe anche in presenza di elevati disturbi elettromagnetici. Controlli specifici del tipo relativi alla sicurezza funzionale, quali quelli eseguiti nella periferia F, si rendono superflui per questi dispositivi. Per quanto concerne la disponibilità, tenere presente i requisiti specifici dell'applicazione, in particolare le norme sul controllo dei bruciatori.

L'adesivo giallo in dotazione con la fornitura, con il marchio di controllo TÜV SÜD della sicurezza funzionale, è destinato esclusivamente all'S7-1500 F Software Controller (non contenuto nella fornitura della versione di download). L'adesivo può essere utilizzato per l'identificazione dell'hardware sul quale è stato installato l'S7-1500 F Software Controller. In caso di disinstallazione dell'S7-1500 F Software Controller, l'adesivo deve essere rimosso.

Backup e ripristino

Il backup e il ripristino dei dati del progetto non vengono supportati.

Password per i livelli di protezione

La stazione PC opera una distinzione tra le password dei due livelli di protezione "Accesso completo incl. fail safe (senza protezione)" e "Accesso completo (senza protezione)". L'S7-1500 F Software Controller opera una distinzione tra le password dei due livelli di protezione "Accesso completo incl. fail safe (senza protezione)" e "Accesso completo (senza protezione)".

Istruzione ENDIS_PW

Con l'impiego dell'istruzione ENDIS_PW sull'IPC, sussiste il rischio di bloccare il proprio accesso al sistema in quando l'IPC non è provvisto di selettore dei modi operativi. Per evitare quest'inconveniente, procedere come indicato nella Guida in linea all'istruzione ENDIS_PW, alla sezione "Prevenzione del blocco indesiderato nelle CPU S7-1200".

Per stazioni PC fino alla versione V2.0 compresa, vale: La rimozione di un eventuale blocco accidentale che si sia verificato, è possibile soltanto disinstallando e reinstallando l'S7-1500 F Software Controller.

Per la stazione PC a partire dalla V2.1 vale: I membri del gruppo utenti di Windows "Failsafe Operators" possono fare uso della funzione "Delete Configuration" ed evitare il blocco.

Nota

L’utente di Windows "Everyone" non viene considerato se fa parte del gruppo utenti di Windows "Failsafe Operators".

Funzionalità TPM

L'uso della a funzionalità TPM non è consentito per l'S7-1500 F Software Controller in quanto può causare uno STOP.

Utilizzo di EWF o UWF ed EWF o Manager UWF

L'EWF o UWF e il Manager EWF o UWF non possono essere selezionati per il volume della CPU.

Ulteriori particolarità

⚠ AVVERTENZA
L'accesso all'S7-1500 F Software Controller deve essere riservato, tramite protezione di accesso, esclusivamente al personale autorizzato all'installazione e alla disinstallazione del relativo software.

Nota

La funzione "Delete Configuration" viene visualizzata sul pannello della stazione PC dell'S7-1500 F Software Controller con una stazione PC con versione V2.1 compresa soltanto se nella CPU F non è stata configurata una protezione di accesso (senza protezione).

Nella stazione PC con versione V2.2 o successiva viene controllato se l'utente Windows è membro del gruppo di utenti Windows "Failsafe Operators". Se l'utente Windows che ha effettuato il login è membro del gruppo, è autorizzato a eseguire la funzione "Delete Configuration" anche se è impostata la password F. Se l'utente Windows non è membro del gruppo la stazione PC si comporta come prima della versione V2.1.

Nota

Se l'S7-1500 F Software Controller è protetto in accesso, non è eliminabile con la funzione "Delete Configuration" e viene mantenuto.

Nota

Versioni del BIOS richieste per la CPU 1505SP F inferiori alla V2.5

L'impiego della CPU 1505SP F presuppone la disponibilità della versione V2.00_02.01 o superiore del BIOS.

Nota

Il clock della CPU non deve subire variazioni durante il funzionamento in RUN in quanto ciò potrebbe causare uno STOP. Per prevenire questo comportamento, disattivare la funzione di risparmio energetico.

Nota

Assegnazione degli indirizzi PROFIsafe ai moduli F sul PROFIBUS negli IPC con software controller S7-1500 F inferiori alla V2.5

Dopo l'assegnazione di indirizzi PROFIsafe ai moduli F operanti, tramite PROFIBUS, su un IPC con un S7-1500 F Software Controller, eseguire un Rete off/Rete on della stazione PROFIBUS.

Nota

Caricamento del programma di sicurezza e/o attivazione del funzionamento di sicurezza per software controller S7-1500 F inferiori alla V2.5

Chiudere e riaprire il pannello operatore dopo il caricamento del programma di sicurezza risp. dopo l'attivazione del funzionamento di sicurezza per aggiornare la visualizzazione del pannello.

Nota

Se l'S7-1500 F Software Controller con versione 2.0 viene aggiornato alla versione > 2.0 e contiene già un programma di sicurezza, il valore di "Ultima modifica fail safe" viene resettato e impostato sul valore valido al momento dell'installazione.

Nota

La funzionalità "Esporta file di configurazione" richiede il pacchetto opzionale *STEP 7 Safety* a partire dalla versione V15 e un software controller S7-1500 F dalla versione V2.5.

产品信息

安全信息

Siemens 为其产品及解决方案提供了工业安全功能，以支持工厂、系统、机器和网络的安全运行。

为了防止工厂、系统、机器和网络受到网络攻击，需要实施并持续维护先进且全面的工业安全保护机制。Siemens 的产品和解决方案仅构成此类概念的其中一个要素

客户负责防止其工厂、系统、机器和网络受到未经授权的访问。只有在必要时并采取适当安全措施（例如，使用防火墙和/或网络分段）的情况下，才能将系统、机器和组件连接到企业网络或 Internet。

关于可采取的工业信息安全措施的更多信息，请访问 (https://www.siemens.com/industrialsecurity)。

西门子不断对产品和解决方案进行开发和完善以提高安全性。Siemens 强烈建议您及时更新产品并始终使用最新产品版本。如果所用的产品版本不再支持，或未更新到到最新版本，则会增加客户遭受网络攻击的风险。

要及时了解有关产品更新的信息，请订阅西门子的工业信息安全 RSS 新闻推送，请访问 (https://www.siemens.com/industrialsecurity)

内容

简介

本产品信息中包含“适用范围”章节中所列 F-CPU 的重要信息。该产品信息随附产品一同提供。任何不确定之处，应以本产品信息中的内容为准。

适用范围

本产品信息中的说明适用于以下所列 F-CPU 型号：

S7-1200 F-CPU	S7-1500 F-CPU		
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1511(T)F-1 PN • CPU 1513F-1 PN • CPU 1515(T)F-2 PN • CPU 1516(T)F-3 PN/DP • CPU 1517(T)F-3 PN/DP • CPU 1518F-4 PN/DP • CPU 1518F-4 PN/DP (MFP/ODK)	• CPU 1510SP F-1 PN • CPU 1512SP F-1 PN • CPU 1516proF-2 PN	S7-1500 F 软件控制器 • CPU 1505SP (T)F • CPU 1507S F • CPU 1508S F

A5E35635424-AG, 11/2018

应用领域

S7-1200/1500 F-CPU 主要适用于人机安全和燃烧器控制的应用领域。除了安全程序之外，也可对标准应用程序进行编程。

S7-1200/1500 F-CPU 可在安全模式下运行，也可在标准模式下运行。

运行在安全模式时，需安装 *STEP 7 Safety* 选件包。如果未安装 *STEP 7 Safety* 选件包，则 S7-1200/S7-1500 F-CPU 只能运行在标准模式下。在标准模式中，S7-1200/1500 F-CPU 的特性与 S7-1200/1500 标准 CPU 的类似。

有关在安全模式下操作 S7-1200/1500 F-CPU 的更多信息，请参见编程和操作手册《SIMATIC 安全 - 组态和编程 (http://support.automation.siemens.com/WW/view/en/54110126)》。

有关在标准模式下操作 S7-1200 F-CPU 的更多信息，请参见《S7-1200 可编程控制器 (https://support.industry.siemens.com/cs/ww/cn/view/109478121)》系统手册。

有关在标准模式下使用 S7-1500 F-CPU 的更多信息，请参见下列链接中 S7-1500 和标准 T-CPU S7-1500 的相关手册：

- CPU 151x (http://support.automation.siemens.com/WW/view/zh/67295862/133300)
- CPUs 151xT (https://support.industry.siemens.com/cs/ww/zh/ps/22057/man)
- CPU 151xSP (http://support.automation.siemens.com/WW/view/zh/90466439/133300)
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/zh/ps/13906/man)
- S7-1500 软件控制器 (http://support.automation.siemens.com/WW/view/zh/109740725)

通过在“工业在线支持 (https://support.industry.siemens.com)”网站中输入相应的文章编号，可搜索到相应 F-CPU 的最新固件文件并进行下载。

说明

取决于应用中的特定要求，如电源/电源组的电源缓冲。

F-CPU 的 PFD_{avg} 和 PFH 值

下面根据请求值给出了上述的使用寿命为 20 年且 MTTR 为 100 小时的 F-CPU 的故障发生率（PFD_{avg} 和 PFH 值）：

低请求模式下的操作 low demand mode **符合 IEC 61508:2010：** PFD_{avg} = Average probability of a dangerous failure on demand	**高请求或持续模式下的操作** high demand/continuous mode **符合 IEC 61508:2010：** PFH = Average frequency of a dangerous failure [h^{-1}]
< 2E-05	< 1E-09

F-CPU 与标准 CPU 的工作存储器对比概述

CPU	工作存储器	F-CPU	工作存储器
CPU 1212C DC/DC/DC CPU 1212C DC/DC/Rly	75 KB	CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly	100 KB
CPU 1214C DC/DC/DC CPU 1214C DC/DC/Rly	100 KB	CPU 1214FC DC/DC/DC CPU 1214FC DC/DC/Rly	125 KB
CPU 1215C DC/DC/DC CPU 1215C DC/DC/Rly	125 KB	CPU 1215FC DC/DC/DC CPU 1215FC DC/DC/Rly	150 KB

CPU 1517-3 PN/DP	2 MB	CPU 1517F-3 PN/DP	3 MB
CPU 1517T-3 PN/DP	3 MB	CPU 1517TF-3 PN/DP	3 MB

CPU	工作存储器	F-CPU	工作存储器
CPU 1518-4 PN/DP (MFP/ODK)	4 MB	CPU 1518F-4 PN/DP (MFP/ODK)	6 MB
CPU 1510SP-1 PN	100 KB	CPU 1510SP F-1 PN	150 KB
CPU 1512SP-1 PN	200 KB	CPU 1512SP F-1 PN	300 KB
CPU 1516pro-2 PN	1 MB	CPU 1516proF-2 PN	1.5 MB
CPU 1505SP (T)	1 MB	CPU 1505SP (T)F	1.5 MB
CPU 1507S	5 MB	CPU 1507S F	7.5 MB
CPU 1508S	10 MB	CPU 1508S F	12.5 MB

PROFIsafe V2 的支持

支持 PROFINET IO 的接口也支持 PROFIsafe V2。

“CREAT_DB”和“DELETE_DB”指令的使用限制

F-DB 既不能创建也不能删除。

“READ_DBL”和“WRIT_DBL”指令的使用限制

目标地址不能指向 F-DB。

组态数据块保持特性时的限制

F-DB 不支持组态数据块的保持性。这意味着，在 F-CPU 电源关闭/打开和重启 (STOP-RUN) 时，F-DB 的实际值不会被保留。F-DB 中将保留装载存储器中的初始值。

在 F-DB 中，所有变量的“保持性”(Retain) 复选框均为灰显。

S7-1200 F-CPU 的组态控制（选件处理）

S7-1200 F-CPU 上的组态控制可通过中央模块实现，但具有以下条件限制：

- 故障安全 S7-1200 模块无法交换并且必须始终插在为其组态的插槽中。

故障安全 S7-1200 模块需紧挨着 F-CPU 插入，而标准模块需插入在故障安全 S7-1200 模块的右侧。

S7-1500 F-CPU 固件版本 V2.0 及以下版本中组态加载的操作过程

如果 S7-1500 F-CPU 加载有固件版本 V2.0 及以上版本且所组态的保护等级为“完全访问，含故障安全（无保护）”(Full access with fail-safe (no protection)) 的组态，同时还希望为该 F-CPU 加载固件版本 V1.8 及以下版本的组态，则需注意以下事项：

将固件版本 V1.8 及以下版本的组态加载到 F-CPU 中时，系统将提示用户输入密码并将所输入的密码将标识为无效。

为了进行补救，可按照 STEP 7 在线帮助中“格式化 S7-1500 存储卡”部分内的说明信息，对 SIMATIC 存储卡进行格式化。之后，F-CPU 即可加载固件版本 V1.8 及以下版本的组态。

使用等时同步模式中断 (F-)OB

等时同步模式中断 (F-)OB 的数量取决于所用的 F-CPU。具体信息，请参见 CPU 的技术规范。

如果等时同步模式中断 OB 与等时同步模式中断 F-OB 的总数量大于 CPU 技术规范中所指定的数量，则在 RUN 模式下无法再加载标准用户程序。

显示屏（S7-1500 F-CPU 带显示屏或面板）

在“总览”(Overview) 菜单中的“故障安全”(Fail-safe) 内，将显示 S7-1500 F-CPU（带显示屏）的以下信息：

- 激活/取消激活安全模式 (Safety mode activated/deactivated)
- 集体 F 签名 (Collective F-signature)
- 上一次故障安全更改 (Last fail-safe change)
- 编译安全程序时的 *STEP 7 Safety* 版本。
- F 运行组的信息
  - F 运行组的名称 (Name of F-runtime group)
  - F 运行组签名
  - 当前循环时间 (Max. cycle time)
  - 最大循环时间 (Max. cycle time)
  - 当前运行时间 (Current runtime)
  - 最长运行时间 (Max. runtime)

在“故障安全参数”(Fail-safe parameters) 中，将显示每个 F-I/O 的以下信息：

- F 参数签名（带地址）(F-parameter signature (with addresses))
- 安全模式 (Safety mode)
- F 监视时间 (F-monitoring time)
- F 源地址 (F-source address)
- F 目标地址 (F-destination address)

在“设置”(Settings) 菜单的“保护”(Protection) 下，将显示以下附加菜单命令：

- 启用/禁用 F 密码 (Enable/disable F-password)

不允许对 F 块进行写访问。

说明

控制故障安全输入/输出会将 F-CPU 设置为 STOP。

说明

显示屏固件版本为 V2.5 时，加载程序更新后数分钟内，屏幕不刷新也无法操作。之后，显示屏重新启动。

Web 服务器

在 Web 服务器的起始页面中，将显示 S7-1200/1500 F-CPU 的以下信息：

- 激活/取消激活安全模式 (Safety mode activated/deactivated)
- 集体 F 签名 (Collective F-signature)
- 上一次故障安全更改 (Last fail-safe change)
- 编译安全程序时的 *STEP 7 Safety* 版本。
- F 运行组的信息
  - F 运行组的名称 (Name of F-runtime group)
  - F 运行组签名
  - 当前循环时间 (Max. cycle time)
  - 最大循环时间 (Max. cycle time)
  - 当前运行时间 (Current runtime)
  - 最长运行时间 (Max. runtime)

在“模块信息”(Module information) Web 页面的“故障安全”(Fail-safe) 选项卡中，将显示每个 F-I/O 的以下信息：

- F 参数签名（带地址）(F-parameter signature (with addresses))
- 安全模式 (Safety mode)
- F 监视时间 (F-monitoring time)
- F 源地址 (F-source address)
- F 目标地址 (F-destination address)

不允许对 F 块进行写访问。

说明

控制故障安全输入/输出会将 F-CPU 设置为 STOP。

下列信息与 S7-1500 F 软件控制器相关

S7-1500 F 软件控制器是用于下列设备的故障安全软件 CPU。

S7-1500 F 软件控制器	设备
CPU 1505SP (T)F	• CPU 1515SP PC
CPU 1507S F	• IPC 2x7E* • IPC 4x7D* • IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**
CPU 1508S F	• IPC 4x7E* • IPC 627D** • IPC 677D** • IPC 827D**

* 仅能在存在 NVRAM 时使用（自动分配）

** 仅能在存在 NVRAM 时才可以与 PROFIBUS 或 PROFINET 接口结合使用（自动分配）

在上表中指定的设备在使用 S7-1500 F 软件控制器和 *STEP 7 Safety* 时将以故障安全方法进行响应，甚至在高电磁干扰条件下也采用这种响应方式。因此，这些设备不需要功能安全的特殊类型测试 - 与 F I/O 相反。然而，就可用性而言，必须遵守应用特定的要求，尤其是燃烧器控制的标准。

带有功能安全 TÜV SÜD 测试标记的黄色不干胶标签包含在供货范围内，专用于与 S7-1500 F 软件控制器结合使用（不包含在产品包的下载版本中）。可用此不干胶标签来标记安装有 S7-1500 F 软件控制器的硬件。在卸载 S7-1500 F 软件控制器时必须移除该不干胶标签。

备份与恢复

不支持项目数据的备份与恢复。

保护等级的密码

PC 站不会区分“故障安全完全访问（无保护）”和“完全访问（无保护）”这两个保护等级的密码。S7-1500 F 软件控制器会区分“故障安全完全访问（无保护）”和“完全访问（无保护）”这两个保护等级的密码。

ENDIS_PW 指令

当对 IPC 使用 ENDIS_PW 指令时，由于 IPC 没有模式选择器，因此系统可能会锁定。作为补救，可以采用与“防止 S7-1200 CPU 的意外锁定”下的 ENDIS_PW 指令在线帮助中所述步骤类似的步骤。

以下内容适用于 V2.0 及以下版本的 PC 站：如果发生意外锁定，仅可以通过卸载并安装 S7-1500 F 软件控制器来进行补救。

以下内容适用于 V2.1 及以上版本的 PC 站：Windows“故障安全操作员”用户组成员可以使用“删除组态”(Delete Configuration) 功能跳过锁定。

说明

即使 Windows 用户“Everyone”包含在“Failsafe Operators”Windows 用户组中，也不具有上述功能。

TPM 功能

TPM 功能无法应用于 S7-1500 F 软件控制器，因为这可能会导致 STOP 状态。

使用 EWF 或 UWF 和 EWF 或 UWF 管理器

使用 EWF 或 UWF 以及 EWF 或 UWF 管理器，无法对 CPU 卷进行管理。

其它特性

⚠ **警告**
必须通过访问保护将 S7-1500 F 软件控制器的访问权限限制为有权安装或卸载 S7-1500 F 软件控制器的软件的人员。

说明

使用带有 PC 站 V2.1 及以下版本的 S7-1500 F 软件控制器时，仅当 F-CPU 中未设置访问保护（无保护）时，PC 站的面板中才能使用“删除组态”(Delete Configuration) 功能。

使用 PC 站 V2.2 及以上版本时，系统将检查 Windows 用户是否为 Windows 用户组“故障安全操作员”(Failsafe Operators) 的组成员。如果登录的 Windows 用户为该组成员，即使设置了 F 密码，也可执行“删除组态”(Delete Configuration) 功能。如果登录的 Windows 用户不在该组中，则该 PC 站仅支持版本 V2.1 及以下版本的功能。

说明

如果 S7-1500 F 软件控制器设置了访问保护，则无法使用“删除组态”功能进行删除，组态将保留不变。

说明

CPU 1505SP F V2.5 以下版本所需的 BIOS 版本

若要使用 CPU 1505SP F，需要 BIOS V2.00_02.01 或更高版本。

说明

处于 RUN 状态时不得修改 CPU 时钟，因为这会导致进入 STOP 状态。可通过禁用节能功能防止这种情况事件发生。

说明

使用 S7-1500 F 软件控制器 V2.5 以下版本通过 IPC 的 PROFIBUS 为 F 模块分配 PROFIsafe 地址

如果想要使用 S7-1500 F 软件控制器为通过 IPC 的 PROFIBUS 操作的 F 模块分配 PROFIsafe 地址，将 PROFIsafe 地址分配给 F 模块，然后执行 PROFIBUS 站通电和断电。

说明

为 S7-1500 F 软件控制器 V2.5 以下版本加载安全程序或激活安全模式

加载安全程序或激活安全模式后，关闭面板并随后重新将其打开以更新面板上的显示屏。

说明

如果将 S7-1500 F 软件控制器 V2.0 的版本升级为 V2.0 以上版本，且 S7-1500 F 软件控制器上安装有安全程序，则“上一次故障安全更改”(Last fail-safe change) 值将设置为该程序的安装时间。

说明

“组态文件导出”(Configuration file export) 功能需要 *STEP 7 Safety* 附加包 V15 及以上版本和 S7-1500 F 软件控制器 V2.5 以下版本。

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

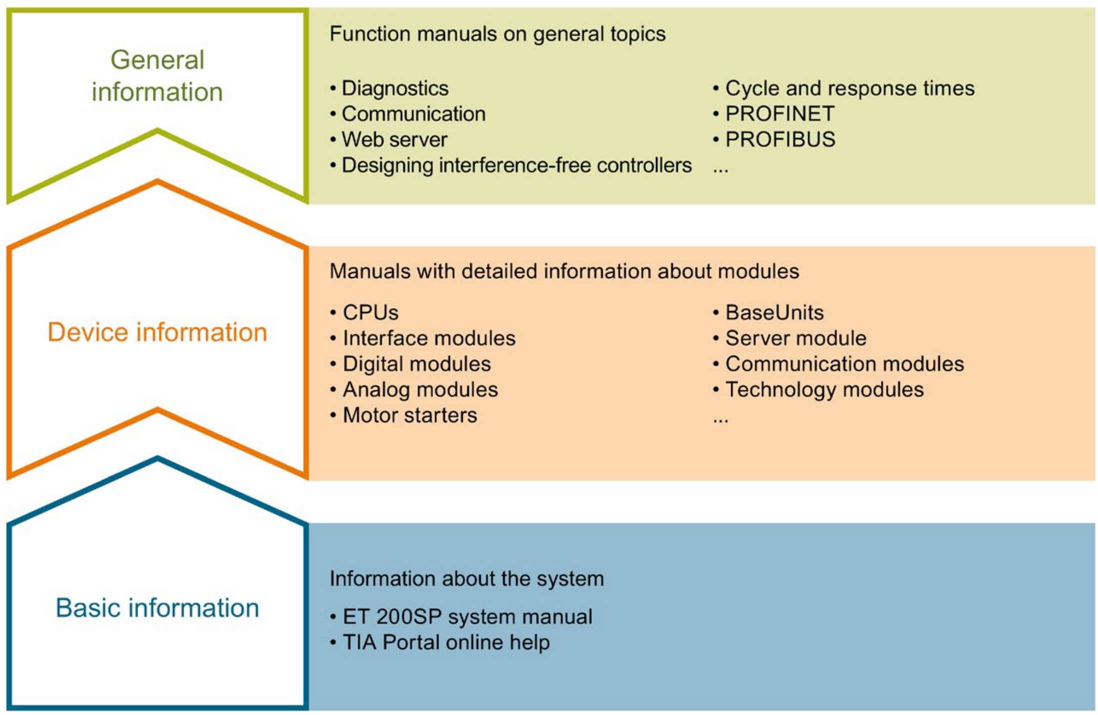
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

2

2.1 Properties

Article number

6ES7155-6BA01-0CN0

Article number 6ES7155-6BA01-0CN0 contains the following components:

- Interface module IM 155-6 DP HF (6ES7155-6BU01-0CN0)
- Server module (6ES7193-6PA00-0AA0)
- PROFIBUS FastConnect bus connector (6ES7972-0BB70-0XA0)

View of the module

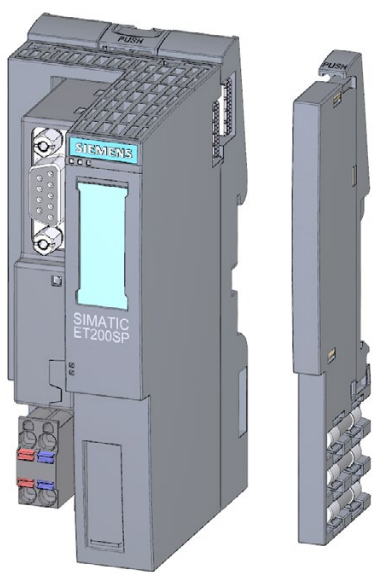


Figure 2-1 View of the 155-6 DP HF interface module with supplied accessories

Properties

The module has the following technical properties:

- Connects the ET 200SP distributed I/O system with PROFIBUS DP
- Power supply 1 L+ 24 V DC (SELV/PELV)
- Bus connection via RS485 interface

The module supports the following functions (Page 14):

Maximum configuration

- 244 bytes I/O data
- 32 I/O modules and 16 ET 200AL modules

Accessories

You order the following accessories separately:

- Labeling strips
- Reference identification label

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Server module

The server module is included in the product package of the interface module and available separately as an accessory.

The server module has the following properties:

- Terminates the backplane bus of the ET 200SP distributed I/O system
- Features a support for 3 spare fuses (5 × 20 mm)
- Provides station functions, e.g., status bytes
- Identification data I&M 0 to 3

Note

You need to configure the server module in the configuration software.

To do so, place the server module with the required length of status bytes at the last slot of the configuration. When there are 32 I/O modules, the server module is inserted at slot 33.

PROFIBUS FastConnect bus connector

The PROFIBUS FastConnect bus connector is included in the product package of the interface module and also available separately as an accessory.

You can find additional information on the PROFIBUS FastConnect bus connector in the corresponding product information on the Internet (http://support.automation.siemens.com/WW/view/en/58648998).

Configuration with more than 244 bytes of parameter data

With a configuration as of STEP 7 V5.5 SP 3 with HSP 242, you have the option of operating the IM 155-6 DP HF interface module as of 6ES7155-6BA00-0CN0 in DPV1 mode with more than 244 bytes of parameter data. Configuration with the GSD file does not offer this option.

Reference

You can find additional information on identification data in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2 Functions

2.2.1 Functions

Introduction

The interface module supports the following functions:

- Identification data I&M 0 to 3
- PROFIBUS DP
- Firmware update via PROFIBUS DP
- Configuration control by means of the user program
- Operation as DPV1 slave
- Operation after Y-link (not with F-modules)
- Station extension via ET-Connection
- F-direct data exchange

Requirements

The table below shows the software requirements for a configuration with the IM 155-6 DP HF interface module:

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of	Configuration software		
			Configuration with GSD file (http://support.automation.siemens.com/WW/view/en/19698639/130000) / software from a third-party manufacturer[1]	STEP 7 as of V5.5 SP3 with HSP0242	STEP 7 (TIA Portal) as of V13
Operation after Y-link (not with F-modules)	1	V1.1.0	X	-	-
Hot-swapping	1	V1.0.0	X	X	X
Station extension via ET-Connection	1	V3.0.0	X	X (as of HSP0242 V2)	-
F-direct data exchange	1	V3.1.0	-	X (as of HSP0242 V3)	-
Interface module; article number: 6ES7155-6BA01-0CN0	1	V4.2	-	X [2]	X (as of V15.1)

1 Systems of third-party manufacturers: Depending on the range of functions of the third-party system

2 Configure the module as version 6ES7155-6BA00-0CN0 FW V3.1 (as of HSP0242 V3)

2.2.2 Configuration control

Properties

Configuration control allows you to prepare your distributed I/O system for future extensions or options. Configuration control means that you can configure the planned maximum configuration of your distributed I/O system in advance and vary it later in a flexible manner by means of the user program.

Reference

You can find more information on configuration control

- in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual
- on the Internet under the following link: Application collection (http://support.automation.siemens.com/WW/view/en/29430270)
- in the STEP 7 online help.

Connecting 3

3.1 Terminal assignment

24 V DC supply voltage

The table below shows the signal names and descriptions of the pin assignment of the 24 V DC supply voltage.

Table 3- 1 Pin assignment 24 V DC supply voltage

View		Signal name1)	Description
Connector	IM connection		
		1L+	24 V DC
		2L+	24 V DC (for looping through)2
		1M	Ground
		2M	Ground (for looping through)2

1 1L+ and 2L+ as well as 1M and 2M are internally bridged.

2 Maximum 10 A permitted.

PROFIBUS DP with RS485 interface

The following table shows the signal names and descriptions of the terminal assignment of the PROFIBUS DP interface.

Table 3- 2 Terminal assignment PROFIBUS DP with RS485 interface

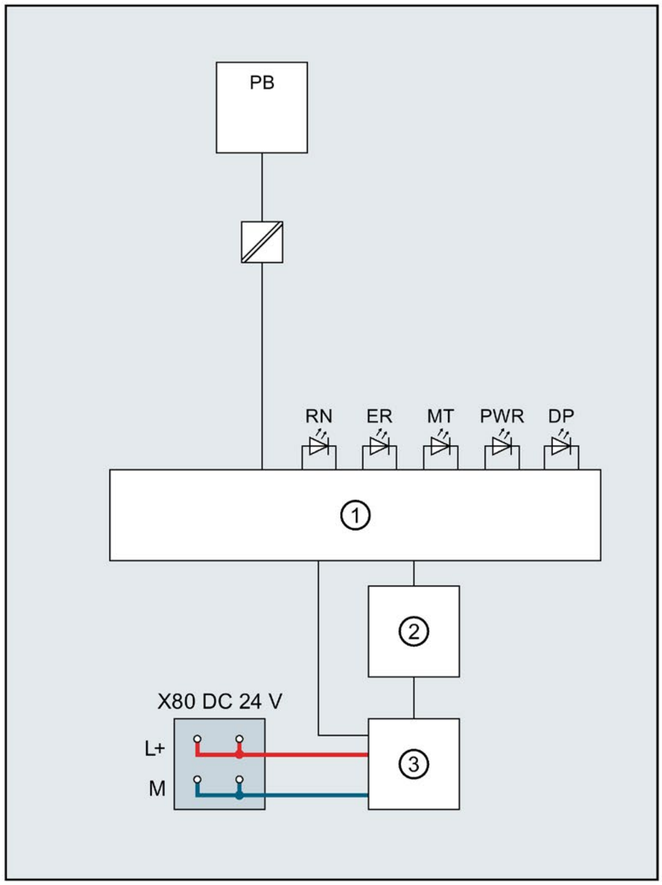
View	Signal name		Description
	1	-	-
	2	-	-
	3	RxD/TxD-P	Data line B
	4	RTS	Request To Send
	5	M5V2	DP data reference potential (from station)
	6	P5V2	Supply plus (from station)
	7	-	-
	8	RxD/TxD-N	Data line A
	9	-	-

Reference

You can find additional information on connecting the interface module and on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Block diagram

The following figure show the block diagram of the IM 155-6 DP HF interface module.



①	ET 200SP backplane bus interface and electronics	L+	24 V DC supply voltage
②	Backplane bus	M	Ground
③	Internal power supply	RN	RUN/STOP LED (green)
X80 24 V DC	Feed supply voltage	ER	ERROR LED (red)
PB	PROFIBUS interface	MT	MAINT LED (yellow)
		PWR	POWER LED (green)
		DP	PROFIBUS DP LED (green)

Figure 3-1 Block diagram of the IM 155-6 DP HF interface module

3.3 Setting the PROFIBUS DP address

Introduction

On the interface module (PROFIBUS), set the PROFIBUS DP address for PROFIBUS DP using the DIP switch. By setting the PROFIBUS DP address, you specify where the ET 200SP is to be addressed on the PROFIBUS DP.

Requirements

- Each PROFIBUS DP address may be assigned only once on the PROFIBUS DP.
- Valid PROFIBUS DP addresses are 1 to 125.
- The set PROFIBUS DP address must match the PROFIBUS DP address specified for the ET 200SP in the configuration software.

Required tools

Screwdriver 3 - 3.5 mm

Setting the PROFIBUS DP address

1. Slide the window of the interface module upwards.
2. Use a screwdriver to set the required PROFIBUS address via the DIP switch.
3. Close the window.

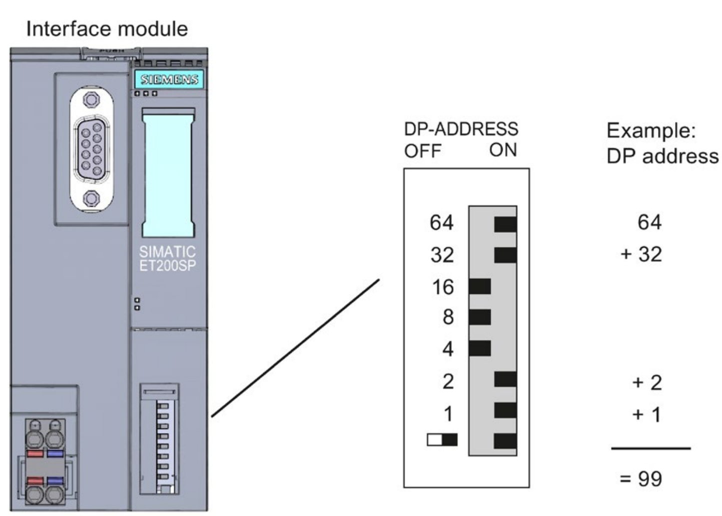


Figure 3-2 Setting the PROFIBUS DP address

Changing the PROFIBUS DP address

You can change the PROFIBUS DP address in exactly the same way as you set it. **A change in the PROFIBUS DP address only becomes valid for the ET 200SP** after a POWER ON of the interface module.

Parameters/address space 4

4.1 Parameters

Parameters for IM 155-6 DP HF interface module

The following table shows the parameters for the IM 155-6 DP HF interface module.

Table 4- 1 Parameters for IM 155-6 DP HF interface module (GSD file)

Parameters	Value range	Default[3]	Effective range
Configuration control [1]	Disable/enable	Disable	ET 200SP
Startup when preset/actual configura-tion differ	Yes/No	No	ET 200SP
Diagnostics interrupt	Yes/No	Yes	ET 200SP
Hardware interrupt	Yes/No	Yes	ET 200SP
Pull/plug module interrupt[2]	Yes/No	No	ET 200SP

[1] Note that the "Startup if preset configuration does not match actual configuration" parameter is always activated when you use configuration control.

[2] The “Pull/plug” parameter is always activated in the GSD file.

[3] The defaults apply to the default startup. If no other parameters are specified by the DP master, the IM 155-6 DP HF starts up with these parameters.

Note

Only for configuration using the PROFIBUS GSD file, does not affect configuration with STEP 7 via HSP:

Not all parameters of an I/O module are provided by the GSD file with GSD configuration, because the PROFIBUS standard limits the number of parameters to 244 bytes per ET 200SP. These parameters can be configured later using data record 128, if necessary. The description is available in the respective manual of the employed I/O module.

Note

PROFIBUS GSD configuration as of STEP 7 V5.5 SP3

The universal module must not be configured.

4.2 Description of parameters

4.2.1 Configuration control

You can use this parameter to enable the configuration control function in the ET 200SP distributed I/O system.

Note

Configuration control

The "Configuration control" function can only be used if you set the parameter "Startup if preset configuration does not match actual configuration" to yes at the same time.

Note

Configuring the enable

If you configure the enable, the ET 200SP distributed I/O system requires control data record 196 from the user program so that the ET 200SP distributed I/O system can operate the I/O modules.

Reference

You can find additional information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and in the STEP 7 online help.

4.2.2 Startup when expected/actual config differ

If the parameter is enabled and

- modules are removed and inserted during operation, this does not lead to a station failure of the ET 200SP distributed I/O system.
- If the preset configuration does not match the actual configuration, the ET 200SP distributed I/O system continues to exchange data with the DP master.

If the parameter is disabled and

- modules are removed and inserted during operation, this leads to a station failure of the ET 200SP distributed I/O system.
- If the preset configuration does not match the actual configuration, data exchange does not take place between the DP master and the ET 200SP distributed I/O system.

4.2.3 Diagnostic interrupt

You can use this parameter to enable or disable diagnostic interrupts.

4.2.4 Hardware interrupt

You can use this parameter to enable or disable hardware interrupts.

4.2.5 Insert/remove module interrupt

You can use this parameter to enable or disable insert/remove module interrupts.

4.3 Substitute value behavior

The substitute value behavior is implemented by the DP master per slot in the ET 200SP distributed I/O system.

The respective output reacts according to its configured substitute value behavior:

- Current-free/voltage-free
- Keep last value
- Output substitute value

The substitute value behavior is triggered in the following cases:

- STOP DP master
- DP master failure (connection interruption)
- Firmware update
- Station stop, for example, due to:
  - No server module
  - At least one I/O module installed on an incorrect BaseUnit
- Deactivate DP slave

Note

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the new configuration to the CPU, the modules no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage on the BaseUnit BU...D or on the interface module is switched off.

The "current-free/voltage-free" behavior takes effect in the following cases:

- Firmware update
- Configuration control: receipt of a new control data record
- Incorrectly configured module
- Module with incorrect parameter assignment

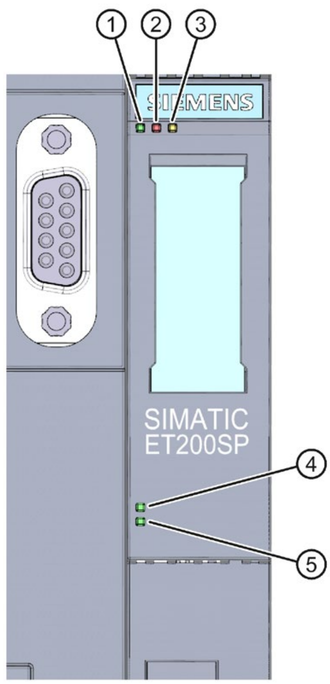
Interrupts, error messages, diagnostics and system alarms

5

5.1 Status and error displays

LED displays

The figure below shows the LED display on the interface module:



①	RN (green)
②	ER (red)
③	MT (yellow)
④	DP (green)
⑤	PWR (green)

Figure 5-1 LED displays on the interface module

Meaning of the LED displays

The following tables contain the meaning of the status and error displays.

RN/ER/MT LEDs on the interface module

Table 5- 1 Status and error displays of RN/ER/MT LEDs

LEDs			Meaning	Remedy
RN (RUN)	ER (ERROR)	MT (MAINT)		
Off	Off	Off	No or too little supply voltage at interface module	Check the supply voltage or switch it on at the interface module.[1]
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-
Flashes	Off	Off	Interface module is deactivated.	Activate the interface module with the configuration software or the user program.
			Interface module is not configured.	Configure the interface module with the configuration software.
			ET 200SP starts up.	-
			ET 200SP is being assigned parameters.	
On	Not relevant	Not relevant	ET 200SP is currently exchanging data with the DP master.	-
Not relevant	Flashes	Not relevant	Group error and group error channels	Evaluate the diagnostics and eliminate the error.
			The preset configuration does not match the actual configuration of the ET 200SP.	Check the configuration of the ET 200SP to see whether a module is missing or faulty, or whether a non-configured module is inserted.
			Invalid configuration states	See the Invalid configuration states of the ET 200SP on PROFINET DP (Page 47) section.
			Parameter assignment error in the I/O module	Evaluate the display of the module status in STEP 7 and correct the error in the corresponding I/O module.
Not relevant	Not relevant	On	Maintenance is demanded.	Perform maintenance
Flashes	Flashes	Flashes	Hardware or firmware faulty.[2]	Run a firmware update. If the error persists, contact Siemens Industry Online Support. Replace the interface module.

[1] PWR LED On (on interface module): Check the backplane bus for a short-circuit.

[2] DP LED Off

PWR LED on the interface module

Table 5- 2 Status display of the PWR LED

PWR LED	Meaning	Remedy
□ Off	No or too little supply voltage	Check the supply voltage.
■ On	Supply voltage present	-

LED DP on the RS485 interface

Table 5- 3 Status display of the DP LED

LED DP	Meaning	Remedy
□ Off	There is no connection between the PROFIBUS interface of your PROFIBUS device and a communication partner (for example, DP master).	Check whether the bus cable to the DP master is broken.
■ On	There is a connection between the PROFIBUS interface of your PROFIBUS device and a communication partner (for example, DP master).	-

LED display of configuration errors

Configuration errors of the ET 200SP distributed I/O system are output on the interface module by the ERROR (red) and MAINT (yellow) LEDs.

The following configuration errors are signaled by the LEDs:

- No server module
- Interruptions or short-circuit on the backplane bus

Operating principle

The LED error display provides information on the cause of the error. After a notification by means of a flashing signal, the error type and then the error location/error code are displayed in each case.

The LED error display:

- Is activated during POWER ON and during operation
- Has priority over all other states that are displayed by means of the ERROR- and MAINT-LED
- Remains on until the cause of the error has been eliminated

Table 5- 4 Display of error type and error location

Sequence		Description
1	ERROR- and MAINT-LED flash 3x with 0.5 Hz	Indication of the error type
2	MAINT-LED flashes with 1 Hz	Display of error type (decimal)
3	ERROR- and MAINT-LED flash 3x with 2 Hz	Indication of error location/error code
4	ERROR-LED flashes with 1 Hz	Display of the tens position (decimal) of the error location/error code
5	MAINT-LED flashes with 1 Hz	Display of the units position (decimal) of the error location/error code
6	Repetition of 1 to 5 until the cause of the error has been eliminated.	

Error display

The following table shows the possible causes of error that can occur.

Table 5- 5 Error display

Error type (MAINT)	Error location (ERROR/MAINT)	Cause of error	Solution
1	33*	• No server module • Interruptions on the backplane bus • Short-circuit on the backplane bus	Check the configuration of the ET 200SP.

* Slot

Note

The following LEDs indicate a short-circuit in the backplane bus supply or in the bus connection supply:

- PWR-LED: On
- RN-, ER- and MT-LED: Off

5.2 Interrupts

5.2.1 Introduction

Definition

The interrupt section of the slave diagnostics indicates the interrupt type and the event that led to an interrupt being triggered. The interrupt section comprises 62 bytes including an interrupt header.

Position in the diagnostics frame

The interrupt section is located after the channel diagnostics.

Data record

The diagnostic data of a module are located in the data records 0 and 1:

- Data record 0 contains 4 bytes of diagnostics data that describe the current status of the distributed I/O system. DS0 is part of the header information of OB 82 (local data bytes 8 to 11).
- Data record 1 contains 4 bytes of diagnostics data that are also available in data record 0.

The figure below shows the structure of data record 1:

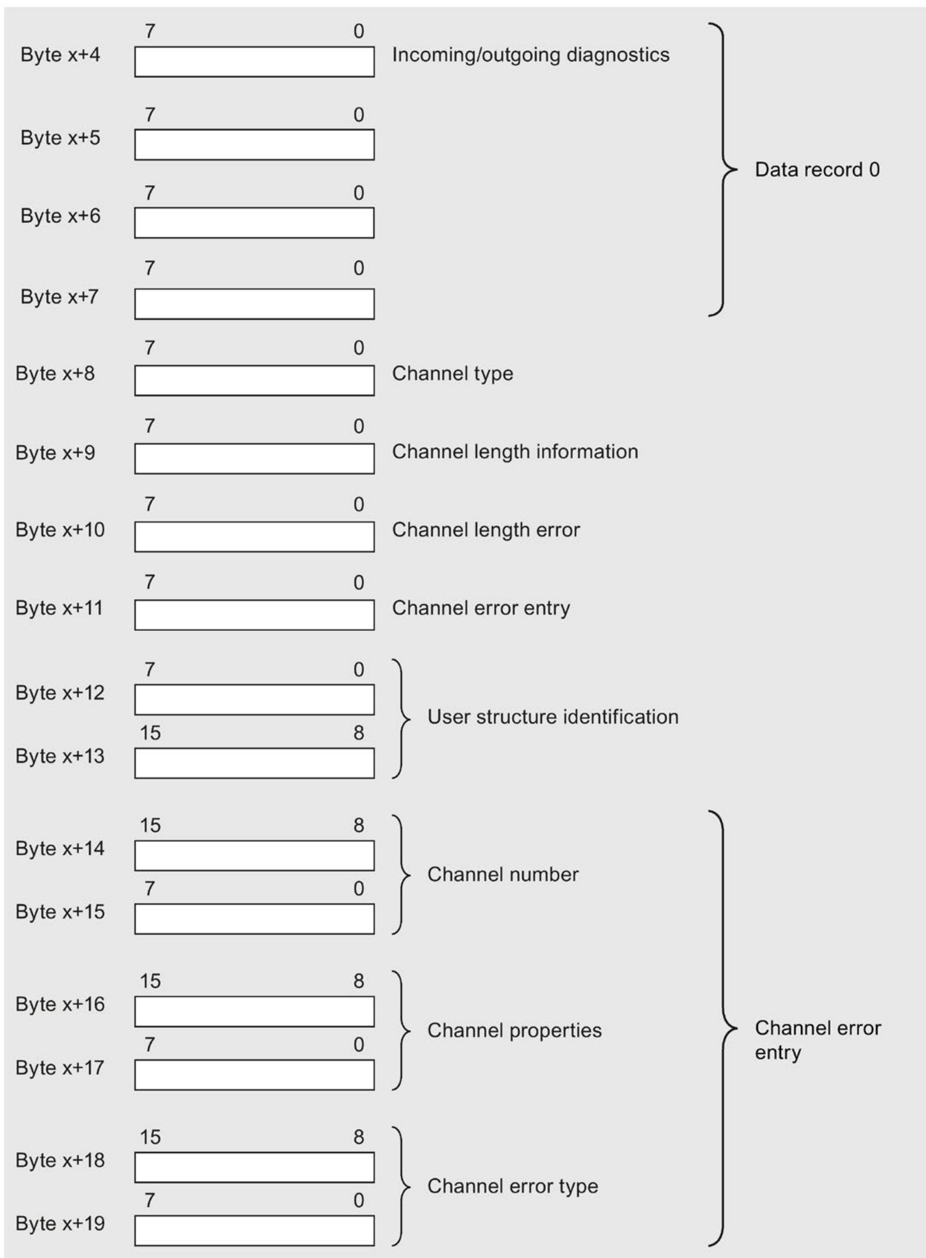


Figure 5-2 Structure of data record 1

Reading data records

DS0 and DS1 can be read with SFC 59 (RD_REC) or SFB 52 (RDREC). The data length of DS 1 can be up to 240 bytes. In this case, DS1 includes up to 38 channel error entries.

Note the figures below in this section.

Content

The contents of the interrupt information depend on the interrupt type:

- In the case of diagnostic interrupts, diagnostic data record 1 (up to 58 bytes) is sent as interrupt status information (starting from byte x+4).
- The length of the interrupt status information for hardware interrupts is 4 bytes.

Structure of interrupts

The figure below shows the structure of the interrupt section for the ET 200SP distributed I/O system:

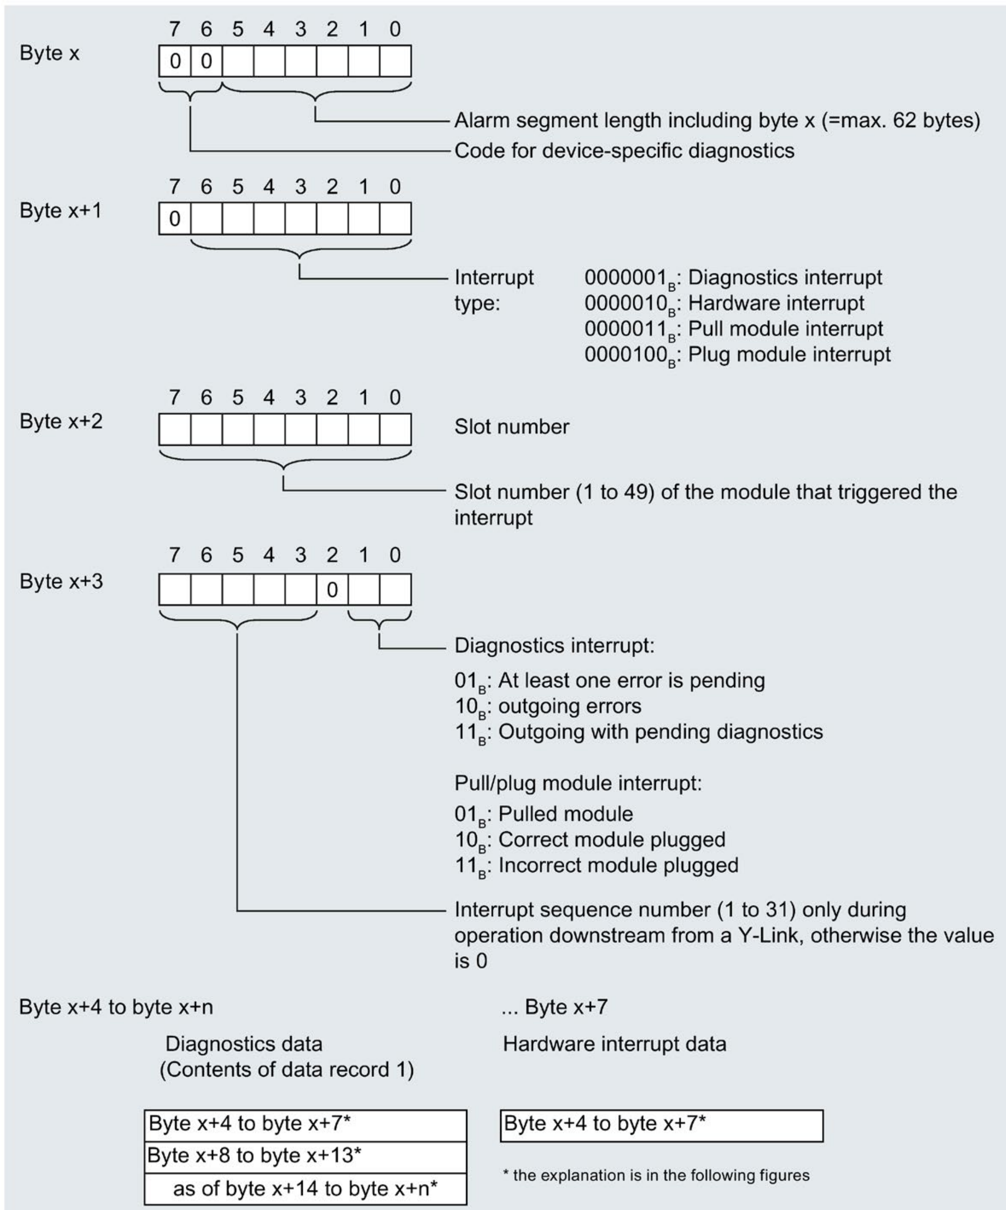

Figure 5-3 Structure of the interrupt status of the interrupt section

Diagnostic interrupt, byte x+4 to x+7

The figure below shows the structure starting at byte x+4 to x+7 for diagnostic interrupt:

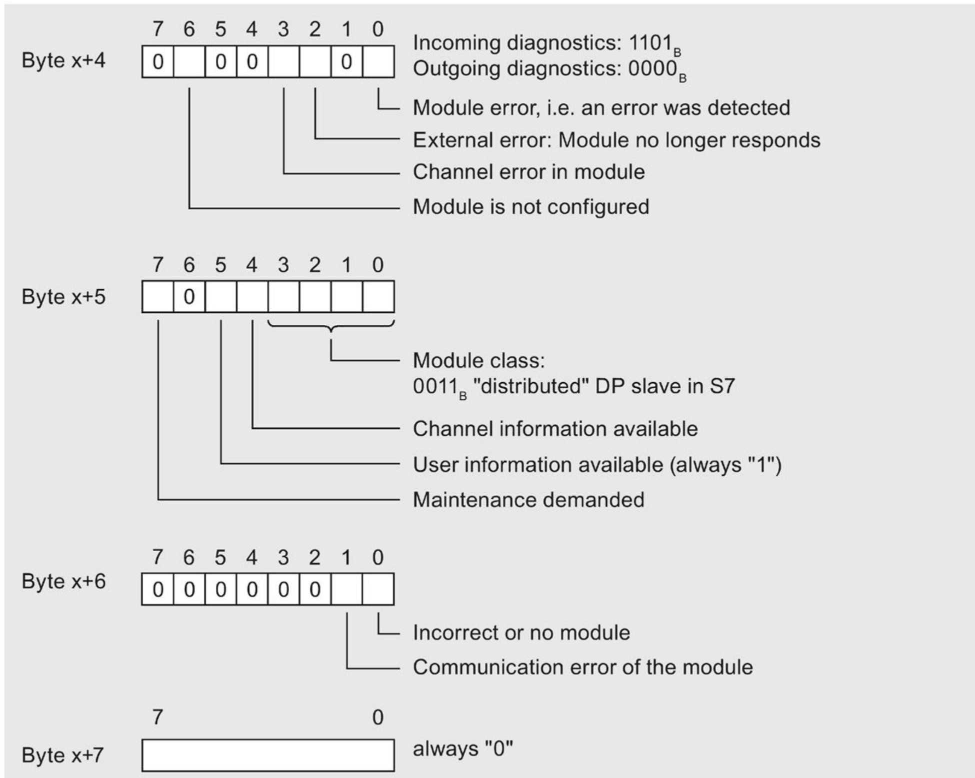

Figure 5-4 Structure of bytes x+4 to x+7 for diagnostic interrupt

Diagnostic interrupt from the modules, starting at byte x+8

The figure below shows the structure starting at byte x+8:

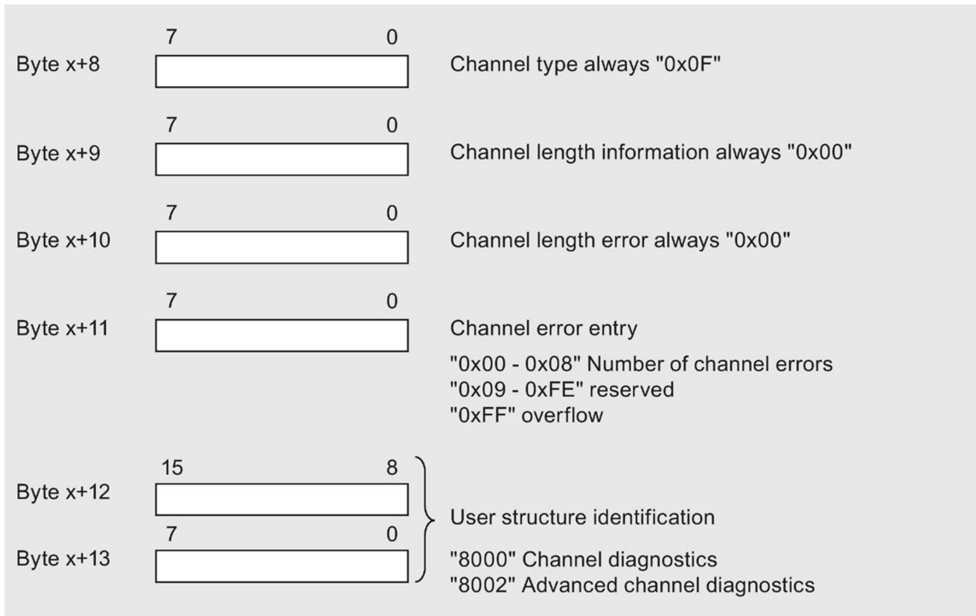

Figure 5-5 Structure starting at byte x+8

Diagnostic interrupt from the modules, starting at byte x+14

The channel error entries start from byte x+14. A channel error entry is 6 bytes long and can follow 8 times starting from byte x+14.

If you read the channel error entries using an SFB or SFC, 38 channel diagnostics are possible.

The figure below shows the structure starting at byte x+14:

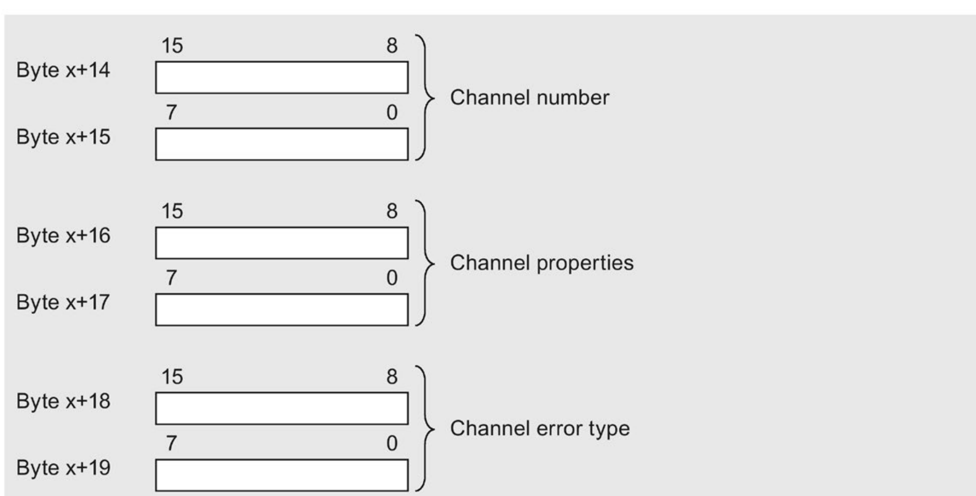

Figure 5-6 Structure starting from byte x+14

The following table is used to explain the channel error entries:

	Description	
Channel number	0 to 63: Channel number for channel error 0x8000: Entire submodule	
Channel properties	Bit 0 to 7	00_H: Free data type 01_H: bit 02_H: 2 bit 03_H: 4 bit 04_H: byte 05_H: word 06_H: Double word 07_H bis FF_H: Reserve
	Bit 8	0: Channel 1: Channel group
	Bit 9, 10	00_H: Diagnostics 01_H: Maintenance demanded 02_H: Maintenance required 03_H: Reserve
	Bit 11, 12	00_H: Channel error-free 01_H: Incoming diagnostics 02_H: Outgoing diagnostics 03_H: Outgoing diagnostics, but other diagnostics are also pending on this channel
	Bit 13 to 15	00_H: Reserve 01_H: Input channel 02_H: Output channel 03_H: Input/output channel
Channel error type	Refer to respective manual for explanation.	

Example of a diagnostic interrupt

The figure below shows an example of a diagnostic interrupt (part 1):

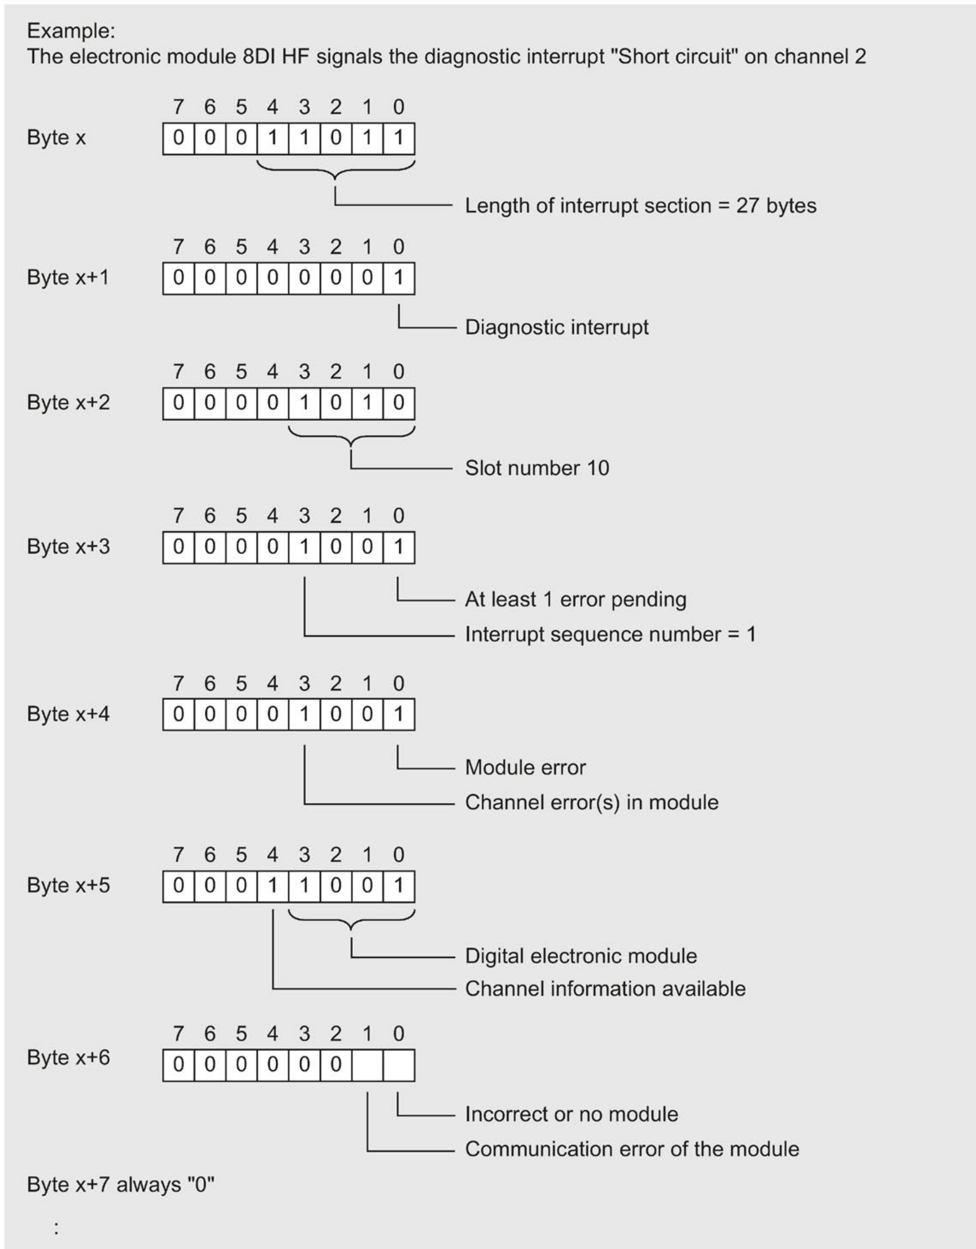

Figure 5-7 Example of a diagnostic interrupt (part 1)

The figure below shows an example of a diagnostic interrupt (part 2):

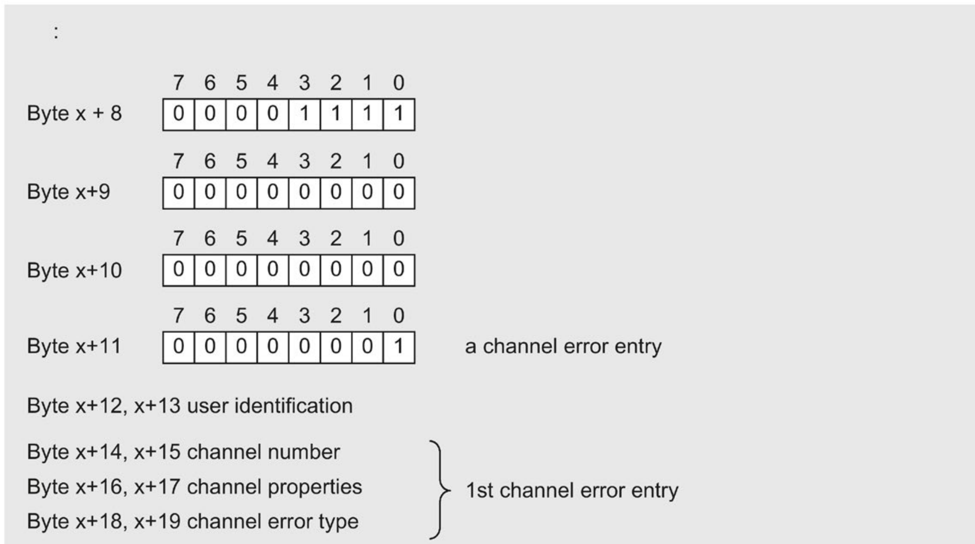

Figure 5-8 Example of a diagnostic interrupt (part 2)

Hardware interrupt of digital and analog input modules

The figure below shows the structure starting at byte x+4 for the hardware interrupt:

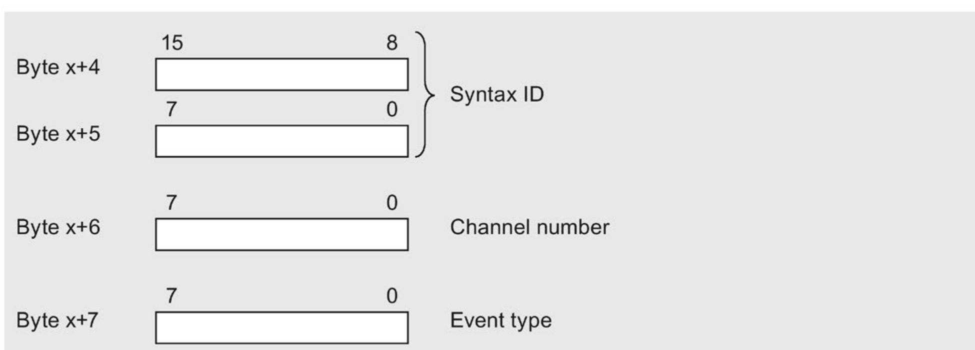

Figure 5-9 Structure starting at byte x+4 for hardware interrupt

5.2.2 Evaluating interrupts of ET 200SP

Introduction

With certain process statuses/errors, the DP slave in each case creates an interrupt block with the corresponding information in the diagnostics frame (DPV1 interrupt mechanism). Regardless of this, the diagnostic status of the DP slave is displayed in the identifier-related diagnostics, in the module status, and in the channel diagnostics.

Interrupts in DPV1 mode

The ET 200SP distributed I/O system supports the following interrupts:

- Diagnostic interrupts
- Hardware interrupts
- Insert/remove module interrupts

5.2.3 Triggering of a diagnostics interrupt

When an event comes or goes (e.g. wire break on a channel of an I/O module), the module triggers a diagnostics interrupt if "Enable: diagnostic interrupt" is set.

The CPU interrupts user program execution and processes the diagnostic interrupt OB (OB 82). The event that triggered the interrupt is entered in the start information of the diagnostic interrupt OB.

5.2.4 Triggering a hardware interrupt

When a hardware interrupt occurs, the CPU interrupts execution of the user program and processes the hardware interrupt OB, for example OB 40. The event that triggered the interrupt is entered in the start information of the hardware interrupt OB.

Note

Diagnostics "Hardware interrupt lost" (from I/O module)

Do not use hardware interrupts for technological purposes (e.g., cyclical generation of hardware interrupts).

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

5.2.5 Triggering an insert/remove module interrupt

When an insert/remove module interrupt occurs, the CPU interrupts execution of the user program and processes the insert/remove module interrupt OB (OB 83). The event that triggered the interrupt is entered in the start information of the insert/remove module interrupt OB.

5.3 Alarms

Actions after a diagnostics alarm in DPV1 mode

The error is entered in the channel diagnostics in the diagnostics frame:

- In DPV1 mode, diagnostics can be reported as diagnostic interrupts.
- After a diagnostics alarm, this is
  - entered in the diagnostics frame as diagnostic interrupt block (always for one interrupt only).
  - Stored in the diagnostics buffer of the CPU.
- The ERROR LED of the interface module flashes.
- OB 82 is called. If OB 82 does not exist, the CPU changes to STOP mode.
- Acknowledgment of diagnostic interrupt (a new interrupt is then possible)

Length of the diagnostics frame

- The maximum frame length for the ET 200SP distributed I/O system with IM155-6 DP HF interface module (DPV1 mode) is 244 bytes.
- The minimum frame length is 6 bytes.

Reading out the diagnostics data

Table 5- 6 Reading out the diagnostics data with STEP 7

Automation system with DP master	Application	See...
SIMATIC S7/M7	Slave diagnostics data as plain text in the "DP slave diagnostics" tab in the STEP 7 user interface	"Diagnosing hardware" in the STEP 7 online help
	Instruction "DP NRM_DG" (SFC 13) Reading out slave diagnostics (store in the data area of the user program)	SFC, see STEP 7 online help
	Instruction "RD_REC" (SFC 59) Reading out data records of the S7 diagnostics data (store in the data area of the user program)	See System and Standard Functions reference manual
	Instruction "RDREC" (SFB 52) Reading data records from the DP slave	SFB, see STEP 7 online help (system functions/function blocks)
	Instruction "RALRM" (SFB 54) Receiving interrupts from the interrupt OBs	SFB, see STEP 7 online help (system functions/function blocks)

5.3.1 Slave diagnostics

The figure below shows the structure of the slave diagnostics.

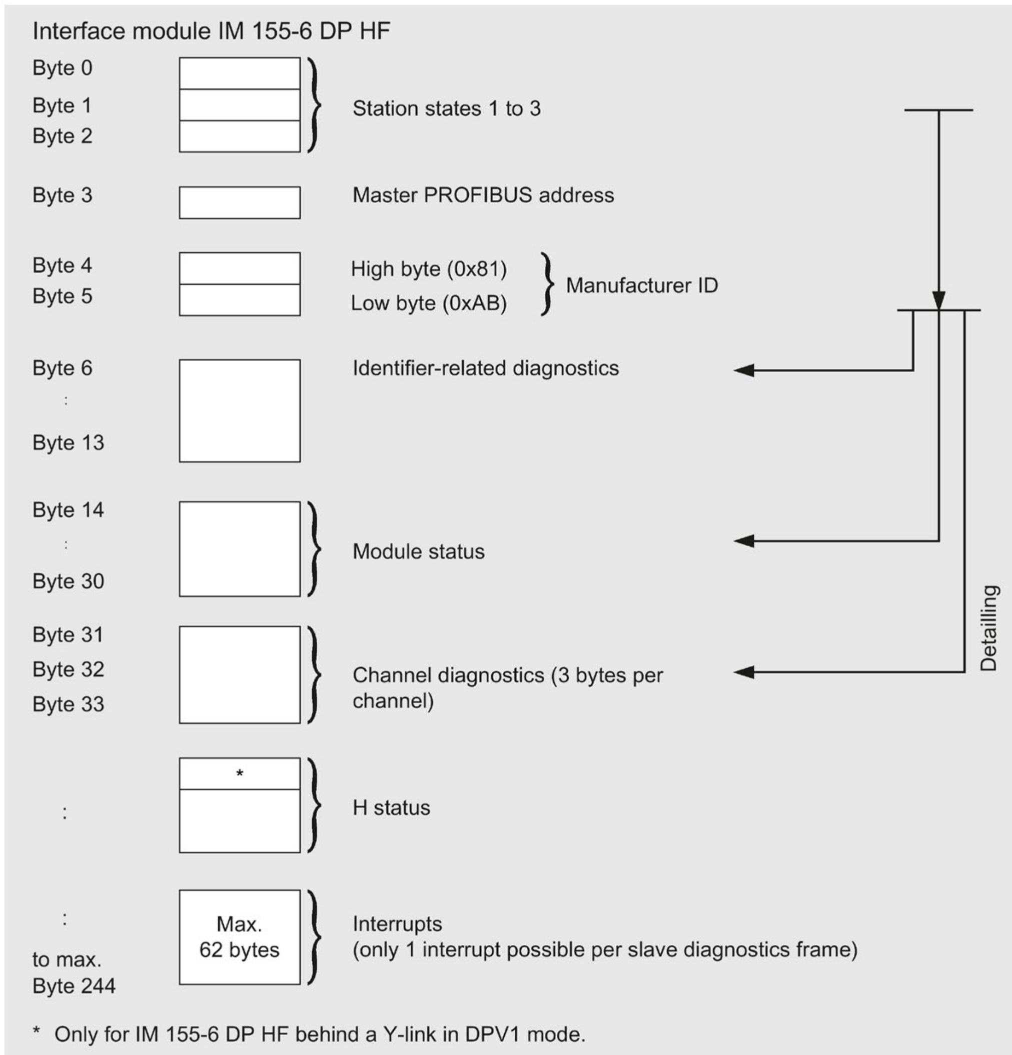

Figure 5-10 Structure of the slave diagnostics

Note

The length of the diagnostics frame varies with the IM 155-6 DP HF (depending on parameter assignment) between 6 and 244 bytes in DPV1 mode.

You can identify the length of the last received diagnostics frame in STEP 7 from the RET_VAL parameter of the SFC 13.

5.3.2 Station statuses 1 to 3

Station statuses 1 to 3 provide an overview of the status of a DP slave.

Structure of station status 1 (byte 0)

Table 5- 7 Structure of station status 1 (byte 0)

Bit	Meaning	Cause/Remedy
0	1: The DP slave is not responding to the DP master.	• Is the correct PROFIBUS address set on the DP slave? • Is the bus connector plugged in? • Is the DP slave connected to the voltage supply? • Is the RS485 repeater properly configured?
1	1: The DP slave is not yet ready to exchange data.	• Wait; the DP slave is currently starting up.
2	1: The configuration data transferred from the DP master to the DP slave does not match the DP slave configuration.	• Has the correct station type or the correct DP slave configuration been entered in the configuration software?
3	1: External diagnostics is available. (Group diagnostics display)	• Evaluate the ID-specific diagnostics, the module status, and/or the channel diagnostics. As soon as all errors have been eliminated, bit 3 is reset. The bit is set again when there is a new diagnostics alarm in the bytes of the aforementioned diagnostics.
4	1: The required function is not supported by the DP slave (for example, changing the PROFIBUS address by means of software).	• Check the configuration.
5	1: The DP master cannot interpret the response of the DP slave.	• Check the bus configuration.
6	1: The DP slave type does not match the software configuration.	• Has the correct station type been entered in the configuration software?
7	1: Parameters have been assigned to the DP slave by a different DP master (not the one that currently has access to the DP slave).	• The bit is always 1, for example, if you access the DP slave with the programming device or another DP master. • The PROFIBUS address of the DP master that assigned parameters to the DP slave is located in the "Master PROFIBUS address" diagnostics byte.

Structure of station status 2 (byte 1)

Table 5- 8 Structure of station status 2 (byte 1)

Bit	Meaning	
0	1:	The DP slave parameters need to be reassigned.
1	1:	A diagnostics alarm is present. The DP slave will not operate until the problem is eliminated (static diagnostics alarm).
2	1:	The bit on the DP slave is always "1".
3	1:	The watchdog is activated for this DP slave.
4	1:	The DP slave has received the "FREEZE" control command.[1]
5	1:	The DP slave has received the "SYNC" control command.[1]
6	0:	Bit is always "0".
7	1:	The DP slave is disabled, that is, it has been removed from the processing in progress.
[1] The bit is updated only if another diagnostics alarm also changes.		

Structure of station status 3 (byte 2)

Table 5- 9 Structure of station status 3 (byte 2)

Bit	Meaning	
0 to 6	0:	Bits are always set to "0".
7	1:	• There are more diagnostic alarms pending than the DP slave is able to store. • The DP master cannot enter all the diagnostics alarms sent by the DP slave in its (channel) diagnostics buffer.

5.3.3 Master PROFIBUS address

The master PROFIBUS address diagnostics byte contains the PROFIBUS address of the DP master:

- That assigned parameters to the DP slave
- That has read and write access to the DP slave

The master PROFIBUS address is located in byte 3 of the slave diagnostics.

5.3.4 Identifier-related diagnostics

The identifier-related diagnostics indicates whether modules of the ET 200SP distributed I/O system have errors or not. Identifier-related diagnostics start at byte 6 and comprise 8 bytes.

The figure below shows how the identifier-related diagnostics for the ET 200SP distributed I/O system is structured with the IM 155-6 DP HF interface module:

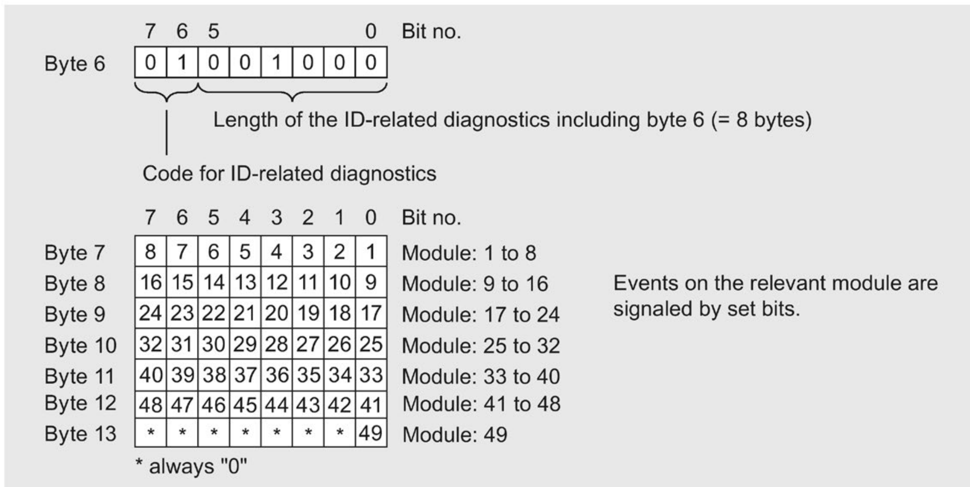

Figure 5-11 Structure of the identifier-related diagnostics

5.3.5 Module status

The module status indicates the status of the configured modules and provides more information on the identifier-related diagnostics with respect to the configuration. The module status begins after the identifier-related diagnostics and comprises 17 bytes.

The following figure shows how the module status for the ET 200SP distributed I/O system is structured with the IM 155-6 DP HF interface module:

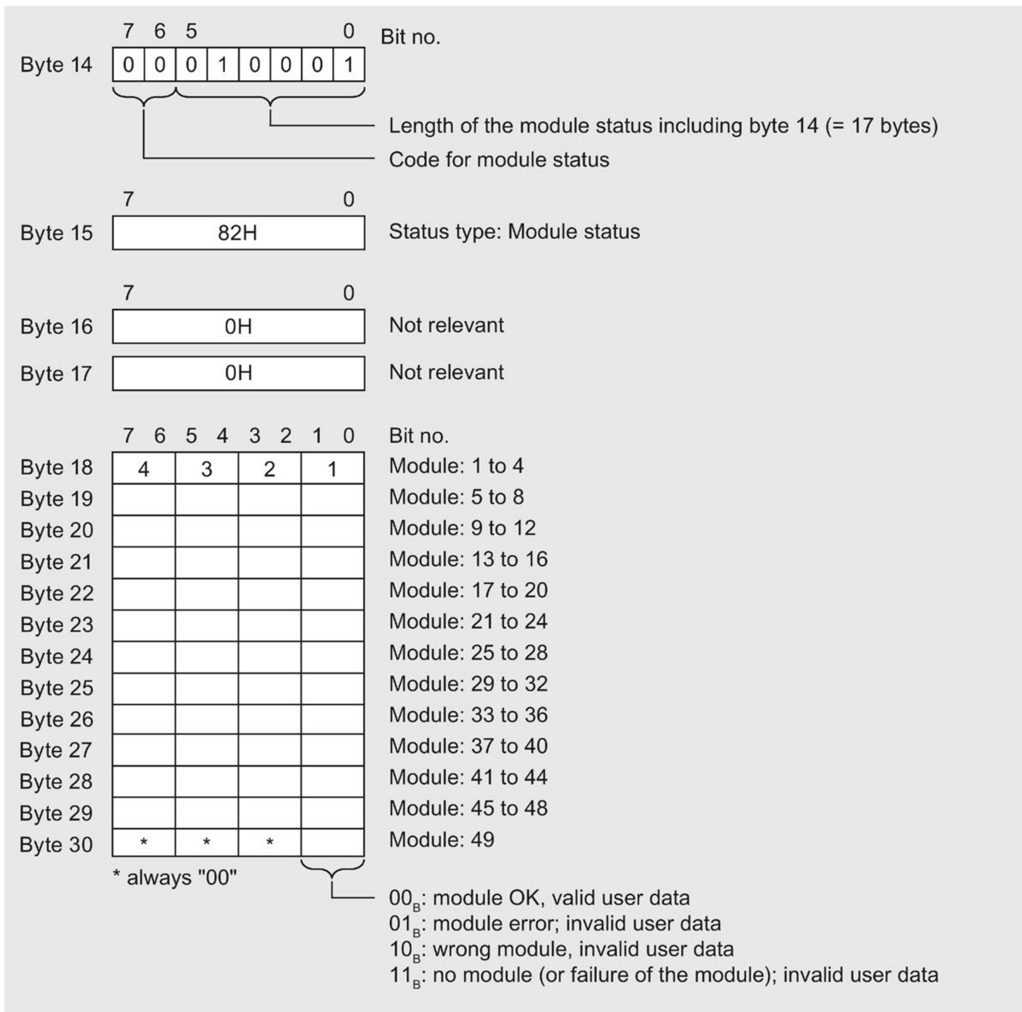

Figure 5-12 Module status structure

5.3.6 Channel diagnostics

Channel diagnostics provides information about channel errors in modules and details of the identifier-related diagnostics. Channel diagnostics begins after the module status. Channel diagnostics does not affect the module status.

The following figure shows how the channel diagnostics for the ET 200SP distributed I/O system is structured with the IM 155-6 DP HF interface module:

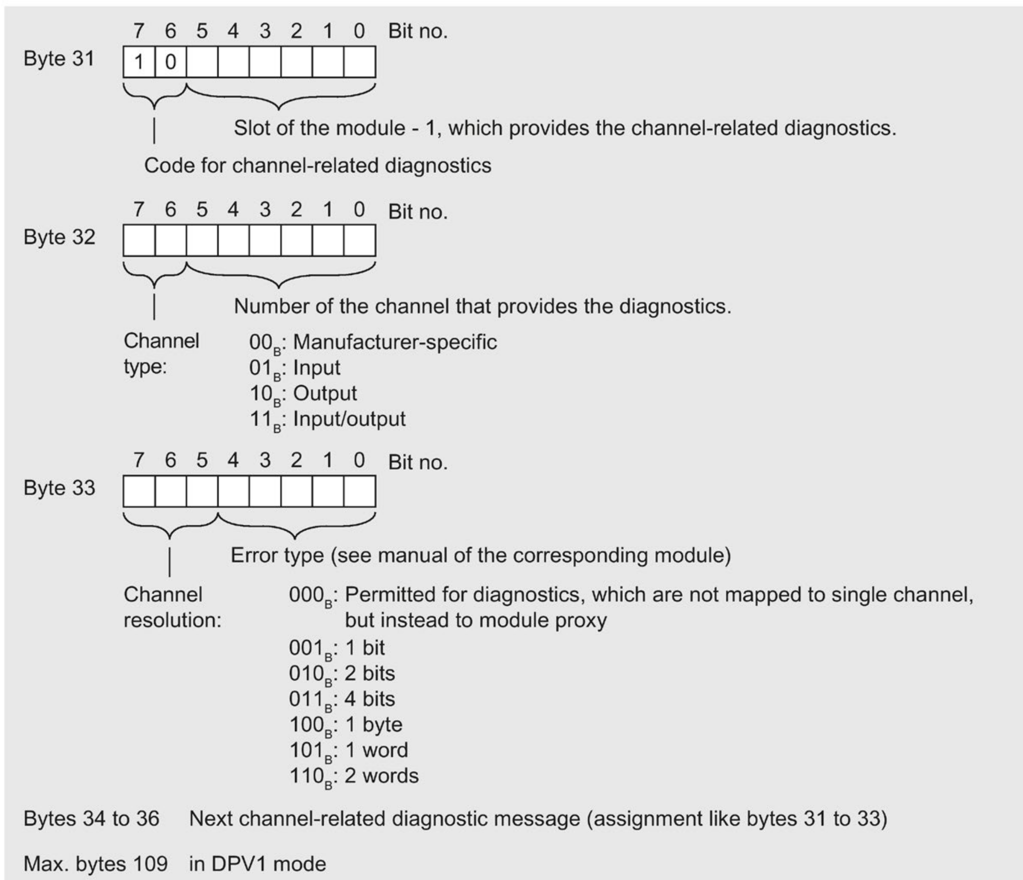

Figure 5-13 Structure of channel diagnostics

When a BaseUnit is incorrectly configured, mapping is made to channel diagnostics. The slot is then apparent from the first byte. In this case, the error type is coded with 0x10 - parameter error. All other fields are set to "0".

5.3.7 H status

Requirements

The H status in the diagnostics frame supplies the IM 155-6 DP HF interface module only when operated behind a Y link (e.g. IM 157) in DPV1 mode. This block can be passed over during the evaluation of the diagnostics frame. The configuration is described in the following section.

Structure of the H status

The following figure shows the structure of the H status of the IM 155-6 DP HF interface module.

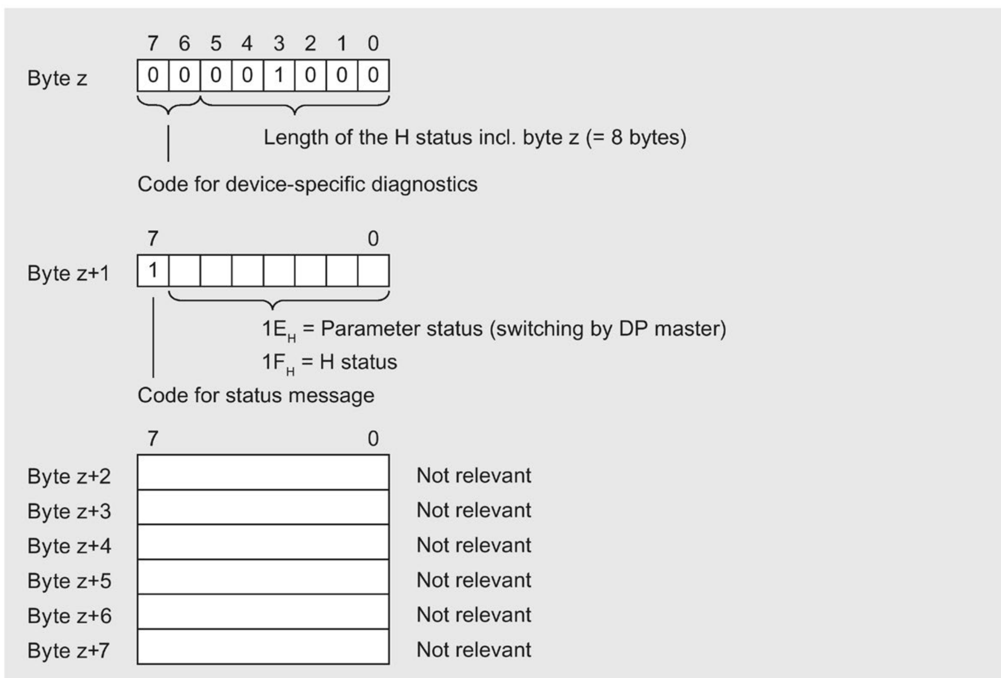

Figure 5-14 Structure of the H status

5.3.8 Invalid configuration states of the ET 200SP on PROFIBUS DP

Incorrect configuration states

The following incorrect configuration states of the ET 200SP distributed I/O system lead to a failure of the DP slave or prevent the start of data exchange.

- Number of modules exceeds maximum configuration.
- Faulty backplane bus (e.g., defective BaseUnit). No interrupt is generated when the ET 200SP backplane bus is interrupted
- No server module
- Configuration exceeds maximum length of 1 m
- Configuration of an incorrect BaseUnit

Note

All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) at a station stop. However, the interface module will continue to exchange data.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

Diagnostics

The table below shows the incorrect configurations and their diagnostics:

Table 5- 10 Diagnostics

Identifier-related diagnostics	Module status	Cause	Response
Slot 33 set, remaining slots not relevant	Slot 33 with 11_B: ""No module; invalid user data" set	• No server module • More than 32 I/O modules • Defective backplane bus	All I/O modules and interface modules fail
All 33 bits set	01_B: "Module error; invalid user data" for all modules	• Configuration > 1 m	All I/O modules and interface modules fail

If the BaseUnit is configured incorrectly, the channel diagnostics "Parameter assignment error" is signaled for the respective slot. Check the parameter "Potential group“ in the parameters of the I/O module.

5.3.9 Load voltage failure on the BaseUnit BU...D

Load voltage failure

If supply voltage fails on the BaseUnit BU...D, the I/O modules react as follows:

- A remove module interrupt is generated if an I/O module is removed during the failure of the supply voltage.
- An insert module interrupt is generated if an I/O module is inserted during the failure of the supply voltage.

Compatibility 6

6.1 Compatibility of modules

Valid firmware versions

The table below lists the valid firmware versions and their field of application for the I/O modules.

I/O modules	Firmware version	Comment
DI 8x24VDC ST	V1.0.1	As of this version, you have the option to operate I/O modules after an IM 155-6 DP HF (6ES7155-6BA00-0CN0) interface module.
DI 16x24VDC ST		
DQ 4x24VDC/2A ST		
DQ 8x24VDC/0.5A ST		
DQ 16x24VDC/0.5A ST		
AI 4xI 2-,4-wire ST		
AI 4xU/I 2-wire ST		
AI 4xRTD/TC 2-,3-,4-wire HF		
AQ 4xU/I ST		

Status of the supply voltage

Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules without parameter assignment in the following table, the status of the supply voltage (status byte of the server module) is always signaled as "1" regardless of the actual status of the supply voltage.
- When a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "Missing supply voltage L+" is signaled for this potential group.

Modules	Article number
DI 8x24VDC ST	6ES7131-6BF00-0BA0
DI 16x24VDC ST	6ES7131-6BH00-0BA0
DI 8x24VDC HF	6ES7131-6BF00-0CA0
DQ 4x24VC/2A ST	6ES7132-6BD20-0BA0
DQ 8x24VDC/0.5A ST	6ES7132-6BF00-0BA0
DQ 16x24VDC/0.5A ST	6ES7132-6BH00-0BA0
DQ 8x24VDC/0.5A HF	6ES7132-6BF00-0CA0

Plugging and pulling (hot-swapping) of ET 200SP I/O modules

NOTICE

Pulling and plugging (hot swapping) of ET 200SP I/O modules during operation on S7-300 via PROFIBUS DP

ET 200SP I/O modules can be pulled and plugged:

- As of STEP7 V5.5 SP3 HSP 242 and
- If "Operation if preset configuration <> actual configuration" parameter is enabled.

Note the following when operating the ET 200SP with S7-300 via PROFIBUS DP: Plugging of ET 200SP I/O modules results in a brief station failure of the ET 200SP.

Note

ET 200SP I/O modules can be pulled and plugged without restrictions for all other DP master systems if you enable the "Pull/plug module (OB83)" parameter.

Communication module IO-Link Master CM 4xIO-Link

Note

Communication module IO-Link Master CM 4xIO-Link

Operation of the CM 4xIO-Link IO-Link Master communication module with the IM 155-6 DP HF interface module is supported as of S7-PCT V3.1 and an updated module firmware version/GSD file.

Reaction times for fail-safe modules

The following maximum reaction time of the interface module must be taken into account when calculating the reaction times of fail-safe modules: **Maximum reaction time = 2.3 ms**

First BaseUnit of an ET 200SP in the configuration

The interface modules support plugging a dark-colored BaseUnit in slot 1. This means that modules without a connection to the integrated voltage buses P1 and P2 can now also be configured starting with slot 1. Currently, this applies to the following modules:

- AI EnergyMeter ST (6ES7134-6PA00-0BD0)
- DI 4x120 … 230VAC ST (6ES7131-6FD00-0BB1)
- DQ 4x24 … 230VAC/2A ST (6ES7132-6FD00-0BB1)

Note

First BaseUnit of an ET 200SP in the configuration

Please note the information on limiting the overvoltage and power rating in the AC I/O module manuals.

The 24 V DC supply voltage is fed in via an external fuse.

The 24 V DC supply voltage is provided by a light-colored BaseUnit.

Requirement for configuration of these modules in slot 1:

- Configuration via GSD or GSDML
- Configuration as of STEP7 V5.5 SP4 as of
  - HSP0242 V2.0 for IM155-6 DP HF
- Configuration as of STEP7 V13 SP1

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

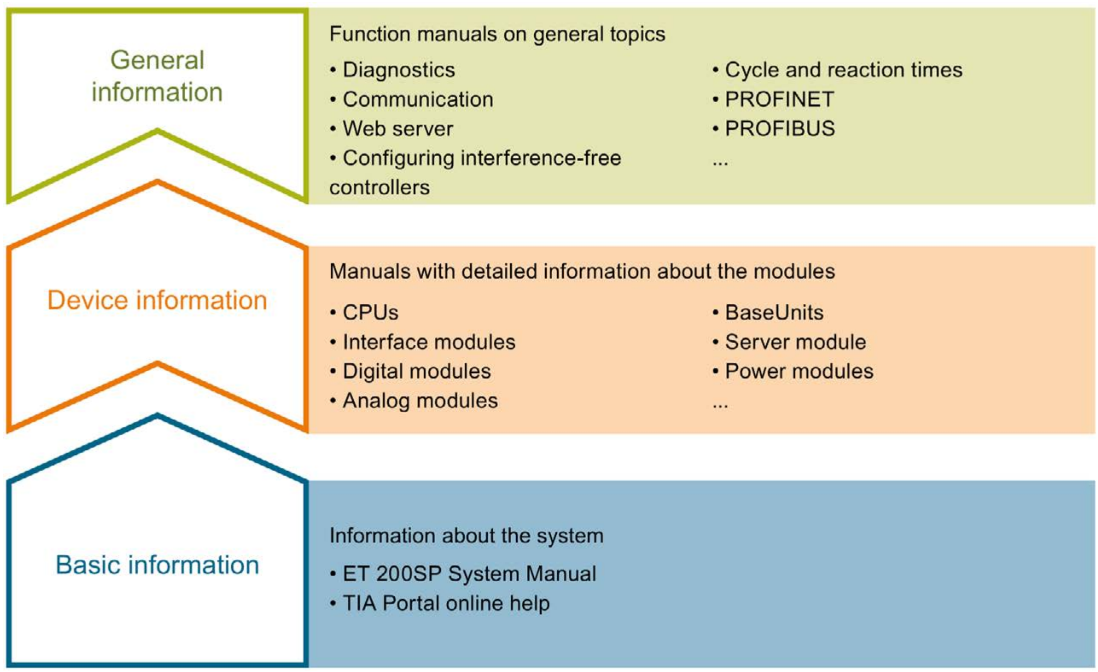
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-controllers/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Application examples

Applications examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

2 Product overview

2.1 Properties

Article number

6ES7155-6AR00-0AN0 (IM 155-6 PN BA interface module and server module)

View of the module

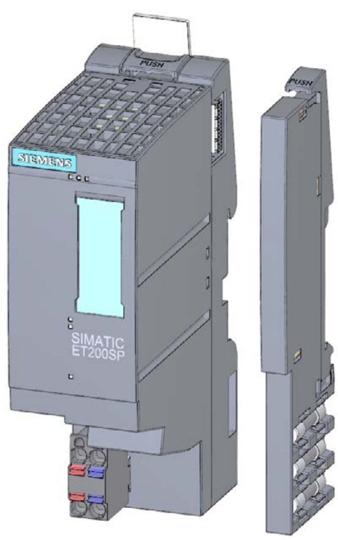


Figure 2-1 View of the IM 155-6 PN BA interface module and the server module

Properties

The module has the following properties:

- Technical properties
  - Connects the ET 200SP distributed I/O system with PROFINET IO
  - Supply voltage 1L+ 24 V DC (SELV/PELV). The connection plug is included in the scope of delivery of the interface module.
- Supported functions (Page 10)

Maximum configuration

- 12 I/O modules

Maximum amount of I/O data

The maximum amount of I/O data is 32 bytes input/output data.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Reference identification label

A detailed list of the available accessories can be found in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Server module

The server module (V1.1.1 and higher) is included in the scope of delivery of the interface module and also available separately as an accessory. The server module has the following properties:

- Terminates the backplane bus of the ET 200SP distributed I/O system
- Features a support for 3 spare fuses (5 × 20 mm)
- Identification data I&M 0 to 3
- Retentive storage of the device name for device replacement without topological configuration

---

Note

You need to configure and assign parameters to the server module in the configuration software.

To do this, place the server module in the last configuration slot and enable the parameter Group diagnostics: No supply voltage L+. If there are 12 I/O modules, the server module is plugged in slot 13.

You can find more information in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

2.2 Functions

Introduction

The interface module supports the following PROFINET IO functions:

- Integrated switch with 2 ports
- Supported Ethernet services: ping, arp, network diagnostics (SNMP: MIB2, LLDP-MIP and MRP-MIB)
- Port diagnostics
- Deactivating of ports
- Minimum update time 1 ms
- Media redundancy MRP
- Device replacement without programming device
- Reset to factory settings via PROFINET IO
- Firmware update via PROFINET IO

The interface module supports additional functions:

- Identification data I&M 0 to 3
- Device replacement with and without topological configuration
- Configuration control (option handling)

Requirements

Configuration takes place with GSDML or STEP 7 V13/HSPxyz.

Cabling with fixed connection setting

If you set a fixed connection setting of the port in STEP 7, you must also disable "Autonegotiation/Autocrossover".

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/de/49948856/0/en)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

Device replacement without topological configuration

In addition to the interface module, the device name is also saved on the server module (V1.1.1 and higher). A device name saved on the server module is the requirement for device replacement without topological configuration.

Storing the name on the server module and the interface module produces a range of scenarios for using the device name when the interface module is replaced.

Table 2- 1 Scenarios for using the device name

	Interface module empty	Interface module with device name
Server module empty	No device name available.	The device name from the interface module is used and copied to the server module.
Server module with device name	The device name from the server module is used and copied to the interface module.	The device name from the server module is used and copied to the interface module if this has a different device name.

Be aware of the following constraints:

- Resetting to factory settings deletes the device name in both the interface module and the server module. To prevent the device name from being deleted in the server module, you can remove the server module from the interface module before resetting to factory settings.
- When a server module is replaced, a device name stored in the server module is applied to the interface module after a POWER ON.
- Do not pull/plug the server module while under voltage. If you pull/plug the server module while under voltage, the interface module restarts.
- If you use a server module with an invalid firmware version (< V1.1.1), channel-specific diagnostics is generated with the error number 27 (general error). To correct this error, you need to replace the server module or update the server module firmware.

IO devices that have already been used in another configuration should be reset to their factory settings before reuse (see system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/de/49948856/0/en)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

Replacement of an IM 155-6 PN BA

If a spare part is required, any IO devices in operation must be reset to their delivery state via "Reset to factory settings" (see the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Media redundancy (MRP)

Function for safeguarding communication and plant availability. A ring topology ensures that an alternative communication path is made available if a transmission route fails.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/de/49948856/0/en)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.1 Configuration control (option handling)

Properties

Configuration control allows you to prepare your distributed I/O system for future extensions or changes. Configuration control means that you can configure the planned maximum configuration of your distributed I/O system in advance and vary it later in a flexible manner by means of the user program.

Reference

You can find more information on configuration control

- in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual
- on the Internet under the following link Application collection (http://support.automation.siemens.com/WW/view/en/29430270)
- in the STEP 7 online help.

Wiring 3

3.1 Terminal assignment

24 V DC supply voltage

The following table shows the signal names and the descriptions of the terminal assignment for a 24 V DC supply voltage.

Table 3- 1 Terminal assignment 24 V DC supply voltage

View		Signal name[1]	Description
Connector	IM connection		
		1L+	24 V DC
		2L+	24 V DC (for looping through)[2]
		1M	Ground
		2M	Ground (for looping through)[2]

[1] 1L+ and 2L+ as well as 1M and 2M are bridged internally.

[2] Maximum 10 A permitted.

PROFINET IO

The following table shows the signal name and description of the terminal assignment.

Table 3- 2 PROFINET IO terminal assignment

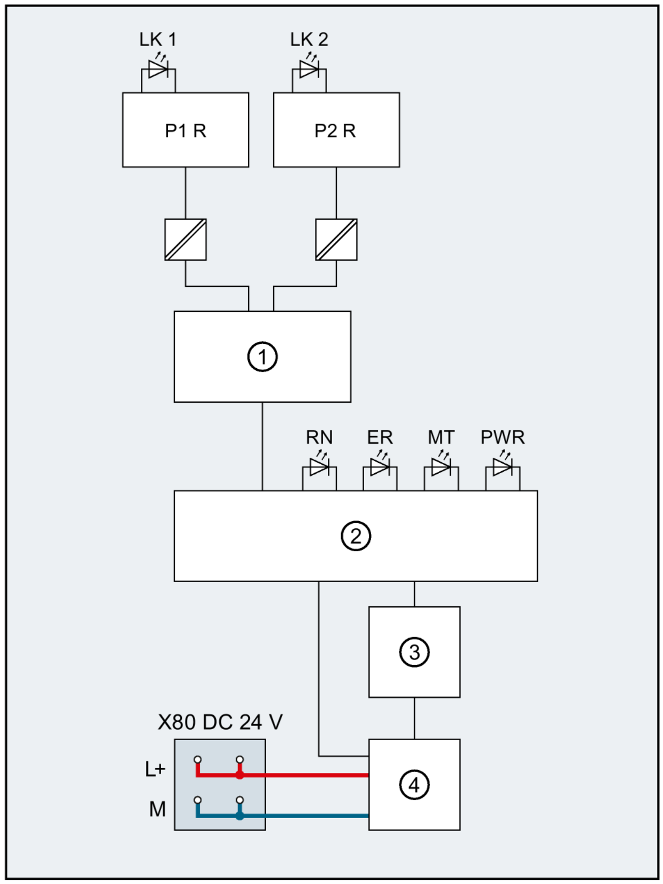
View	Signal name		Description
	1	TD	Transmit data +
	2	TD_N	Transmit data -
	3	RD	Receive data +
	4	GND	Ground
	5	GND	Ground
	6	RD_N	Receive data -
	7	GND	Ground
	8	GND	Ground

Reference

You can find more information on accessories and how to connect the interface module in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

3.2 Block diagram

The following figure shows the block diagram of the interface module IM 155-6 PN BA.



①	Switch	L+	24 V DC supply voltage
②	ET 200SP backplane bus interface and electronics	M	Ground
③	Backplane bus	LK 1,2	LED Link TX/RX
④	Internal power supply	RN	LED RUN/STOP (green/yellow)
X80 24 V DC	Infeed of supply voltage	ER	ERROR LED (red)
P1 R	PROFINET interface X1 Port 1	MT	MAINT LED (yellow)
P2 R	PROFINET interface X1 Port 2	PWR	POWER LED (red)

Figure 3-1 Block diagram of IM 155-6 PN BA interface module

Parameters/address space 4

4.1 Parameters

Parameters for IM 155-6 PN BA interface module

The following table shows the parameters for the IM 155-6 BA interface module.

Table 4- 1 Parameters for interface module IM 155-6 PN BA (GSD file)

Parameters	Range of values	Default	Efficiency range
Configuration control	Disable/enable	Disable	ET 200SP

4.2 Explanation of the parameters

4.2.1 Enabling configuration control

You can use this parameter to enable the configuration control function in the ET 200SP distributed I/O system.

Note

If you configure the enable, the ET 200SP distributed I/O system requires a control data record 196 from the user program in order for the ET 200SP distributed I/O system to operate the I/O modules.

Reference

You can find more information on the control data record in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and in the STEP 7 online help.

4.3 Substitute value behavior

The substitute value behavior in the ET 200SP distributed I/O system is executed by the IO controller for each slot.

The respective output behaves according to its configured substitute value behavior:

- Current-free/voltage-free
- Output substitute value
- Keep last value

The substitute value behavior is triggered in the following cases:

- STOP controller
- Controller failure (connection interrupted)
- Station stop, for example, due to:
  - Missing server module
  - Removing more than one I/O module at a time
  - At least one I/O module installed on an incorrect BaseUnit
- Deactivating the IO device

Note

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage is switched off at the interface module.

The "current-free/voltage-free" behavior takes effect in the following cases:

- Firmware update
- Reset to factory settings
- Configuration control: receipt of a new control data record
- Incorrectly configured module
- Module with incorrect parameter assignment

4.4 Status of the supply voltage L+ of the I/O modules

Configurations

The "Status of supply voltage L+ of the I/O modules" is configured in the IM 155-6 PN BA on the server module. The input data can then be read out on the server module. You will find the relevant description in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

Interrupts, error messages, diagnostics and system alarms 5

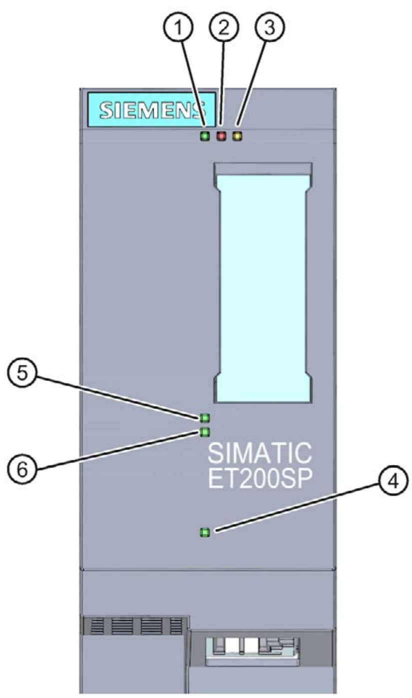
5.1 Status and error displays

Introduction

Diagnostics by means of LEDs is an initial tool for error localization. In order to localize errors still further, you usually evaluate the display of the module status in STEP 7 or the diagnostics buffer of the CPU. The buffer contains plain text information on the error that has occurred. For example, you will find the number of the relevant error OB in the plain text information.

LED display

The following diagram shows the LED display on the interface module and the BusAdapter.



① RN (green)

② ER (red)

③ MT (yellow)

④ PWR (green)

⑤ LK1 (green)

⑥ LK2 (green)

Figure 5-1 LED display on the interface module

Meaning of the LEDs

The following tables describe the meanings of the status and error displays.

RN/ER/MT LED on the interface module

Table 5- 1 RN/ER/MT status and error displays

LEDs			Meaning	Solution
RN (RUN)	ER (ERROR)	MT (MAINT)		
Off	Off	Off	No or insufficient supply voltage on interface module.	Check the supply voltage or turn it on at the interface module. *
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-
Flashes	Off	Off	Interface module is deactivated.	Activate the interface module with the configuration software or the user program.
			Interface module is not configured.	Configure the interface module with the configuration software.
			ET 200SP starts up.	-
			ET 200SP is being assigned parameters.	
			ET 200SP is being reset to factory settings.	
On	Not relevant	Not relevant	ET 200SP is currently exchanging data with the IO controller.	
Not relevant	Flashes	Not relevant	Group errors and group error channels.	Evaluate the diagnostics and eliminate the error.
			The preset configuration does not correspond to the actual configuration of the ET 200SP .	Check the structure of the ET 200SP to see whether a module is missing or defective, or whether a non-configured module is plugged.
			Invalid configuration states.	Refer to section Invalid configuration states of the ET 200SP on PROFINET IO (Page 27)
			Parameter error in the I/O module.	Evaluate the display of the module status in STEP 7 and eliminate the error in the respective I/O module.
Flashes	Flashes	Flashes	The "Node flash test" is running (the LEDs LK1 and LK2 of the PROFINET interface also flash).	-
			Hardware or firmware defective (the LEDs LK1 and LK2 of the PROFINET interface do not flash).	Run a firmware update. If the error persists, contact Siemens Industry Online Support. Replace the interface module.

* PWR LED on (on the interface module): Check the backplane bus for a short circuit.

PWR LED on the interface module

Table 5- 2 PWR status display on the interface module

PWR LED	Meaning	Solution
□ Off	No or insufficient supply voltage	Check the supply voltage.
■ On	Supply voltage present	-

LK1/LK2 LED on the interface module

Table 5- 3 LK1/LK2 status display on the interface module

LEDs LK1/LK2	Meaning	Solution
□ Off	There is no Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner (e.g. IO controller).	Check whether the bus cable to the switch/IO controller is interrupted.
■ On	There is an Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner (e.g. IO controller).	-
☼ Flashes	The "Node flash test" is running (the RN/ER/MT LEDs also flash).	-

LED display of configuration errors

Configuration errors of the ET 200SP distributed I/O system are output on the interfacemodule by the ERROR (red) and MAINT (yellow) LEDs.

The following configuration errors are indicated by the LEDs:

- More than one I/O module pulled
- Missing server module
- Interruptions or short circuit on the backplane bus

Operating principle

You determine the information for cause of the error with the LED error display. After notification by the flash signal, the error type is displayed followed by the error location/error code.

The LED error display

- is active during POWER ON as well as during operation.
- has priority before all other states displayed by the ERROR and MAINT LED.
- remains turned on until the cause of the error has been corrected.

Table 5- 4 Display of error type and error location

Sequence		Description
1	The ERROR and MAINT LEDs flash 3x at 0.5 Hz	Signaling of error type
2	MAINT LED flashes at 1 Hz	Display of the error type (decimal)
3	The ERROR and MAINT LEDs flash 3x at 2 Hz	Signaling of error location/error code
4	The ERROR LED flashes at 1 Hz	Display of tens digit (decimal) of the error location/error code
5	The MAINT LED flashes at 1 Hz	Display of ones digit (decimal) of the error location/error code
6	Repeat steps 1 to 5 until the cause of the error has been corrected.	

Error display

The following table shows the possible causes of error that can occur.

Table 5- 5 Error display

Error type (MAINT)	Error location (ERROR/MAINT)	Cause of error	Remedy
1	02 to 12*	The number of pulled I/O modules is displayed. The diagnostics data is generated starting with two pulled I/O modules.	Check the configuration of the ET 200SP.
	65*	• Missing server module • Interruptions at the backplane bus • Short circuit of communication on the backplane bus	

* Slot

Note

A short circuit in the backplane bus supply or the bus connection supply is indicated by the following LEDs:

- PWR LED: On
- RN, ER and MT LED: Off

5.2 Interrupts

Introduction

The I/O device generates interrupts as a reaction to specific error events. Interrupts are evaluated based on the I/O controller used.

Evaluating interrupts with I/O controllers

The ET 200SP distributed I/O system supports the following interrupts:

- Diagnostics interrupts
- Hardware interrupts
- Pull/plug module interrupts
- Maintenance events

In the event of an interrupt, interrupt OBs are automatically called in the CPU of the IO controller.

Information on the cause and class of the error is already available, based on the OB number and start information.

Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).

System diagnostics

STEP 7 (TIA portal) offers innovative system diagnostics for the devices of the S7-1500 (IO controller CPU S7-1500) and the ET 200SP (IO device) automation system. Independent of the cyclic user program, alarms are made available on the display of the CPU S7-1500, the CPU web server and the HMI device.

For more information on system diagnostics, refer to the System Diagnostics function manual. (http://support.automation.siemens.com/WW/view/en/59192926).

5.2.1 Triggering a diagnostics interrupt

Triggering a diagnostics interrupt

For an incoming or outgoing event (e.g. wire break on a channel of an I/O module), the module triggers a diagnostics interrupt if this is configured accordingly.

The CPU interrupts the user program and processes the diagnostics block OB 82. The interrupt triggering event is logged in the start information of OB 82.

5.2.2 Triggering a hardware interrupt

Triggering a hardware interrupt

If there is a hardware interrupt, the CPU interrupts user program execution and processes the hardware interrupt block OB 40. The result that triggered the interrupt is added to the start information of the hardware interrupt block.

Note

Diagnostics "Hardware interrupt lost" (from I/O module)

Avoid creating hardware interrupts cyclically.

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

5.2.3 Triggering a pull/plug interrupt

Triggering a pull/plug interrupt

If there is a pull/plug interrupt, the CPU interrupts user program execution and processes the hardware interrupt block OB 83. The result that triggered the interrupt is added to the start information of OB 83.

5.3 Alarms

Actions after a diagnostics alarm

There can be more than one diagnostic alarm at a given time. Actions initiated by diagnostics alarms:

- The ERROR LED of the interface module flashes.
- Diagnostic data is reported as diagnostic interrupts to the CPU of the IO controller and can be read via data records.
- Incoming diagnostics alarms are saved to the diagnostics buffer of the I/O controller.
- OB 82 is called.

You can find more information on this topic in the STEP 7 online help.

Reading out the diagnostics data

Table 5- 6 Reading the diagnostics with STEP 7

Automation system with IO controller	Application	See...
SIMATIC S7	Diagnostics as plain text in STEP 7 in online and diagnostics view	STEP 7 online help • As of STEP 7 V13, function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/de/49948856/0/en) • As of STEP 7 V5.5 system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
	Instruction "RDREC" (SFB 52) Read data records from the IO device	
	Instruction "RALRM" (SFB 54) Receive interrupts from the IO device	

Additional information on the data records for PROFINET IO

The structure of the diagnostic data records and programming examples are available in the programming manual From PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) and in Application example (http://support.automation.siemens.com/WW/view/en/24000238).

Causes of error and corrective measures

The causes of error and corrective measures for the diagnostics alarms are described in the manuals for I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300) in the chapter, "Interrupts/diagnostics alarms".

See also

Channel diagnostics (Page 26)

PROFINET with STEP 7 V11
(http://support.automation.siemens.com/WW/view/en/49948856)

5.3.1 Channel diagnostics

Function

Channel-related diagnostics provides information about channel faults in modules.

Channel faults are mapped as channel diagnostics data in IO diagnostics data records.

The data record is read using the instruction "RDREC".

Structure of the diagnostics data records

The data records supported by the ET 200SP distributed I/O system are based on the PROFINET IO standard - Application Layer Service Definition V2.2 or higher.

You can download the standard PROFIBUS user organization (http://www.profibus.com) from the homepage of the PROFIBUS User Organization free of charge.

5.3.2 Invalid configuration states of the ET 200SP on PROFINET IO

Invalid configuration states

The following invalid configuration states of the ET 200SP distributed I/O system lead to the failure of the IO device or prevent the exchange of user data with the I/O modules.

- Number of modules exceeds maximum configuration
- Faulty backplane bus (e.g. defective BaseUnit). ET 200SP backplane bus interruptions do not trigger an interrupt.
- Missing server module
- At least one I/O module is installed in a different BaseUnit than the one configured in the parameters.

Note

If you remove more than one I/O module or the server module, this results in a station stop. All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) but the interface module is still exchanging data.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

See also

Status and error displays (Page 18)

Channel diagnostics (Page 26)

5.3.3 Failure of supply voltage L+ at BaseUnit BU...D

Failure of the supply voltage L+

The I/O modules react as follows to failure of the supply voltage L+ on the BaseUnit BU...D:

- If an I/O module is removed during failure of the supply voltage, a pull interrupt is generated.
- If an I/O module is installed during failure of the supply voltage, a plug interrupt is generated.

5.3.4 STOP of the IO controller and recovery of the IO device

STOP of the SIMATIC IO controller

Diagnostics frames received from the IO device while the IO controller is in STOP do not initiate a call of any corresponding OBs when the IO controller goes into RUN. You must read the data record $E00C_H$ with the "RDREC" instruction in OB 100. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Recovery of the SIMATIC IO device

If you want to read the diagnostics of a station after its return, you have to read the $E00C_H$ data record with the "RDREC" instruction in OB 86. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

6 Compatibility

Status of the supply voltage

Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules in the following table without a parameter assignment, the status of the supply voltage is always signaled as "1" regardless of the actual status of the supply voltage.
- If a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "No supply voltage L+" is signaled for this potential group.

Module	Order number
DI 8x24VDC ST	6ES7132-6BF00-0BA0

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes labeled as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product, or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

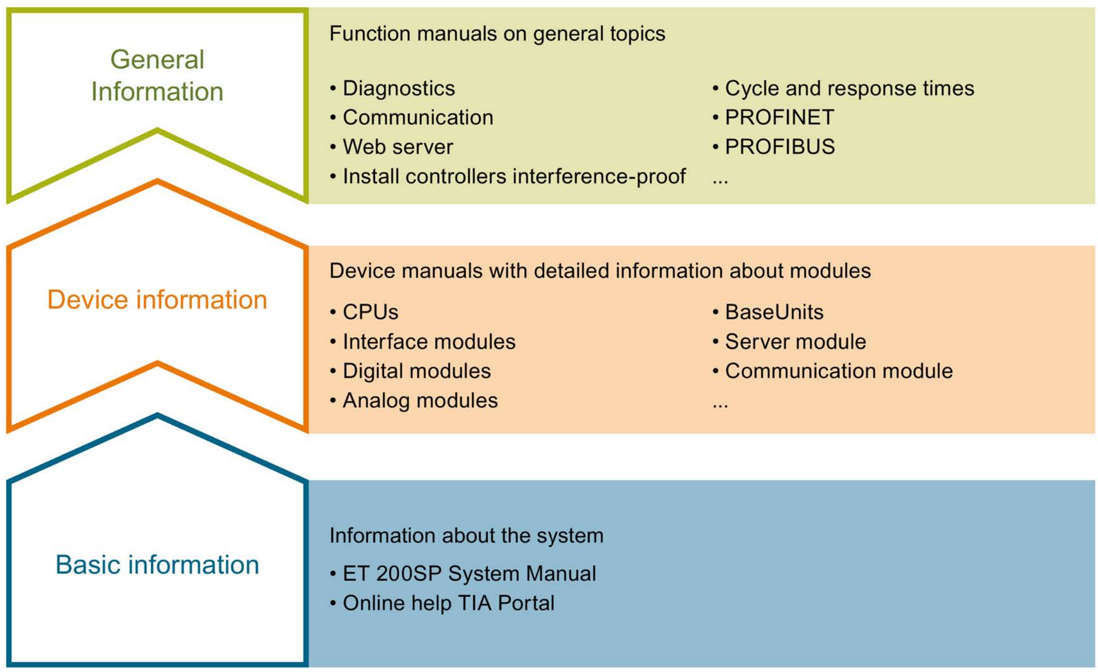
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Product overview

2

2.1 Properties

Article number

6ES7155-6AU00-0DN0 (interface module IM 155-6 PN HS and server module)

View of the module

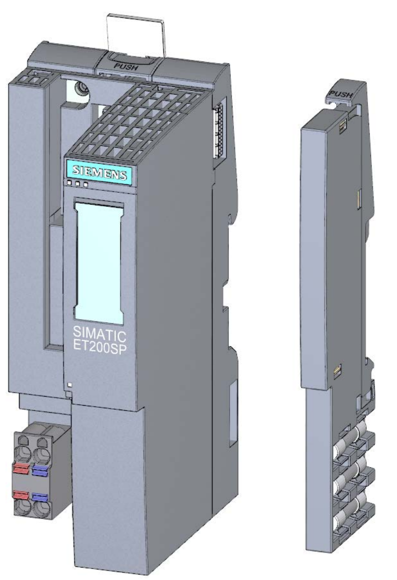


Figure 2-1 View of the IM 155-6 PN HS interface module and the server module

Properties

The module has the following properties:

- Connects the ET 200SP distributed I/O system with PROFINET IO
- High-speed applications as of 125 µs
- Isochronous mode according to PROFINET V2.3
- Supply voltage 1L+ 24 V DC (SELV/PELV).
- The connection plugs for the 24 V DC supply voltage and the server module are included in the scope of delivery of the interface module.
- PROFINET IO connection via selectable BusAdapters
  - For RJ45 bus connection plug (BA 2×RJ45)
  - For direct connection of the bus cable (BA 2×FC)
  - For POF/PCF fiber-optic cable (BA 2xSCRJ)
  - As media converter for POF/PCF fiber-optic cable ⇔ standard RJ45 plug (BA SCRJ/RJ45)
  - As media converter for POF/PCF fiber-optic cable ⇔ direct connection of the bus cable (BA SCRJ/FC)
  - For glass fiber-optic cable (BA 2xLC)
  - As media converter for glass fiber-optic cable ⇔ standard RJ45 plug (BA LC/RJ45)
  - As media converter for glass fiber-optic cable ⇔ direct connection of the bus cable (BA LC/FC)

The module supports the following PROFINET IO functions (see (Page 15))

Maximum configuration

- 30 I/O modules
- 0.5 m backplane bus (without interface module but with server module)

Maximum amount of I/O data

The maximum amount of I/O data without user data qualifier is 968 bytes.

Note

- In the case of a shared device configuration, the 968 bytes apply to the total I/O data of all controllers that share the device.
- If more than two (max. four) controllers share the device, the maximum amount of I/O data including user data qualifier is limited to 360 bytes per controller.

Accessories

You order the following accessories separately:

- BA 2×RJ45 BusAdapter
- BA 2×FC BusAdapter
- BA 2×SCRJ BusAdapter
- BA SCRJ/RJ45 BusAdapter
- BA SCRJ/FC BusAdapter
- BA 2×LC BusAdapter
- BA LC/RJ45 BusAdapter
- BA LC/FC BusAdapter
- Labeling strips
- Reference identification label

A detailed list of the available accessories can be found in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Server module

The server module is included in the scope of delivery of the interface module and is available separately as a spare part. The server module has the following properties:

- Terminates the backplane bus of the ET 200SP distributed I/O system
- Features a support for 3 spare fuses (5 × 20 mm)
- Provides station functions, for example, group load diagnostics, status bytes.
- Identification data I&M 0 to 3

Note

You need to configure and assign parameters to the server module in the configuration software.

To do this, place the server module in the last configuration slot and enable the parameter Group diagnostics: Missing supply voltage L+. When there are 30 I/O modules, the server module is inserted in slot 31.

You can find more information in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

First BaseUnit of an ET 200SP in the configuration

The interface modules support dark-colored BaseUnits in slot 1. This means that modules without a connection to the integrated voltage buses P1 and P2 can be configured starting with slot 1. Currently, this applies to the following modules:

- AI EnergyMeter
- DI 4x120..230VAC ST (6ES7131-6FD00-0BB1)
- DQ 4x24..230VAC/2A ST (6ES7132-6FD00-0BB1)
- RQ 4x120VDC-230VAC/5A NO ST (6ES7132-6HD00-0BB1)
- RQ 4x120VDC-230VAC/5A NO MA ST (6ES7132-6MD00-0BB1)

Note

First BaseUnit of an ET 200SP in the configuration

The first BaseUnit of an ET 200SP station may be a dark-colored one if an AC I/O module or AI Energy Meter is plugged. Please observe the information on limiting the overvoltage and power rating in the AC I/O module manuals.

A light-colored BaseUnit must be plugged into the slot of the first 24 V DC I/O module to supply the 24 V DC supply voltage.

Pay attention to the type of the BaseUnits during the configuration.

2.2 Functions

PROFINET IO

The interface module supports the following PROFINET IO functions:

- Integrated switch with 2 ports
- Supported Ethernet services: ping, arp, network diagnostics (SNMP)/MIB-2, LLDP-MIB and MRP-MIB
- Port diagnostics
- Disabling ports
- Minimum update time 125 μs
- Device replacement without programming device, also without topological configuration
- Reset to factory settings via PROFINET IO
- Firmware update via PROFINET IO
- Isochronous real-time communication
- Prioritized startup
- Media redundancy (MRP)
- Media redundancy with planned duplication (MRPD)
- Shared device
- Module division of I/O modules (submodules)
- Module-internal Shared Input/Shared Output (MSI/MSO)
- Isochronous mode as of 125 μs
- Performance upgrade PROFINET V2.3
- Freely selectable connection method and connection technology over SIMATIC BusAdapter for PROFINET copper, POF, PCF or fiber-optic cables.

The interface module supports additional functions:

- Identification data I&M 0 to 3
- Oversampling
- PROFIenergy
- Configuration control (option handling)
- Value status of I/O modules
- Use of fail-safe modules
- Multi Hot Swap (removal/insertion of multiple I/O modules during operation)
- Reset to factory settings via RESET button

Note

Docking unit

The use of the IM155-6 PN HS interface module as a docking unit (function: IO device changing in operation) in a docking system is not supported.

Requirements

The table below shows the software requirements for a configuration with the IM 155-6 PN HS interface module:

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of	Configuration software		
			Configuration with GSD file/software from a third-party manufacturer [1]	STEP 7 as of V5.5 SP4 with HSP0238	STEP 7 (TIA Portal) as of V14
Real-time communication	1	V4.0.0	X	X	X
Isochronous real-time communication according to PROFINET	1	V4.0.0	X	X	X
Prioritized startup	1	V4.0.0	X	X	X
Media redundancy (MRP)	1	V4.0.0	X	X	X
Shared device	1	V4.0.0	X	X	X
Multi Hot Swap	1	V4.0.0	X	X	X
Media redundancy with planned duplication (MRPD)	1	V4.0.0	X	X	X
Isochronous mode ≥ 250 μs	1	V4.0.0	---	X	X
Isochronous mode ≥ 125 μs/187.5 μs	1	V4.0.0	---	---	X
Device replacement without programming device	1	V4.0.0	X	X	X
Module-internal Shared Input/Shared Output (MSI/MSO)	1	V4.0.0	X	X	X
Module division of I/O modules (submodules)	1	V4.0.0	X	X	X
PROFIenergy	1	V4.0.0	X	X	X
Value status	1	V4.0.0	X	X	X
Use of fail-safe modules	1	V4.0.0	---	X	X
Oversampling	1	V4.0.0	---	X	X
BA 2xRJ45 BusAdapter	1	V4.0.0	X	X	X
BA 2xFC BusAdapter	1	V4.0.0	X	X	X
BA 2xSCRJ BusAdapter	1	V4.0.0	X	X	X
BA SCRJ/RJ45 BusAdapter	1	V4.0.0	X	X	X
BA SCRJ/FC BusAdapter	1	V4.0.0	X	X	X
BA 2xLC BusAdapter	1	V4.0.0	X	X	X
BA LC/RJ45 BusAdapter	1	V4.0.0	X	X	X
BA LC/FC BusAdapter	1	V4.0.0	X	X	X

[1] systems of third-party manufacturers: Depending on the range of functions of the third-party system

Cabling with fixed connection setting

If you set a fixed connection setting of the port in STEP 7, you should also disable "Autonegotiation/Autocrossover".

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Real-time communication

A transmission method for PROFINET IO based on cyclic data exchange with a provider-consumer model.

Isochronous real-time communication

Synchronized communication protocol for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth is available in the send cycle for IRT data. The reserved bandwidth ensures that the IRT data can also be transferred with another high network load (e.g. TCP/IP communication or additional real time communication) at reserved, chronologically synchronized intervals.

A topological configuration is required for IRT.

Note

IO controller as sync master with IRT communication

We recommend also operating the IO controller as a sync master when configuring the IRT communication.

Otherwise, IO devices with IRT and RT configuration could fail as a result of sync master failure.

You can find more information on the configuration of synchronized PROFINET devices in sync domains in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Isochronous mode of I/O data

I/O data, transmission cycle via PROFINET IO, and the user program are synchronized to achieve maximum deterministics. The input and output data of distributed I/O modules in the system is simultaneously collected and simultaneously output. The constant PROFINET IO cycle forms the corresponding clock generator. The interface module supports isochronous mode of I/O data for the modules starting at 125 μs. The IO device can exchange isochronous process data with a maximum of one IO controller.

Note

If the IO controller cannot access a module (for example, module pulled, activated configuration control without written control data record), cycle time violations may occur with activated isochronous mode in the synchronous cycle interrupt OB (OB61). The time error OB (OB80) is called in the event of a cycle time violation.

This behavior is associated with updating the process image by means of the "SYNC_PI" (SFC126) and "SYNC_PO" (SFC127) instructions and depends, among other things, on the set cycle time and the configuration limits.

Note

Isochronous mode restrictions with IM 155-6 PN HS

Isochronous mode of I/O data in combination with the following functions is not possible with the interface module IM 155-6 PN HS:

- PROFIenergy

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Prioritized startup

Prioritized startup describes the PROFINET IO functionality for accelerating the startup of IO devices in a PROFINET IO system with IRT and RT communication.

The function reduces the time that the appropriately configured IO devices require in order to return to cyclic user data exchange in the following cases:

- After the supply voltage has returned
- After a station has returned
- After IO devices have been activated

Note

Dependency on the startup time

The startup time depends on the number and type of modules.

The interface module permits startup times from 0.5 s.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Device replacement

Device replacement without topological configuration

The device name is also stored on the BusAdapter in addition to the interface module. A device name saved on the BusAdapter is the requirement for device replacement without topological configuration.

Storing the name on the BusAdapter and the interface module produces a range of scenarios for using the device name when the interface module is replaced.

Table 2- 2 Scenarios for using the device name

	Interface module empty	**Interface module with device name**
BusAdapter empty	No device name available	The device name from the interface module is used and copied to the BusAdapter.
BusAdapter with device name	The device name from the BusAdapter is used and copied to the interface module.	The device name from the BusAdapter is used and copied to the interface module if this has a different device name.

Be aware of the following constraints:

- Resetting to factory settings via the RESET button deletes the device name in both the interface module and the BusAdapter. To prevent the device name from being deleted in the BusAdapter, you can remove the BusAdapter from the interface module before resetting to factory settings.
- When a BusAdapter is replaced, a device name stored in the BusAdapter is applied to the interface module after a POWER ON.
- Do not pull/plug the BusAdapter while under voltage. If you pull/plug the BusAdapter while under voltage, the interface module restarts.

Device replacement with topological configuration

IO devices having this function can be replaced in a simple manner:

- The device name does not have to be assigned with the programming device.

The replaced IO device is assigned the device name by the IO controller and not by the programming device. The IO controller uses the configured topology and the neighboring relationships determined by the IO devices for this purpose. All involved devices must support the LLDP protocol (Link Layer Discovery Protocol). The configured target topology must match the actual topology.

IO devices that were already operated in a different configuration should be reset to their factory settings before reuse (see system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)).

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Replacement scenario of an IM 155-6 PN HS or of a BusAdapter

In a replacement scenario, any IO device or BusAdapter in operation must be reset to its delivery state via "Reset to factory settings" (see the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Media redundancy (MRP)

Function for safeguarding communication and system availability. A ring topology ensures that an alternative communication path is made available if a transmission route fails.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Media redundancy with planned duplication (MRPD)

If bumpless media redundancy is to be reached with short update times (together with IRT), you must use the MRP extension "Media redundancy with planned duplication (MRPD)".

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Shared device

IO device which makes its data available to multiple IO controllers.

The interface module supports shared device at submodule level.

Notes on configuring:

- Always load hardware changes to all affected IO controllers.
- Set the same send clocks in the projects.
- Limit the I/O data including user data qualifier to 360 bytes per IO controller.
- Use the same station name and the same IP address for each shared configuration.
- Assign each module or submodule to only one IO controller.
- In the case of an incorrect configuration, you may need to perform a power OFF/ON on the interface module.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

Submodules

The IM 155-6 PN HS interface module supports the module division of I/O modules into up to 4 submodules. This allows parts of an I/O module to be separately configured and assigned parameters.

It is possible to assign each of these submodules to different IO controllers.

The functions

- Firmware update
- Write I&M data
- Calibration
- PROFIenergy

can only be executed if you have configured submodule 1 during configuration.

Module-internal Shared Input/Shared Output (MSI/MSO)

The module-internal Shared Input function allows an input module to make its input data available to up to three additional IO controllers. Each controller has read access to the same channels.

The module-internal Shared Output function allows an output module to make the status of its output data available to up to three additional IO controllers. These additional IO controllers can read the status of the channels as input data.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V14, in the PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual

Value status

The IM 155-6 PN HS interface module supports I/O modules with value status.

You can find more information on the value status in the manuals for the I/O modules.

Oversampling

The IM 155-6 PN HS interface module supports the oversampling mode of HS modules. With oversampling, the modules reduce the respective PROFINET send clocks in isochronous mode.

You can find more information on oversampling in the manuals for the I/O modules.

2.2.1 PROFIenergy

Properties

PROFIenergy (for PROFINET) reduces the energy consumption by using PROFIenergy commands during production-free periods.

Reference

You can find more information on PROFIenergy in the

- I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300) manual
- PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual
- PROFIenergy (http://support.automation.siemens.com/WW/view/en/66928686) product information.
- Internet (http://www.profibus.com) under Common Application Profile PROFIenergy; Technical Specification for PROFINET; Version 1.0; January 2010; Order No: 3.802.

2.2.2 Configuration control (option handling)

Properties

Configuration control allows you to prepare your distributed I/O system for future extensions or changes. Configuration control means that you can configure the planned maximum configuration of your distributed I/O system in advance and vary it later in a flexible manner by means of the user program.

Reference

You can find more information on configuration control

- in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual
- on the Internet under the following link Application collection (http://support.automation.siemens.com/WW/view/en/29430270)
- in the STEP 7 online help.

2.2.3 Use of fail-safe modules

Properties

The interface module IM 155-6 PN HS supports the use of fail-safe modules.

Reference

You can find more information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2.4 Multi Hot Swap

Properties

You can remove and insert any number of I/O modules during operation. The interface module and the inserted I/O modules remain in operation.

Note

The IM 155-6 PN HS interface module does not support the removal and insertion of the server module, the interface module and BusAdapter during operation.

Reference

You can find more information on the removal/insertion of modules in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

3 Connecting

3.1 Terminal assignment

24 V DC supply voltage

The table below shows the signal names and descriptions of the pin assignment of the 24 V DC supply voltage.

Table 3- 1 Pin assignment 24 V DC supply voltage

View		Signal name[1]	Description
Connector	IM connection		
		1L+	24 V DC
		2L+	24 V DC (for looping through)[2]
		1M	Ground
		2M	Ground (for looping through)[2]

[1] 1L+ and 2L+ as well as 1M and 2M are bridged internally.

[2] Maximum 10 A permitted.

PROFINET IO with BusAdapter BA 2×RJ45

The following table shows the signal name and description of the pin assignment of the BusAdapter BA 2×RJ45.

Table 3- 2 PROFINET IO pin assignment with BusAdapter BA 2×RJ45

PROFINET IO with BusAdapter BA LC/FC

The following table shows the signal names and description of the pin assignment for the BA LC/FC BusAdapter.

The pin assignment for the BA LC/FC BusAdapter is shown individually for a clearer overview.

Table 3- 9 PROFINET IO pin assignment with BusAdapter BA LC/FC

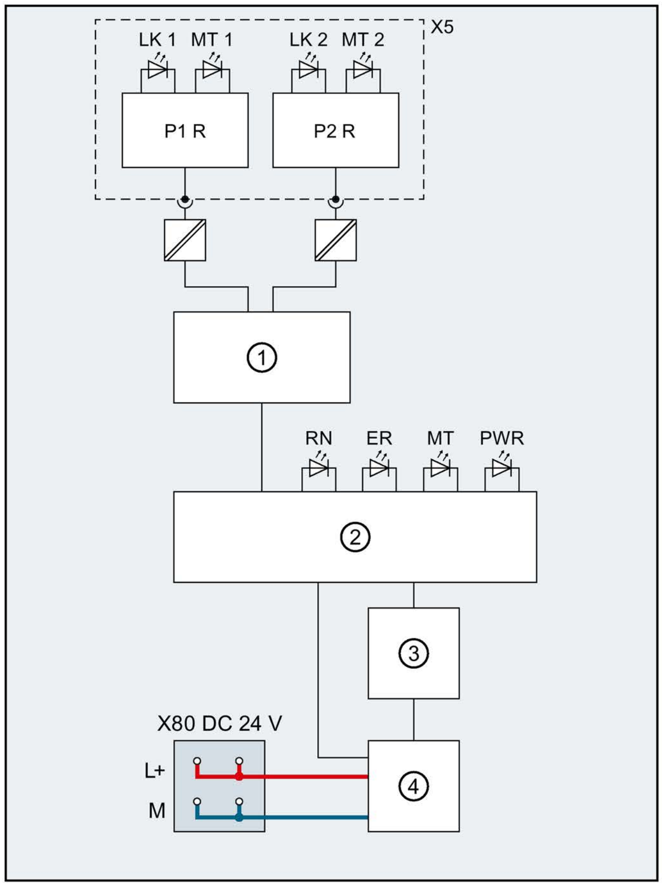
View	Signal name		Description
	①		Receiver/Receive data
	②		Sender/Transmit data
	1	TD	Transmit data +
	2	TD_N	Transmit data –
	3	RD	Receive data +
	4	RD_N	Receive data -

Reference

You can find more information on accessories and how to connect the interface module in the System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

3.2 Schematic circuit diagram

The following figure shows the block diagram of the interface module IM 155-6 PN HS.



①	Switch	L+	24 V DC supply voltage
②	ET 200SP backplane bus interface and electronics	M	Ground
③	Backplane bus	LK 1,2	Link TX/RX LED (green)
④	Internal power supply	MT 1,2	MAINT FiberOptic LED (SCRJ port) (yellow)
X80 24 V DC	Feed supply voltage	RN	RUN/STOP LED (green/yellow)
X5	BusAdapter	ER	ERROR LED (red)
P1 R	PROFINET interface X1 Port 1	MT	MAINT LED (yellow)
P2 R	PROFINET interface X1 Port 2	PWR	POWER LED (green)

Figure 3-1 Block diagram of the IM 155-6 PN HS interface module

Parameters/address space 4

4.1 Parameters

Parameters for IM 155-6 PN HS interface module

The following table shows the parameters for the IM 155-6 PN HS interface module.

Table 4- 1 Parameters for IM 155-6 PN HS interface module (GSD file)

Parameters	Value range	Default	Efficiency range
Configuration control	Disable/enable	Disable	ET 200SP

4.2 Explanation of parameters

4.2.1 Configuration control

You can use this parameter to enable the configuration control function in the ET 200SP distributed I/O system.

Note

If you configure the enable, the ET 200SP distributed I/O system requires a control data record 196 from the user program in order for the ET 200SP distributed I/O system to operate the I/O modules.

Reference

You can find more information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and in the STEP 7 online help.

4.3 Substitute value behavior

Substitute value behavior

The substitute value behavior in the ET 200SP distributed I/O system is defined through the configuration.

The respective output behaves according to its configured substitute value behavior:

- Current-free/voltage-free
- Output substitute value
- Keep last value

The substitute value behavior is triggered in the following cases:

- STOP controller
- Controller failure (connection interrupted)
- Parameter assignment phase during startup
- Deactivating the IO device
- Station stop:
  - Missing server module
  - At least one I/O module installed on an incorrect BaseUnit

---

Note

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage is switched off at the interface module.

The "current-free/voltage-free" behavior becomes effective in the following cases:

- Firmware update
- Reset to factory settings
- Configuration control: The IM has not received a valid control data record 196 yet.
- Incorrectly configured module
- Module with incorrect parameter assignment

4.4 Status of the supply voltage L+ of the I/O modules

The status of the supply voltage L+ of the ET 200SP I/O modules is mapped to the server module with the interface module IM 155-6 PN HS.

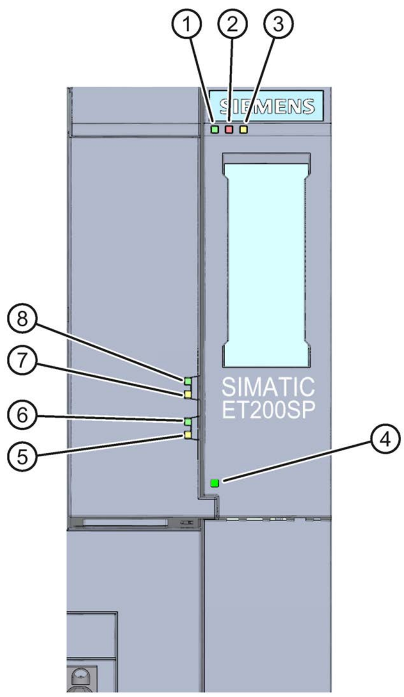
You can find information on the status of the supply voltage L+ of the I/O modules in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

5 Interrupts, diagnostics, error, and system messages

5.1 Status and error displays

LED displays

The following figure shows the LED displays on the interface module and BusAdapter.



①	RN (green)
②	ER (red)
③	MT (yellow)
④	PWR (green)
⑤	MT2 (yellow) (SCRJ port)
⑥	LK2 (green)
⑦	MT1 (yellow) (SCRJ port)
⑧	LK1 (green)

Figure 5-1 LED displays on the interface module and BusAdapter

Meaning of the LEDs

The following tables contain the meaning of the status and error displays.

RN/ER/MT LEDs on the interface module

Table 5- 1 Status and error displays of RN/ER/MT LEDs

LEDs			Meaning	Remedy
RN (RUN)	**ER (ERROR)**	**MT (MAINT)**		
Off	Off	Off	Missing or insufficient supply voltage on interface module.	Check the supply voltage or turn it on at the interface module.*
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	---
Flashes	Not relevant	Not relevant	Interface module is deactivated.	Activate the interface module with the configuration software or the user program.
			Interface module is not configured.	Configure the interface module with the configuration software.
			ET 200SP starts up.	---
			ET 200SP is being assigned parameters.	
On	Not relevant	Not relevant	ET 200SP is currently exchanging data with the IO controller.	---
Not relevant	Flashes	Not relevant	Group errors and group error channels.	Evaluate the diagnostics data and remedy the error.
			The configured structure does not correspond to the actual structure of the ET 200SP .	Check the structure of the ET 200SP to see whether a module is missing or defective, or whether a non-configured module is plugged.
			Invalid configuration states.	See section Invalid configuration states of the ET 200SP on PROFINET IO (Page 44)
			Parameter error in the I/O module.	Evaluate the display of the module status in STEP 7 and eliminate the error in the respective I/O module.
Not relevant	Not relevant	On	Maintenance	See section Maintenance events (Page 42)
Flashes	Flashes	Not relevant	Invalid BusAdapter	Check the BusAdapter.
Flashes	Flashes	Flashes	The "Node flash test" is run (the LEDs LK1 and LK2 of the PROFINET interface also flash).	---
			Hardware or firmware defective (the LEDs LK1 and LK2 of the PROFINET interface do not flash).	Run a firmware update. If the error persists, contact Siemens Industry Online Support. Replace the interface module.
Not relevant	Flashes	Flashes	Configuration error on backplane bus	Insert the server module as bus termination or check the number of inserted modules.

* PWR LED on (on the interface module): Check the backplane bus for a short circuit.

PWR LED on the interface module

Table 5- 2 Status display of the PWR LED

PWR LED	Meaning	Remedy
Off	Supply voltage not present or too small	Check the supply voltage.
On	Supply voltage present	---

LK1/LK2 and MT1/MT2 LEDs on the BusAdapter

Table 5- 3 Status and error displays of LK1/LK2 and MT1/MT2 LEDs

LED		Meaning	Remedy
LK1/LK2	MT1/MT2*		
Off	Not relevant	There is no Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner (e.g. IO controller).	Check whether the bus cable to the switch/IO controller is interrupted.
On	Not relevant	There is an Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner (e.g. IO controller).	---
Flashes	Not relevant	The "Node flash test" is run (the RN/ER/MT LEDs also flash).	---
Not relevant	Off	No error	---
Not relevant	On	• Fiber-optic error • Maintenance demanded: Attenuation through the fiber-optic cable is so high that operation will soon no longer be possible.	Causes and measures for the transmission route: • Replacement of fiber-optic cable if damaged or aged • Correct installation of the PROFINET connector/PROFINET connections • Adherence to maximum length of 50 m for POF cable or 100 m for PCF cable. • Secure fit of the FOC connector

* Available only on BA 2×SCRJ, BA SCRJ/RJ45 and BA SCRJ/FC BusAdapters

LED display of configuration errors

Configuration errors of the ET 200SP distributed I/O system are output on the interface module by the ER (red) and MT (yellow) LEDs.

The following configuration errors are indicated by the LEDs:

- Missing server module
- Interruptions or short circuit on the backplane bus

Principle of operation

You determine the information for cause of the error with the LED error display. After notification by the flash signal, the error type is displayed followed by the error location/error code.

The LED error display

- is active during POWER ON as well as during operation.
- Has priority over all other states that are displayed by means of the ER and MT LEDs.
- remains turned on until the cause of the error has been corrected.

Table 5- 4 Display of error type and error location

Sequence		Description
1	ER and MT LEDs flash 3x with 0.5 Hz	Signaling of error type
2	MT LED flashes with 1 Hz	Display of the error type (decimal)
3	ER and MT LEDs flash 3x with 2 Hz	Signaling of error location/error code
4	ER LED flashes with 1 Hz	Display of tens digit (decimal) of the error location/error code
5	MT LED flashes with 1 Hz	Display of ones digit (decimal) of the error location/error code
6	Repeat steps 1 to 5 until the cause of the error has been corrected.	

Error display

The following table shows the possible causes of error that can occur.

Table 5- 5 Error display

Error type (MT)	Error location (ER/MT)	Cause of error	Remedy
1	65*	• Missing server module • Interruptions at the backplane bus • Short circuit of communication on the backplane bus	Check the configuration of the ET 200SP.

* Slot

Note

A short circuit in the backplane bus supply or the bus connection supply is indicated by the following LEDs:

- PWR LED: On
- RN-, ER and MT LED: Off

5.2 Interrupts

Introduction

The I/O device generates interrupts as a reaction to specific error events. Interrupts are evaluated based on the I/O controller used.

Evaluating interrupts with I/O controllers

The ET 200SP distributed I/O system supports the following interrupts:

- Diagnostics interrupts
- Hardware interrupts
- Swapping interrupts
- Maintenance events

In the event of an interrupt, interrupt OBs are automatically called in the CPU of the IO controller.

Information on the cause and class of the error is already available, based on the OB number and start information.

Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).

System diagnostics

STEP 7 (TIA Portal) offers innovative system diagnostics for the devices of the S7-1500 (IO controller CPU S7-1500) and the ET 200SP (IO device) automation system. Independent of the cyclic user program, messages are made available on the display of the CPU S7-1500, the CPU web server and the HMI device.

For more information on system diagnostics, refer to the System Diagnostics function manual. (http://support.automation.siemens.com/WW/view/en/59192926).

5.2.1 Triggering of a diagnostics interrupt

Triggering of a diagnostics interrupt

For an incoming or outgoing event (e.g. wire break on a channel of an I/O module), the module triggers a diagnostics interrupt if this is configured accordingly.

The CPU interrupts the processing of the user program and processes the diagnostics interrupt (OB 82). The event which led to the interrupt is entered in the start information of the diagnostics interrupt (OB 82).

5.2.2 Triggering a hardware interrupt

Triggering a hardware interrupt

During a hardware interrupt, the CPU interrupts the processing of the user program and processes the hardware interrupt block (e.g., OB 40). The event that triggered the interrupt is entered in the start information of the hardware interrupt block.

Note

Diagnostics "Hardware interrupt lost" (from I/O module)

Avoid creating hardware interrupts cyclically.

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

5.2.3 Triggering a swapping interrupt

Triggering a remove/insert interrupt

In the event of a remove/insert interrupt, the CPU interrupts processing of the user program and processes the remove/insert interrupt (OB 83). The event which led to the interrupt is entered in the start information of the remove/insert interrupt (OB 83).

Note

Parameter assignment error after removal/insertion

If you write data records from the user program to the modules of the distributed I/O, make sure that these modules actually exist and are available. You can do this by evaluating the remove/insert interrupt (OB83). After inserting a module, the remove/insert interrupt (OB83) is not called until the module has started up and its parameters are assigned. This ensures that data record operations can be executed without errors.

5.3 Alarms

Actions after a diagnostics alarm

There can be more than one diagnostic alarm at a given time. Actions initiated by diagnostics alarms:

- The ER LED on the interface module flashes.
- Diagnostic data is reported as diagnostic interrupts to the CPU of the IO controller and can be read via data records.
- Incoming diagnostics alarms are saved to the diagnostics buffer of the I/O controller.
- The diagnostics interrupt (OB 82) is called. If the diagnostics interrupt (OB 82) is not available, the I/O controller goes into STOP mode.

You can find more information on this topic in the STEP 7 online help.

Reading out the diagnostics data

Table 5- 6 Reading the diagnostics with STEP 7

Automation system with IO controller	Application	See...
SIMATIC S7	Diagnostics as plain text in STEP 7 in online and diagnostics view	STEP 7 online help • As of STEP 7 V14, function manual PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) • As of STEP 7 V5.5, system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
	Instruction "RDREC" (SFB 52) Read data records from the IO device	
	Instruction "RALRM" (SFB 54) Receive interrupts from the IO device	

Additional information on the data records for PROFINET IO

The structure of the diagnostic data records and programming examples are available in the Programming Manual From PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) and in Example application (http://support.automation.siemens.com/WW/view/en/24000238).

Causes of error and troubleshooting

The causes of error and remedies for the diagnostics alarms are described in the product manuals for I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300) in the section "Interrupts/diagnostics alarms".

See also

Channel diagnostics (Page 43)

5.3.1 Maintenance events

Triggering of a maintenance event

The PROFINET IO interfaces of the interface module support the diagnostic concept and maintenance concept in PROFINET IO according to the IEC 61158-6-10 standard. The goal is to detect and remove potential problems as soon as possible.

For the interface module, maintenance events signal to the user when a network component must be checked or replaced.

The CPU interrupts the processing of the user program and processes the diagnostics interrupt (OB 82). The event that triggered the maintenance event is entered in the start information of the diagnostics interrupt (OB 82).

At the following events:

- The interface module signals a maintenance event to the higher-level diagnostic system
- The I/O module signals a maintenance event.

Table 5- 7 Triggering of a maintenance event

Maintenance alarm	Event	Meaning
Maintenance demanded (*maintenance demanded*) MT LED is lit	Synchronization loss	• No synchronization telegram received No synchronization telegram was received by the sync master within the timeout period after parameter assignment or during operation. • Successive synchronization telegrams are located outside permitted limits (jitter)
	Critical FOC attenuation	The received light intensity at the FOC port is critical. The FOC should be replaced.
	Maintenance request from I/O module	An I/O module signals a maintenance event that is sent and displayed by the interface module

System alarms in STEP 7 (TIA Portal)

The maintenance information is generated in STEP 7 with the following system alarms:

- Maintenance demanded - indicated for each port by a yellow wrench icon  in the device view or in the hardware configuration.

You can find more information in the STEP 7 online help.

5.3.2 Channel diagnostics

Function

Channel-related diagnostics provides information about channel faults in modules.

Channel faults are mapped as channel diagnostics data in IO diagnostics data records.

The data record is read using the instruction "RDREC".

Structure of the diagnostics data records

The data records supported by the ET 200SP distributed I/O system are based on the standard PROFINET IO - Application Layer Service Definition V2.3.

You can download the standard PROFIBUS user organization (http://www.profibus.com) from the homepage of the PROFIBUS User Organization.

Codes of the extended channel diagnostics

With the IM 155-6 PN HS interface module, the following extended channel diagnostics are reported:

Slot number	ChannelError-Type (CET)	ExtendedChannel-ErrorType (ECET)	Associated value AddValue	Diagnostics
Module slot	0x0602	0x0691	Slot	Station stop - module parameter "Potential group" faulty or incorrect BaseUnit in actual slot (AddValue)
Slot 0	0x0602	0x0693	0x00	Diagnostics with missing server module
	0x0602	0x0698	0x00	Diagnostics backplane bus too long
	0x0602	0x0699	Slot	Diagnostics with incorrect bus configuration
	0x0602	0x069C	0x00	Diagnostics with incorrectly plugged BusAdapter
Server module slot	0x0610	0x06B0	0x00	Group diagnostics: Missing supply voltage L+ for the potential groups Note: The slot in which the light-colored BaseUnit of the respective load module is located is coded in the "ChannelNumber" element.

5.3.3 Invalid configuration states of the ET 200SP on PROFINET IO

Invalid configuration states

The following invalid configuration states of the ET 200SP distributed I/O system lead to the failure of the IO device or prevent the exchange of user data with the I/O modules.

- Number of modules exceeds maximum configuration
- Faulty backplane bus (e.g. defective BaseUnit). ET 200SP backplane bus interruptions do not trigger an interrupt.
- At least one I/O module is installed in a different BaseUnit than the one configured in the parameters.
- Missing server module
- Invalid or incorrectly configured BusAdapter.

Note

Removal of the server module will trigger a station stop. All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) but the interface module is still exchanging data.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

See also

Status and error displays (Page 34)

Channel diagnostics (Page 43)

5.3.4 Failure of supply voltage L+ at BaseUnit BU...D

Failure of the supply voltage L+

The I/O modules react as follows to failure of the supply voltage L+ on the BaseUnit BU...D:

- If an I/O module is removed during failure of the supply voltage, a pull alarm is generated.
- If an I/O module is installed during failure of the supply voltage, an insert alarm is generated.

5.3.5 STOP of the IO controller and recovery of the IO device

STOP of the SIMATIC IO controller

Diagnostics frames received from the IO device while the IO controller is in STOP do not initiate a call of any corresponding OBs when the IO controller goes into RUN. You must read the data record $E00C_H$ with the "RDREC" instruction in OB 100. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Recovery of the SIMATIC IO devices

If you want to read the diagnostics of a station after its return, you have to read the $E00C_H$ data record with the "RDREC" instruction in the rack interrupt (OB 86). This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Compatibility 6

Status of the supply voltage

Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules in the following table without a parameter assignment, the status of the supply voltage is always signaled as "1" regardless of the actual status of the supply voltage.
- If a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "Missing supply voltage L+" is signaled for this potential group.

Modules	Order number
DI 8x24VDC ST	6ES7131-6BF00-0BA0
DI 16x24VDC ST	6ES7131-6BH00-0BA0
DI 8x24VDC HF	6ES7131-6BF00-0CA0
DQ 4x24VDC/2A ST	6ES7132-6BD20-0BA0
DQ 4x24VDC/2A HF	6ES7132-6BD20-0CA0
DQ 8x24VDC/0,5A ST	6ES7132-6BF00-0BA0
DQ 8x24VDC/0,5A HF	6ES7132-6BF00-0CA0
DQ 16x24VDC/0,5A ST	6ES7132-6BH00-0BA0

Reaction times for fail-safe modules

The following maximum reaction time of the interface module must be taken into account when calculating the reaction times of fail-safe modules:
maximum reaction time = configured update time + 400 µs (but at least 1.4 ms)

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

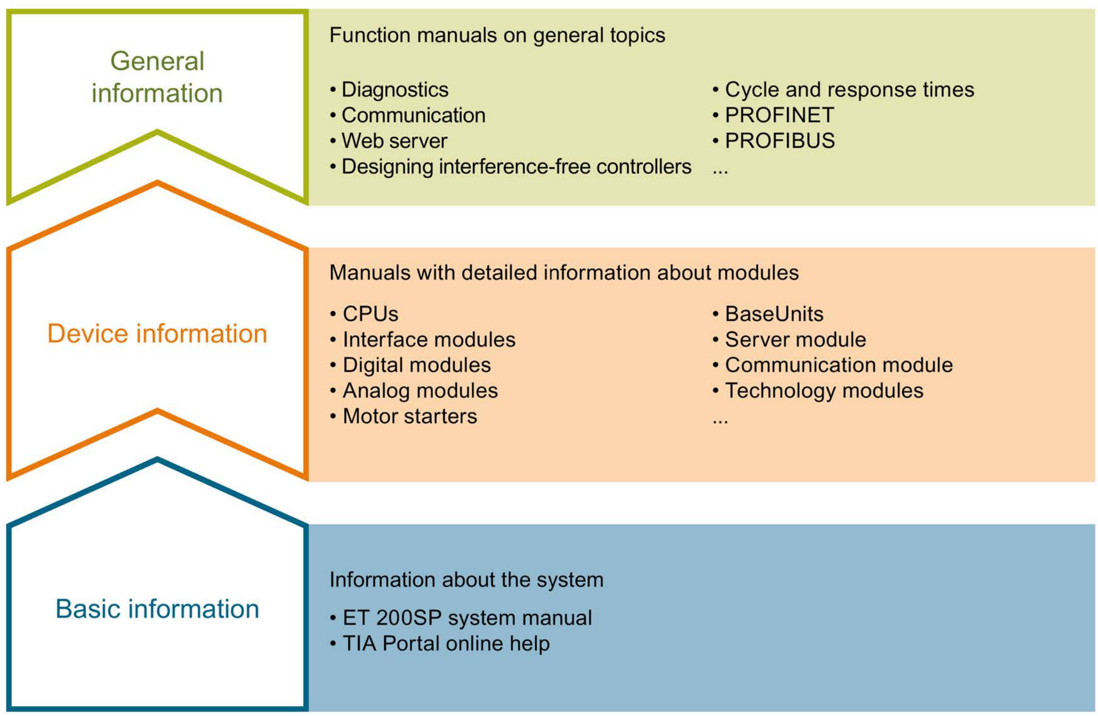
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Product overview 2

2.1 Properties

Article number

6ES7155-6AU01-0BN0 (IM 155-6 PN ST interface module and server module)

6ES7155-6AA01-0BN0 (IM 155-6 PN ST interface module with BusAdapter BA 2×RJ45 and server module)

View of the module

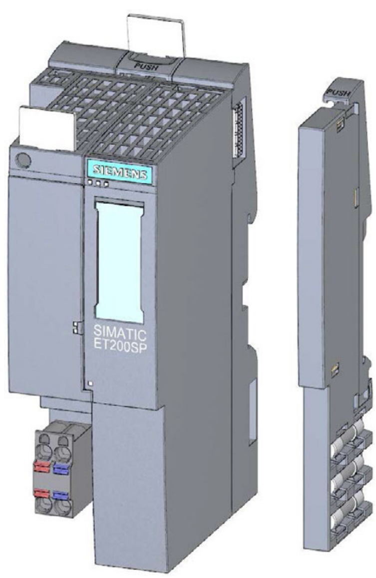


Figure 2-1 View of the IM 155-6 PN ST interface module and the server module

Properties

The module has the following technical properties:

- Connects the ET 200SP distributed I/O system with PROFINET IO
- Supply voltage 1L+ 24 V DC (SELV/PELV). The connection plug is included in the scope of delivery of the interface module.
- PROFINET IO connection via selectable BusAdapter for RJ45 bus connector (BA 2×RJ45) or for direct connection of the bus cable (BA 2×FC)
- Use of fail-safe modules
- As of firmware version V 3.0, you can plug a light-colored or a dark-colored BaseUnit into slot 1.

The module supports the following functions (Page 13)

Maximum configuration

- 32 I/O modules
- 512 bytes I/O data
- 1 m backplane bus (without interface module)

Accessories

The following accessories can be ordered separately:

- BA 2xRJ45 BusAdapter
- BA 2xFC BusAdapter
- 24 V DC connector
- Labeling strips
- Reference identification label

Note

The interface module is also available as a bundle with the BusAdapter BA 2xRJ45 (and the server module). The article number is 6ES7155-6AA01-0BN0.

A detailed list of the available accessories can be found in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Server module

The server module is included in the scope of delivery of the interface module and available separately as an accessory.

The server module has the following properties:

- Terminates the backplane bus of the ET 200SP distributed I/O system
- Features a holder for 3 spare fuses (5 × 20 mm)
- Identification data I&M 0 to 3

Note

You need to configure and assign parameters to the server module in the configuration software.

To do this, place the server module in the last configuration slot and enable the parameter Group diagnostics: Missing supply voltage L+. When there are 32 I/O modules, the server module is inserted in slot 33.

You can find more information in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

First BaseUnit of an ET 200SP in the configuration (as of V3.0)

Note

First BaseUnit of an ET 200SP in the configuration

The first BaseUnit of an ET 200SP station may be a dark-colored one if an AC I/O module or AI Energy Meter ST is plugged. Please note the information on limiting the overvoltage and power rating in the AC I/O module manuals.

A light-colored BaseUnit must be plugged into the slot of the first 24 V DC I/O module in order to route the 24 V DC supply voltage via a fuse.

Pay attention to the type of the BaseUnits during the configuration.

As of firmware V3.x, the interface modules support plugging dark-colored BaseUnits in slot 1. This means that modules without a connection to the integrated voltage buses P1 and P2 can now also be configured starting with slot 1. Currently, this applies to the following modules:

- AI EnergyMeter
- DI 4x120..230VAC ST (6ES7131-6FD00-0BB1)
- DQ 4x24..230VAC/2A ST (6ES7132-6FD00-0BB1)

Requirement for configuration of these modules in slot 1:

- Configuration via GSD or GSDML
- Configuration as of STEP 7 V5.5 SP4 with
  - HSP0241 V2.0 for IM155-6 PN ST
  - HSP0242 V2.0 for IM155-6 DP HF
  - HSP0255 V3.0 for IM155-6 PN HF
- Configuration as of STEP 7 V13 SP1

2.2 Functions

Introduction

The interface module supports the following PROFINET IO functions:

- Integrated switch with 2 ports
- Supported Ethernet services: ping, arp, network diagnostics (SNMP)/MIB-2, LLDP-MIB and MRP-MIB
- Port diagnostics
- Disabling ports
- Isochronous real-time communication
- Minimum update time 1 ms
- Prioritized startup
- Media redundancy (MRP)
- Shared device
- Support of submodules on suitable I/O modules
- Module-internal Shared Input/Shared Output (MSI/MSO)
- Device replacement without PG and without topological configuration
- Reset to factory settings via PROFINET IO
- Firmware update via PROFINET IO
- Station extension via ET-Connection
- The BusAdapter provides the connection system for PROFINET IO. The following versions are available for the IM 155-6 PN ST interface module:
  - For standard RJ45 connector: BA 2×RJ45
  - For direct connection of the bus cable: BA 2×FC

The interface module supports additional functions:

- Identification data I&M 0 to 3
- PROFIenergy
- Use of fail-safe modules
- Configuration control (option handling)
- Value status (quality information, QI) of I/O modules

Requirements

The table below shows the software requirements for a configuration with the IM 155-6 PN ST interface module:

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of	Configuration software		
			Configuration with GSD file (http://support.automation.siemens.com/WW/view/en/19698639/130000)/software from a third-party manufacturer [1]	STEP 7 as of V5.5 SP3 with HSP241	STEP 7 (TIA Portal), as of V11 SP2
Real-time communication	1	V1.0.0	X	X	X
Isochronous real-time communication	1	V1.0.0	X	X	X
Prioritized startup	1	V1.0.0	X	X	X
Device replacement without programming device	1	V1.0.0	X	X	X
Media redundancy (MRP)	1	V1.0.0	X	X	X
Shared device	1	V1.0.0	X	X	X (as of V13 SP1)
PROFIenergy	1	V1.0.0	---	X	X
Use of fail-safe modules	1	V1.0.1	X	X	X (as of V13 SP1)
Module-internal Shared Input/Shared Output (MSI/MSO)	1	V3.1.0	X	X	X (as of V13 SP1)
Station extension via ET-Connection	5	V3.1.0	X	X	X (as of V13 SP1)
User data 512 bytes	1	V3.1.0	X	X	X (as of V13 SP1)
Distribution of module channels to multiple submodules	1	V3.3.0	X	X (as of V5.5 SP4, HSP0241 V3)	X (as of V13 SP1, Update 6)
Interface module; article number: 6ES7155-6AU01-0BN0	1	V4.1	X	X (as of V5.5 SP4, HSP241 V4)	X (as of V14 HSP205)

[1] Systems of third-party manufacturers: Depending on the range of functions of the third-party system

Cabling with fixed connection setting

If you set a fixed connection setting of the port in STEP 7, you should also disable "Autonegotiation/Autocrossover".

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

Isochronous real-time communication

Synchronized transmission method for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth within the send clock is available for IRT data. The reserved bandwidth ensures that the IRT data can also be transferred without being affected by another high network load (e.g. TCP/IP communication or additional real time communication) at reserved, chronologically synchronized intervals.

A topological configuration is required for IRT.

Note

IO controller as sync master with IRT communication

We recommend also operating the IO controller as a sync master when configuring the IRT communication.

Otherwise, IO devices with IRT and RT configuration could fail as a result of sync master failure.

You can find more information on the configuration of synchronized PROFINET devices in sync domains in the STEP 7 online help and:

- As of STEP 7 V12, in the PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

Prioritized startup

Prioritized startup describes the PROFINET IO functionality for accelerating the startup of IO devices in a PROFINET IO system with IRT and RT communication.

The function reduces the time that the appropriately configured IO devices require in order to return to cyclic user data exchange in the following cases:

- After the supply voltage has returned
- After a station has returned
- After IO devices have been activated

Note

Dependency of the startup time

The interface module permits startup times from 0.9 s.

The startup time depends on the number and type of modules.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

Device replacement

Device replacement without topological configuration

The device name is also stored on the BusAdapter in addition to the interface module. A device name saved on the BusAdapter is the requirement for device replacement without topological configuration.

Storing the name on the BusAdapter and the interface module produces a range of scenarios for using the device name when the interface module is replaced.

Table 2- 2 Scenarios for using the device name

	Interface module empty	**Interface module with device name**
BusAdapter empty	No device name available	The device name from the interface module is used and copied to the BusAdapter.
BusAdapter with device name	The device name from the BusAdapter is used and copied to the interface module.	The device name from the BusAdapter is used and copied to the interface module if this has a different device name.

Be aware of the following constraints:

- Resetting to factory settings deletes the device name in both the interface module and the BusAdapter. To prevent the device name from being deleted in the BusAdapter, you can remove the BusAdapter from the interface module before resetting to factory settings.
- When a BusAdapter is replaced, a device name stored in the BusAdapter is applied to the interface module after a POWER ON.
- Do not pull/plug the BusAdapter while under voltage. If you pull/plug the BusAdapter while under voltage, the interface module restarts.

Device replacement with topological configuration

IO devices with this function can be replaced in a simple manner:

- The device name does not have to be assigned with the programming device.

The replacement IO device is assigned the device name by the IO controller and not by the programming device. The IO controller uses the configured topology and the neighboring relationships determined by the IO devices for this purpose. All involved devices must support the LLDP protocol (Link Layer Discovery Protocol). The configured target topology must match the actual topology.

IO devices that have already been used in another configuration should be reset to their factory settings before reuse (see system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

Replacement of an IM 155-6 PN ST

In a replacement scenario, any IO devices in operation must be reset to their as-delivered state via "Reset to factory settings" (see the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Media redundancy (MRP)

Function for safeguarding communication and plant availability. A ring topology ensures that an alternative communication path is made available if a transmission route fails.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

Shared device

IO device which makes its data available to multiple IO controllers.

The interface module supports shared device at submodule level.

If **there is no validity check of the shared device projects by the Engineering System**, note the following:

- Make sure the configurations are consistent. In particular, modules or submodules may only be assigned to one controller. Multiple assignment will result in an error; the module or submodule will only be available in the first controller.
- If you reconfigure the shared device configurations without the validity check mentioned above, you must commission the ET 200SP once again. This means that you have to reload the projects of all involved IO controllers to the specific CPU after reconfiguration and, if necessary, switch the interface module POWER OFF/POWER ON.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856)
- As of STEP 7 V5.5, in the PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127) system manual

---

Note

In the case of a shared device application, make sure that all controllers work with the same send clock. If controllers do not have the same send clock, the differing send clock can result in communication relationships that are not set up.

If you set up all controllers in one project, the same send clock is ensured. Set the same send clock for engineering in separate projects.

Submodules

The IM 155-6 PN ST interface module supports the division of I/O modules into up to 4 submodules. This allows parts of an I/O module to be separately configured and parameterized.

It is possible to assign each of these submodules to different IO controllers.

The functions:

- Firmware update
- Write I&M data
- Calibration
- PROFIenergy

can only be executed if you have configured submodule 1 during configuration.

Module-internal Shared Input/Shared Output (MSI/MSO)

The Module-internal Shared Input function allows an input module to make its input data available to up to two IO controllers (for ET 200SP PN ST). Each controller has read access to the same channels.

The Module-internal Shared Output function allows an output module to make its output data available to up to two IO controllers. One IO controller has write access. A second IO controller can have read access to the same channels.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856)

Value status

The IM 155-6 PN ST interface module supports I/O modules with value status.

Additional information on the value status can be found in the manuals for the I/O modules.

2.2.1 PROFIenergy

Properties

PROFIenergy (for PROFINET) reduces the energy consumption by using PROFIenergy commands during production-free periods.

Reference

You can find more information on PROFIenergy in the:

- Product manual I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300)
- PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856) function manual.
- System manual PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127)
- PROFIenergy (http://support.automation.siemens.com/WW/view/en/66928686) product information.
- Internet (http://www.profibus.com) under Common Application Profile PROFIenergy; Technical Specification for PROFINET; Version 1.0; January 2010; Order No: 3.802.

2.2.2 Use of fail-safe modules

Properties

The IM 155-6 PN ST interface module as of firmware V1.0.1 supports the use of fail-safe modules.

Reference

You can find more information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2.3 Use of technology modules

Technology modules

As of firmware version V3.1, the interface module IM 155-6 PN ST supports the "Position input for Motion Control" mode of the technology modules TM Count 1x24V (6ES7138-6AA00-0BA0) and TM PosInput 1 (6ES7138-6BA00-0BA0).

2.2.4 Configuration control (option handling)

Properties

Configuration control allows you to prepare your distributed I/O system for future extensions or changes. Configuration control means that you can configure the planned maximum configuration of your distributed I/O system in advance and vary it later in a flexible manner by means of the user program.

Reference

You can find more information on configuration control

- in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual
- on the Internet under the following link: Application collection (http://support.automation.siemens.com/WW/view/en/29430270)
- in the STEP 7 online help.

Wiring 3

3.1 Pin assignment

24 V DC supply voltage

The following table shows the signal names and the descriptions of the pin assignment for a 24 V DC supply voltage.

Table 3- 1 Pin assignment 24 V DC supply voltage

View		Signal name[1]	Description
Connector	IM connection		
		1L+	24 V DC
		2L+	24 V DC (for looping through)[2]
		1M	Ground
		2M	Ground (for looping through)[2]

1 1L+ and 2L+ as well as 1M and 2M are bridged internally.

2 Maximum 10 A permitted.

PROFINET IO with BusAdapter BA 2×RJ45

The following table shows the signal name and description of the pin assignment of the BusAdapter BA 2×RJ45.

Table 3- 2 PROFINET IO pin assignment with BusAdapter BA 2×RJ45

View	Signal name		Description
	1	TD	Transmit data +
	2	TD_N	Transmit data -
	3	RD	Receive data +
	4	GND	Ground
	5	GND	Ground
	6	RD_N	Receive data -
	7	GND	Ground
	8	GND	Ground

Note

PROFINET interface X1 Port 2

If autonegotiation is disabled, the RJ-45 socket (X1 Port 2) has the switch assignment (MDI-X).

PROFINET IO with BusAdapter BA 2×FC

The following table shows the signal name and description of the pin assignment of the BusAdapter BA 2×FC.

Table 3- 3 PROFINET IO pin assignment with BusAdapter BA 2×FC

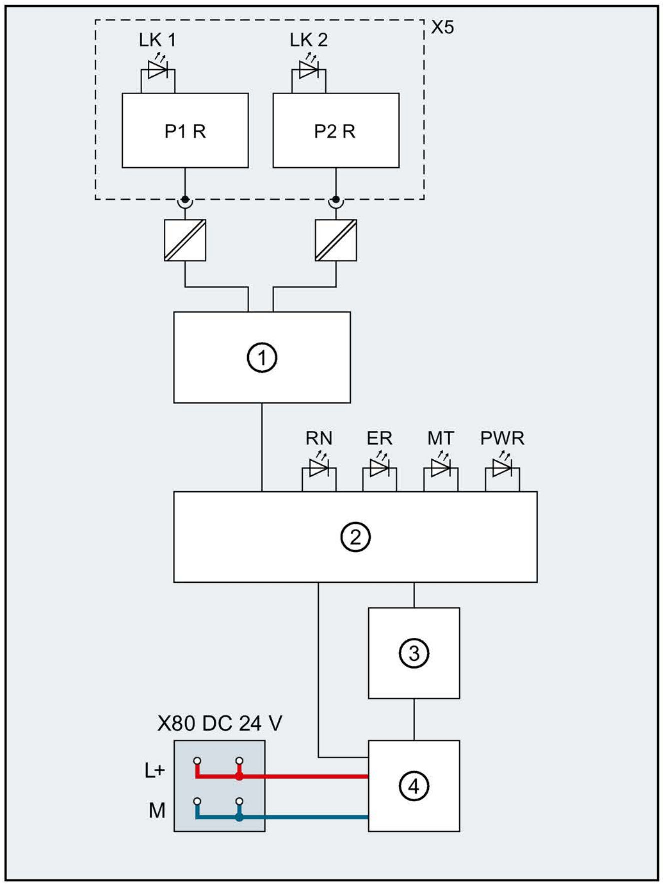
View	Signal name		Description
Port 1  Port 2	1	TD	Transmit data +
	2	RD	Receive data +
	3	TD_N	Transmit data -
	4	RD_N	Receive data -

Reference

You can find more information on accessories and how to connect the interface module in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Schematic circuit diagram

The following figure shows a block diagram of the IM 155-6 PN ST interface module.



①	Switch	L+	24 V DC supply voltage
②	ET 200SP backplane bus interface and electronics	M	Mass
③	Backplane bus	LK 1,2	TX/RX Link LED
④	Internal power supply	RN	RUN LED (green)
X80 24 V DC	Supply voltage infeed	ER	ERROR LED (red)
X5	BusAdapter	MT	MAINT LED (yellow)
P1 R	PROFINET interface X1 Port 1	PWR	POWER LED (green)
P2 R	PROFINET interface X1 Port 2		

Figure 3-1 Block diagram of the IM 155-6 PN ST interface module

Parameters/address space 4

4.1 Parameters

Parameters for IM 155-6 PN ST interface module

The following table shows the parameters for the IM 155-6 PN ST interface module.

Table 4- 1 Parameters for interface module IM 155-6 PN ST (GSD file)

Parameters	Value range	Default	Efficiency range
Configuration control	Disable/enable	Disable	ET 200SP

4.2 Explanation of parameters

4.2.1 Configuration control

You can use this parameter to enable the configuration control function in the ET 200SP distributed I/O system.

Note

If you configure the enable, the ET 200SP distributed I/O system requires a control data record 196 from the user program in order for the ET 200SP distributed I/O system to operate the I/O modules.

Reference

You can find more information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and in the STEP 7 online help.

4.3 Substitute value behavior

The substitute value behavior in the ET 200SP distributed I/O system is executed by the IO controller for each slot.

The respective output behaves according to its configured substitute value behavior:

- Current-free/voltage-free
- Output substitute value
- Keep last value

The substitute value behavior is triggered in the following cases:

- STOP controller
- Controller failure (connection interrupted)
- Firmware update
- Reset to factory settings
- Station stop, for example, due to:
  - Missing server module
  - Removing more than one I/O module at a time.
  - At least one I/O module installed on an incorrect BaseUnit
- Deactivating the IO device

Note

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage is switched off at the interface module.

The "current-free/voltage-free" behavior takes effect in the following cases:

- Firmware update
- Reset to factory settings
- Configuration control: The IM has not received a valid control data record 196 yet.
- Incorrectly configured module
- Module with incorrect parameter assignment

4.4 Status of the supply voltage L+ of the I/O modules

Introduction

The "Status of the supply voltage L+ of the I/O modules" is configured on the server module as of IM 155-6 PN ST V1.1.x and GSD file 04/2013. The input data can then be read out on the server module. You will find the relevant description in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) device manual.

Configurations

You can select two configurations for the IM 155-6 PN ST or the server module of the IM 155-6 PN ST in the configuration software:

- Configuration without input data
- Configuration with input data

Input data

You can read out the status of the supply voltage L+ for each I/O module of the ET 200SP in the input data (byte 0 to 3).

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	16	15	14	13	12	11	10	9
Byte 2	24	23	22	21	20	19	18	17
Byte 3	32	31	30	29	28	27	26	25

Slots of the I/O modules

Bit = 0: Supply voltage L+ missing or I/O module not installed

Bit = 1: Supply voltage L+ and I/O module available

Figure 4-1 Status of the supply voltage L+

Note

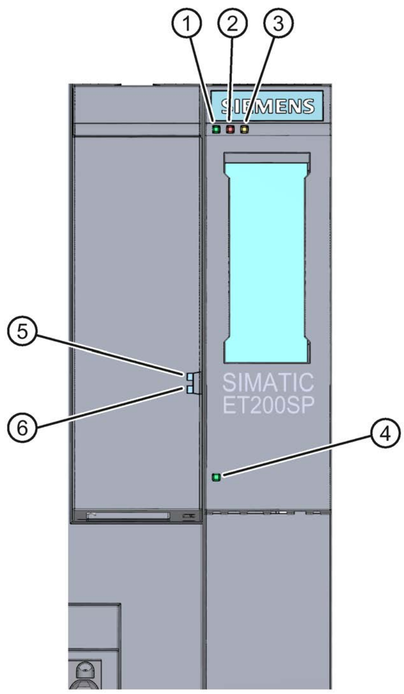
An inserted or missing server module always signals "bit = 0" for the slot.

5 Interrupts, diagnostics, error, and system messages

5.1 Status and error displays

LED display

The following diagram shows the LED display on the interface module and the BusAdapter.



① RN (green)
② ER (red)
③ MT (yellow)
④ PWR (green)
⑤ LK1 (green)
⑥ LK2 (green)

Figure 5-1 LED display on the interface module and BusAdapter

Meaning of the LEDs

The meaning of the status and error messages is described in the following tables.

RN/ER/MT LED on the interface module

Table 5- 1 RN/ER/MT status and error displays

LEDs			Meaning	Remedy
RN (RUN)	ER (ERROR)	MT (MAINT)		
Off	Off	Off	Missing or insufficient supply voltage on interface module.	Check the supply voltage or turn in on at the interface module. *
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-
Flashes	Off	Off	Interface module is deactivated.	Activate the interface module with the configuration software or the user program.
			Interface module is not configured.	Configure the interface module with the configuration software.
			ET 200SP starts up.	-
			ET 200SP is configured.	
			ET 200SP is reset to factory settings.	
On	Not relevant	Not relevant	ET 200SP is currently exchanging data with the IO controller.	
Not relevant	Flashes	Not relevant	Group errors and group error channels.	Evaluate the diagnostics data and remedy the error.
			The configured structure does not correspond to the actual structure of the ET 200SP .	Check the structure of the ET 200SP to see whether a module is missing or defective, or whether a non-configured module is plugged.
			Invalid configuration states.	See section Invalid configuration states of the ET 200SP on PROFINET IO (Page 41)
			Parameter error in the I/O module.	Evaluate the display of the module status in STEP 7 and eliminate the error in the respective I/O module.
Not relevant	Not relevant	On	Maintenance	See section Maintenance events (Page 36)
Flashes	Flashes	Flashes	The "Node flash test" is run (the LEDs LK1 and LK2 of the PROFINET interface also flash).	-
			Hardware or firmware defective (the LEDs LK1 and LK2 of the PROFINET interface do not flash).	Run a firmware update. If the error persists, contact Siemens Industry Online Support. Replace the interface module.

* PWR LED on (on the interface module): Check the backplane bus for a short circuit.

PWR LED on the interface module

Table 5- 2 PWR status display on the interface module

PWR LED	Meaning	Remedy
□ Off	Supply voltage not present or too small	Check the supply voltage.
■ On	Supply voltage present	-

LK1/LK2 LED on the BusAdapter

Table 5- 3 LK1/LK2status display on the BusAdapter

LEDs LK1/LK2	Meaning	Remedy
□ Off	There is no Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner (e.g. IO controller).	Check whether the bus cable to the switch/IO controller is interrupted.
■ On	There is an Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner (e.g. IO controller).	-
Flashes	The "Node flash test" is run (the RN/ER/MT LEDs also flash).	-

LED display of configuration errors

Configuration errors of the ET 200SP distributed I/O system are output on the interfacemodule by the ERROR (red) and MAINT (yellow) LEDs.

The following configuration errors are indicated by the LEDs:

- More than one I/O module pulled
- Missing server module
- Interruptions or short circuit on the backplane bus

Principle of operation

You determine the information for cause of the error with the LED error display. After notification by the flash signal, the error type is displayed followed by the error location/error code.

The LED error display

- is active during POWER ON as well as during operation.
- has priority before all other states displayed by the ERROR and MAINT LED.
- remains turned on until the cause of the error has been corrected.

Table 5- 4 Display of error type and error location

Sequence		Description
1	The ERROR and MAINT LEDs flash 3x at 0.5 Hz	Signaling of error type
2	MAINT LED flashes at 1 Hz	Display of the error type (decimal)
3	The ERROR and MAINT LEDs flash 3x at 2 Hz	Signaling of error location/error code
4	The ERROR LED flashes at 1 Hz	Display of tens digit (decimal) of the error location/error code
5	The MAINT LED flashes at 1 Hz	Display of ones digit (decimal) of the error location/error code
6	Repeat steps 1 to 5 until the cause of the error has been corrected.	

Error display

The following table shows the possible causes of error that can occur.

Table 5- 5 Error display

<table>
<tr><th>Error type (MAINT)</th><th>Error location (ERROR/MAINT)</th><th>Cause of error</th><th>Remedy</th></tr>
<tr><td rowspan="2">1</td><td>02 to 32*</td><td>The number of pulled I/O modules is displayed. The diagnostics data is generated starting with two pulled I/O modules.</td><td rowspan="2">Check the configuration of the ET 200SP.</td></tr>
<tr><td>65*</td><td>• Missing server module
• Interruptions at the backplane bus
• Short circuit of communication on the backplane bus</td></tr>
</table>

* Slot

Note

A short circuit in the backplane bus supply or the bus connection supply is indicated by the following LEDs:

- PWR LED: On
- RN-, ER and MT LED: Off

5.2 Interrupts

Introduction

The I/O device generates interrupts as a reaction to specific error events. Interrupts are evaluated based on the I/O controller used.

Evaluating interrupts with I/O controllers

The ET 200SP distributed I/O system supports the following interrupts:

- Diagnostics interrupts
- Hardware interrupts
- Swapping interrupts
- Maintenance events

In the event of an interrupt, interrupt OBs are automatically called in the CPU of the IO controller.

Information on the cause and class of the error is already available, based on the OB number and start information.

Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).

System diagnostics

In STEP 7 (TIA Portal), the updated system diagnostics is available for the devices of the S7-1500 automation system (IO controller S7-1500 CPU) and ET 200SP (IO device). Independent of the cyclic user program, messages are made available on the display of the CPU S7-1500, the CPU web server and the HMI device.

You will find more information on system diagnostics in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

5.2.1 Triggering of a diagnostics interrupt

Triggering of a diagnostics interrupt

For an incoming or outgoing event (e.g. wire break on a channel of an I/O module), the module triggers a diagnostics interrupt if this is configured accordingly.

The CPU interrupts the user program and processes the diagnostics block OB 82. The interrupt triggering event is logged in the start information of OB 82.

5.2.2 Triggering a hardware interrupt

Triggering a hardware interrupt

If there is a process interrupt, the CPU interrupts user program execution and processes the process interrupt block OB 40. The result that triggered the interrupt is added to the start information of the hardware interrupt block.

Note

Diagnostics "Hardware interrupt lost" (from I/O module)

Avoid creating hardware interrupts cyclically.

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

5.2.3 Triggering a swapping interrupt

Triggering a swapping interrupt

If there is a swapping interrupt, the CPU interrupts user program execution and processes the process interrupt block OB 83. The result that triggered the interrupt is added to the start information of OB 83.

5.3 Alarms

5.3.1 Diagnostics alarms

Actions after a diagnostics alarm

There can be more than one diagnostic alarm at a given time. Each diagnostics alarm initiates the following actions:

- The ERROR LED of the interface module flashes.
- Diagnostics are reported as diagnostic error interrupts to the CPU of the IO controller and can be read via data records.
- Incoming diagnostics alarms are saved to the diagnostics buffer of the I/O controller.
- OB 82 is called. If OB 82 is not available, the I/O controller goes into STOP mode.

You can find more information in the STEP 7 online help.

Reading the diagnostics

Table 5- 6 Reading the diagnostics with STEP 7

Automation system with IO controller	Application	See...
SIMATIC S7	Diagnostics as plain text in STEP 7 using Online and Diagnostics view	STEP 7 online help • as of STEP 7 V12 function manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856) • as of STEP 7 V5.5 system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
	Instruction "RDREC" (SFB 52) Read data records from the IO device	
	Instruction "RALRM" (SFB 54) Receive interrupts from the IO device	

Additional information on the data records for PROFINET IO

The structure of the diagnostic data records and programming examples are available in the programming manual From PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) and in Example application (http://support.automation.siemens.com/WW/view/en/24000238).

Causes of error and troubleshooting

The causes of error and remedies for the diagnostics alarms are described in the Product Manuals for I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300) in the section, "Interrupts/diagnostics alarms".

See also

Channel diagnostics (Page 37)

5.3.2 Maintenance events

Triggering of a maintenance event

The PROFINET IO interfaces of the interface module support the diagnostic concept and maintenance concept in PROFINET IO according to the IEC 61158-6-10 standard. The goal is to detect and remove potential problems as soon as possible.

For the interface module, maintenance events signal to the user when a network component must be checked or replaced.

The CPU interrupts user program execution and processes the diagnostic block OB 82. The event that triggered the maintenance event is entered in the start information of the OB 82.

The interface module signals a maintenance event to the higher-level diagnostic system in the case of the following events:

Table 5- 7 Triggering of a maintenance event

Maintenance alarm	Event	Meaning
Maintenance demanded (*maintenance demanded*) LED MAINT is lit.	Synchronization loss	• No synchronization frame received No synchronization frame was received by the sync master within the timeout period after parameter assignment or during operation. • Successive synchronization frames are located outside permitted limits (jitter)

System events in STEP 7 (TIA Portal)

The maintenance information is generated in STEP 7 with the following system events:

- Maintenance demanded - indicated for each port by a yellow wrench icon in the device view or in the hardware configuration.

You can find more information in the STEP 7 online help.

5.3.3 Channel diagnostics

Function

Channel-related diagnostics provides information about channel faults in modules.

Channel faults are mapped as channel diagnostics data in IO diagnostics data records.

The data record is read using the instruction "RDREC".

Structure of the diagnostics data records

The data records supported by the ET 200SP distributed I/O system are based on the standard PROFINET IO - Application Layer Service Definition V2.3.

You can purchase the standard from the PROFIBUS User Organization on the Internet (http://www.profibus.com).

Coding of the extended channel diagnostics (as of firmware version V3.3.0)

With the IM 155-6 PN ST interface module, the following extended channel diagnostics are reported:

Slot number	ChannelError-Type (CET)	ExtendedChannel-ErrorType (ECET)	Associated value AddValue	Diagnostics
Module slot	0x0602	0x0691	Slot	Station stop - module parameter "Potential group" faulty or incorrect BaseUnit in actual slot (AddValue)
Slot 0	0x0602	0x0693	0x00	Diagnostics with missing server module
	0x0602	0x0698	0x00	Diagnostics backplane bus too long
	0x0602	0x0699	Slot	Diagnostics with incorrect bus configuration
	0x0602	0x069C	0x00	Diagnostics with incorrectly plugged BusAdapter
Server module slot	0x0610	0x06B0	0x00	Group diagnostics: Missing supply voltage L+ for the potential groups Note: The slot in which the light-colored BaseUnit of the respective load module is located is coded in the "ChannelNumber" element.

Structure of the manufacturer-specific diagnostics data records (firmware version < V3.3.0)

The structure of the diagnostics data records is differentiated by the BlockVersion. The following BlockVersion applies to the IM 155-6 PN ST interface modules:

Table 5- 8 Structure of the manufacturer-specific diagnostics data records

IM 155-6 PN ST interface module	BlockVersion
6ES7155-6AU00-0BN0	W#16#0101

Manufacturer-specific diagnostics in the User Structure Identifier (USI)

The following manufacturer-specific diagnostics are signaled in the USI with the IM 155-6 PN ST interface module:

Table 5- 9 Manufacturer-specific diagnostics in the USI

USI no. W#16#...	Diagnostics
0003	Group diagnostics: Missing supply voltage L+ for the potential groups *
0004	Diagnostics with missing server module
0005	Diagnostics when more than one I/O module has been pulled
0006	Diagnostics with incorrect BaseUnit
0007	Diagnostics with incorrect bus configuration

* As of IM 155-6 PN ST V1.1.x and GSD file 04/2013, this diagnostics is only signaled if the "Group diagnostics: Missing supply voltage L+" parameter has been activated.

Reserved			1

5.3.4 Invalid configuration states of the ET 200SP on PROFINET IO

Invalid configuration states

The following invalid configuration states of the ET 200SP distributed I/O system lead to the failure of the IO device or prevent the exchange of user data with the I/O modules.

- Number of modules exceeds maximum configuration
- Faulty backplane bus (e.g. defective BaseUnit). ET 200SP backplane bus interruptions do not trigger an interrupt.
- At least one I/O module is installed in a different BaseUnit than the one configured in the parameters.
- Missing server module
- Invalid or incorrectly configured BusAdapter

Note

If you drag more than one I/O module or the server module the node will stop. All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) but the interface module is still exchanging data.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

See also

Status and error displays (Page 28)

Channel diagnostics (Page 37)

5.3.5 Failure of supply voltage L+ at BaseUnit BU...D

Failure of the supply voltage L+

The I/O modules react as follows to failure of the supply voltage L+ on the BaseUnit BU...D:

- If an I/O module is removed during failure of the supply voltage, a pull alarm is generated.
- If an I/O module is installed during failure of the supply voltage, an insert alarm is generated.

5.3.6 STOP of the IO controller and recovery of the IO device

STOP of the SIMATIC IO controller

Diagnostics frames received from the IO device while the IO controller is in STOP do not initiate a call of any corresponding OBs when the IO controller goes into RUN. You must read the data record $E00C_H$ with the "RDREC" instruction in OB 100. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Recovery of the SIMATIC IO devices

If you want to read the diagnostics of a station after its return, you have to read the $E00C_H$ data record with the "RDREC" instruction in OB 86. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Compatibility 6

Compatibility between the versions of the IM 155-6 PN ST

The table below describes which version you can use in the configuration for which actually plugged version of the IM 155-6 PN ST interface module. The table also describes the functional differences of the versions of the IM 155-6 PN ST interface module.

IM 155-6 PN ST configured	IM 155-6 PN ST plugged					Changes compared to previous version
	V1.0.x	V1.1.x	V3.1.x	V3.3.x	V4.1.x	
V1.0	✓	✓	✓	✓	✓	---
V1.1	---	✓	✓	✓	✓	• The "Group diagnostics: Missing supply voltage L+" parameter can be set on the server module • "Status of supply voltage L+ of the I/O modules" can be configured on the server module
V3.1	---	---	✓	✓	✓	• User data 512 bytes • Station extension via ET-Connection
V3.3	---	---	---	✓	✓	• Support of submodules
V4.1	---	---	---	---	✓	---

Note

IM 155-6 PN ST (6ES7155-6AU00-0BN0) with firmware version V4.1

You can upgrade the previous version of the IM 155-6 PN ST interface module (6ES7155-6AU**00**-0BN0) to the firmware version V4.1. In this case configure the module as IM 155-6 PN ST interface module (6ES7155-6AU**01**-0BN0) with firmware version V4.1.

Status of the supply voltage

Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules in the following table without a parameter assignment, the status of the supply voltage is always signaled as "1" regardless of the actual status of the supply voltage.
- If a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "Missing supply voltage L+" is signaled for this potential group.

Modules	Article number
DI 8x24VDC ST	6ES7132-6BF00-0BA0
DI 16x24VDC ST	6ES7131-6BH00-0BA0
DI 8x24VDC HF	6ES7132-6BF00-0CA0
DQ 4x24VC/2A ST	6ES7132-6BD20-0BA0
DQ 8x24VDC/0,5A ST	6ES7132-6BF00-0BA0
DQ 16x24VDC/0,5A ST	6ES7132-6BH00-0BA0
DQ 8x24VDC/0,5A HF	6ES7131-6BF00-0CA0

Reaction times for fail-safe modules

The following maximum reaction time of the interface module must be taken into account when calculating the reaction times of fail-safe modules:
maximum reaction time = configured update time + 400 μs (but at least 1.4 ms)

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes labeled as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product, or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

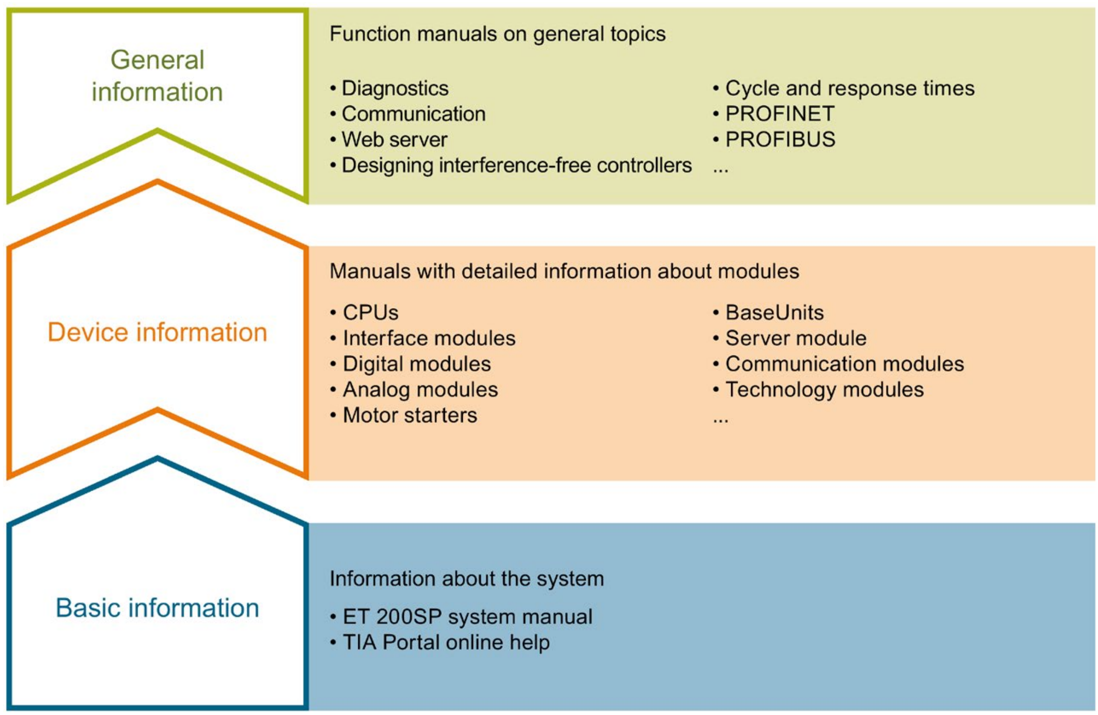
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview 2

2.1 Properties

Article number

6ES7155-6AU01-0CN0

View of the module

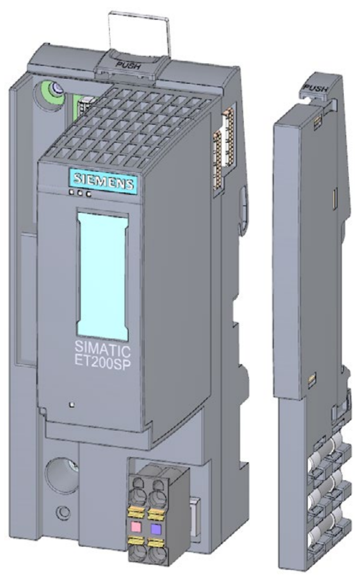


Figure 2-1 View of the AS interface module 155-6 PN/2 HF with included accessory (24 V DC connector and server module) and optional accessories (labeling strips and reference identification label)

Properties

The module has the following technical properties:

- Connects the ET 200SP distributed I/O system with PROFINET IO.
- Power supply 1 L+ 24 V DC (SELV/PELV). The connection plug is included in the scope of delivery of the interface module and is available as replacement part.
- PROFINET IO connection via selectable BusAdapters
  - BA 2×RJ45 for RJ45 bus connector
  - BA 2×FC for direct connection of the bus cable
  - BA 2xLC for glass fiber-optic cable
  - BA 2xSCRJ for POF/PCF fiber-optic cable
  - BA SCRJ/RJ45 as media converter for POF/PCF fiber-optic cable ⇔ standard RJ45 connector
  - BA SCRJ/FC as media converter for POF/PCF fiber-optic cable ⇔ direct connection of the bus cable
  - BA LC/RJ45 as media converter for glass fiber-optic cable ⇔ standard RJ45 connector
  - BA LC/FC as media converter for glass fiber-optic cable ⇔ direct connection of the bus cable

Maximum configuration

- 64 ET 200SP I/O modules + 16 ET 200AL modules
- 1 m backplane bus (without interface and server module)

Maximum amount of I/O data

Gross data length (for input data and output data):

Without system redundancy S2:

- 1440 bytes
- 1440 bytes for shared device with 2 IOC (in total for both IOC)
- 360 bytes for shared device with more than 2 IOC (per IOC)

With system redundancy S2:

- 1000 bytes
- 360 bytes for system redundancy S2 and shared device with min. 1 additional IOC (per IOC)

The number of maximum net data length for input data and output data depends on the number and type of I/O modules used including ET 200AL modules.

Net data length (for input data and output data):

The following minimum lengths can be applied without shared device and without explicit calculation of the maximum net data length.

- 933 bytes without system redundancy S2
- 493 bytes with system redundancy S2

Calculation of the max. net data length:

Max. net data length = Max. gross length - number of I/O submodules (no user data, input or output data) - number of I/O mixed modules (input and output data) - 5 bytes for interface module and server module without ET-Connection (6 bytes for interface module with ET-Connection)

The result of the calculation of the maximum net data length applies equally to input and output data.

Accessories

You order the following accessories separately:

- BA 2×RJ45 BusAdapter
- BA 2×FC BusAdapter
- BA 2×LC BusAdapter
- BA 2xSCRJ BusAdapter
- BA SCRJ/RJ45 BusAdapter
- BA SCRJ/FC BusAdapter
- BA LC/RJ45 BusAdapter
- BA LC/FC BusAdapter
- Strain relief for PROFINET cable
- 24 V DC connector (one included in the scope of delivery)
- Labeling strips
- Reference identification label

Information on the BusAdapters is available in the BusAdapter (https://support.industry.siemens.com/cs/ww/en/view/109751716) manual.

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Server module

The server module is included in the scope of delivery of the interface module and available separately as an accessory.

The server module has the following properties:

- Terminates the backplane bus of the ET 200SP distributed I/O system
- Includes a holder for 3 spare fuses (5 × 20 mm).
- Provides station functions, e.g., group diagnostics: No supply voltage L+, status bytes.
- Identification data I&M 0 to 4

Note

You need to configure and assign parameters to the server module in the configuration software.

Place the server module in the last slot of the configuration. If there are 64 I/O modules, the server module is plugged in slot 65.

You can find more information in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

First BaseUnit of an ET 200SP in the configuration

The interface modules support plugging a dark-colored BaseUnit in slot 1. This means that modules without a connection to the integrated voltage buses P1 and P2 can now also be configured starting with slot 1. Currently, this applies to the following modules:

- AI Energy Meter ST
- DI 4 x 120…230 V AC ST (6ES7131-6FD00-0BB1)
- DQ 4 x 24…230 V AC/2 A ST (6ES7132-6FD00-0BB1)

Note

First BaseUnit of an ET 200SP in the configuration

Please note the information on limiting the overvoltage and power rating in the AC I/O module manuals.

You route the infeed of the 24 V DC supply voltage over an external fuse.

The 24 V DC supply voltage is provided by a light-colored BaseUnit.

Requirement for configuration of these modules in slot 1:

- Configuration via GSD or GSDML
- Configuration as of STEP 7 V5.5 SP4 with
  – HSP0255 V3.0 for IM155-6 PN HF
- Configuration as of STEP 7 V13 SP1

See also

Functions (Page 16)

2.2 Functions

Introduction

The interface module supports the following PROFINET IO functions:

- Integrated switch with 2 ports
- Supported Ethernet services: PING, ARP, SNMP, LLDP
- Port diagnostics
- Disabling ports
- Minimum update time 250 µs
- Device replacement without programming device, also without topological configuration
- Reset to factory settings via PROFINET IO or RESET button
- Firmware update via PROFINET IO
- Isochronous real-time communication
- Prioritized startup
- Media redundancy (MRP)
- Shared device
- Distribution of module channels to a maximum of 4 submodules
- Module-internal or submodule-internal Shared Input/Shared Output (MSI/MSO)
- Isochronous mode
- System redundancy S2
- Station extension via ET-Connection
- Alternating IO devices during operation ("docking systems")
  - Docking station
  - Docking unit
- Supports BusAdapter for different connection technologies to PROFINET IO.

The interface module supports additional functions:

- Identification data I&M 0 to I&M 4
- PROFIenergy
- Configuration control (option handling)
- Use of fail-safe modules
- Removal/insertion of multiple I/O modules during operation (Multi Hot Swap)
- Module-to-Module Communication (MtM)

Requirements

The table below shows the software requirements for a configuration with the IM 155-6 PN/2 HF interface module:

Table 2- 1 Version dependencies of the module functions

Function	Functional status of the module as of	Firmware version of the module as of	Configuration software			
			Configuration with GSD file (http://support.automation.siemens.com/WW/view/en/19698639/130000)/software from a third-party manufacturer [1]	STEP 7 as of V5.5 SP3 with HSP 233	STEP 7 as of V5.5 SP4 with HSP 250/255	STEP 7 (TIA Portal) as of V12.0.1 with HSP 0058
Real-time communication	1	V2.0.0	X	X	X	X
Isochronous real-time communication	1	V2.0.0	X	X	X	X

[1] Systems of third-party manufacturers: Depending on the range of functions of the third-party system

Cabling with fixed connection setting

If you set a fixed connection setting of the port in STEP 7, you must also disable "Autonegotiation/Autocrossover".

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

Compatibility with the IM 155-6 PN interface module

In an existing plant, the IM 155-6 PN/2 HF replaces the IM 155-6 PN ST without reconfiguration. When the IM 155-6 PN/2 HF replaces the IM 155-6 PN ST, it is possible to insert and remove several I/O modules during operation.

For more information on compatibility, refer to section: Compatibility (Page 48)

See also

ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)

PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856)

2.2.1 Device replacement

Device replacement

Device replacement without topological configuration

The device name is also stored on the BusAdapter in addition to the interface module. A device name saved on the BusAdapter is the requirement for device replacement without topological configuration.

Replacing the interface module produces a range of scenarios for using the device name.

Table 2- 2 Scenarios for using the device name

	Interface module empty	**Interface module with device name**
BusAdapter without device name	No device name available	The device name from the interface module is used and copied to the BusAdapter.
BusAdapter with device name	The device name from the BusAdapter is used and copied to the interface module.	The device name from the BusAdapter is used and copied to the interface module if this has a different device name.

Be aware of the following constraints:

- Resetting to factory settings deletes the device name in both the interface module and the BusAdapter. To prevent the device name from being deleted in the BusAdapter, you can remove the BusAdapter from the interface module before resetting to factory settings.
- When a BusAdapter is replaced, a device name stored in the BusAdapter is applied to the interface module after a POWER ON.
- Do not pull/plug the BusAdapter while under voltage.

Device replacement with topological configuration

IO devices with this function can be replaced in a simple manner:

- The device name does not have to be assigned with the programming device.

The replacement IO device is assigned the device name by the IO controller and not by the programming device. The IO controller uses the configured topology and the neighboring relationships determined by the IO devices for this purpose. All involved devices must support the LLDP protocol (Link Layer Discovery Protocol). The configured target topology must match the actual topology.

If the IO devices were already used in another configuration, reset them to factory settings before reusing them. You can find information on this in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.2 Real-time communication

Real-time communication

A transmission method for PROFINET IO based on cyclic data exchange with a provider-consumer model.

2.2.3 Isochronous real-time communication

Isochronous real-time communication

A synchronized transmission method for cyclic exchange of IO data between PROFINET devices. A reserved bandwidth within the send clock is available for the transmission. The reserved bandwidth ensures that the IRT data is also transmitted in reserved, time-synchronized intervals, unaffected by other high network load (e.g. TCP/IP communication or additional real time communication).

A topology configuration is required for IRT.

Note

IO controller as sync master with IRT communication

We recommend operating the IO controller also as a sync master when configuring the IRT communication. Otherwise, IRT- and RT-configured IO devices may fail if the sync master fails.

You can find more information on the configuration of synchronized PROFINET devices in sync domains in the STEP 7 online help and

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.4 Prioritized startup

Prioritized startup

Prioritized startup is a PROFINET IO function in a PROFINET IO system with IRT and RT communication. It reduces the time needed for correspondingly configured IO devices to return to cyclic user data exchange.

The function accelerates the startup of IO devices in the following cases:

- After recovery of supply voltage
- After station recovery
- After activation of IO devices

Note

Dependency of the startup time

The interface module permits startup times from 0.5 s.

The startup time depends on the number and type of modules.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.5 Submodules

Submodules

The IM 155-6 PN/2 HF interface module supports the division of I/O modules into up to 4 submodules. This allows parts of an I/O module to be separately configured and parameterized.

A maximum of 256 submodules is supported, whereby 4 submodules are used for the interface module and one submodule for the server module.

You can assign each of these submodules to different IO controllers.

The following functions are only executed if you have configured submodule 1 during configuration:

- Firmware update
- Write I&M data
- Calibration
- PROFIenergy

2.2.6 Media redundancy (MRP)

Media redundancy (MRP)

Function for safeguarding communication and plant availability. A ring topology ensures that an alternative communication path is made available if a transmission route fails.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.7 Shared device

Shared device

IO device that makes its data available to up to four IO controllers.

The interface module supports shared device at submodule level.

If there is no validity check of the shared device projects by the Engineering System, note the following:

- Make sure the configurations are consistent. Assign each module or submodule to only one IO controller. Multiple assignment will result in an error as the module or submodule will only be available in the first controller.
- If you reconfigure the shared device configurations without the validity check mentioned above, you must commission ET 200SP again. This means you must download the projects of all involved IO controllers to the respective CPU again after reconfiguration. If necessary, perform a POWER OFF/POWER ON of the interface module.

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

Note

In the case of a shared device application, make sure that all controllers work with the same send clock. If the controller does not have the same send clock, this results in communication relationships not being set up.

If you set up all controllers in one project, the same send clock is ensured. Set the same send clock for engineering in separate projects.

2.2.8 Isochronous mode

Isochronous mode

The input and output data of distributed I/O modules in the system is simultaneously acquired and simultaneously output. For this purpose, the I/O data, the transmission cycle via PROFINET IO, and the user program are synchronized. The constant PROFINET IO cycle forms the corresponding clock generator. The interface module supports isochronous mode of I/O data for the modules starting at 250 µs. The IO device can exchange isochronous process data with a maximum of one IO controller.

Note

When the module is pulled or no written control data record has been written with activated configuration control, the IO controller cannot access a module. In this case, cycle time violations may occur with activated isochronous mode in the synchronous cycle interrupt OB (OB61). The time error OB (OB80) is called in the event of a cycle time violation.

This behavior is associated with updating the process image by means of the "SYNC_PI" (SFC126) and "SYNC_PO" (SFC127) instructions. It depends on the set cycle time and the configuration limits.

You can find additional information in the STEP 7 online help and

- As of STEP 7 V12, in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) function manual.
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.9 Module-internal Shared Input/Shared Output (MSI/MSO)

Module-internal Shared Input/Shared Output (MSI/MSO)

The Module-internal Shared Input function allows an input module to make its input data available to up to four IO controllers. Each controller has read access to the same channels.

The Module-internal Shared Output function allows an output module to be operated by up to four IO controllers. One IO controller has write access. Up to three additional IO controllers can have read access to the same channels.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.10 System redundancy S2

System redundancy S2

An IO device with S2 system redundancy supports redundant ARs.

In a redundant system, an IO device with system redundancy S2 has a redundant AR for each of the two CPUs (IO controllers). If one CPU fails, the IO device with S2 system redundancy remains accessible to the remaining IO controller via the AR.

The interface module supports system redundancy S2 on CPUs S7-400H (from firmware version V3.0) and on CPUs S7-1500R/H (from firmware version V4.2).

You can find additional information in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

2.2.11 Alternating IO devices during operation ("docking systems")

Alternating IO devices during operation ("docking systems")

- Docking station
- Docking unit

You can find additional information in the STEP 7 online help and

- As of STEP 7 V12, in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) function manual

2.2.12 Oversampling

Oversampling

The IM 155-6 PN/2 HF interface module supports the oversampling mode of HS modules. With oversampling, the modules reduce the respective PROFINET send clocks in isochronous mode.

Additional information on oversampling can be found in the manuals for the I/O modules.

2.2.13 Value status

Value status

The IM 155-6 PN/2 HF interface module supports I/O modules with value status.

Additional information on the value status can be found in the manuals for the I/O modules.

2.2.14 PROFIenergy

Properties

PROFIenergy (for PROFINET) reduces the energy consumption by using PROFIenergy commands during production-free periods.

Reference

You will find additional information on PROFIenergy in the following manuals:

- Manual I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300)
- Function manual PROFINET as of STEP 7 V12 (http://support.automation.siemens.com/WW/view/en/49948856)
- System manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
- PROFIenergy (http://support.automation.siemens.com/WW/view/en/66928686) product information
- Internet (http://www.profibus.com) under Common Application Profile PROFIenergy; Technical Specification for PROFINET; Version 1.0; January 2010; Order No: 3.802

2.2.15 Configuration control (option handling)

Properties

Configuration control allows you to prepare your automation system for future expansions or changes. Configuration control means you can configure the planned maximum expansion of your automation system in advance and flexibly vary it later by means of the user program.

Reference

You can find more information on configuration control:

- In the system manual ET 200SP distributed I/O system. (http://support.automation.siemens.com/WW/view/en/58649293)
- On the Internet under the following link: Application collection (http://support.automation.siemens.com/WW/view/en/29430270).
- In the STEP 7 online help.

2.2.16 Use of fail-safe modules

Properties

The IM 155-6 PN/2 HF interface module supports the use of fail-safe modules.

Reference

You can find more information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2.17 Multi Hot Swap

Properties

You can remove and insert any number of I/O modules during operation. The interface module and the inserted I/O modules remain in operation.

Note

The IM 155-6 PN/2 HF interface module does not support removal and insertion of the server module, interface module and BusAdapter during operation.

Reference

You can find more information on the removal/insertion of modules in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

2.2.18 Module-to-Module Communication (MtM)

Introduction

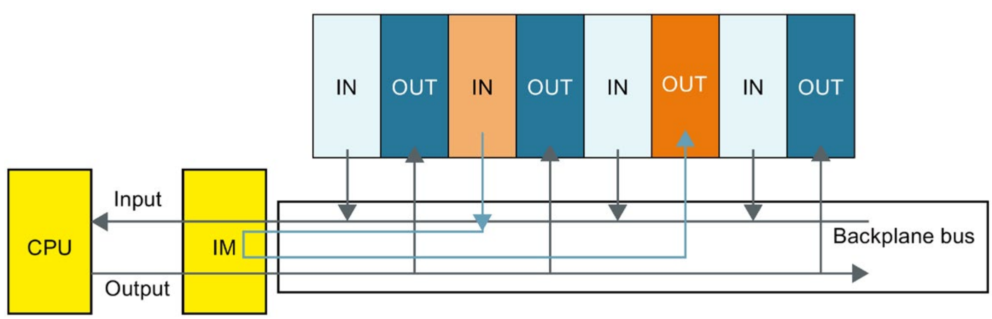
Module-to-Module Communication (MtM) offers the following advantages:

- Improved performance during transmission of data by bypassing the IO controller.
- Deterministic cycle times
- Cost-effective, high-performance solutions for applications where the performance of a specific technology module is not required.

Module-to-Module Communication (MtM)

Module-to-Module Communication (MtM) enables direct exchange of data between specific IO modules within a station via the interface module. This enables you to move small and/or time-critical tasks to the IO module. You achieve better performance while reducing the load on the CPU.

With Module-to-Module Communication (MtM), the interface module copies the input data of an IO module directly to a different IO module via the ET 200SP backplane bus. The IO module (data sink) carries out application-specific processing of the data.



You configure the data source and data sink for Module-to-Module Communication (MtM) in the hardware configuration of the respective output module. Programming of the user program is **not** required in the variant for Module-to-Module Communication (MtM).

Note

The preparation of the input data in the output module (mapping) and the output of the data to the outputs are application- and technology-specific.
Example: The DQ 4x24VDC/2A HS digital output module supports

- the application cam control with Module-to-Module Communication (MtM) under the designation DQ 4x24VDC/2A HS **MCC MtM**

Additional information can be found in the manuals of the corresponding IO modules.

2.2.19 Setting the time

The interface module supports time setting, for example with AI Energy Meter 480VAC/CT HF (6ES7134-6PA00-0CU0).

We show you how to set the time in an application example (https://support.automation.siemens.com/WW/view/en/109754890).

Wiring 3

3.1 Pin assignment

24 V DC supply voltage

The following table shows the signal names and the descriptions of the pin assignment for a 24 V DC supply voltage.

Table 3- 1 Pin assignment 24 V DC supply voltage

View		Signal name[1]	Description
Connector	IM connection		
		1L+	24 V DC (SELV/PELV)
		2L+	24 V DC (for looping through)[2]
		1M	Ground
		2M	Ground (for looping through)[2]

[1] 1L+ and 2L+ as well as 1M and 2M are bridged internally.

[2] Maximum 10 A permitted.

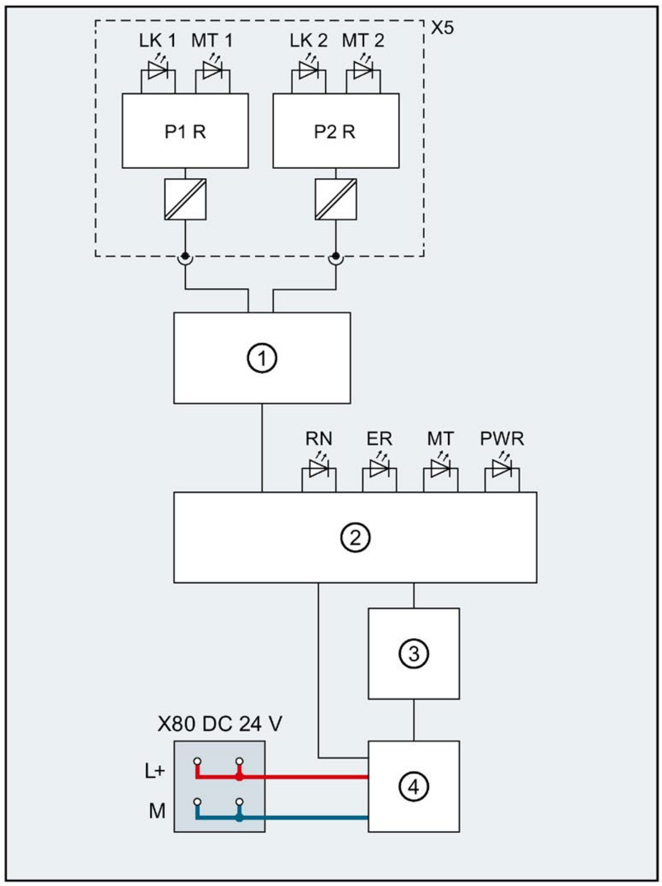
Reference

You can find more information on accessories and how to connect the interface module in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Block diagram

Block diagram

The following figure shows the block diagram of the IM 155-6 PN/2 HF interface module.



①	Switch	L+	24 V DC supply voltage
②	ET 200SP backplane bus interface and electronics	M	Ground
③	Backplane bus	LK 1,2	Link TX/RX LED (green)
④	Internal power supply	MT 1,2	MAINTENANCE FiberOptic LED (SCRJ port, yellow)
X80 24 V DC	Feed supply voltage	RN	RUN LED (green)
X5	BusAdapter	ER	ERROR LED (red)
P1 R	PROFINET interface X1 Port 1	MT	MAINTENANCE LED (yellow)
P2 R	PROFINET interface X1 Port 2	PWR	POWER LED (green)

Figure 3-1 Block diagram of the IM 155-6 PN/2 HF interface module

Parameters/address space 4

4.1 Parameters

Parameters for IM 155-6 PN/2 HF interface module

The following table shows the parameters for the interface module IM 155-6 PN/2 HF.

Table 4- 1 Parameters for IM 155-6 PN/2 HF interface module (GSD file)

Parameters	Value range	Default	Effective range
Enable configuration control	Yes/No	No	ET 200SP
Diagnostics (maintenance) undervoltage	Yes/No	No	ET 200SP

4.2 Explanation of parameters

4.2.1 Enable configuration control

Enable configuration control

You use this parameter to enable the configuration control function in the ET 200SP distributed I/O system.

Note

If you configure the enable, the ET 200SP distributed I/O system requires a control data record 196 from the user program in order for the ET 200SP distributed I/O system to operate the I/O modules.

Reference

You can find more information on the control data record in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and in the STEP 7 online help.

4.2.2 Diagnostics (maintenance) undervoltage

Diagnostics (maintenance) undervoltage

Diagnostics (maintenance) undervoltage is triggered if the supply voltage falls below the value 19.2 V DC. When the supply voltage then exceeds 20.4 V DC, the diagnostics alarm is reported as outgoing.

See also

Channel diagnostics (Page 43)

4.3 Substitute value behavior

Substitute value behavior

The respective output behaves according to its configured substitute value behavior:

- Zero current or zero voltage
- Output substitute value
- Keep last value

The substitute value behavior is triggered in the following cases:

- STOP controller
- Controller failure (connection interrupted)
- Parameter assignment phase during startup
- Deactivating the IO device
- Station stop
  - Missing server module
  - Insertion of invalid I/O modules
  - At least one I/O module is installed on an incorrect BaseUnit

---

Note

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage is switched off at the interface module.

The "current-free/voltage-free" behavior becomes effective in the following cases:

- Firmware update
- Reset to factory settings
- Configuration control: The IM has not received a valid control data record 196 yet
- Incorrectly configured module
- Module with incorrect parameter assignment

Substitute value behavior for module-internal Shared Output (MSO) and module-internal Shared Input (MSI)

Substitute value behavior for module-internal Shared Output (MSO) and module-internal Shared Input (MSI) corresponds to the behavior described above.

4.4 Status of the supply voltage L+ of the I/O modules

The status of the supply voltage L+ of the ET 200SP I/O modules can be mapped to the server module with the interface module IM 155-6 PN/2 HF.

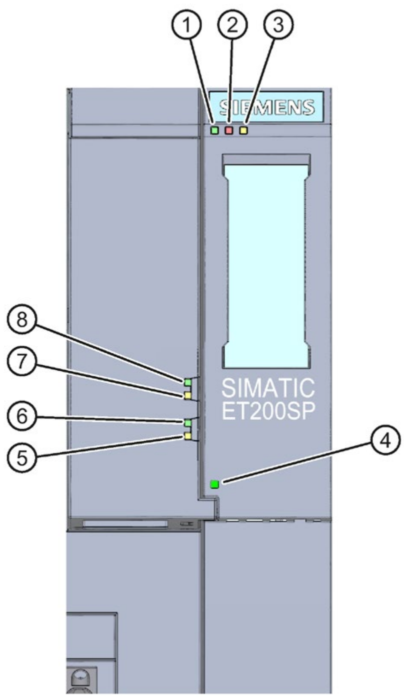
You can find information on the status of the supply voltage L+ of the I/O modules in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

Interrupts, error messages, diagnostics and system alarms 5

5.1 Status and error displays

LED displays

The following figure shows the LED displays on the interface module and BusAdapter.



①	RN (green)
②	ER (red)
③	MT (yellow)
④	PWR (green)
⑤	MT2 (yellow), SCRJ port
⑥	LK2 (green)
⑦	MT1 (yellow), SCRJ port
⑧	LK1 (green)

Figure 5-1 LED displays on the interface module and BusAdapter

Meaning of the LED displays

The following tables contain the meaning of the status and error displays.

RN/ER/MT LEDs on the interface module

Table 5- 1 Status and error displays of RN/ER/MT LEDs

LEDs			Meaning	Solution
RN (RUN)	ER (ERROR)	MT (MAINT)		
Off	Off	Off	Missing or insufficient supply voltage on interface module.	Check the supply voltage or turn it on at the interface module.*
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-
Flashes	Not relevant	Not relevant	Interface module is deactivated.	Activate the interface module with the configuration software or via the user program.
			Interface module is not configured.	Configure the interface module with the configuration software.
			ET 200SP starts up.	-
			ET 200SP is being assigned parameters.	
			ET 200SP is being reset to factory settings.	
On	Not relevant	Not relevant	ET 200SP is currently exchanging data with the IO controller.	-
Not relevant	Flashes	Not relevant	Group errors and group error channels.	Evaluate the diagnostics and eliminate the error.
			The preset configuration does not match the actual configuration of the ET 200SP.	Check the configuration of the ET 200SP to see whether a module is missing, faulty or not configured.
			Invalid configuration states.	For additional information, see section Invalid configuration states of the ET 200SP on PROFINET IO (Page 46)
			Parameter assignment error in the I/O module.	Evaluate the display of the module status in STEP 7. Eliminate the error in the corresponding I/O module.
Not relevant	Not relevant	On	Maintenance	For additional information, see section Maintenance events (Page 42)
Flashes	Flashes	Flashes	The "Node flash test" is run (LEDs LK1 and LK2 of the PROFINET interface also flash).	-
			Hardware or firmware defective (LEDs LK1 and LK2 of the PROFINET interface do not flash).	Run a firmware update. If the error persists, contact Siemens Industry Online Support. Replace the interface module.

* PWR LED on (on the interface module): Check the backplane bus for a short-circuit.

PWR LED on the interface module

Table 5- 2 Status display of the PWR LED

PWR LED	Meaning	Solution
□ Off	Supply voltage not present or too small.	Check the supply voltage.
■ On	Supply voltage present. Observe the maintenance messages if the MAIN LED is lit	-

LED display of configuration errors

Configuration errors of the ET 200SP distributed IO system are indicated on the interface module via the red ERROR LED and the yellow MAINT LED.

The following configuration errors are signaled by the LEDs:

- No server module
- Interruptions or short-circuit on the backplane bus

Operating principle

The LED error display provides information on the cause of the error. After notification by the flash signal, the error type is displayed followed by the error location/error code.

The LED error display:

- Is activated during POWER ON and during operation.
- Has priority over all other states that are displayed by means of the ERROR and MAINT LED.
- Remains on until the cause of the error has been eliminated.

Table 5- 3 Display of error type and error location

Sequence		Description
1	The ERROR and MAINT LEDs flash 3x at 0.5 Hz	Indication of the error type
2	The MAINT LED flashes at 1 Hz	Display of error type (decimal)
3	The ERROR and MAINT LEDs flash 3x at 2 Hz	Signaling of error location/error code
4	The ERROR LED flashes at 1 Hz	Display of tens digit (decimal) of the error location/error code
5	The MAINT LED flashes at 1 Hz	Display of ones digit (decimal) of the error location/error code
6	Repetition of 1 to 5 until the cause of the error has been eliminated.	

Error display

Table 5- 4 Error display

Error type (MAINT)	Error location (ERROR/ MAINT)	Cause of error	Solution
1	65	• No server module • Interruptions on the backplane bus • Short circuit of communication on the backplane bus	Check the configuration of the ET 200SP.

Note

A short circuit in the backplane bus supply or the bus connection supply is indicated by the following LEDs:

- PWR LED: On
- RN, ER and MT LED: Off

5.2 Interrupts

Introduction

The I/O device triggers interrupts as a reaction to specific errors. Interrupts are evaluated based on the I/O controller used.

Evaluating interrupts with I/O controllers

The ET 200SP distributed I/O system supports the following interrupts:

- Diagnostic error interrupts
- Hardware interrupts
- Pull/plug interrupts
- Maintenance events

In the event of an interrupt, interrupt OBs are automatically called in the CPU of the IO controller.

Information on the cause and class of the error is already available, based on the OB number and start information.

Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).

System diagnostics

In STEP 7 (TIA Portal), the innovated system diagnostics is available for the devices of the S7-1500 automation system (IO controller S7-1500 CPU) and ET 200SP (IO device). Independent of the cyclic user program, alarms are made available on the display of the S7-1500 CPU, the CPU web server and the HMI device.

You will find more information on system diagnostics in the Diagnostics (https://support.industry.siemens.com/cs/ww/en/view/59192926) function manual.

5.2.1 Triggering of a diagnostics interrupt

Triggering of a diagnostics interrupt

For an incoming or outgoing event (e.g. wire break on a channel of an I/O module), the module triggers a diagnostic error interrupt if this is configured accordingly.

The CPU interrupts processing of the user program and processes the diagnostic error interrupt OB (OB 82). The event that triggered the interrupt is entered in the start information of the diagnostic error interrupt OB.

5.2.2 Triggering a hardware interrupt

Triggering a hardware interrupt

If there is a hardware interrupt, the CPU interrupts user program execution and processes the hardware interrupt block OB, e.g., OB 40. The result that triggered the interrupt is added to the start information of the hardware interrupt OB.

Note

Diagnostics "Hardware interrupt lost" (from I/O module)

Do not use hardware interrupts for functional purposes (e.g. the cyclic generation of hardware interrupts).

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

5.2.3 Triggering of a remove/insert module interrupt

Triggering of a remove/insert module interrupt

In the event of a remove/insert module interrupt, the CPU interrupts processing of the user program and processes the remove/insert module OB, e.g. OB 83. The event that triggered the interrupt is entered in the start information of the remove/insert module OB.

Note

Parameter assignment error after removal/insertion

If you write data records from the user program to the modules of the distributed I/O, make sure that these modules actually exist and are available. You can do this by evaluating OB83. After inserting a module, OB83 is not called until the module has started up and its parameters are assigned. This ensures that data record operations can be executed without errors.

5.3 Alarms

5.3.1 Diagnostics alarms

Actions after a diagnostics alarm

There can be more than one diagnostics alarm at the same time. Each diagnostics alarm initiates the following actions:

- The ERROR LED of the interface module flashes.
- Diagnostics are reported as diagnostic error interrupts to the CPU of the IO controller and can be read via data records.
- Incoming diagnostics alarms are saved to the diagnostics buffer of the I/O controller.
- (S7-300/400) The diagnostic interrupt OB is called. If the diagnostics interrupt OB (OB 82) is not available, the IO controller goes into STOP mode.

You can find more information in the STEP 7 online help.

Reading the diagnostics

Table 5- 5 Reading the diagnostics with STEP 7

Automation system with IO controller	Application	See...
SIMATIC S7	Diagnostics as plain text in STEP 7 using Online and Diagnostics view	STEP 7 online help • as of STEP 7 V12, function manual PROFINET with STEP 7 as of V12 (http://support.automation.siemens.com/WW/view/en/49948856) • as of STEP 7 V5.5, system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
	Instruction "RDREC" (SFB 52) Read data records from the IO device	
	Instruction "RALRM" (SFB 54) Receive interrupts from the IO device	

Additional information on the data records for PROFINET IO

The structure of the diagnostic data records and programming examples are available in the programming manual From PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) and in Example application (http://support.automation.siemens.com/WW/view/en/24000238).

Causes of error and troubleshooting

The causes of error and remedies for the diagnostic alarms are described in the manuals for I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300) in the section, "Interrupts, error messages, and system events".

See also

Channel diagnostics (Page 43)

5.3.2 Maintenance events

Triggering of a maintenance event

The PROFINET IO interfaces of the interface module support the diagnostic concept and maintenance concept in PROFINET IO according to the IEC 61158 Type 10 standard. The goal is to detect and remove potential problems as soon as possible.

For the interface module, maintenance events signal to the user when a plant component must be checked or replaced.

The CPU interrupts user program execution and executes the diagnostic error interrupt OB. The event that triggered the maintenance event is entered in the start information of the diagnostic error interrupt OB.

The interface module signals a maintenance event to the higher-level diagnostic system in the case of the following event:

Table 5- 6 Triggering of a maintenance event

Maintenance alarm	Event	Alarm/Meaning
Maintenance demanded LED MAINT is lit.	Synchronization loss	• No synchronization frame received. No synchronization frame was received by the sync master within the timeout period after parameter assignment or during operation. • Successive synchronization frames are located outside permitted limits (jitter).
	Undervoltage	• Diagnostics Undervoltage If the supply voltage of the interface falls below the value 19.2 V DC, this diagnostics is reported as incoming Maintenance demanded.

System alarms in STEP 7 (TIA Portal)

The maintenance information is generated in STEP 7 (TIA Portal) with the following system alarms:

- Maintenance demanded - indicated for each port by a yellow wrench icon in the device view or in the hardware configuration.

You can find more information in the STEP 7 online help.

5.3.3 Channel diagnostics

Function

Channel-related diagnostics provides information about channel faults in modules.

Channel faults are mapped as channel diagnostics data in IO diagnostics data records.

The data record is read using the instruction "RDREC".

Structure of the diagnostics data records

The data records supported by the ET 200SP distributed I/O system are based on the standard PROFINET IO - Application Layer Service Definition V2.2.

If required, you can find the standard on the Internet (http://www.profibus.com) on the PROFIBUS user organization home page.

Codes of the extended channel diagnostics

With the IM 155-6 PN/2 HF interface module, the following extended channel diagnostics are reported:

ChannelErrorType (CET)	ExtendedChannelError-Type (ECET)	Associated value AddValue	Diagnostics
0x0602	0x0691	Slot	Station stop - module parameter "Potential group" faulty or incorrect BaseUnit in actual slot (AddValue)
0x0602	0x0693	0x00	Diagnostics with missing server module
0x0602	0x0698	0x00	Diagnostics backplane bus too large
0x0602	0x0699	Slot	Diagnostics with incorrect bus configuration
0x0602	0x069C	0x00	Diagnostics with incorrectly plugged BusAdapter
0x0610	0x06B0	0x00	Group diagnostics: Missing supply voltage L+ for the potential groups Note: The slot in which the light-colored BaseUnit of the respective load module is located is coded in the "ChannelNumber" element.
0x0610	0x06B4	0x00	Diagnostics "Undervoltage power supply" Note: This diagnostics is not supported by the hardware IM 155-6 PN HF (6ES7155-6AU00-0CN0). If the supply voltage of the interface falls below the value 19.2 V DC, this diagnostics is reported as incoming Maintenance demanded.

Structure of the manufacturer-specific diagnostics data records (IM 155-6 PN HF Version < V3.3)

The structure of the diagnostics data records is differentiated by the BlockVersion. The following BlockVersion applies to the IM 155-6 PN HF interface modules:

Table 5- 7 Structure of the manufacturer-specific diagnostics data records

IM 155-6 PN HF interface module	BlockVersion
6ES7155-6AU00-0CN0	W#16#0101

Note

Manufacturer-specific diagnostics are not reported as of version V3.3 for the interface module IM 155-6 PN HF.

Manufacturer-specific diagnostics in the User Structure Identifier (USI)

The following manufacturer-specific diagnostics are signaled in the USI with the IM 155-6 PN HF interface module:

Table 5- 8 Manufacturer-specific diagnostics in the USI

USI no. W#16#...	Diagnostics
0003	Group diagnostics: Missing supply voltage L+ for the potential groups
0004	Diagnostics with missing server module
0006	Diagnostics with incorrect BaseUnit
0007	Diagnostics with incorrect bus configuration

USI structure = W#16#0003

Table 5- 9 USI structure = W#16#0003

5.3.4 Invalid configuration states of the ET 200SP on PROFINET IO

Invalid configuration states

The following invalid configuration states of the ET 200SP distributed I/O system lead to the failure of the IO device or prevent data exchange:

- Number of modules exceeds maximum configuration.
- Faulty backplane bus (e.g. defective BaseUnit). ET 200SP backplane bus interruptions do not trigger an interrupt.
- At least one I/O module is plugged into a different BaseUnit as the one configured in the parameters.
- No server module.
- Invalid or incorrectly configured BusAdapter.

Note

Removal of the server module will trigger a station stop. All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) but the interface module continues to exchange data.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

See also

Status and error displays (Page 35)

Channel diagnostics (Page 43)

5.3.5 Failure of supply voltage L+ at BaseUnit BU...D

Failure of the supply voltage L+

The I/O modules react as follows to failure of the supply voltage L+ on the BaseUnit BU...D:

- If an I/O module is removed during failure of the supply voltage, a pull interrupt is generated.
- If an I/O module is installed during failure of the supply voltage, a plug interrupt is generated.

5.3.6 STOP of the IO controller and recovery of the IO device

STOP of the SIMATIC IO controller

Diagnostics received from the IO device while the IO controller is in STOP do not initiate a call of any corresponding OBs when the IO controller goes into RUN. Read the $E00C_H$ data record in startup OB using the instruction "RDREC". This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Recovery of the SIMATIC IO devices

If you want to read the occurring diagnostics in the STOP state of the IO controller, you have to read the $E00C_H$ data record with the "RDREC" instruction. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

6 Compatibility

6.1 Compatibility of modules

Compatibility with the IM 155-6 PN/2 HF interface module

If you exchange or replace an interface module, the following table shows the compatibilities:

- Between the interface modules IM 155-6 PN/2 HF and IM 155-6 PN ST
- Between the various firmware versions

	Interface module configured											
Interface module plugged	**IM 155-6 PN ST V1.0**	**IM 155-6 PN ST V1.1**	**IM 155-6 PN ST V3.1**	**IM 155-6 PN ST V3.3**	**IM 155-6 PN ST V4.1**	**IM 155-6 PN HF V2.0**	**IM 155-6 PN HF V2.1**	**IM 155-6 PN HF V2.2**	**IM 155-6 PN HF V3.0**	**IM 155-6 PN HF V3.1**	**IM 155-6 PN HF V3.3**	**IM 155-6 PN HF V4.2**
IM 155-6 PN HF V2.0	Yes*	---	---	---	---	Yes	---	---	---	---	---	---
IM 155-6 PN HF V2.1	Yes*	Yes*	---	---	---	Yes	Yes	---	---	---	---	---
IM 155-6 PN HF V2.2	Yes*	Yes*	---	---	---	Yes	Yes	Yes	---	---	---	---
IM 155-6 PN HF V3.0	Yes*	Yes*	---	---	---	Yes	Yes	Yes	Yes	---	---	---
IM 155-6 PN HF V3.1	Yes*	Yes*	Yes*	---	---	Yes	Yes	Yes	Yes	Yes	---	---
IM 155-6 PN HF V3.3	Yes*	Yes*	Yes*	Yes*	---	Yes	Yes	Yes	Yes	Yes	Yes	---
IM 155-6 PN/2 HF V4.2	Yes*	Yes*	Yes*	Yes*	Yes*	Yes	Yes	Yes	Yes	Yes	Yes	Yes

* The interface module IM 155-6 PN HF only supports the transmission rate 100 Mbps for Ethernet services.

Station configuration with more than 32 I/O modules

Certain I/O modules with functional status 001 and 002 do not support a station configuration with more than 32 I/O modules.

The table below shows all modules that do not support a station configuration with more than 32 I/O modules:

Table 6- 1 Incompatible modules with functional status

Modules	Article number	Up to functional status
Analog modules		
AI 4xI 2-/4-wire ST	6ES7134-6GD00-0BA1	002
AI 4xU/I 2-wire ST	6ES7134-6HD00-0BA1	002
AI 4xRTD/TC 2-/3-/4-wire HF	6ES7134-6JD00-0CA1	002
AI 4xU/I ST	6ES7135-6HD00-0BA1	002
Digital modules		
DI 16x24VDC ST	6ES7131-6BH00-0BA0	002
DI 8x24VDC ST	6ES7131-6BF00-0BA0	002
DQ 16x24VDC/0.5A ST	6ES7132-6BH00-0BA0	002
DQ 4x24VDC/2A ST	6ES7132-6BD20-0BA0	002
DQ 8x24VDC/0.5A ST	6ES7132-6BF00-0BA0	002

Status of the supply voltage

Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules without parameter assignment in the following table, the status of the supply voltage (status byte of the server module) is always signaled as "1" regardless of the actual status of the supply voltage.
- If a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "Missing supply voltage L+" is signaled for this potential group.

Modules	Article number
DI 8x24VDC ST	6ES7131-6BF00-0BA0
DI 16x24VDC ST	6ES7131-6BH00-0BA0
DI 8x24VDC HF	6ES7131-6BF00-0CA0
DQ 4x24VDC/2A ST	6ES7132-6BD20-0BA0
DQ 8x24VDC/0.5A ST	6ES7132-6BF00-0BA0
DQ 16x24VDC/0.5A ST	6ES7132-6BH00-0BA0
DQ 8x24VDC/0.5A HF	6ES7132-6BF00-0CA0

Resetting an interface module to factory settings via the RESET button

There is a special operation for interface module IM 155-6 PN/2 HF to reset it to the factory settings using the Reset button.

Requirements

The supply voltage to the interface module must be switched on.

Required tools

3 to 3.5 mm screwdriver (for resetting via the RESET button)

Procedure

1. Remove the interface module from the mounting rail and swivel it downwards.
2. The RESET button is located on the back of the interface module behind a small opening: Push a screwdriver into the small opening, thus pressing the RESET button.
3. Release the RESET button.
4. Press the RESET button for another 3 seconds.
5. Look at the LED display of the interface module to see whether the reset was successful: RUN LED flashes for 3 seconds, ERROR and MAINT LED are off.
6. Install the interface module back on the mounting rail.
7. Assign parameters to the interface module again.

AQ 4xU/I ST analog output module

Note

For operation of the AQ 4xU/I ST analog output module, firmware version V1.0 (6ES7135-6HD00-0BA1) with the interface module, you need to set the "Reaction to CPU STOP" parameter to "Turn off" with a PROFINET send clock < 1 ms.

Reaction times for fail-safe modules

The following maximum reaction time of the interface module must be taken into account when calculating the reaction times of fail-safe modules: **Maximum reaction time = configured update time + 400 μs (but at least 1.4 ms)**

Operation with activated system redundancy S2

Note

Restrictions in operation with activated system redundancy S2

You cannot use the following functions during operation of the IM155-6 PN/2 HF, firmware version V4.2 with activated system redundancy S2:

- Configuration control (option handling)
- Module-to-Module Communication (MtM)

Interface module IM 155-6 PPN HF (6ES7155-6AU00-0CN0) with version V4.2

Note

You cannot use the following functions during operation of the IM 155-6 PN HF (6ES7155-6AU00-0CN0) with firmware version V4.2:

- Module-to-Module Communication (MtM)
- Setting the time
- Diagnostics (maintenance) undervoltage

Technical specifications 7

Technical specifications of the IM 155-6 PN/2 HF

The following table shows the technical specifications as of 08/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/de/en/pv/6ES7155-6AU01-0CN0/td?dl=en).

Article number	6ES7155-6AU01-0CN0
General information	
Product type designation	IM 155-6 PN/2 HF with server module
Firmware version	V4.2
• FW update possible	Yes
Number of MtM communication relationships/connections, max.	16
Product function	
• I&M data	Yes; I&M0 to I&M3
• Module swapping during operation (hot swapping)	Yes; Multi-hot swapping
• Tool changer	Yes; Docking station and docking unit
• Local coupling, IO data	No
• Local coupling, data records	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	STEP 7 V15.1 or higher
• STEP 7 configurable/integrated as of version	Configurable via GSD file
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Configuration control	
via dataset	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Mains buffering	
• Mains/voltage failure stored energy time	10 ms

Article number	6ES7155-6AU01-0CN0
Input current	
Current consumption, max.	700 mA
Inrush current, max.	4.5 A
I^2t	0.25 $A^2 \cdot s$
Power loss	
Power loss, typ.	2.4 W
Address area	
Address space per module	
• Address space per module, max.	288 byte; For input and output data respectively
Address space per station	
• Address space per station, max.	1 440 byte; Dependent on configuration
Hardware configuration	
Rack	
• Modules per rack, max.	64; + 16 ET 200AL modules
Submodules	
• Number of submodules per station, max.	256
Time stamping	
Accuracy	10 ms
Interfaces	
Number of PROFINET interfaces	1; 2 ports (switch)
1. Interface	
Interface types	
• Number of ports	2; via BusAdapter
• integrated switch	Yes
• BusAdapter (PROFINET)	Yes; Compatible BusAdapter: BA 2x RJ45, BA 2x FC, BA 2x SCRJ, BA SCRJ / RJ45, BA SCRJ / FC, BA 2x LC, BA LC / RJ45, BA LC / FC
Protocols	
• PROFINET IO Device	Yes
• Open IE communication	Yes
• Media redundancy	Yes; PROFINET MRP
Interface types	
RJ 45 (Ethernet)	
• Transmission procedure	PROFINET with 100 Mbit/s full duplex (100BASE-TX)
• 10 Mbps	No
• 100 Mbps	Yes; PROFINET with 100 Mbit/s full duplex (100BASE-TX)
• Autonegotiation	Yes
• Autocrossing	Yes

Article number	6ES7155-6AU01-0CN0
Protocols	
PROFINET IO Device	
Services	
– Isochronous mode	Yes; Bus cycle time: min. 250 µs
– Open IE communication	Yes
– IRT	Yes; 250 µs, 500 µs, 1 ms, 2 ms, 4 ms additionally with IRT with high performance: 250 µs to 4 ms in 125 µs frame
– PROFIenergy	Yes
– Prioritized startup	Yes
– Shared device	Yes
– Number of IO Controllers with shared device, max.	4
Redundancy mode	
– MRP	Yes
– MRPD	No
– PROFINET system redundancy (S2)	Yes; NAP S2
– Redundant PROFINET configuration (R1)	No
– H-Sync forwarding	Yes
Open IE communication	
• TCP/IP	Yes
• SNMP	Yes
• LLDP	Yes
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Equidistance	Yes
shortest clock pulse	250 µs
max. cycle	4 ms
Bus cycle time (TDP), min.	250 µs
Jitter, max.	1 µs
Interrupts/diagnostics/status information	
Status indicator	Yes
Alarms	Yes
Diagnostic functions	Yes
Diagnostics indication LED	
• RUN LED	Yes; Green LED
• ERROR LED	Yes; Red LED
• MAINT LED	Yes; yellow LED

Article number	6ES7155-6AU01-0CN0
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Connection to network LINK (green)	Yes; 2x green link LEDs on BusAdapter
Potential separation	
between backplane bus and electronics	No
between PROFINET and all other circuits	Yes
between supply and all other circuits	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Network loading class	3
Security level	According to Security Level 1 Test Cases V1.1.1
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation
• horizontal installation, max.	60 °C
• vertical installation, min.	-30 °C; No condensation
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	2 000 m; On request: Installation altitudes greater than 2 000 m
Connection method	
ET-Connection	
• via BU/BA Send	Yes; + 16 ET 200AL modules
Mechanics/material	
Strain relief	Yes; Optional
Dimensions	
Width	50 mm
Height	117 mm
Depth	74 mm
Weights	
Weight, approx.	120 g; without BusAdapter

Dimension drawing

A

This appendix contains a dimension drawing of the module mounted on a mounting rail. Always observe the specified dimensions for installation in cabinets, control rooms, etc.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes labeled as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product, or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

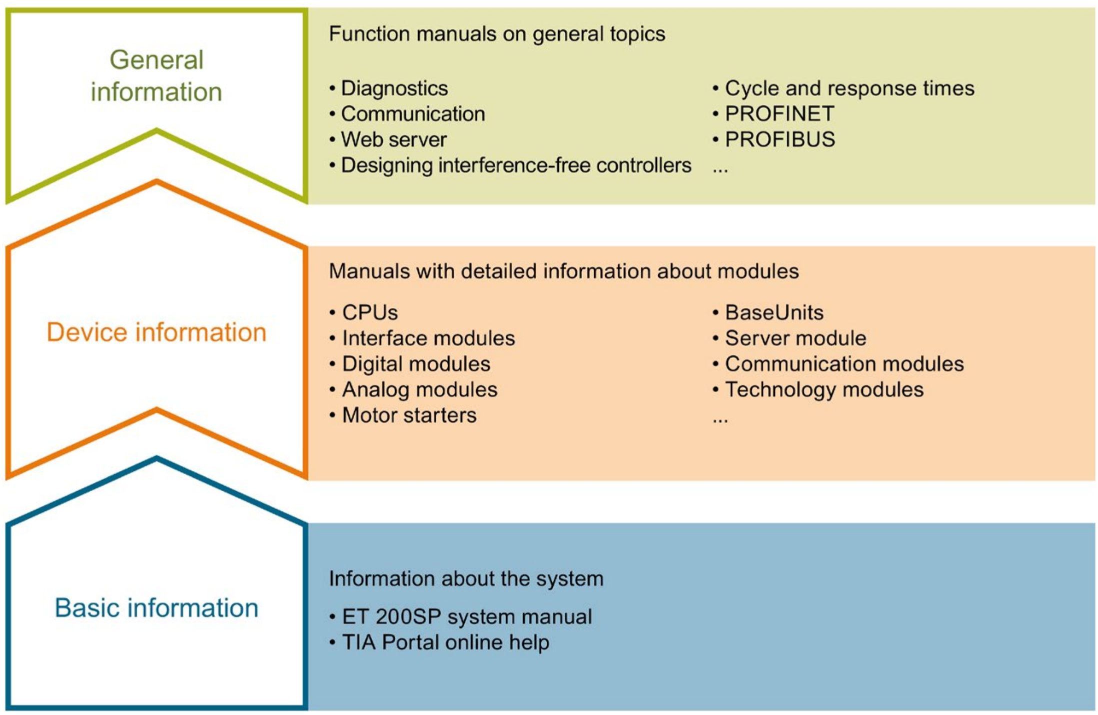
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview 2

2.1 Properties

Article number

6ES7155-6AU30-0CN0 (interface module 155-6 PN/3 HF and server module)

View of the module

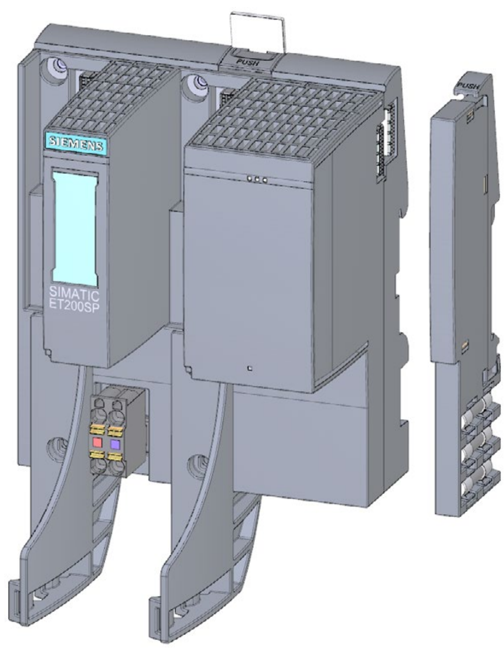


Figure 2-1 View AS interface module 155-6 PN/3 HF with included accessory (24 V DC connector and server module) and optional accessories (strain-relief for PROFINET cable, labeling strips and reference identification label)

Properties

The module has the following technical properties:

- Integrated switch with 3 ports
- Connects the ET 200SP distributed I/O system with PROFINET IO.
- Supply voltage 1 L+ DC 24 V (SELV/PELV). The connection plug is included in the scope of delivery of the interface module and available as replacement part.
- PROFINET IO connection via selectable BusAdapters
  - BA 2×RJ45 for RJ45 bus connector
  - BA 2×FC for direct connection of the bus cable
  - BA 2xSCRJ for POF/PCF fiber-optic cable
  - BA SCRJ/RJ45 as media converter for POF/PCF fiber-optic cable ⇔ standard RJ45 connector
  - BA SCRJ/FC as media converter for POF/PCF fiber-optic cable ⇔ direct connection of the bus cable
  - BA 2xLC for glass fiber-optic cable
  - BA LC/RJ45 as media converter for glass fiber-optic cable ⇔ standard RJ45 connector
  - BA LC/FC as media converter for fiber-optic cable ⇔ direct connection of the bus cable

Maximum configuration

- 64 ET 200SP I/O modules + 16 ET 200AL modules
- 1 m backplane bus (without interface module and server module)

Maximum amount of I/O data

Gross data length (for input and output data):

Without system redundancy S2:

- 1440 bytes
- 1440 bytes for shared device with 2 IOCs (in total for both IOCs)
- 360 bytes for shared device with more than 2 IOCs (per IOC)

With system redundancy S2:

- 1000 bytes
- 360 bytes with system redundancy S2 and shared device with at least 1 additional IOC (per IOC)

The number of the max. net data length for input and output data depends on the number and type of I/O modules used, including ET 200AL modules and virtual modules.

Net data length (for input and output data):

Without explicit calculation of the maximum net data length, the following minimum lengths can be used without shared device.

- 933 bytes (without system redundancy S2)
- 493 bytes (with system redundancy S2)

Calculation of the max. net data length:

Max. length net data = max. gross length - number of I/O submodules (input or output data, without user data) - number of mixed I/O modules (input and output data) - 5 bytes for interface module and server module without ET connection (6 bytes for interface module with ET connection)

The result of the calculation of the maximum net data length applies equally to input and output data.

Accessories

You order the following accessories separately:

- BA 2×RJ45 BusAdapter
- BA 2×FC BusAdapter
- BA 2×LC BusAdapter
- BA 2xSCRJ BusAdapter
- BA SCRJ/RJ45 BusAdapter
- BA SCRJ/FC BusAdapter
- BA LC/RJ45 BusAdapter
- BA LC/FC BusAdapter
- Strain relief for PROFINET cables
- Labeling strips
- Reference identification label

Information on the BusAdapters is available in the BusAdapter (https://support.industry.siemens.com/cs/ww/en/view/109751716) manual.

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Server module

The server module is included in the scope of delivery of the interface module and available separately as an accessory.

The server module has the following properties:

- Terminates the backplane bus of the ET 200SP distributed I/O system
- Includes a holder for 3 spare fuses (5 × 20 mm).
- Provides station functions, e.g., group diagnostics: No supply voltage L+, status bytes.
- Identification data I&M 0 to 3

Note

You need to configure and assign parameters to the server module in the configuration software.

Place the server module in the last slot of the configuration. If there are 64 I/O modules, the server module is plugged in slot 65.

You can find more information in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

First BaseUnit of an ET 200SP in the configuration

The interface modules support plugging dark-colored BaseUnits in slot 1. This means that modules without a connection to the integrated voltage buses P1 and P2 can now also be configured starting with slot 1. Currently, this applies to the following modules:

- AI Energy Meter ST
- DI 4 x 120..230V AC ST (6ES7131-6FD00-0BB1)
- DQ 4 x 24..230V AC/2A ST (6ES7132-6FD00-0BB1)

Note

First BaseUnit of an ET 200SP in the configuration

Please note the information on limiting the overvoltage and power rating in the AC I/O module manuals.

The 24 V DC supply voltage is fed in via an external fuse.

The DC 24 V supply voltage is supplied via a light-colored BaseUnit.

Functions (Page 16)

2.2 Functions

Introduction

The interface module supports the following PROFINET IO functions:

- Integrated switch with 3 ports
- Supported Ethernet services: PING, ARP, SNMP, LLDP
- Port diagnostics
- Disabling ports
- Minimum update time 250 µs
- Device replacement without programming device, also without topological configuration
- Reset to factory settings via PROFINET IO
- Firmware update via PROFINET IO
- Isochronous real-time communication
- Prioritized startup
- Media redundancy (MRP)
- Shared device
- Distribution of module channels to a maximum of 4 submodules
- Module-internal or submodule-internal Shared Input/Shared Output (MSI/MSO)
- Isochronous mode
- System redundancy S2
- Station extension via ET-Connection
- Alternating IO devices during operation ("docking systems")
  - Docking station
  - Docking unit
- Supports BusAdapter for different connection technologies to PROFINET IO.

The interface module supports additional functions:

- Interface local coupling of IO data (configuration only via GSDML)
- Module-to-Module Communication (MtM)
- Identification data I&M 0 to I&M 3
- PROFIenergy
- Configuration control (option handling)
- Use of fail-safe modules
- Removal/insertion of multiple I/O modules during operation (Multi Hot Swap)

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 (TIA Portal), in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).

Requirements

The table below shows the software requirements for a configuration with the IM 155-6 PN/3 HF interface module:

Table 2- 1 Version dependencies of the module functions

Function	Functional status of the module as of	Firmware version of the module as of	Configuring with GSD file (http://support.automation.siemens.com/WW/view/en/19698639/130000)[1]	Configuration software	
				STEP 7 as of V5.5 SP4	STEP 7 (TIA Portal) as of V15.1
Real-time communication	1	V4.2.0	X	---	X
Isochronous real-time communication	1	V4.2.0	X	---	X
Prioritized startup	1	V4.2.0	X	---	X

[1] Systems of third-party manufacturers: Depending on the range of functions of the third-party system

Cabling with fixed connection setting

If you set a fixed connection setting of the port in STEP 7, you must also disable "Autonegotiation/Autocrossover".

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.1 Device replacement

Device replacement

Device replacement without topological configuration

The device name is also stored on both BusAdapters in addition to the interface module. A device name stored in both BusAdapters is required for device replacement without topology configuration.

Replacing the interface module produces a range of scenarios for using the device name.

- The interface module generally starts with the device name of the left BusAdapter. In the case of different device names, the device name is distributed (stored) from the left BusAdapter to the right Bus Adapter and to the interface module.
- If the left BusAdapter is missing or does not yet have a device name, the device name is taken from the right BusAdapter and, if there are differences, distributed (stored) accordingly.
- If only BusAdapters without device names are connected, the device name is taken from the interface module and stored on both BusAdapters.

Be aware of the following constraints:

- Resetting to factory settings deletes the device name in both the interface module and the BusAdapter. To prevent the device name from being deleted in the BusAdapter, you can remove the BusAdapter from the interface module before resetting to factory settings.
- When a BusAdapter is replaced, a device name stored in the BusAdapter is applied to the interface module after a POWER ON.
- Do not pull/plug the BusAdapter while under voltage.

Device replacement with topological configuration

IO devices with this function can be replaced in a simple manner:

- The device name does not have to be assigned with the programming device.

The replacement IO device is assigned the device name by the IO controller and not by the programming device. The IO controller uses the configured topology and the neighboring relationships determined by the IO devices for this purpose. All involved devices must support the LLDP protocol (Link Layer Discovery Protocol). The configured target topology must match the actual topology.

If the IO devices were already used in another configuration, reset them to factory settings before reusing them. You can find information on this in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.2 Real-time communication

Real-time communication

A transmission method for PROFINET IO based on cyclic data exchange with a provider-consumer model.

2.2.3 Isochronous real-time communication

Isochronous real-time communication

Is a synchronized communication protocol for cyclic exchange of data between PROFINET devices. A reserved bandwidth within the send clock is available for the transfer. The reserved bandwidth ensures that the IRT data is also transmitted in time-synchronized intervals, unaffected by other high network loading (e.g. TCP/IP communication or additional real time communication).

A topology configuration is required for IRT.

Note

For IRT, both BusAdapters must be plugged in.

Note

IO controller as sync master with IRT communication

We recommend operating the IO controller also as a sync master when configuring the IRT communication.

Otherwise, IRT and RT configured IO devices may fail if the sync master fails.

You can find more information on the configuration of synchronized PROFINET devices in sync domains in the STEP 7 online help and

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.4 Prioritized startup

Prioritized startup

Prioritized startup is a PROFINET IO function in a PROFINET IO system with IRT and RT communication. It reduces the time needed for correspondingly configured IO devices to return to cyclic user data exchange.

The function accelerates the start-up of IO devices in the following cases:

- After recovery of supply voltage
- After station recovery
- After activation of IO devices

Note

Dependency of the startup time

The interface module permits startup times from 1.2 s.

The startup time depends on the number and type of modules.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 (TIA Portal) V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.5 Submodules

Submodules

The IM 155-6 PN/3 HF interface module supports the division of I/O modules into up to 4 submodules. This allows parts of an I/O module to be separately configured and parameterized.

A maximum of 256 submodules is supported, whereby 4 submodules are used for the interface module and one submodule for the server module.

You can assign each of these submodules to different IO controllers.

The following functions are only executed if you have configured submodule 1 during configuration:

- Firmware update
- Write I&M data
- Calibration
- PROFIenergy

2.2.6 Media redundancy (MRP)

Media redundancy (MRP)

Function for safeguarding communication and plant availability. A ring topology ensures that an alternative communication path is made available if a transmission route fails.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.7 Shared device

Shared device

IO device that makes its data available to up to four IO controllers.

The interface module supports shared device at submodule level.

If **there is no validity check of the shared device projects by the Engineering System**, note the following:

- Make sure the configurations are consistent. Assign each module or submodule to only one IO controller. Multiple assignment will result in an error as the module or submodule will only be available in the first controller.
- If you reconfigure the shared device configurations without the validity check mentioned above, you must commission ET 200SP again. This means you must download the projects of all involved IO controllers to the respective CPU again after reconfiguration. If necessary, perform a POWER OFF/POWER ON of the interface module.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

Note

In the case of a shared device application, make sure that all controllers work with the same send clock. If the controller does not have the same send clock, this results in communication relationships not being set up.

If you set up all controllers in one project, the same send clock is ensured. Set the same send clock for engineering in separate projects.

2.2.8 Isochronous mode

Isochronous mode

The input and output data of distributed I/O modules in the system is simultaneously acquired and simultaneously output. The I/O data, the transmission cycle via PROFINET IO, and the user program are synchronized for this purpose. The constant PROFINET IO cycle forms the corresponding clock generator. The interface module supports isochronous mode of I/O data for the modules starting at 250 µs. The IO device can exchange isochronous process data with a maximum of one IO controller.

Note

If the module is pulled or if no control data record was written with activated configuration control, then the IO controller cannot access a module. In this case, cycle time violations may occur with activated isochronous mode in the synchronous cycle interrupt OB (OB61). The time error OB (OB80) is called in the event of a cycle time violation.

This behavior is associated with updating the process image by means of the "SYNC_PI" (SFC126) and "SYNC_PO" (SFC127) instructions. It depends on the set cycle time and the configuration limits.

You can find additional information in the STEP 7 online help and

- As of STEP 7 V12, in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) function manual.
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.9 Module-internal Shared Input/Shared Output (MSI/MSO)

Module-internal Shared Input/Shared Output (MSI/MSO)

The Module-internal Shared Input function allows an input module to make its input data available to up to four IO controllers. Each controller has read access to the same channels.

The Module-internal Shared Output function allows an output module to be operated by up to four IO controllers. One IO controller has write access. Up to three additional IO controllers can have read access to the same channels.

You can find more information on this topic in the STEP 7 online help and:

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856).
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127).

2.2.10 System redundancy S2

System redundancy S2

An IO device with S2 system redundancy supports redundant ARs.

In a redundant system, an IO device with system redundancy S2 has a redundant AR for each of the two CPUs (IO controllers). If one CPU fails, the IO device with S2 system redundancy remains accessible to the remaining IO controller via the AR.

The interface module supports system redundancy S2 on S7-400H CPUs and on S7-1500R/H CPUs.

You can find additional information in the STEP 7 online help and

- As of STEP 7 V12, in the function manual PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856)
- As of STEP 7 V5.5, in the system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)

2.2.11 Alternating IO devices during operation ("docking systems")

Alternating IO devices during operation ("docking systems")

- Docking station
- Docking unit

You can find additional information in the STEP 7 online help and

- As of STEP 7 V12, in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) function manual

2.2.12 Oversampling

Oversampling

The IM 155-6 PN/3 HF interface module supports the oversampling mode of HS modules. With oversampling, the modules reduce the respective PROFINET send clocks in isochronous mode.

Additional information on oversampling can be found in the manuals for the I/O modules.

2.2.13 Value status

Value status

The IM 155-6 PN/3 HF interface module supports I/O modules with value status.

Additional information on the value status can be found in the manuals for the I/O modules.

2.2.14 PROFIenergy

Properties

PROFIenergy (for PROFINET) reduces the energy consumption by using PROFIenergy commands during production-free periods.

Reference

You will find additional information on PROFIenergy in the following manuals:

- Manual I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300)
- Function manual PROFINET with STEP 7 V12 and higher (http://support.automation.siemens.com/WW/view/en/49948856)
- System manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
- PROFIenergy (http://support.automation.siemens.com/WW/view/en/66928686) product information
- Internet (http://www.profibus.com) under Common Application Profile PROFIenergy; Technical Specification for PROFINET; Version 1.0; January 2010; Order No: 3.802

2.2.15 Configuration control (option handling)

Properties

Configuration control allows you to prepare your automation system for future expansions or changes. Configuration control means you can configure the planned maximum expansion of your automation system in advance and flexibly vary it later by means of the user program.

Reference

You can find more information on configuration control:

- In the system manual ET 200SP distributed I/O system. (http://support.automation.siemens.com/WW/view/en/58649293)
- On the Internet under the following link: Application collection (http://support.automation.siemens.com/WW/view/en/29430270).
- In the STEP 7 online help.

2.2.16 Use of fail-safe modules

Properties

The IM 155-6 PN/3 HF interface module supports the use of fail-safe modules.

Reference

You can find more information in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2.17 Multi Hot Swap

Properties

You can remove and insert any number of I/O modules during operation. The interface module and the inserted I/O modules remain in operation.

Note

The IM 155-6 PN/3 HF interface module does not support the removal and insertion of the server module, the interface module and BusAdapter during operation.

Reference

You can find more information on the removal/insertion of modules in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

2.2.18 Module-to-Module Communication (MtM)

Introduction

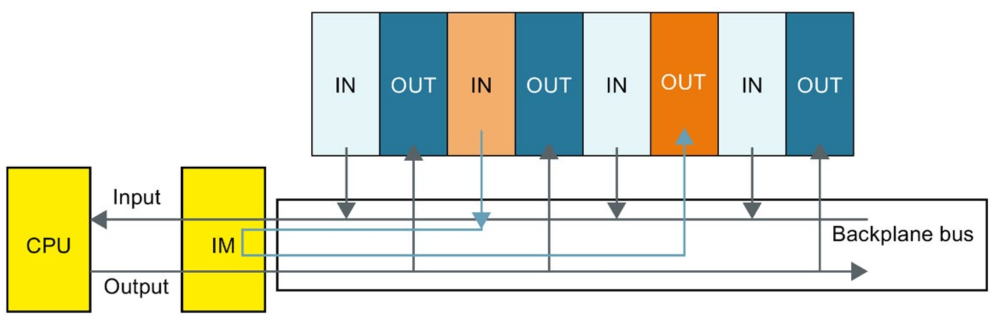
Module-to-Module Communication (MtM) offers the following advantages:

- Improved performance during transmission of data by bypassing the IO controller.
- Deterministic cycle times
- Cost-effective, high-performance solutions for applications where the performance of a specific technology module is not required.

Module-to-Module Communication (MtM)

Module-to-Module Communication (MtM) enables direct exchange of data between specific IO modules within a station via the interface module. This enables you to move small and/or time-critical tasks to the IO module. You achieve better performance while reducing the load on the CPU.

With Module-to-Module Communication (MtM), the interface module copies the input data of an IO module directly to a different IO module via the ET 200SP backplane bus. The IO module (data sink) carries out application-specific processing of the data.



For Module-to-Module Communication (MtM), configure the data source and the data sink in the hardware configuration of the respective output module. Programming of the user program is **not** required in the variant for Module-to-Module Communication (MtM).

Note

The preparation of the input data in the output module (mapping) and the output of the data to the outputs are application- and technology-specific.
Example: The DQ 4x24VDC/2A HS digital output module supports

- the application cam control with Module-to-Module Communication (MtM) under the designation DQ 4x24VDC/2A HS **MCC MtM**

Additional information can be found in the manuals of the corresponding IO modules.

2.2.19 Setting the time

The interface module supports time-setting, for example with AI Energy Meter 480VAC/CT HF (6ES7134-6PA00-0CU0).

In an Application example (https://support.automation.siemens.com/WW/view/en/109754890) we show you how to set the time of day.

2.2.20 Interface local coupling of IO data

Module-internal Shared Output is transferred to other controllers

In this example, IO data are transferred from one controller to other controllers over the PROFINET interface X1 by means of the Module-internal Shared Output.

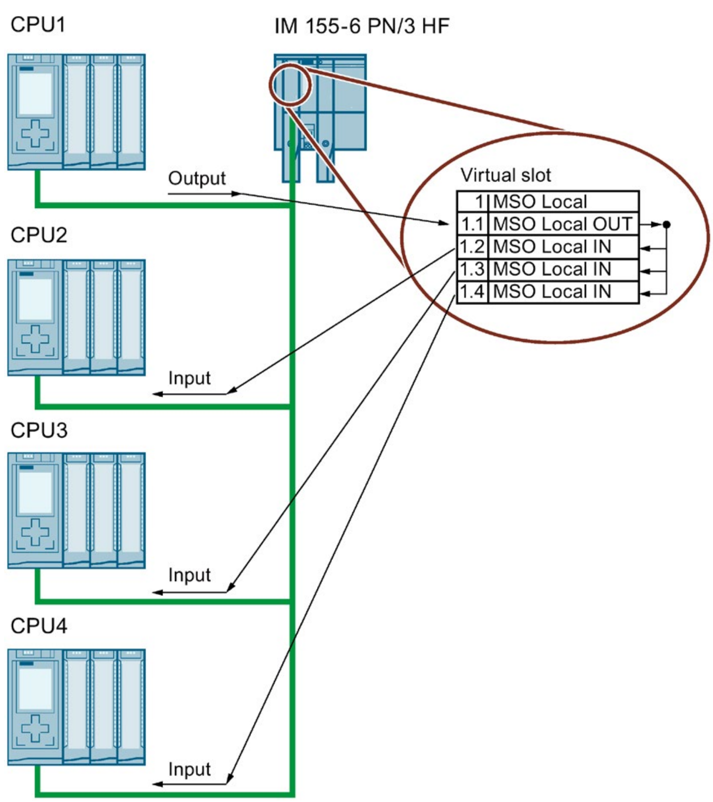


Figure 2-2 I/O data are transferred to other controllers in the same PROFINET network

Configuration

Table 2- 2 Example of the configuration

Virtual slot	Type	I-length	Q-length	Access
1	MSO Local	-	-	-
1.1	MSO Local OUT	-	4 bytes	CPU 1
1.2	MSO Local IN	5 bytes incl. 1 byte DS	-	CPU 2
1.3	MSO Local IN	5 bytes incl. 1 byte DS	-	CPU 3
1.4	MSO Local IN	5 bytes incl. 1 byte DS	-	CPU 4

Editing in the user program

The controller CPU 1 writes I/O data to the MSO Local OUT module with the virtual slot 1.1 of the interface module. The data is available to CPUs 2 to 4 for reading with the remaining MSO Local IN modules. The validity of the provided user data is displayed by the data status byte (DS) of the MSO Local IN modules.

You can also use this example:

- with fewer controllers and
- configure it with other virtual modules.

Note

Virtual IO modules

The use of virtual IO modules increases the communication load. This increases the data update time of all IO data accordingly.

Wiring

3

3.1 Pin assignment

24 V DC supply voltage

The following table shows the signal names and the descriptions of the pin assignment for a 24 V DC supply voltage.

Table 3- 1 Pin assignment 24 V DC supply voltage

View		Signal name[1]	Description
Connector	IM connection		
		1L+	24 V DC
		2L+	24 V DC (for looping through)[2]
		1M	Ground
		2M	Ground (for looping through)[2]

[1] 1L+ and 2L+ as well as 1M and 2M are bridged internally.

[2] Maximum 10 A permitted.

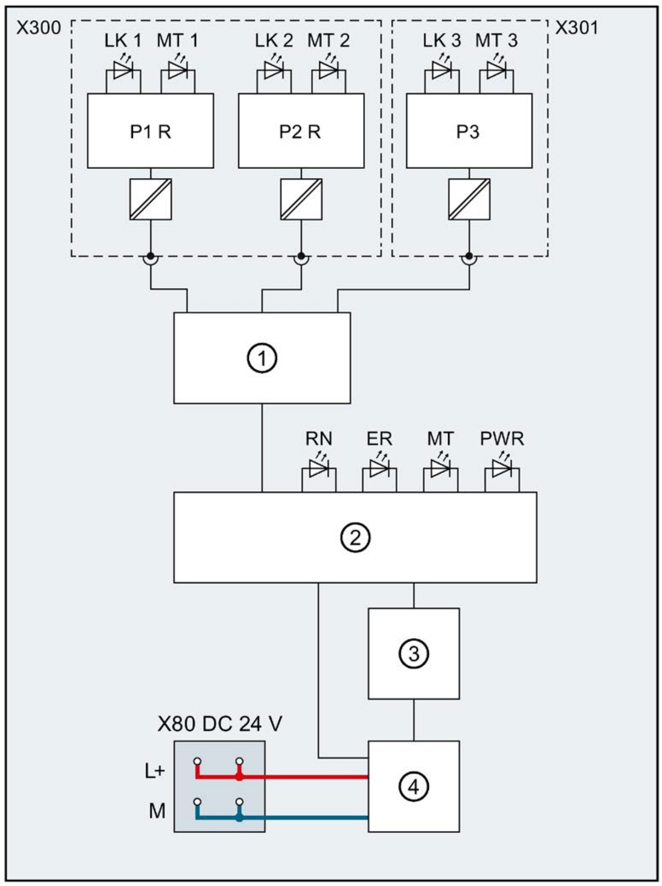
Reference

You can find more information on accessories and how to connect the interface module in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Block diagram

Block diagram

The following figure shows a block diagram of the IM 155-6 PN/3 HF interface module.



①	Switch	L+	24 V DC supply voltage
②	ET 200SP backplane bus interface and electronics	M	Ground
③	Backplane bus	LK 1, 2, 3	Link TX/RX LED (green)
④	Internal power supply	MT 1,2,3	MAINTENANCE FiberOptic LED (SCRJ port, yellow)
X80 24 V DC	Feed supply voltage	RN	RUN LED (green)

P2 R	PROFINET interface X1 Port 2	PWR	POWER LED (green)
P3	PROFINET interface X1 Port 3		

Figure 3-1 Block diagram of the IM 155-6 PN/3 HF interface module

Note

To set up a ring topology, use only the P1 R and P2 R ports.

Note

Operation with only one BusAdapter

If you operate the interface module with only one BusAdapter, then provide the free bus adapter interface with a cover for the BusAdapter interface.

Note

For IRT operation, both bus adapters must be plugged in.

Parameters/address space 4

4.1 Parameters

Parameters for IM 155-6 PN/3 HF interface module

The following table shows the parameters for the interface module IM 155-6 PN/3 HF.

Table 4- 1 Parameters for IM 155-6 PN/3 HF interface module (GSD file)

Parameters	Value range	Default	Effective range
Enable configuration control	Yes/No	No	ET 200SP
Diagnostics (maintenance) undervoltage	Yes/No	No	ET 200SP

4.2 Explanation of parameters

4.2.1 Enable configuration control

Enable configuration control

You use this parameter to enable the configuration control function in the ET 200SP distributed I/O system.

Note

If you configure the enable, the ET 200SP distributed I/O system requires a control data record 196 from the user program in order for the ET 200SP distributed I/O system to operate the I/O modules.

Reference

You can find more information on the control data record in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and in the STEP 7 online help.

4.2.2 Diagnostics (maintenance) undervoltage

Diagnostics (maintenance) undervoltage

The diagnostics alarm (maintenance) for undervoltage is triggered (incoming) if the supply voltage falls below the value 19.2 V DC. When the supply voltage then exceeds 20.4 V DC, the diagnostics alarm is reported as outgoing.

4.3 Substitute value behavior

Substitute value behavior

The respective output behaves according to its configured substitute value behavior:

- Zero current or zero voltage
- Output substitute value
- Keep last value

The substitute value behavior is triggered in the following cases:

- STOP controller
- Controller failure (connection interrupted)
- Parameter assignment phase during startup
- Deactivating the IO device
- Station stop
  - Missing server module
  - Insertion of invalid I/O modules
  - At least one I/O module is installed on an incorrect BaseUnit

---

Note

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage is switched off at the interface module.

The "current-free/voltage-free" behavior becomes effective in the following cases:

- Firmware update
- Reset to factory settings
- Configuration control: The IM has not received a valid control data record 196 yet
- Incorrectly configured module
- Module with incorrect parameter assignment

Substitute value behavior for module-internal Shared Output (MSO) and module-internal Shared Input (MSI)

Substitute value behavior for module-internal Shared Output (MSO) and module-internal Shared Input (MSI) corresponds to the behavior described above.

4.4 Status of the supply voltage L+ of the I/O modules

You can find information on the status of the supply voltage L+ of the I/O modules in the Server module (http://support.automation.siemens.com/WW/view/en/63257531) manual.

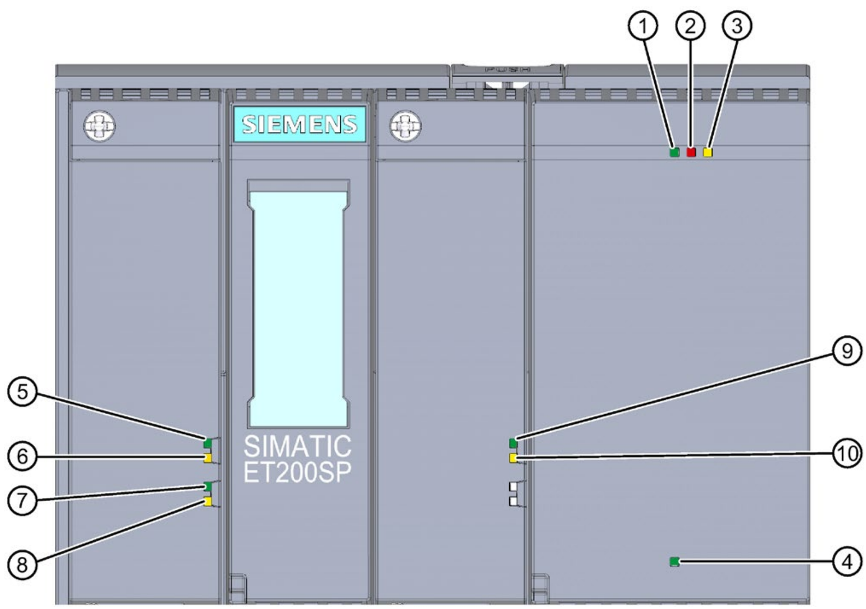
Interrupts, error messages, diagnostics and system alarms

5

5.1 Status and error displays

LED displays

The figure below shows the LED displays on the interface module and on the BusAdapters:



① RN (green)
② ER (red)
③ MT (yellow)
④ PWR (green)
⑤ LK1 (green)
⑥ MT1 (yellow), SCRJ port
⑦ LK2 (green)
⑧ MT2 (yellow), SCRJ port
⑨ LK3 (green)
⑩ MT3 (yellow), SCRJ port

Figure 5-1 LED displays on the interface module and BusAdapter 2xSCRJ

Meaning of the LED displays

The following tables contain the meaning of the status and error displays.

RN/ER/MT LEDs on the interface module

Table 5- 1 Status and error displays of RN/ER/MT LEDs

LEDs			Meaning	Solution
RN (RUN)	ER (ERROR)	MT (MAINT)		
Off	Off	Off	Missing or insufficient supply voltage on interface module.	Check the supply voltage or turn it on at the interface module.*
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-
Flashes	Not relevant	Not relevant	Interface module is deactivated.	Activate the interface module with the configuration software or the user program.
			Interface module is not configured.	Configure the interface module with the configuration software.
			ET 200SP starts up.	-
			ET 200SP is being assigned parameters.	
			ET 200SP is being reset to factory settings.	
On	Not relevant	Not relevant	ET 200SP is currently exchanging data with the IO controller.	-
Not relevant	Flashes	Not relevant	Group errors and group error channels.	Evaluate the diagnostics and eliminate the error.
			The preset configuration does not match the actual configuration of the ET 200SP.	Check the configuration of the ET 200SP to see whether a module is missing, faulty or not configured.
			Invalid configuration states.	For additional information, see section Invalid configuration states of the ET 200SP on PROFINET IO (Page 45)
			Parameter assignment error in the I/O module.	Evaluate the display of the module status in STEP 7. Eliminate the error in the corresponding I/O module.
Not relevant	Not relevant	On	Maintenance	For additional information, see section Maintenance events (Page 43)
Flashes	Flashes	Flashes	The "Node flash test" is run (LEDs LK1 and LK2 of the PROFINET interface also flash).	-
			Hardware or firmware defective (LEDs LK1 and LK2 of the PROFINET interface do not flash).	Run a firmware update. If the error persists, contact Siemens Industry Online Support. Replace the interface module.

* PWR LED on (on the interface module): Check the backplane bus for a short-circuit.

PWR LED on the interface module

Table 5- 2 Status display of the PWR LED

PWR LED	Meaning	Solution
□ Off	Supply voltage not present or too small.	Check the supply voltage.
■ On	Supply voltage present. Observe the maintenance messages if the MAIN LED is lit	-

LED display of configuration errors

Configuration errors of the distributed IO system ET 200SP are indicated on the interface module via the red LED ERROR and the yellow LED MAINT.

The following configuration errors are signaled by the LEDs:

- No server module
- Interruptions or short-circuit on the backplane bus

Operating principle

The LED error display provides information on the cause of the error. After notification by the flash signal, the error type is displayed followed by the error location/error code.

The LED error display:

- Is activated during POWER ON and during operation.
- Has priority over all other states that are displayed by means of the ERROR and MAINT LED.
- Remains on until the cause of the error has been eliminated.

Table 5- 3 Display of error type and error location

Sequence		Description
1	The ERROR and MAINT LEDs flash 3x at 0.5 Hz	Indication of the error type
2	The MAINT LED flashes at 1 Hz	Display of error type (decimal)
3	The ERROR and MAINT LEDs flash 3x at 2 Hz	Signaling of error location/error code
4	The ERROR LED flashes at 1 Hz	Display of tens digit (decimal) of the error location/error code
5	The MAINT LED flashes at 1 Hz	Display of ones digit (decimal) of the error location/error code
6	Repetition of 1 to 5 until the cause of the error has been eliminated.	

Error display

Table 5- 4 Error display

Error type (MAINT)	Error location (ERROR/ MAINT)	Cause of error	Solution
1	65	• No server module • Interruptions on the backplane bus • Short circuit of communication on the backplane bus	Check the configuration of the ET 200SP.

Note

A short circuit in the backplane bus supply or the bus connection supply is indicated by the following LEDs:

- PWR LED: On
- RN, ER and MT LED: Off

5.2 Interrupts

Introduction

The I/O device triggers interrupts as a reaction to specific errors. Interrupts are evaluated based on the I/O controller used.

Evaluating interrupts with I/O controllers

The ET 200SP distributed I/O system supports the following interrupts:

- Diagnostic error interrupts
- Hardware interrupts
- Pull/plug interrupts
- Maintenance events

In the event of an interrupt, interrupt OBs are automatically called in the CPU of the IO controller.

Information on the cause and class of the error is already available, based on the OB number and start information.

Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).

System diagnostics

In STEP 7 (TIA Portal), the innovated system diagnostics is available for the devices of the S7-1500 automation system (IO controller S7-1500 CPU) and ET 200SP (IO device). Independent of the cyclic user program, alarms are made available on the display of the S7-1500 CPU, the CPU web server and the HMI device.

You will find more information on system diagnostics in the Diagnostics (https://support.industry.siemens.com/cs/ww/en/view/59192926) function manual.

5.2.1 Triggering of a diagnostics interrupt

Triggering of a diagnostics interrupt

For an incoming or outgoing event (e.g. wire break on a channel of an I/O module), the module triggers a diagnostic error interrupt if this is configured accordingly.

The CPU interrupts processing of the user program and processes the diagnostic error interrupt OB (OB 82). The event that triggered the interrupt is entered in the start information of the diagnostic error interrupt OB.

5.2.2 Triggering a hardware interrupt

Triggering a hardware interrupt

If there is a hardware interrupt, the CPU interrupts user program execution and processes the hardware interrupt block OB, e.g., OB 40. The result that triggered the interrupt is added to the start information of the hardware interrupt OB.

Note

Diagnostics "Hardware interrupt lost" (from I/O module)

Do not use hardware interrupts for functional purposes (e.g. the cyclic generation of hardware interrupts).

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

5.2.3 Triggering of a remove/insert module interrupt

Triggering of a remove/insert module interrupt

In the event of a remove/insert module interrupt, the CPU interrupts processing of the user program and processes the remove/insert module OB, e.g. OB 83. The event that triggered the interrupt is entered in the start information of the remove/insert module OB.

Note

Parameter assignment error after removal/insertion

If you write data records from the user program to the modules of the distributed I/O, make sure that these modules actually exist and are available. You can do this by evaluating OB83. After inserting a module, OB83 is not called until the module has started up and its parameters are assigned. This ensures that data record operations can be executed without errors.

5.3 Alarms

5.3.1 Diagnostics alarms

Actions after a diagnostics alarm

There can be more than one diagnostics alarm at the same time. Each diagnostics alarm initiates the following actions:

- The ERROR LED of the interface module flashes.
- Diagnostics are reported as diagnostic error interrupts to the CPU of the IO controller and can be read via data records.
- Incoming diagnostics alarms are saved to the diagnostics buffer of the I/O controller.
- (S7-300/400) The diagnostic interrupt OB is called. If the diagnostics interrupt OB (OB 82) is not available, the IO controller goes into STOP mode.

You can find more information in the STEP 7 online help.

Reading the diagnostics

Table 5- 5 Reading the diagnostics with STEP 7

Automation system with IO controller	Application	See...
SIMATIC S7	Diagnostics as plain text in STEP 7 using Online and Diagnostics view	STEP 7 online help • as of STEP 7 V12 function manual PROFINET with STEP 7 as of V12 (http://support.automation.siemens.com/WW/view/en/49948856) • as of STEP 7 V5.5, system manual PROFINET System Description (http://support.automation.siemens.com/WW/view/en/19292127)
	Instruction "RDREC" (SFB 52) Read data records from the IO device	
	Instruction "RALRM" (SFB 54) Receive interrupts from the IO device	

Additional information on the data records for PROFINET IO

The structure of the diagnostic data records and programming examples are available in the programming manual From PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) and in Example application (http://support.automation.siemens.com/WW/view/en/24000238).

Causes of error and troubleshooting

The causes of error and remedies for the diagnostic alarms are described in the manuals for I/O modules (http://support.automation.siemens.com/WW/view/en/55679691/133300) in the section, "Interrupts, error messages, and system events".

See also

Channel diagnostics (Page 44)

5.3.2 Maintenance events

Triggering of a maintenance event

The PROFINET IO interfaces of the interface module support the diagnostic concept and maintenance concept in PROFINET IO according to the IEC 61158 Type 10 standard. The goal is to detect and remove potential problems as soon as possible.

For the interface module, maintenance events signal to the user when a plant component must be checked or replaced.

The CPU interrupts user program execution and executes the diagnostic error interrupt OB. The event that triggered the maintenance event is entered in the start information of the diagnostic error interrupt OB.

The interface module signals a maintenance event to the higher-level diagnostic system in the case of the following event:

Table 5- 6 Triggering of a maintenance event

Maintenance alarm	Event	Alarm/Meaning
Maintenance demanded LED MAINT is lit.	Synchronization loss	• No synchronization frame received. No synchronization frame was received by the sync master within the timeout period after parameter assignment or during operation. • Successive synchronization frames are located outside permitted limits (jitter).
	Undervoltage	• Diagnostics Undervoltage If the supply voltage of the interface falls below the value 19.2 V DC, these diagnostics are reported as incoming Maintenance demanded.

System alarms in STEP 7 (TIA Portal)

The maintenance information is generated in STEP 7 (TIA Portal) with the following system alarms:

- Maintenance demanded - indicated for each port by a yellow wrench icon in the device view or in the hardware configuration.

You can find more information in the STEP 7 online help.

5.3.3 Channel diagnostics

Function

Channel-related diagnostics provides information about channel faults in modules.

Channel faults are mapped as channel diagnostics data in IO diagnostics data records.

The data record is read using the instruction "RDREC".

Structure of the diagnostics data records

The data records supported by the ET 200SP distributed I/O system are based on the standard PROFINET IO - Application Layer Service Definition V2.2.

If required, you can find the standard on the Internet (http://www.profibus.com) at the home page of the PROFIBUS user organization.

Codes of the extended channel diagnostics

With the IM 155-6 PN/3 HF interface module, the following extended channel diagnostics are reported:

ChannelErrorType (CET)	ExtendedChannelError-Type (ECET)	Associated value AddValue	Diagnostics
0x0602	0x0691	Slot	Station stop - module parameter "Potential group" faulty or incorrect BaseUnit in actual slot (AddValue)
0x0602	0x0693	0x00	Diagnostics with missing server module
0x0602	0x0698	0x00	Diagnostics backplane bus too large
0x0602	0x0699	Slot	Diagnostics with incorrect bus configuration
0x0610	0x06B0	0x00	Group diagnostics: Missing supply voltage L+ for the potential groups Note: The slot in which the light-colored BaseUnit of the respective load module is located is coded in the "ChannelNumber" element.
0x0610	0x06B4	0x00	Diagnostics "Undervoltage power supply" If the supply voltage of the interface falls below the value 19.2 V DC, these diagnostics are reported as incoming Maintenance demanded.

5.3.4 Invalid configuration states of the ET 200SP on PROFINET IO

Invalid configuration states

The following invalid configuration states of the ET 200SP distributed I/O system lead to the failure of the IO device or prevent data exchange:

- Number of modules exceeds maximum configuration.
- Faulty backplane bus (e.g. defective BaseUnit). ET 200SP backplane bus interruptions do not trigger an interrupt.
- At least one I/O module is plugged into a different BaseUnit as the one configured in the parameters.
- No server module.
- Invalid or incorrectly configured BusAdapter.

Note

Removal of the server module will trigger a station stop. All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) but the interface module continues to exchange data.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

See also

Status and error displays (Page 36)

Channel diagnostics (Page 44)

5.3.5 Failure of supply voltage L+ at BaseUnit BU...D

Failure of the supply voltage L+

The I/O modules react as follows to failure of the supply voltage L+ on the BaseUnit BU...D:

- If an I/O module is removed during failure of the supply voltage, a pull interrupt is generated.
- If an I/O module is installed during failure of the supply voltage, a plug interrupt is generated.

5.3.6 STOP of the IO controller and recovery of the IO device

STOP of the SIMATIC IO controller

Diagnostics received from the IO device while the IO controller is in STOP do not initiate a call of any corresponding OBs when the IO controller goes into RUN. Read the $E00C_H$ data record in startup OB using the instruction "RDREC". This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Recovery of the SIMATIC IO devices

If you want to read the occurring diagnostics in the STOP state of the IO controller, you have to read the $E00C_H$ data record with the "RDREC" instruction. This record contains all diagnostics for the slots assigned to an IO controller in an IO device.

Compatibility 6

6.1 Compatibility of modules

Station configuration with more than 32 I/O modules

Certain I/O modules with functional status 001 and 002 do not support a station configuration with more than 32 I/O modules.

The table below shows all modules that do not support a station configuration with more than 32 I/O modules:

Table 6- 1 Incompatible modules with functional versions

Modules	Article number	up to functional status
Analog modules		
AI 4xI 2-/4-wire ST	6ES7134-6GD00-0BA1	002
AI 4xU/I 2-wire ST	6ES7134-6HD00-0BA1	002
AI 4xRTD/TC 2-/3-/4-wire HF	6ES7134-6JD00-0CA1	002
AI 4xU/I ST	6ES7135-6HD00-0BA1	002
Digital modules		
DI 16x24VDC ST	6ES7131-6BH00-0BA0	002
DI 8x24VDC ST	6ES7131-6BF00-0BA0	002
DQ 16x24VDC/0.5A ST	6ES7132-6BH00-0BA0	002
DQ 4x24VDC/2A ST	6ES7132-6BD20-0BA0	002
DQ 8x24VDC/0.5A ST	6ES7132-6BF00-0BA0	002

Status of the supply voltage

Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules without parameter assignment in the following table, the status of the supply voltage (status byte of the server module) is always signaled as "1" regardless of the actual status of the supply voltage.
- If a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "Missing supply voltage L+" is signaled for this potential group.

Modules	Article number
DI 8x24VDC ST	6ES7131-6BF00-0BA0
DI 16x24VDC ST	6ES7131-6BH00-0BA0
DI 8x24VDC HF	6ES7131-6BF00-0CA0
DQ 4x24VDC/2A ST	6ES7132-6BD20-0BA0
DQ 8x24VDC/0.5A ST	6ES7132-6BF00-0BA0
DQ 16x24VDC/0.5A ST	6ES7132-6BH00-0BA0
DQ 8x24VDC/0.5A HF	6ES7132-6BF00-0CA0

AQ 4xU/I ST analog output module

Note

For operation of the AQ 4xU/I ST analog output module, firmware version V1.0 (6ES7135-6HD00-0BA1) with the interface module, you need to set the "Reaction to CPU STOP" parameter to "Turn off" with a PROFINET send clock < 1 ms.

Reaction times for fail-safe modules

The following maximum reaction time of the interface module must be taken into account when calculating the reaction times of fail-safe modules: **Maximum reaction time = configured update time + 400 μs (but at least 1.4 ms)**

Operation with activated system redundancy S2

Note

Restrictions in operation with activated system redundancy S2

You cannot use the following functions during operation of the IM155-6 PN/3 HF, firmware version V4.2 with activated system redundancy S2:

- Configuration control (option handling)
- Module-to-Module Communication (MtM)
- Interface local coupling of IO data

7 Technical specifications

Technical specifications of IM 155-6 PN/3 HF

The following table shows the technical specifications as of 08/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/de/en/pv/6ES7155-6AU30-0CN0/td?dl=en).

Article number	6ES7155-6AU30-0CN0
General information	
Product type designation	IM 155-6 PN/3 HF with server module
Firmware version	V4.2
• FW update possible	Yes
Number of MtM communication relationships/connections, max.	16
Product function	
• I&M data	Yes; I&M0 to I&M3
• Module swapping during operation (hot swapping)	Yes; Multi-hot swapping
• Tool changer	Yes; Docking station and docking unit
• Local coupling, IO data	Yes
– Number of coupling modules	16
– Number of coupling submodules per module	4
• Local coupling, data records	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15.1
• STEP 7 configurable/integrated as of version	Configurable via GSD file
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Configuration control	
via dataset	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7155-6AU30-0CN0
Mains buffering	
• Mains/voltage failure stored energy time	10 ms
Input current	
Current consumption (rated value)	175 mA; At 24 V, 2 slots 2x RJ45 BusAdapter, no I/O modules
Current consumption, max.	950 mA
Inrush current, max.	9 A
I^2t	0.34 $A^2 \cdot s$
Power loss	
Power loss, typ.	4.9 W
Address area	
Address space per module	
• Address space per module, max.	288 byte; For input and output data respectively
Address space per station	
• Address space per station, max.	1 440 byte; Dependent on configuration
Hardware configuration	
Rack	
• Modules per rack, max.	64; + 16 ET 200AL modules
Submodules	
• Number of submodules per station, max.	256
Interfaces	
Number of PROFINET interfaces	1; 3 ports (switch)
1. Interface	
Interface types	
• Number of ports	3; Via 2 BusAdapter slots
• integrated switch	Yes
• BusAdapter (PROFINET)	Yes; Compatible BusAdapter: BA 2x RJ45, BA 2x FC, BA 2x SCRJ, BA SCRJ / RJ45, BA SCRJ / FC, BA 2x LC, BA LC / RJ45, BA LC / FC
Protocols	
• PROFINET IO Device	Yes
• Open IE communication	Yes
• Media redundancy	Yes; PROFINET MRP
Interface types	
RJ 45 (Ethernet)	
• Transmission procedure	PROFINET with 100 Mbit/s full duplex (100BASE-TX)

Protocols	
PROFINET IO Device	
Services	
– Isochronous mode	Yes; Bus cycle time: min. 250 µs
– Open IE communication	Yes
– IRT	Yes; 250 µs, 500 µs, 1 ms, 2 ms, 4 ms additionally with IRT with high performance: 250 µs to 4 ms in 125 µs frame
– PROFIenergy	Yes
– Prioritized startup	Yes
– Shared device	Yes
– Number of IO Controllers with shared device, max.	4
Redundancy mode	
– MRP	Yes
– MRPD	No
– PROFINET system redundancy (S2)	Yes; NAP S2
– Redundant PROFINET configuration (R1)	No
– H-Sync forwarding	Yes
Open IE communication	
• TCP/IP	Yes
• SNMP	Yes
• LLDP	Yes
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Equidistance	Yes
shortest clock pulse	250 µs
max. cycle	4 ms
Bus cycle time (TDP), min.	250 µs
Jitter, max.	1 µs
Interrupts/diagnostics/status information	
Status indicator	Yes
Alarms	Yes
Diagnostics function	Yes
Diagnostics indication LED	
• RUN LED	Yes; Green LED
• ERROR LED	Yes; Red LED

Article number	6ES7155-6AU30-0CN0
• MAINT LED	Yes; yellow LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Connection to network LINK (green)	Yes; 2x green link LEDs on BusAdapter
Potential separation	
between backplane bus and electronics	No
between PROFINET and all other circuits	Yes
between supply and all other circuits	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Network loading class	3
Security level	According to Security Level 1 Test Cases V1.1.1
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation
• horizontal installation, max.	60 °C
• vertical installation, min.	-30 °C; No condensation
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	2 000 m; On request: Installation altitudes greater than 2 000 m
Connection method	
ET-Connection	
• via BU/BA Send	Yes; + 16 ET 200AL modules
Mechanics/material	
Strain relief	Yes; Optional
Dimensions	
Width	100 mm
Height	117 mm
Depth	74 mm
Weights	
Weight, approx.	220 g; without BusAdapter

Dimension drawing

A

This appendix contains a dimension drawing of the module mounted on a mounting rail. Always observe the specified dimensions for installation in cabinets, control rooms, etc.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes labeled as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product, or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

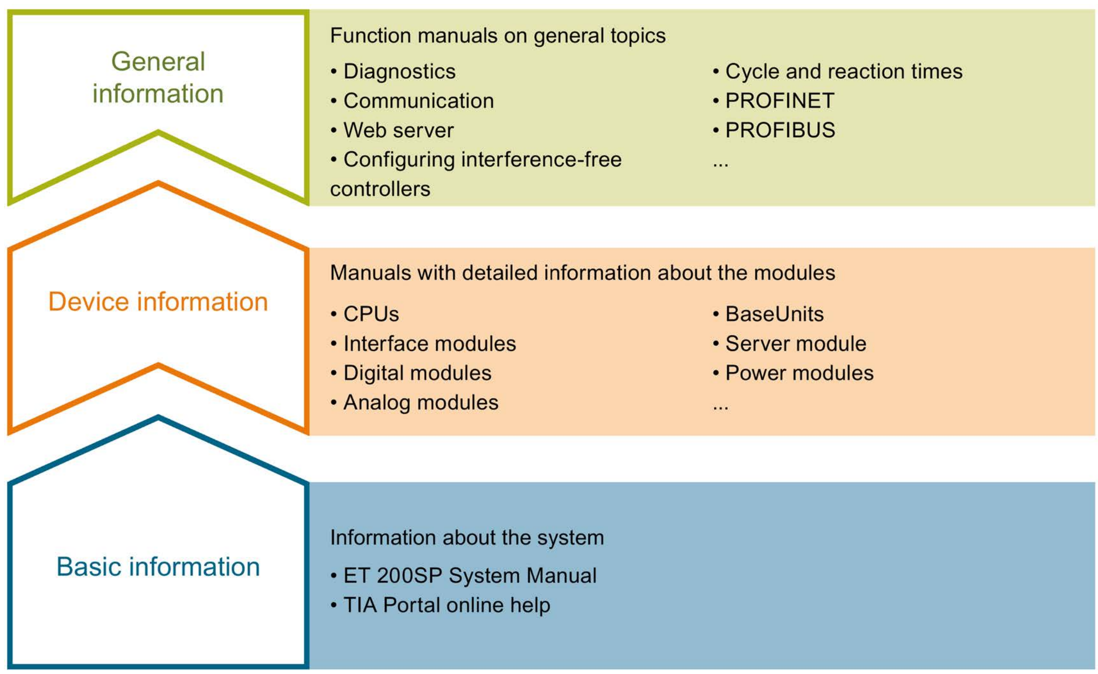
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Application examples

Applications examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

2

2.1 Properties

Article number

6ES7193-6PA00-0AA0

View of the module

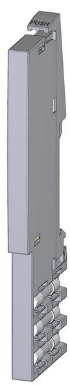


Figure 2-1 View of the server module

Properties

The module has the following technical properties:

- Closes off the backplane bus of the ET 200SP
- Contains a support for 3 spare fuses (5 × 20 mm)

The module supports the following functions:

- Firmware update
- I&M identification data
- Reconfiguration in RUN
- Representation of the statuses of supply voltage L+ and the feedback voltage (Page 15) per slot.
- Retentive storage of device name for device replacement without topological configuration of the IM 155-6 PN BA.

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Function and properties	Product version of the module as of	Firmware version of the module as of
Support of the IM 155-6 PN BA	1	V1.1.1

Parameters/address space 3

3.1 Parameters

Parameters for the server module

The effective range of the configurable parameter depends on the type of configuration. Possible configuration: Distributed operation on PROFINET IO in an ET 200SP system.

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameter to the module by means of data records, see section Parameter assignment and structure of parameter data record (Page 19).

The following parameter settings are possible:

Table 3- 1 Configurable parameter and its default (GSD file)

Parameters	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Group diagnostics: No supply voltage L+	• Disable • Enable	No	Yes	ET 200SP	---

3.2 Explanation of the parameters

Group diagnostics: No supply voltage L+

When you enable this parameter, the ET 200SP generates one diagnostic per potential group (as group information) when the supply voltage L+ fails.

This function does not depend on enabling the parameter "Diagnostics: No supply voltage L+" of the I/O modules.

The diagnostics is formed from the states of the supply voltage of the installed I/O modules within the potential group.

Requirements

- All I/O modules must be inserted, i.e. the current configuration must not have any empty slots.
- If no I/O modules are inserted on light-colored BaseUnits BU..D, the beginning of this potential group is not recognized. The I/O modules of this potential group are therefore part of the previous potential group.
  If the I/O module is installed on the light-colored BaseUnit, the potential group is detected, the diagnostics is reevaluated according to the potential group arrangement and new diagnostics may be reported. The position of the light-colored BaseUnit remains stored in the structure until the supply voltage 1L+ of the CPU/interface module is turned off.

3.3 Address space

Introduction

You can read out the status of the supply voltage L+ and the feedback voltage of I/O modules via the address space of the server module:

- All I/O modules:
  No supply voltage L+ or no I/O module available
- Additional digital output module HF:
  feedback voltage present

Requirements

- The I/O module used must support monitoring of the supply voltage.
- The I/O module used must support monitoring of a feedback voltage.

Length of input data

The length of the input data depends on the CPU/interface module:

- Interface module with 12 I/O modules maximum configuration: 2/4 bytes
- Interface module with 32 I/O modules maximum configuration: 4/8 bytes
- CPU/interface module with 64 I/O modules maximum configuration: 8/16 bytes

Configurations

In the configuration software, you can select 3 configurations for the server module for operation on the CPU/interface module:

- Configuration with disabled "Status of the supply voltage L+" and disabled "Status of the feedback voltage":
  - The server module only has one diagnostics address.
- Configuration with enabled "Status of the supply voltage L+" and disabled "Status of the feedback voltage":
  - The server module has 2/4/8 bytes of input data for the display of the status of the supply voltage L+ of the inserted I/O modules.
  - Display in the input data of the server module:

    Supply voltage L+ present/missing or I/O module available/not available
- Configuration with enabled "Status of the supply voltage L+" and enabled "Status of the feedback voltage":
  - The server module has 4/8/16 bytes of input data for the display of the status of the supply voltage L+ and the status of the feedback voltage of the inserted I/O modules.
  - Display in the input data of the server module:

    Supply voltage L+ present/missing or I/O module available/not available

    Feedback voltage present/missing

Table 3- 2 Data length depending on configuration and maximum configuration

Maximum configuration	"Status supply voltage" deactivated	Activated	Activated
	"Status feedback voltage" deactivated	Deactivated	Activated
12 slots	0	2	4
32 slots	0	4	8
64 slots	0	8	16

3.3.1 Input data for interface modules with maximum 12 I/O modules

Configuration with enabled status detection of the supply voltage L+ (2 bytes of input data)

You can read out the following status for each I/O module of the ET 200SP in the input data (byte 0 to 1):

- Supply voltage L+ present/missing or I/O module available/not available (2 bytes)

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	x	x	x	x	12	11	10	9

Slots of the I/O modules
Bit = 1:
Supply voltage L+ available and I/O module available
Bit = 0:
Missing supply voltage L+ or no I/O module available
X = 0

Figure 3-1 Configuration with enabled status detection of the supply voltage L+ (2 bytes)

Configuration with enabled status detection of the supply voltage L+ and enabled status detection of the feedback voltage (4 bytes of input data)

You can read out the following status for each I/O module of the ET 200SP in the input data (byte 0 to 3).

- Supply voltage L+ present/missing or I/O module available/not available (2 bytes)
- Feedback voltage present/missing (2 bytes)

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	x	x	x	x	12	11	10	9

Slots of the I/O modules
Bit = 1:
Supply voltage L+ available and I/O module available
Bit = 0:
Missing supply voltage L+ or I/O module not available
x = 0

Byte 2	8	7	6	5	4	3	2	1
Byte 3	x	x	x	x	12	11	10	9

Bit = 1:
Feedback voltage present
Bit = 0:
Feedback voltage missing
x = 0

Figure 3-2 Configuration with enabled status detection of the supply voltage L+ and enabled status detection of the feedback voltage (4 bytes of input data)

Note

- An inserted or missing server module always signals bit=0 for the slot.
- If the server module is missing, the input data is invalid.
- For I/O modules without feedback voltage monitoring, the bit for the feedback voltage is the same as the bit for the missing supply voltage L+.

3.3.2 Input data for interface modules with maximum 32 I/O modules

Configuration with enabled status detection of the supply voltage L+ (4 bytes of input data)

You can read out the following status for each I/O module of the ET 200SP in the input data (byte 0 to 3):

- Supply voltage L+ present/missing or I/O module available/not available (4 bytes)

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	16	15	14	13	12	11	10	9
Byte 2	24	23	22	21	20	19	18	17
Byte 3	32	31	30	29	28	27	26	25

Slots of the I/O modules
Bit = 1:
Supply voltage L+ available and I/O module available
Bit = 0:
Missing supply voltage L+ or no I/O module available

Figure 3-3 Supply voltage L+ missing or I/O module not available (4 bytes); feedback voltage not available

Configuration with enabled status detection of the supply voltage L+ and enabled status detection of the feedback voltage (8 bytes of input data)

You can read out the following status for each I/O module of the ET 200SP in the input data (byte 0 to 7).

- Supply voltage L+ present/missing or I/O module available/not available (4 bytes)
- Feedback voltage present/missing (4 bytes)

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	16	15	14	13	12	11	10	9
Byte 2	24	23	22	21	20	19	18	17
Byte 3	32	31	30	29	28	27	26	25

Slots of the I/O modules
Bit = 1:
Supply voltage L+ available and I/O module available
Bit = 0:
Missing supply voltage L+ or I/O module not available

Byte 4	8	7	6	5	4	3	2	1
Byte 5	16	15	14	13	12	11	10	9
Byte 6	24	23	22	21	20	19	18	17
Byte 7	32	31	30	29	28	27	26	25

Bit = 1:
Feedback voltage present
Bit = 0:
Feedback voltage missing

Figure 3-4 Configuration with enabled status detection of the supply voltage L+ and enabled status detection of the feedback voltage (8 bytes of input data)

Note

- An inserted or missing server module always signals bit=0 for the slot.
- If the server module is missing, the input data is invalid.
- For I/O modules without feedback voltage monitoring, the bit for the feedback voltage is the same as the bit for the missing supply voltage L+.

3.3.3 Input data for CPU/interface modules with maximum 64 I/O modules

Configuration with enabled status detection of the supply voltage L+ (8 bytes of input data)

You can read out the following status for each I/O module of the ET 200SP in the input data (byte 0 to 7):

- Supply voltage L+ present/missing or I/O module available/not available (8 bytes)

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	16	15	14	13	12	11	10	9
Byte 2	24	23	22	21	20	19	18	17
Byte 3	32	31	30	29	28	27	26	25
Byte 4	40	39	38	37	36	35	34	33
Byte 5	48	47	46	45	44	43	42	41
Byte 6	56	55	54	53	52	51	50	49
Byte 7	64	63	62	61	60	59	58	57

Slots of I/O modules
Bit = 1:
Supply voltage L+ present and I/O module available
Bit = 0:
Missing supply voltage L+ or no I/O module available

Figure 3-5 Configuration with enabled status detection of the supply voltage L+ (8 bytes)

Configuration with enabled status detection of the supply voltage L+ and enabled status detection of the feedback voltage (16 bytes of input data)

You can read out the following status for each I/O module of the ET 200SP in the input data (byte 0 to 15):

- Supply voltage L+ present/missing or I/O module available/not available (8 bytes)
- Feedback voltage present/missing (8 bytes)

	7	6	5	4	3	2	1	0
Byte 0	8	7	6	5	4	3	2	1
Byte 1	16	15	14	13	12	11	10	9
Byte 2	24	23	22	21	20	19	18	17
Byte 3	32	31	30	29	28	27	26	25
Byte 4	40	39	38	37	36	35	34	33
Byte 5	48	47	46	45	44	43	42	41
Byte 6	56	55	54	53	52	51	50	49
Byte 7	64	63	62	61	60	59	58	57

Slots of I/O modules
Bit = 1:
Supply voltage L+ present and I/O module available
Bit = 0:
Missing supply voltage L+ or no I/O module available

Byte 8	8	7	6	5	4	3	2	1
Byte 9	16	15	14	13	12	11	10	9
Byte 10	24	23	22	21	20	19	18	17
Byte 11	32	31	30	29	28	27	26	25
Byte 12	40	39	38	37	36	35	34	33
Byte 13	48	47	46	45	44	43	42	41
Byte 14	56	55	54	53	52	51	50	49
Byte 15	64	63	62	61	60	59	58	57

Bit = 1:
Feedback voltage available
Bit = 0:
Feedback voltage not available

Figure 3-6 Configuration with enabled status detection of the supply voltage L+ and enabled status detection of the feedback voltage (16 bytes of input data)

Note

- An inserted or missing server module always signals bit=0 for the slot.
- If the server module is missing, the input data is invalid.
- For I/O modules without feedback voltage monitoring, the bit for the feedback voltage is the same as the bit for the missing supply voltage L+.

3.3.4 Evaluating feedback voltage

Ranges of error

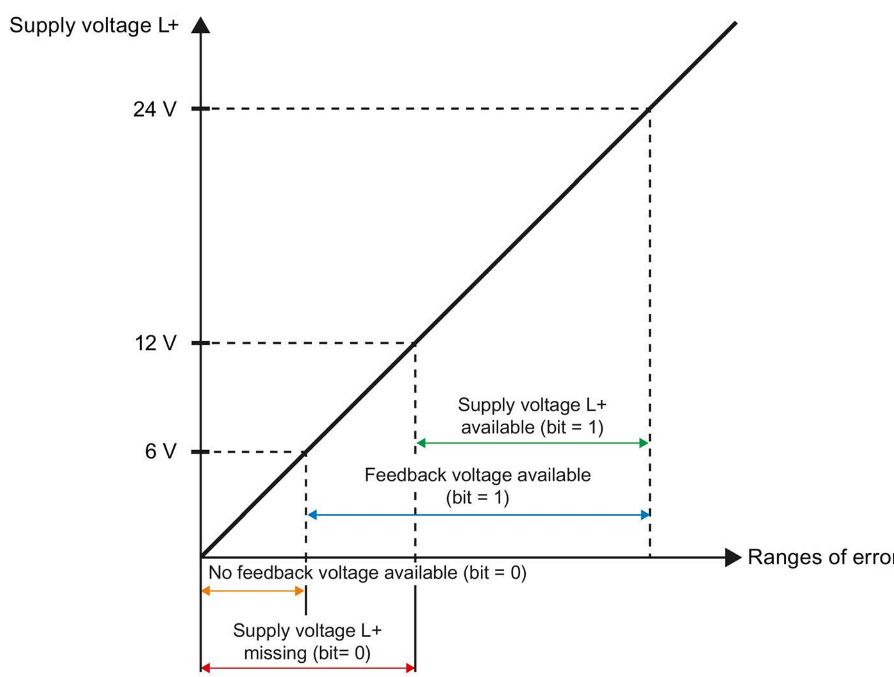

Figure 3-7 Ranges of error of the supply voltage L+ and the feedback voltage

Feedback voltage

A feedback may occur, for example, due to a crossover in a cable of a digital output module and depends on the target status of the supply voltage L+:

If the supply voltage L+ of the I/O module is greater than 6 V, this is entered in the input data in the respective bit.

- Byte 2 and 3 (for 12 I/O modules and 4 bytes of input data)
- Byte 4 to 7 (for 32 I/O modules and 8 bytes of input data)
- Byte 8 to 15 (for 64 I/O modules and 16 bytes of input data)

The feedback voltage can be evaluated via the user program in the following cases:

Table 3- 3 Under what circumstances can the feedback voltage be evaluated via the user program?

Supply voltage L+ safely disconnected[1]	Status detection of supply voltage L+ (input data)	Status detection of feedback voltage (input data)	Explanation
Yes	Not available: Bit = 0	Available: Bit = 1	The feedback voltage detected is in the range 6 to 12 V (e.g. in the event of a fault in the system)
Yes	Available: Bit = 1	Available: Bit = 1	The feedback voltage detected is > 12 V (e.g. in the event of a fault in the system)

[1] This does not refer to the supply voltage applied to the BaseUnit, but, for example, to the status information of a safety relay.

4 Diagnostics alarms

A diagnostics alarm is output for each diagnostics event. The diagnostics alarms can, for example, be read out in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 4- 1 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Server module with invalid firmware version (< V1.1.1)	$1B_H$	General error	• Replace the server module. • Firmware update of the server module.

Technical specifications 5

5.1 Technical specifications

Technical specifications of the server module

	6ES7193-6PA00-0AA0
Dimensions	
Width	7 mm
Height	117 mm
Depth	36 mm
Weights	
Weight, approx.	19 g

Parameter data record 6

6.1 Parameter assignment and structure of parameter data record

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The WRREC instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

STATUS output parameter

The module ignores errors that occurred during the transfer of parameters with the WRREC instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7131-6BF00-0AA0 to 6ES7131-6BF01-0AA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

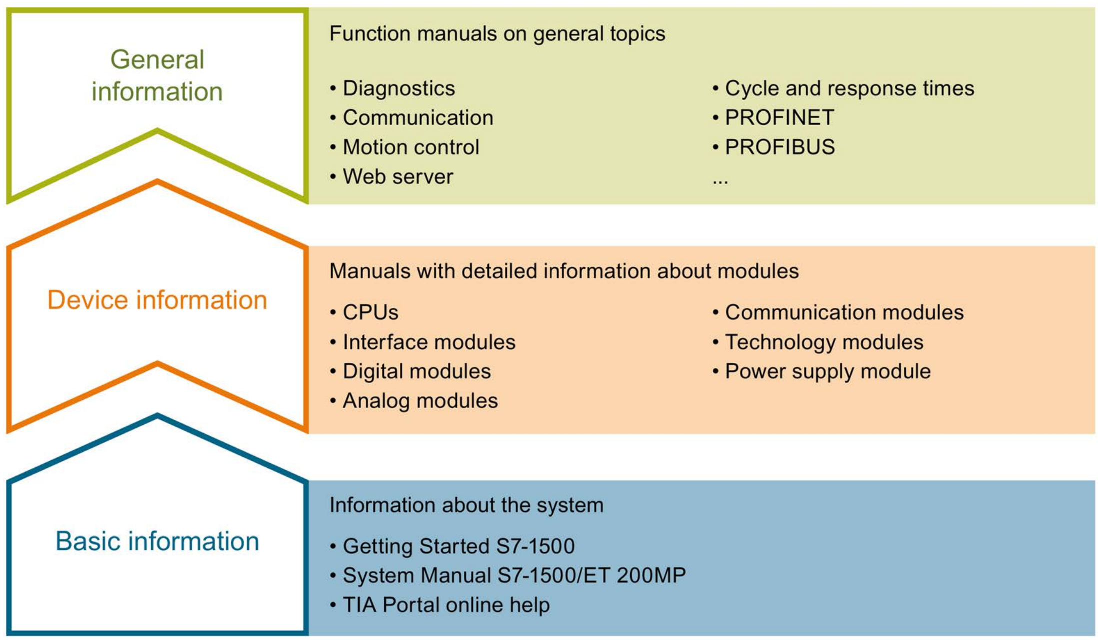
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC S7-1500 and ET 200MP systems, e.g. diagnostics, communication, motion control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/68052815).

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86140384).

SIMATIC S7-1500 comparison list for programming languages

The comparison list contains an overview of which instructions and functions you can use for which controller families.

You can find the comparison list on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86630375).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal.

General function overview:

- Network browsing and creation of a table showing the accessible devices in the network.
- Flashing of device LEDs or HMI display to locate a device
- Downloading of addresses (IP, subnet, gateway) to a device
- Downloading the PROFINET name (station name) to a device
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your PG/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- Performing a CPU memory reset
- Resetting devices to factory settings
- Downloading a firmware update to a device

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the PROFINET network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET network and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 Product overview

2.1 Properties

Figure 2-1 View of the DI 8×24VDC BA module

Properties

The module has the following technical properties:

- Digital input module with 8 inputs
- Supply voltage L+
- Sink input (PNP, sinking input)
- Configurable input delay 0.05 ms to 20 ms (per channel)
- Suitable for connection of switches and 2-wire sensors according to IEC 61131, type 1, 2 and 3

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X

You can configure the module with STEP 7 and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DI 8x24VDC BA module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection.

Information about wiring of the BaseUnit is available in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

You may use and combine the different wiring options for all channels.

Note

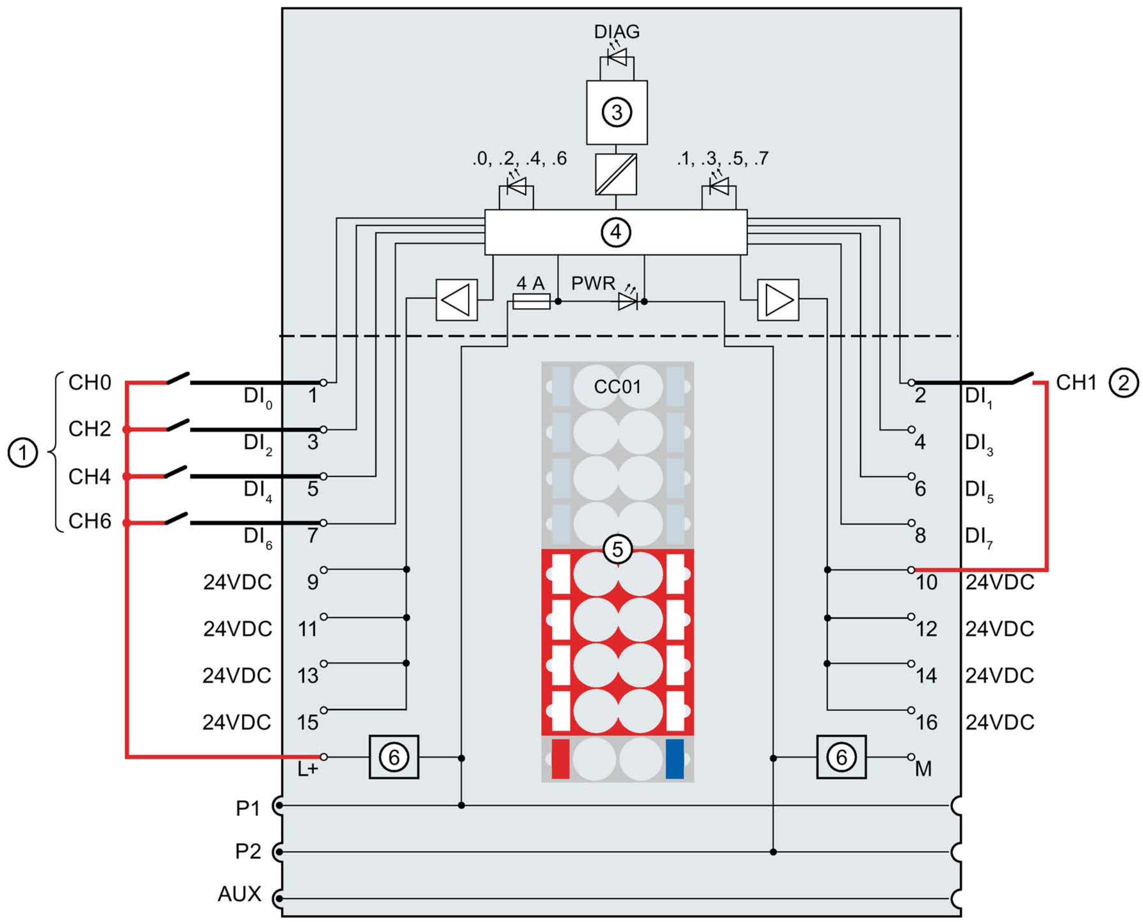
The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Note

The input channels provide values even without connected supply voltage L+. The characteristic type 2 is only maintained with connected supply voltage L+.

Connection: 1-wire and 2-wire connection

The figure below shows the block diagram and an example of the terminal assignment of the digital input module DI 8x24VDC BA on the BaseUnit BU type A0 without AUX terminals (1-wire and 2-wire connection).

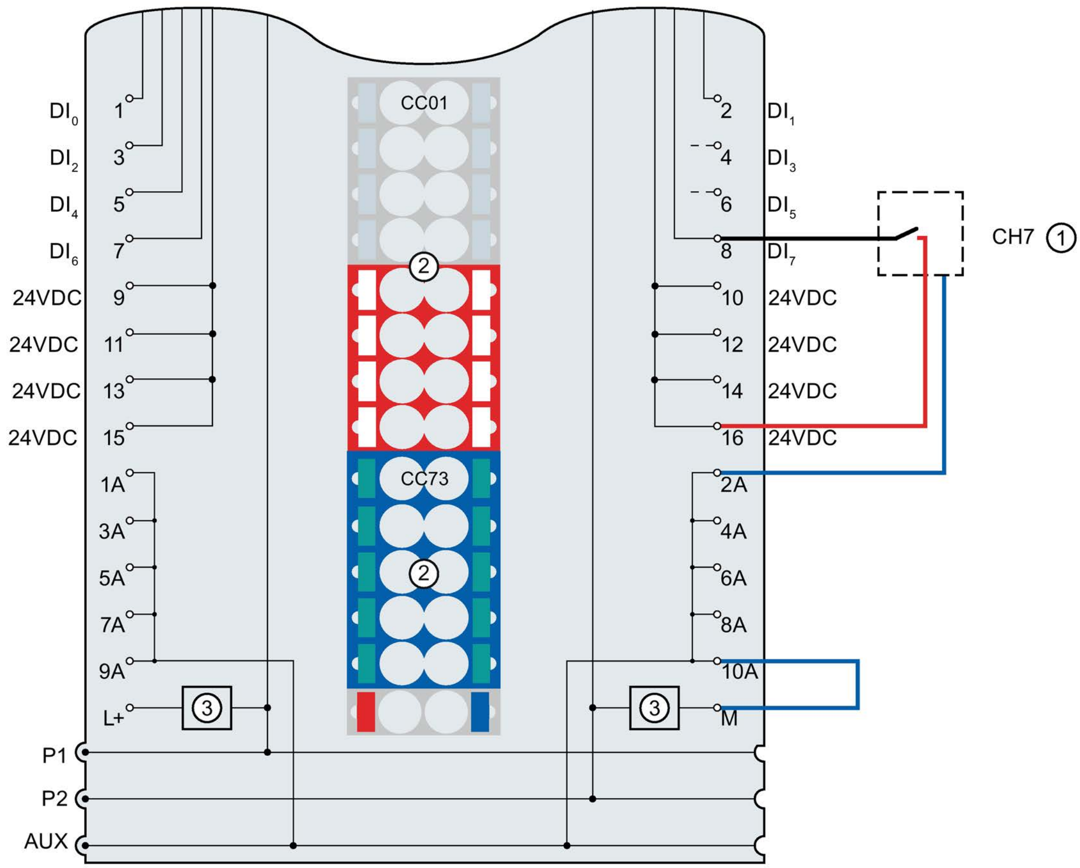


①	1-wire connection	DI_n	Input signal, channel n
②	2-wire connection	24 V DC	Encoder supply, channel n
③	Backplane bus interface	L+	24 V DC (feed for light-colored BaseUnit only)
④	Input electronics	M	Ground
⑤	Color identification label CCxx (optional)	DIAG	Error or Diagnostics LED (green, red)
⑥	Filter connection supply voltage (only when light-colored BaseUnit is present)	.0 to .7	Channel status LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of encoders

Connection: 3-wire connection

The figure below shows the block diagram and an example of the terminal assignment of the digital input module DI 8x24VDC BA on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color identification labels CCxx (optional)
③	Filter connection supply voltage (only when light-colored BaseUnit is present)
DI_n	Input signal, channel n
24 V DC	Encoder supply, channel n
L+	24 V DC (feed for light-colored BaseUnit only)
M	Ground
1 A to 10 A	AUX terminals
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Wiring and block diagram for 3-wire connection of encoders

Parameters/address space 4

4.1 Parameters

DI 8x24VDC BA parameters

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the parameters that can be set depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records; see section Parameter assignment and structure of the parameter data record (Page 28).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	Yes	Channel	Module [1]
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP: The parameter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes for each ET 200SP station. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 16 bytes.

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Input delay

This parameter can be used to suppress signal interference. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DI 8x24VDC BA

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DI 8x24VDC BA V0.0	V14, SP1 or higher with HSP 0222	X	X

Address space

The figure below shows the assignment of the address space for DI 8x24VDC BA.

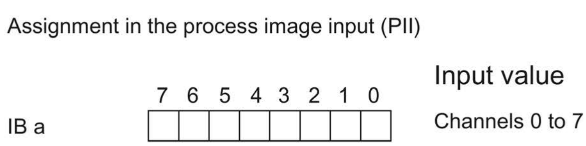


Figure 4-1 Address space of DI 8x24VDC BA

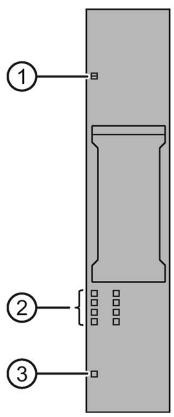
Interrupts/diagnostics alarms

5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC BA.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following tables contain the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 23).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned
Flashes	Module diagnostics is available

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Process signal = 0
On	Process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ present

5.2 Interrupts

The DI 8×24VDC BA digital input module supports diagnostic interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Parameter assignment error
- No supply voltage

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+.	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

Technical specifications 6

6.1 Technical specifications

Technical specifications of the DI 8×24VDC BA

Article number	6ES7131-6BF01-0AA0
General information	
Product type designation	DI 8x24 VDC BA
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3 / -
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	No
• Oversampling	No
• MSI	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	70 mA; All channels are supplied from the encoder supply

Article number	6ES7131-6BF01-0AA0
Encoder supply	
Number of outputs	8
Output voltage encoder supply, min.	19.2 V
Short-circuit protection	Yes; per module
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes
Power loss	
Power loss, typ.	1.6 W; 24 V, 8 inputs supplied via encoder supply
Address area	
Address space per module	
• Inputs	1 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals
• 4-wire connection	BU type A0 + Potential isolation module
Digital inputs	
Number of digital inputs	8
Digital inputs, parameterizable	Yes
Source/sink input	P-reading
Input characteristic curve in accordance with IEC 61131, type 2	Yes
Input voltage	
• Type of input voltage	DC
• Rated value (DC)	24 V
• for signal "0"	-30 to +5V
• for signal "1"	+11 to +30V
Input current	
• for signal "1", typ.	6.8 mA

Article number	6ES7131-6BF01-0AA0
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms (in each case + delay of 30 to 500 µs, depending on line length)
– at "0" to "1", min.	0.05 ms
– at "0" to "1", max.	20 ms
– at "1" to "0", min.	0.05 ms
– at "1" to "0", max.	20 ms
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	2 mA
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Monitoring of encoder power supply	No
• Wire-break	No
• Short-circuit	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED

Article number	6ES7131-6BF01-0AA0
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	28 g

Dimension drawing

See the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

The module parameters can be re-assigned in RUN (for example, the input delay of selected channels can be edited in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid again after a restart.

STATUS output parameter

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

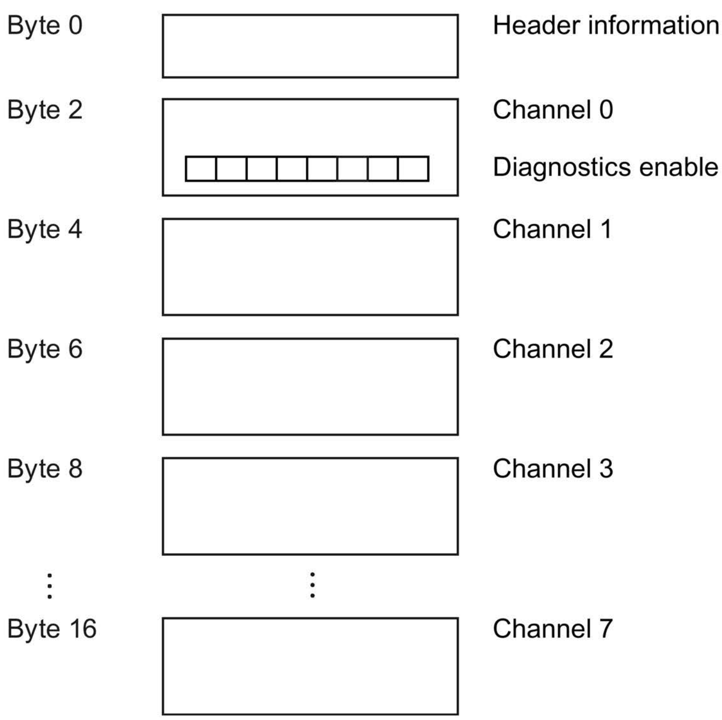


Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

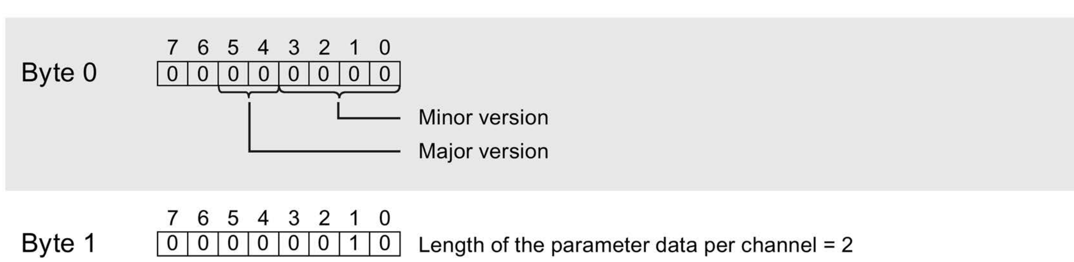

Figure A-2 Header information

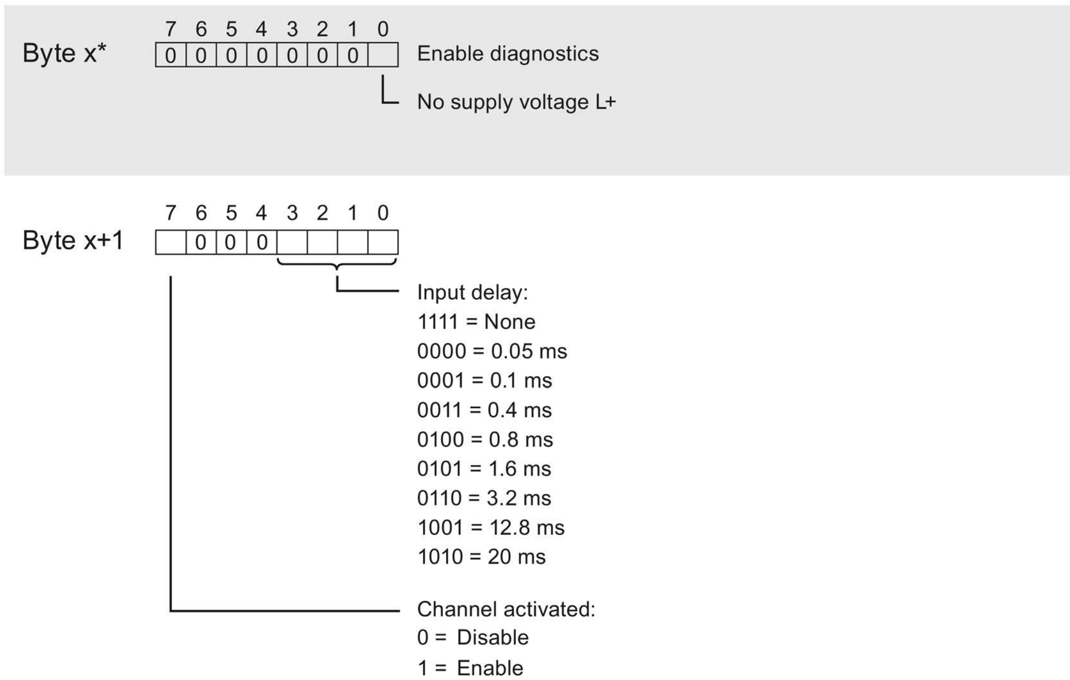
Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

Enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 2); channel number = 0 to 7

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	07	Invalid coding for input filter time.	Check the parameters of the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Number in pack: 10 units (6ES7131-BF00-2CA0)

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

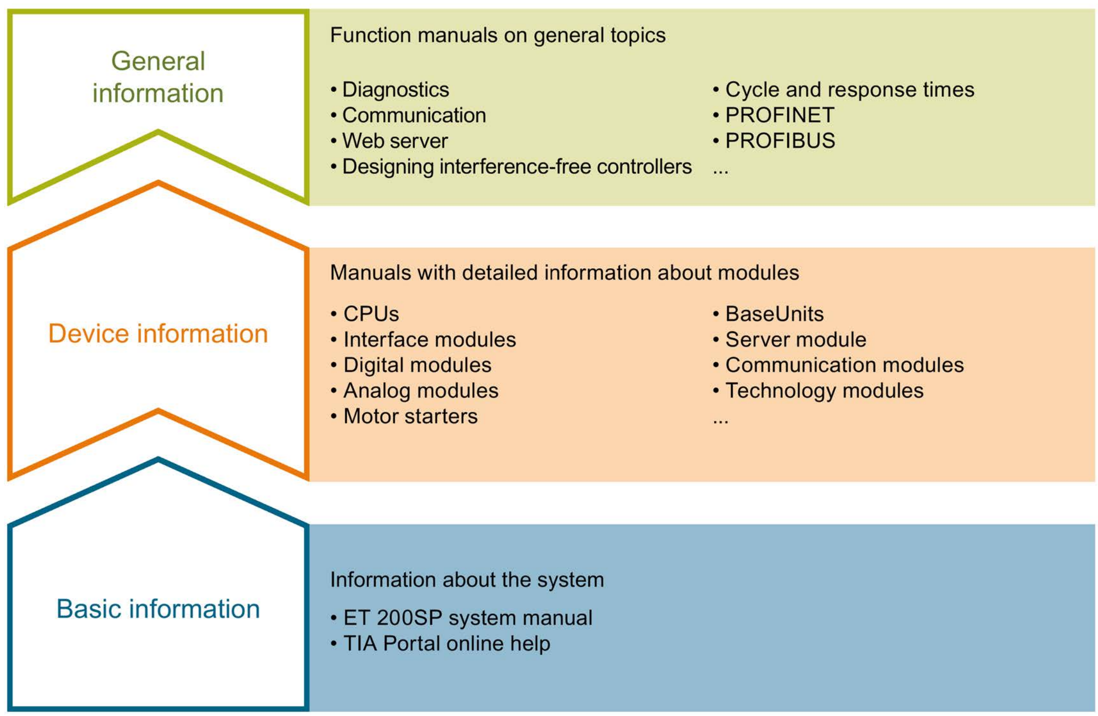
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the DI 8x24VDC HF module

Properties

The module has the following technical properties:

- Digital input module with 8 inputs
- Sink input (PNP, active high)
- Supply voltage L+
- Configurable input delay 0.05 ms to 20 ms (per channel)
- Configurable diagnostics (per channel)
- Configurable hardware interrupts (per channel)
- Suitable for connection of switches and 2-wire sensors according to IEC 61131, type 1 and 3

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Pulse stretching	FS01	V1.0.0 or higher	V12 or higher	V5.5 SP3 or higher with HSP 0229 V1.0 or higher	X	X
Firmware update	FS01	V1.0.0 or higher	V12 or higher	V5.5 SP3 or higher with HSP 0229 V1.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V1.0.0 or higher	V12 or higher	V5.5 SP3 or higher with HSP 0229 V1.0 or higher	X	X
Reconfiguration in RUN	FS01	V1.0.0 or higher	V12 or higher	V5.5 SP3 or higher with HSP 0229 V1.0 or higher	X	X
Value status	FS01	V1.1.0 or higher	V12, SP1 or higher with HSP 0057	V5.5 SP3 or higher with HSP 0229 V2.0 or higher	X	X
Isochronous mode	FS01	V1.1.0 or higher	V12, SP1 or higher with HSP 0057	V5.5 SP3 or higher with HSP 0229 V2.0 or higher	X	X

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Module-internal shared input (MSI)	FS01	V1.2..0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0229 V3.1 or higher	X	X
Configurable sub-module/submodules for shared device	FS01	V2.0.0 or higher	V13 SP1 Update 4 or higher with HSP 0163	V5.5 SP3 or higher with HSP 0229 V6.0 or higher	X	X

Accessories

The following accessories are supplied with the module and can also be ordered separately as spare parts:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connector

See also

You can find additional information on the accessories in the system manual Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Wiring 3

3.1 Wiring and block diagrams

This section includes the block diagram of the DI 8x24VDC HF module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection in the DI operating mode. You can use and combine the different wiring options for all channels.

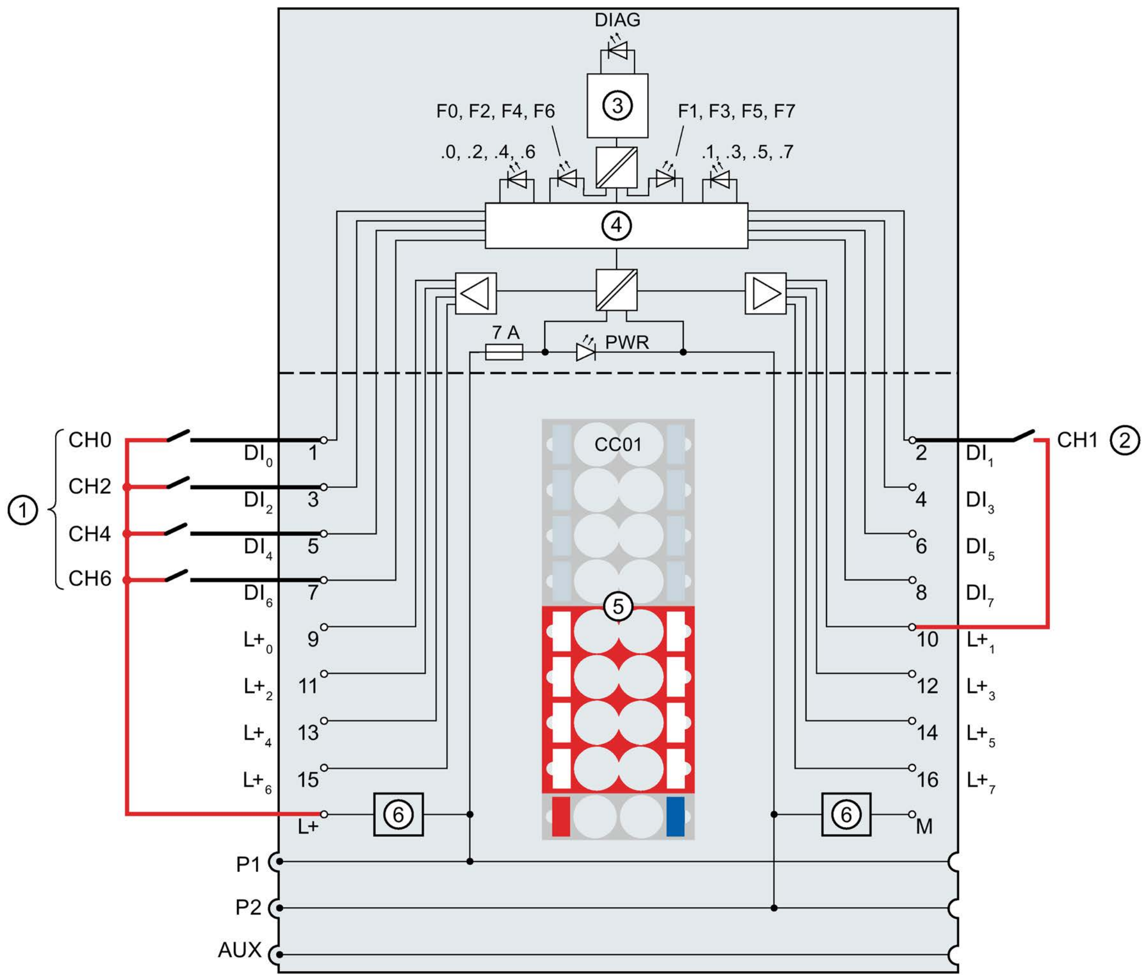
You can find information on wiring the BaseUnit in the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/91696622).

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: 1 and 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input module DI 8×24VDC HF on the BaseUnit BU type A0 without AUX terminals (1- and 2-wire connection).

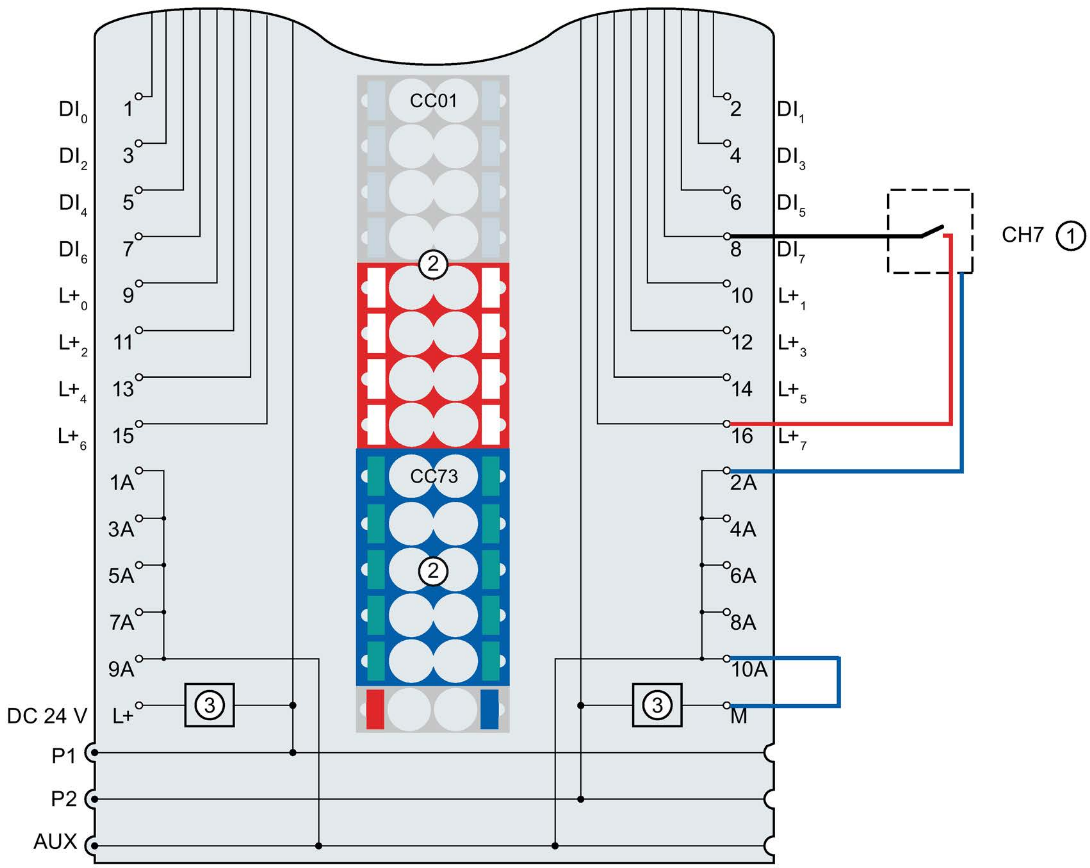


①	1-wire connection	L+n	Encoder supply, channel n
②	2-wire connection	L+	24 V DC (infeed only with light BaseUnit)
③	Backplane bus interface	DIAG	Error or diagnostics LED (green, red)
④	Input electronics	.0 to .7	Channel status LED (green)
⑤	Color-coded label with color code CC01 (optional)	PWR	Power LED (green)
⑥	Supply voltage filter circuit (only available with light BaseUnit)	F0 to F7	Channel fault LED (red)
M	Ground	P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)
DIn	Input signal, channel n		

Figure 3-1 Pinout and block diagram for 1 and 2-wire connection of encoders

Wiring: 3-wire connection

The following figure shows an example of the terminal assignment of the digital input module DI 8×24VDC HF on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color-coded labels with color code CC01 and CC73 (optional)
③	Supply voltage filter circuit (only available with light BaseUnit)
DI_n	Input signal, channel n
$L+_n$	Encoder supply, channel n
DC 24 V	Supply voltage L+ (infeed only with light BaseUnit)
M	Ground
1A ... 10A	AUX terminals
P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)

Figure 3-2 Pinout and block diagram for 3-wire connection of encoders

4 Parameters/address space

4.1 Parameters

Parameters of the DI 8x24VDC HF

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records (see chapter Parameter assignment and structure of the parameter data record (Page 37)).

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics wire break[1]	• Disable • Enable	Disable	Yes	Channel	Channel
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	Yes	Channel	Module [2]
Pulse stretching	• None • 0.05 s • 0.1 s • 0.2 s • 0.5 s • 1 s • 2 s	None	Yes	Channel	[2]
Hardware interrupt rising edge	• Disable • Enable	Disable	Yes	Channel	[2]
Hardware interrupt falling edge	• Disable • Enable	Disable	Yes	Channel	[2]
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] If you use a floating switch, you need to connect a resistor in parallel so that the wire break diagnostics is enabled in the open state (sensor resistance for the wire break diagnostics: 25 kΩ to 45 kΩ).

[2] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 6 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter, however, with data records 0 to 7 or data record 128, see Appendix "Parameter data record".

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Diagnostics: Wire break

Enabling diagnostics if the line to the encoder is interrupted.

Channel activated

Determines whether a channel is activated or deactivated.

Input delay

This parameter can be used to suppress signal interference. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

In isochronous mode, the terminal signal is read in at the time T_i (time for reading the input data). The read-in time T_i refers to the channel for which no input delay time was configured.

For input channels with longer input delays, the read-in time is moved accordingly. This means individual channels can be assigned input delays, if necessary, without having a negative impact on the possible cycle time.

Isochronous configuration is only possible if there is no input delay configured for at least one channel.

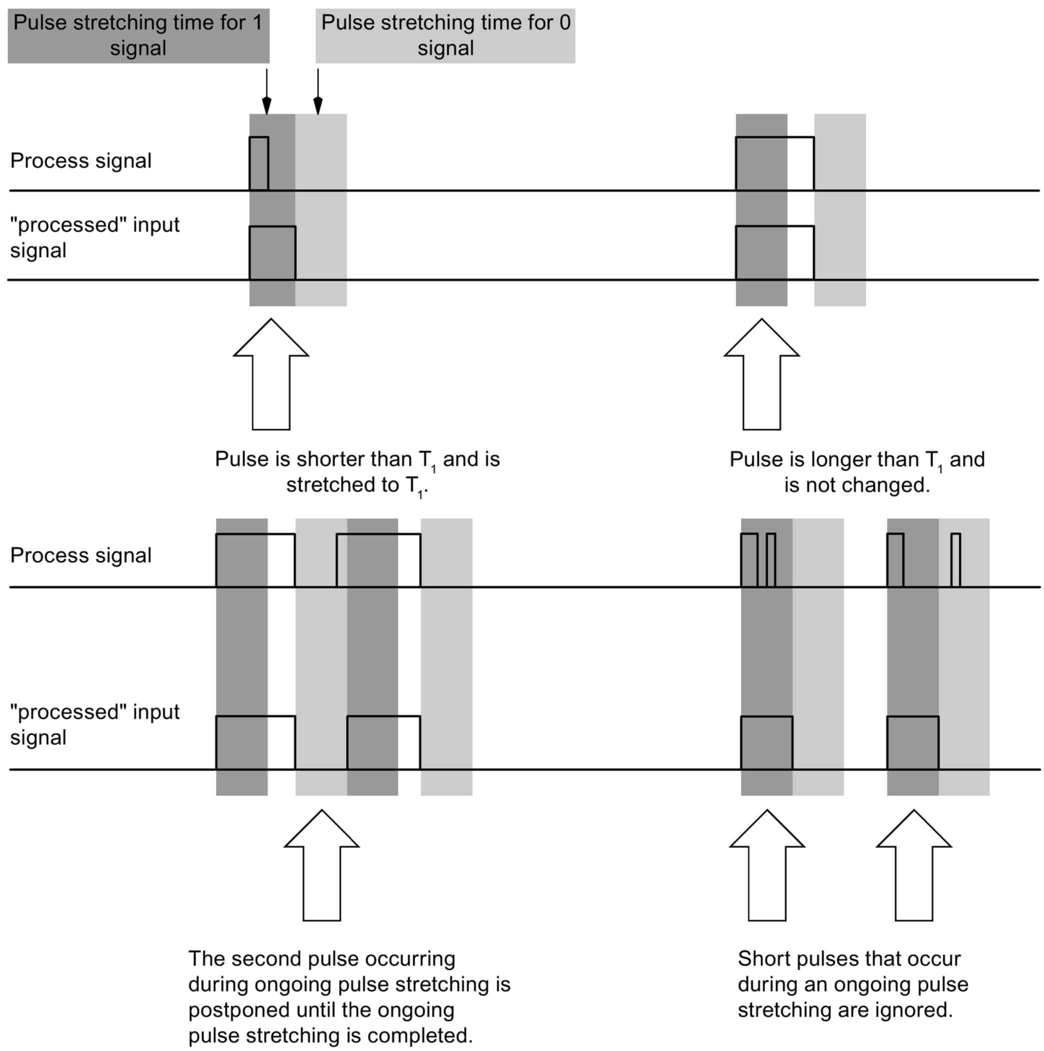
Pulse stretching

Pulse stretching is a function used to change a digital input signal. A pulse on a digital input is stretched to at least the configured length. If the input pulse is already longer than the configured length, the pulse is not changed.

In isochronous mode, the terminal signal is read in at time T_i (time for reading in the input data), i.e. smaller pulses than T_DC (data cycle) are not recognized in certain cases.

Principle of pulse stretching

The figure below uses examples to show whether and how input pulses are changed.



T_1 Pulse stretching parameter

Figure 4-1 Principle of pulse stretching

Hardware interrupt, rising edge

Specifies whether a hardware interrupt is generated by a rising edge.

Hardware interrupt, falling edge

Specifies whether a hardware interrupt is generated by a falling edge.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/91696622).

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image input.

Configuration options of DI 8x24VDC HF

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, as of V13, SP1	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DI 8x24VDC HF V1.0	X	X	X
1 x 8-channel without value status	DI 8x24VDC HF V1.1	X	X	X
1 x 8-channel with value status	DI 8x24VDC HF V1.1, QI	X	X	---
1 x 8-channel without value status	DI 8x24VDC HF V1.2	X	X	X
1 x 8-channel with value status for module-internal Shared Input with up to 4 submodules	DI 8x24VDC HF V1.2, MSI	X	X	---
1 x 8-channel with value status	DI 8x24VDC HF V1.2, QI	X	X	---
1 x 8-channel without value status	DI 8x24VDC HF V2.0	---	X	X
1 x 8-channel with value status for module-internal Shared Input with up to 4 submodules	DI 8x24VDC HF V2.0, MSI	---	X	---
1 x 8-channel with value status	DI 8x24VDC HF V2.0, QI	---	X	---
2 x 4-channel without value status	DI 8x24VDC HF V2.0, S.2	---	X	---
2 x 4-channel with value status	DI 8x24VDC HF V2.0, S.2 QI	---	X	---
4 x 2-channel without value status	DI 8x24VDC HF V2.0, S.4	---	X	---
4 x 2-channel with value status	DI 8x24VDC HF V2.0, S.4 QI	---	X	---

Note

The following functions are only fully available when the submodule X.1 is configured and the IO controller to which submodule X.1 is assigned has established a connection to the IO device.

- Firmware update
- I&M identification data
- PROFIenergy

2 x 4- / 4 x 2-channel configuration

For the configuration, the channels of the module are divided into submodules. The submodules can be assigned to different IO controllers when the module is used in a shared device.

The number of usable submodules is dependent on the interface module used. Read the information in the manual for the particular interface module.

Value status (Quality Information, QI)

The value status is always activated for the following module names:

- DI 8x24VDC HF QI,
- DI 8x24VDC HF MSI

An additional bit is assigned to each channel for the value status. The value status bit indicates if the read in digital value is valid. (0 = value is incorrect).

Address space for configuration as 1 x 8-channel DI 8x24VDC HF

The figure below shows the address space assignment for configuration as a 8-channel module without value status.

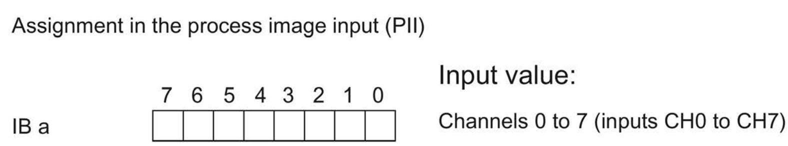


Figure 4-2 Address space for configuration as 1 x 8-channel DI 8x24VDC HF without value status

Address space for configuration as 1 x 8-channel DI 8x24VDC HF, QI

The following figure shows the assignment of the address space for the configuration as a 8-channel module with value status. You can freely assign the start address for the module. The addresses of the channels are derived from the start address.

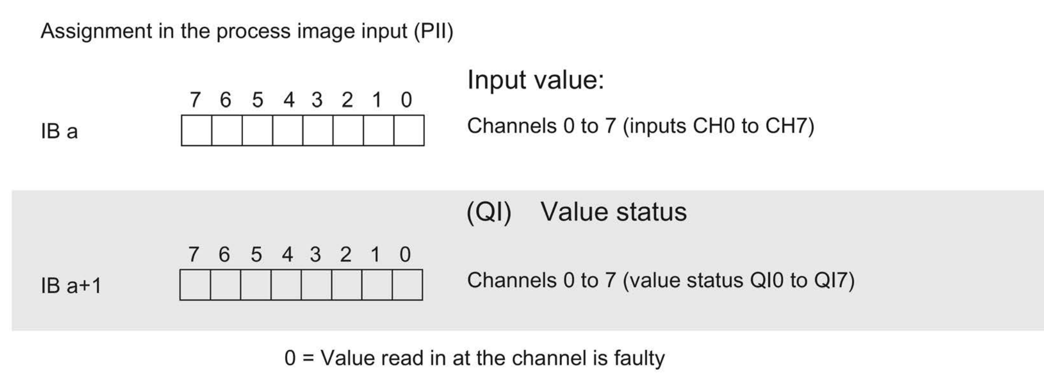

Figure 4-3 Address space for configuration as 1 x 8-channel DI 8x24VDC HF QI with value status

Address space for configuration as 1 x 8-channel DI 8x24VDC HF MSI

The channels 0 to 7 of the module are copied in up to four submodules with configuration 1 x 8-channel module (Module-internal shared input, MSI). Channels 0 to 7 are then available with identical input values in various submodules. These submodules can be assigned to up to four IO controllers when the module is used in a shared device. Each IO controller has read access to the same channels.

The number of usable submodules is dependent on the interface module used. Please observe the information in the manual for the particular interface module.

Value status (Quality Information,QI)

The meaning of the value status depends on the submodule on which it occurs.

For the 1st submodule (=basic submodule), the value status 0 indicates that the value is incorrect.

For the 2nd to 4th submodule (=MSI submodule), the value status 0 indicates that the value is incorrect or the basic submodule has not yet been configured (not ready).

The following figure shows the assignment of the address space with submodule 1, 2, 3 and 4 and the value status.

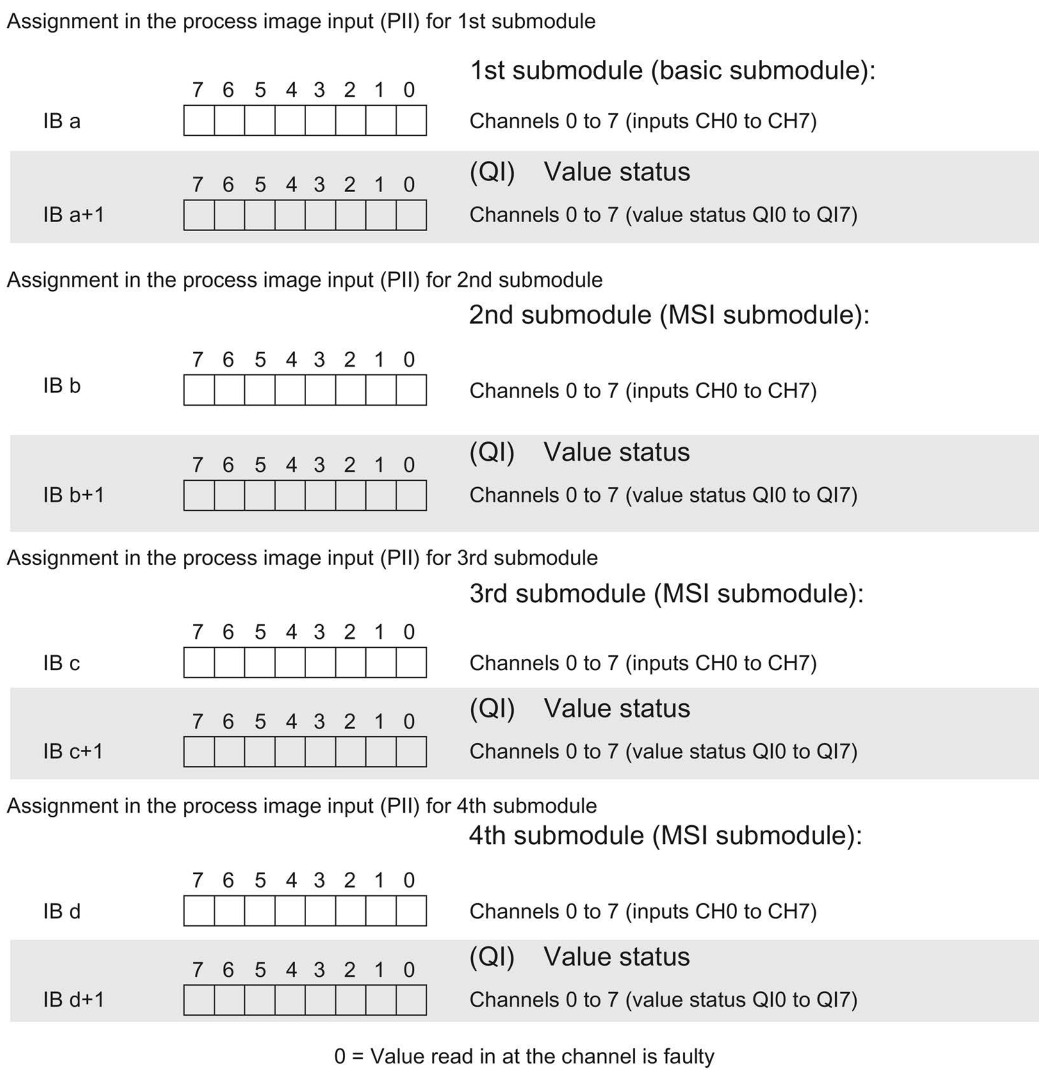

Figure 4-4 Address space for configuration as 1 x 8-channel DI 8x24VDC HF MSI with value status

Address space for configuration as 2 x 4-channel DI 8x24VDC HF V2.0, S.2

The figure below shows the address space assignment for configuration as a 2 x 4-channel module without value status.

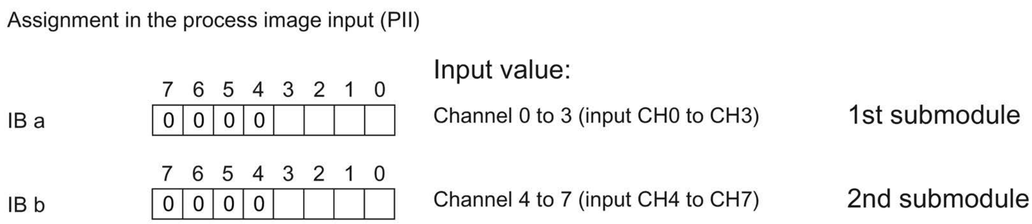

Figure 4-5 Address space for configuration as 2 x 4-channel DI 8x24VDC HF V2.0, S.2 without value status

Address space for configuration as 2 x 4-channel DI 8x24VDC HF V2.0, S.2 QI

Each of the two submodules has a freely assignable start address.

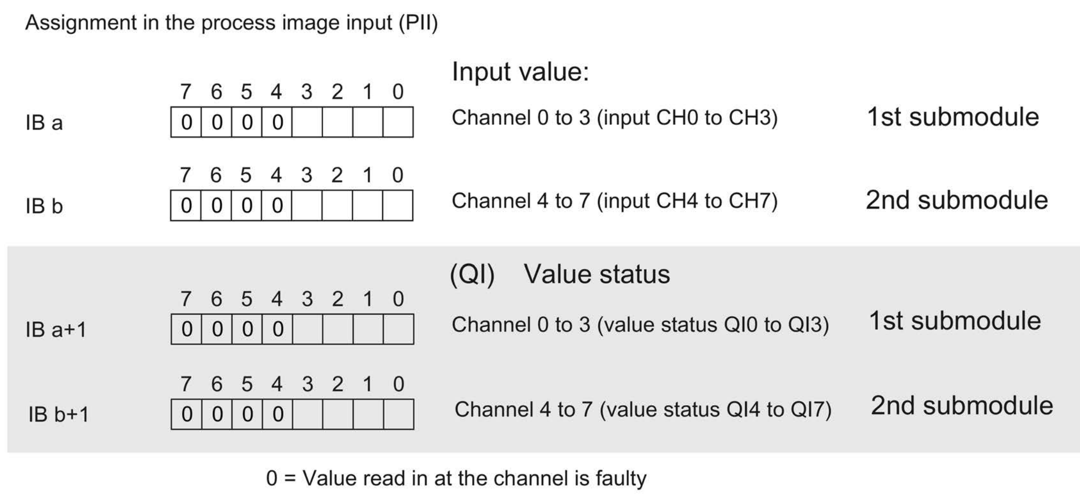

Figure 4-6 Address space for configuration as 2 x 4-channel DI 8x24VDC HF V2.0, S.2 QI with value status

Address space for configuration as 4 x 2-channel DI 8x24VDC HF V2.0, S.4

The figure below shows the address space assignment for configuration as a 4 x 2-channel module without value status.

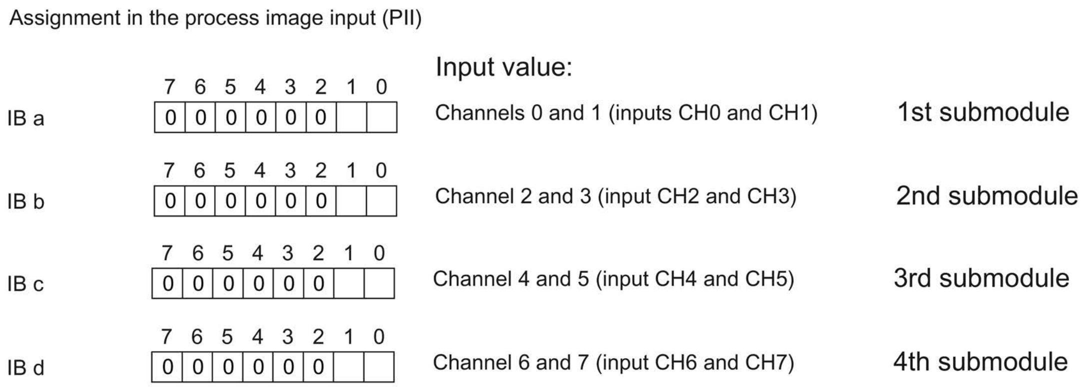

Figure 4-7 Address space for configuration as 4 x 2-channel DI 8x24VDC HF V2.0, S.4 without value status

Address space for configuration as 4 x 2-channel DI 8x24VDC HF V2.0, S.4 QI

Each of the four submodules has a freely assignable start address.

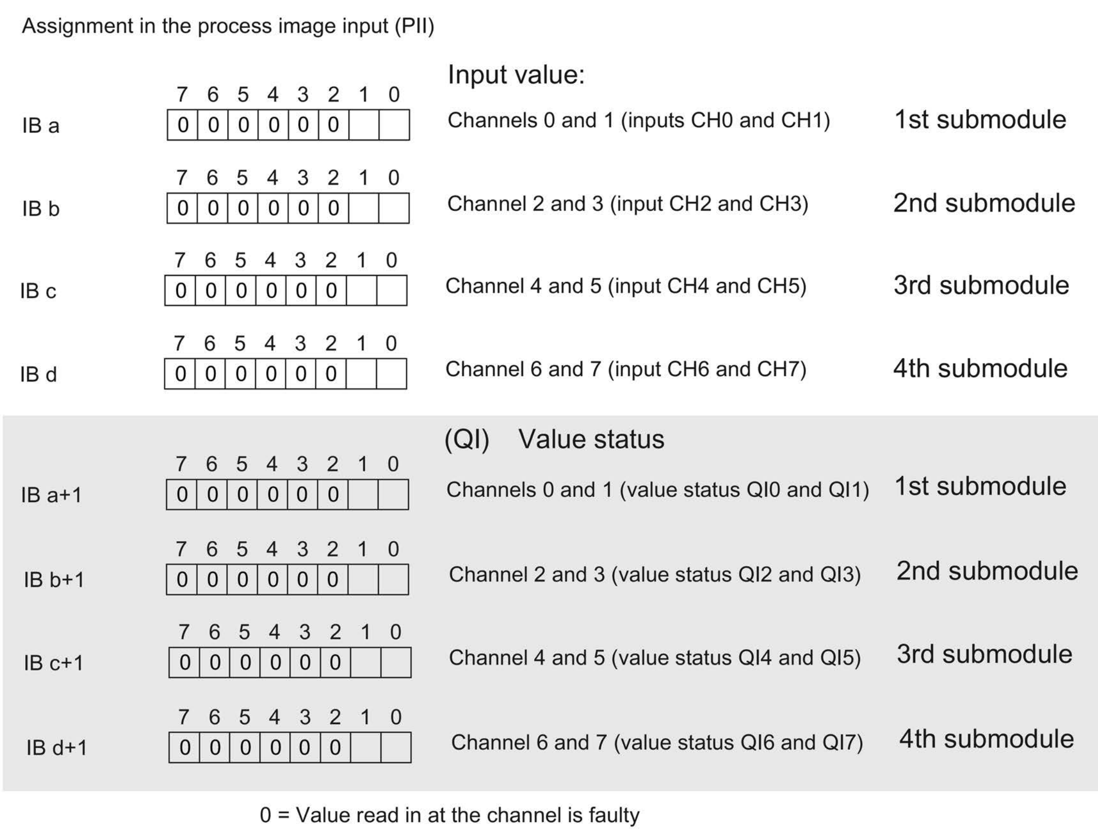

Figure 4-8 Address space for configuration as 4 x 2-channel DI 8x24VDC HF V2.0, S.4 QI with value status

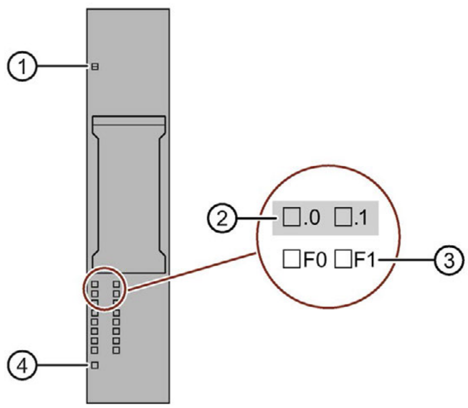
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC HF.



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The tables below explain the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 32).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
On	Module parameters assigned and no module/channel diagnostics
Flashes	Module parameters assigned and module/channel diagnostics

LED channel status/channel error

Table 5- 2 Status / error display of the LED channel status / channel error

LED channel status	LED channel error	Meaning
Off	Off	Channel deactivated or process signal = 0
On	Off	• No supply voltage present or • Process voltage > 11 V is present regardless of whether or not the channel is activated and regardless of whether diagnostics was detected
Off	On	Supply voltage is available and process voltage < 11V is present regardless of whether or not the channel is activated and regardless of whether diagnostics was detected
On	On	Channel activated and diagnostics enable was recognized

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The digital input module DI 8×24VDC HF supports hardware and diagnostics alarms.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- Supply voltage missing
- Hardware interrupt lost
- Channel temporarily unavailable

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- At positive edge (signal change from 0 to 1)
- At negative edge (signal change from 1 to 0)

In the event of an interrupt, interrupt OBs are automatically executed in the CPU of the IO controller.

You can obtain detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of double word 8 in local data.

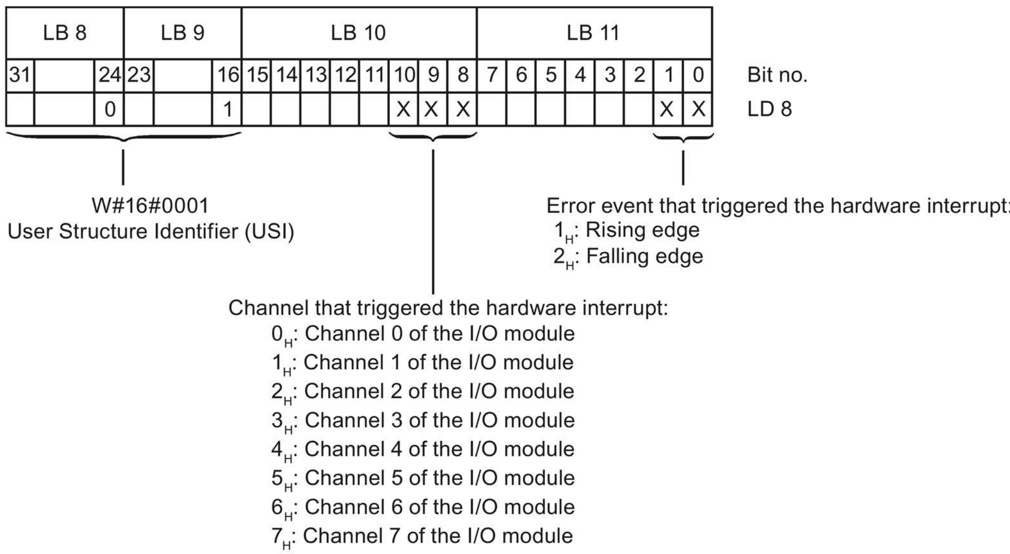


Figure 5-2 Start information of the organization block

Structure of the additional interrupt information

Table 5- 4 Structure of USI = W#16#0001

Data block name		Content	Comment	Bytes
USI		W#16#0001	User Structure Identifier: Additional interrupt information for hardware interrupts of the I/O module	2
The channel that triggered the hardware interrupt follows.				
	Channel	B#16#00 to B#16#07	Channel 0 to 7 of the I/O module	1
It follows the error event that triggered the hardware interrupt.				
	Error event	B#16#01	Positive edge	1
		B#16#02	Negative edge	

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meaning and corrective measures

<table>
<tr><th>Diagnostics alarm</th><th>Error code</th><th>Meaning</th><th>Solution</th></tr>
<tr><td>Short-circuit</td><td>1_H</td><td>Short-circuit to ground at sensor supply</td><td>Correct the process wiring</td></tr>
<tr><td rowspan="3">Wire break</td><td rowspan="3">6_H</td><td>Impedance of encoder circuit too high</td><td>Use a different encoder type or modify the wiring, for example, use cables with larger cross-section</td></tr>
<tr><td>Wire break between the module and sensor</td><td>Connect the cable</td></tr>
<tr><td>Channel not connected (open)</td><td>• Disable diagnostics
• Connect in parallel a resistor of 25 kOhm to 45 kOhm to the encoder contacts</td></tr>
<tr><td>Parameter assignment error</td><td>10_H</td><td>• The module cannot evaluate parameters for the channel.
• Incorrect parameter assignment.</td><td>Correct the parameter assignment</td></tr>
<tr><td>Supply voltage missing</td><td>11_H</td><td>No or insufficient supply voltage L+</td><td>• Check supply voltage L+ on the BaseUnit
• Check BaseUnit type</td></tr>
<tr><td>Hardware interrupt lost</td><td>16_H</td><td>The module cannot trigger an interrupt because the previous interrupt was not acknowledged; possible configuration error</td><td>• Change interrupt processing in the CPU and, if necessary, edit the module parameters.
• The error persists until the module is assigned new parameters</td></tr>
<tr><td>Channel/component temporarily unavailable</td><td>$1F_H$</td><td>Firmware update is currently in progress or has been canceled. The module does not read in process values in this state.</td><td>• Wait for firmware update.
• Restart the firmware update.</td></tr>
</table>

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DI 8×24VDC HF

Article number	6ES7131-6BF00-0CA0
General information	
Product type designation	DI 8x24 V DC HF
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1 / -
• STEP 7 configurable/integrated as of version	V5.5 / -
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	No
• Oversampling	No
• MSI	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7131-6BF00-0CA0
Encoder supply	
Number of outputs	8
Output voltage encoder supply, min.	19.2 V
Short-circuit protection	Yes
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes; per channel, electronic
Power loss	
Power loss, typ.	1.5 W; 24 V, 8 inputs supplied via encoder supply
Address area	
Address space per module	
• Inputs	1 byte; + 1 byte for QI information
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Submodules	
• Number of configurable submodules, max.	4
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals
• 4-wire connection	BU type A0 + Potential isolation module
Digital inputs	
Number of digital inputs	8
Digital inputs, parameterizable	Yes
Source/sink input	P-reading
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Pulse extension	Yes; Pulse duration from 4 µs
• Length	2 s; 50 ms, 100 ms, 200 ms, 500 ms, 1 s, 2 s
Edge evaluation	Yes; rising edge, falling edge, edge change
Input voltage	
• Type of input voltage	DC
• Rated value (DC)	24 V
• for signal "0"	-30 to +5V
• for signal "1"	+11 to +30V
Input current	
• for signal "1", typ.	2.5 mA

Article number	6ES7131-6BF00-0CA0
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms (in each case + delay of 30 to 500 µs, depending on line length)
– at "0" to "1", min.	0.05 ms
– at "0" to "1", max.	20 ms
– at "1" to "0", min.	0.05 ms
– at "1" to "0", max.	20 ms
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	1.5 mA
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Filtering and processing time (TCI), min.	420 µs
Bus cycle time (TDP), min.	500 µs
Jitter, max.	8 µs
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes; channel by channel
• Hardware interrupt	Yes; Parameterizable, channels 0 to 7
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Monitoring of encoder power supply	Yes; channel by channel
• Wire-break	Yes; Channel by channel, optional protective circuit for preventing wire-break diagnostics in the case of simple encoder contacts: 25 kOhm to 45 kOhm
• Short-circuit	Yes; channel by channel

Article number	6ES7131-6BF00-0CA0
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Negative ambient temperature down to -30 °C (without condensation), installation altitudes between 2 000 m and 5 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	28 g

Dimension drawing

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

With data records 0 to 7, you can reconfigure individual channels.

Operation of the module behind a PROFIBUS DP interface module

If the module is operated behind a PROFIBUS DP interface module, the parameter data records 0 and 1 cannot be read back. You obtain the diagnostics data records 0 and 1 with the read back parameter data records 0 and 1. You can find additional information in the Interrupts section of the PROFIBUS DP interface module manual on the Internet (http://support.automation.siemens.com/WW/view/en/78324181).

Parameter assignment in the user program

The module parameters can be re-assigned in RUN (for example, the input delay of selected channels can be edited in RUN without having an effect on the other channels).

Changing parameters in RUN

The WRREC instruction is used to transfer the parameters to the module using data record 128 or data records 0 to 7. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

If you reconfigure a module and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing".

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Data record structure

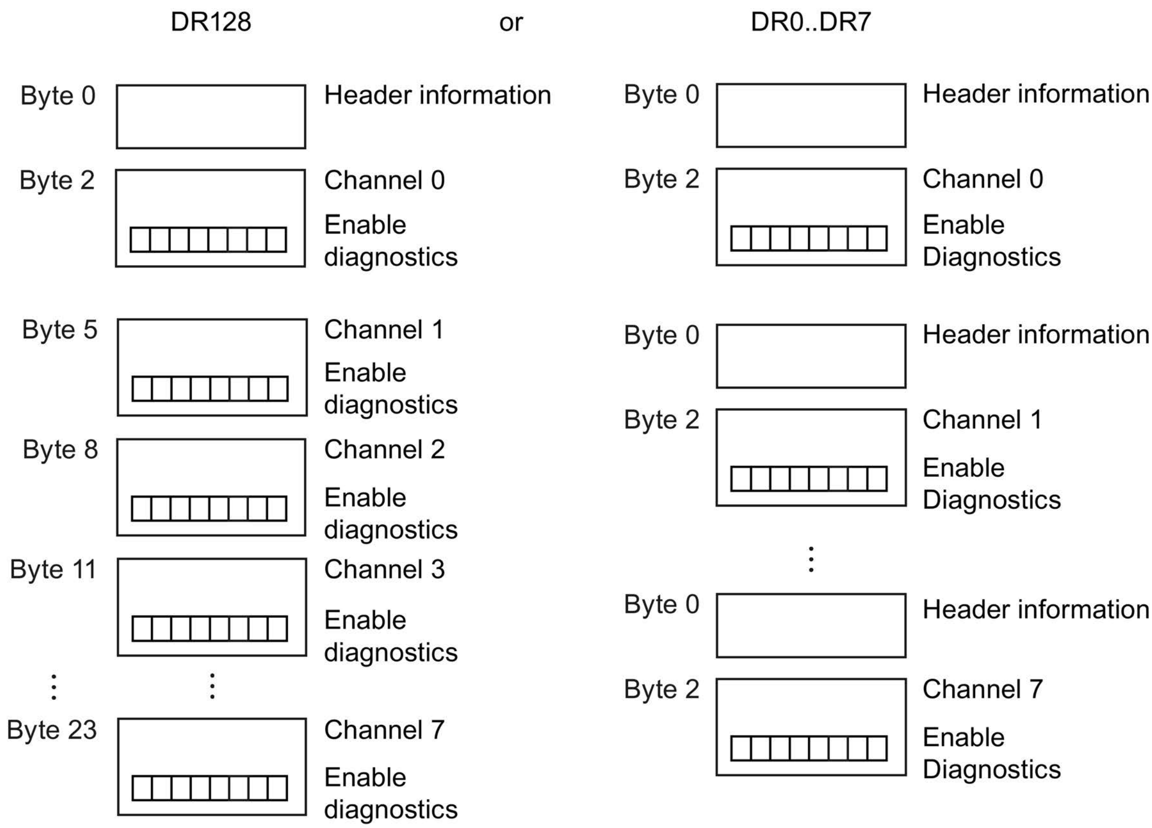

Figure A-1 Structure of data record 128 and data records 0 to 7

Header information

The figure below shows the structure of the header information.

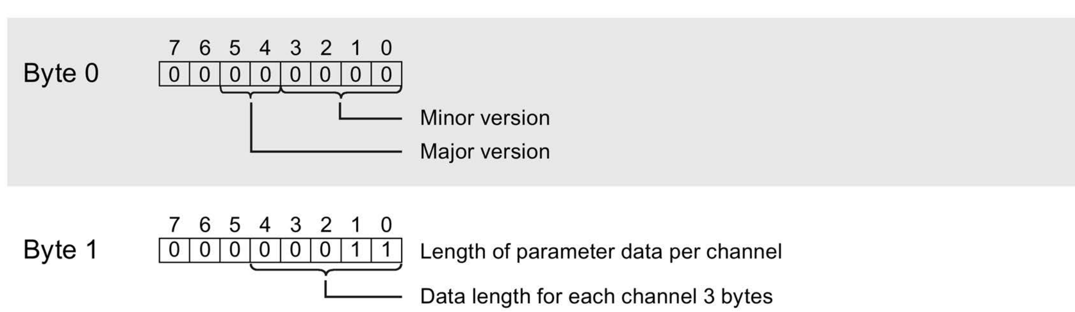

Figure A-2 Header information

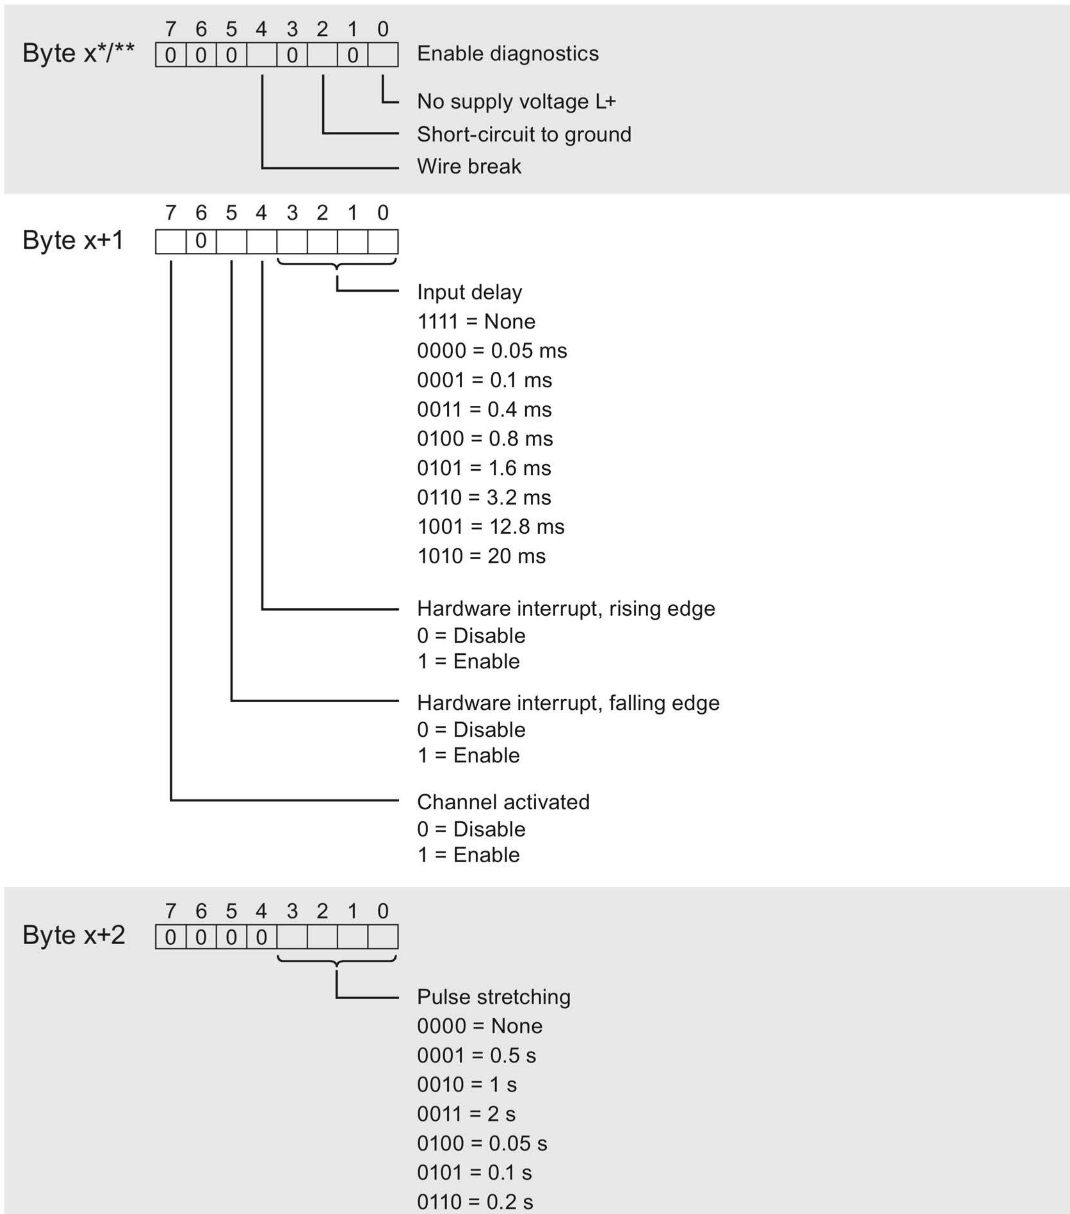
Parameter

The figure below shows the structure of the parameters for channels 0 to 7.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 3); channel number = 0 to 7 for DR 128
** x = 2 for DR 0 to DR 7

Figure A-3 Structure of byte x to x+2 for channels 0 to 7

Error transmitting the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				**Meaning**	**Solution**
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF	80	B0	xx	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine whether the module is plugged or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	E0	xx	Wrong version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	E1	xx	Parameter error	Check the parameters of the module

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that relate generally to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you when commissioning the ET 200SP distributed I/O system.

Changes compared to the previous version

Compared to the previous version, this manual contains the following change:

Parameters and value range are harmonized in "Counting" mode (GSD file and TIA Portal).

Conventions

Please pay particular attention to notes highlighted as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

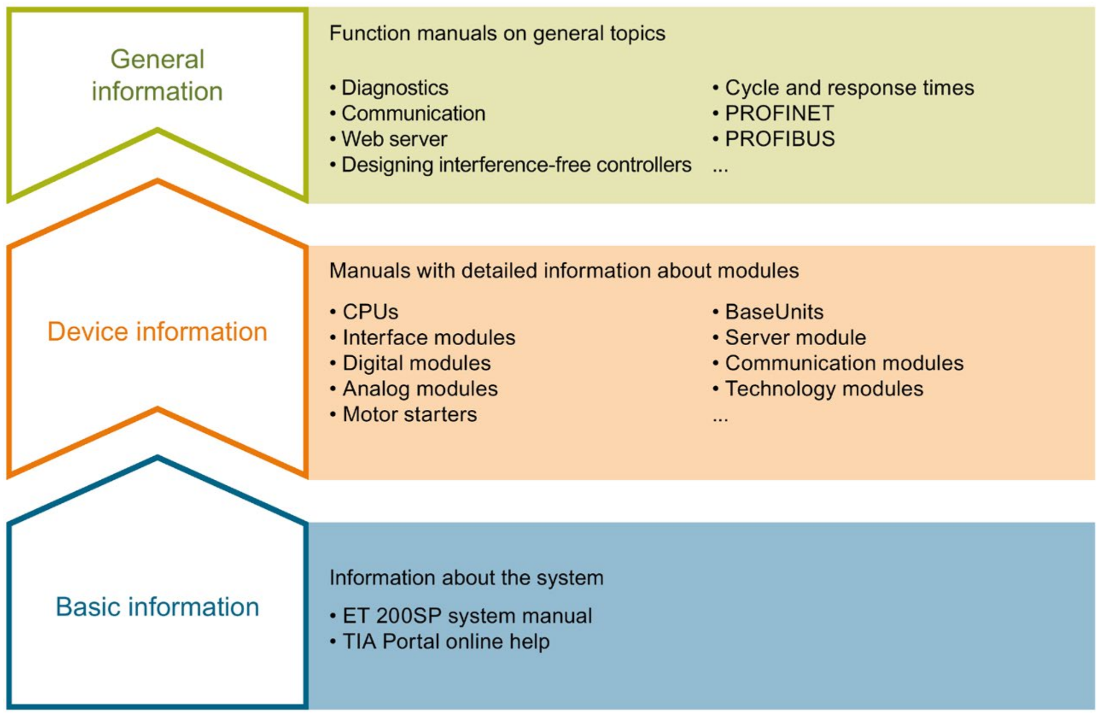
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet.

Figure 2-1 View of the DI 8×24VDC HS module

Properties

The module has the following technical properties:

- Digital input module with 8 high-speed inputs
- Supply voltage L+
- Sink input (PNP)
- Module-specific configurable diagnostics for supply voltage and short-circuit to M
- Suitable for connection of switches and 2-wire sensors in accordance with IEC 61131, type 1 and 3
- Three operating modes:

Table 2- 1 Operating modes of the DI 8×24VDC HS

Property		Operating mode			
		DI (Page 15)		Counting (CNT) (Page 30)	Oversampling (OVS) (Page 49)
		Without value status (QI)	With value status (QI)		
Number of channels		8	8	4	8
Isochronous mode		Yes, optional	Yes, optional	Yes, optional	Yes, required
• Shortest send clock		125 µs	125 µs	125 µs	250 µs
Oversampling		No	No	No	Yes
• Number of oversampling levels (sampling rate)		—	—	—	2 ... 32
• Shortest sub-cycle (= shortest sampling time)		—	—	—	7.8125 µs
Counter length, max. counting frequency		—	—	32-bit, 10 kHz *	—
Configurable input delay		0 ms ... 20 ms	0 ms ... 20 ms	0.05 ms - 20 ms	0 ms ... 20 ms
Configurable hardware interrupts; rising edge and/or falling edge (per channel)		×	×	—	—
Data length	Inputs	1 byte	2 bytes	25 bytes	32 bytes
	Outputs	0 bytes	0 bytes	20 bytes	0 bytes

* If a diagnostic event occurs, the maximum counting frequency is reduced to 9 kHz.

The module supports the following functions:

- Isochronous mode
- Firmware update
- I&M identification data
- Reconfiguration in RUN
- PROFIenergy

The module can be configured with HSP or a GSD file. The configurations for the operating modes can be found under various codes / module names:

Table 2- 2 Codes / module names for the configuration options

Operating mode		Configuration software			
		HSP0127 for STEP 7 (TIA Portal)	HSP0229 for STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
DI	Without QI	DI 8×24VDC HS	DI 8×24VDC HS DI/OVS	DI 8×24VDC HS	DI 8×24VDC HS
	With QI			DI 8×24VDC HS QI	—
Counting (CNT)			DI 8×24VDC HS CNT	DI 8×24VDC HS CNT	DI 8×24VDC HS CNT
Oversampling (OVS) *			DI 8×24VDC HS DI/OVS	—	—

* The interface module or CPU with which the module is used must support isochronous mode.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Operating mode DI 3

3.1 Wiring up

3.1.1 Wiring and block diagrams

This section contains the block diagram for the DI 8x24VDC HS with the pin assignments for 1, 2 and 3-wire connection in DI operating mode. You may use and combine the different wiring options for all channels.

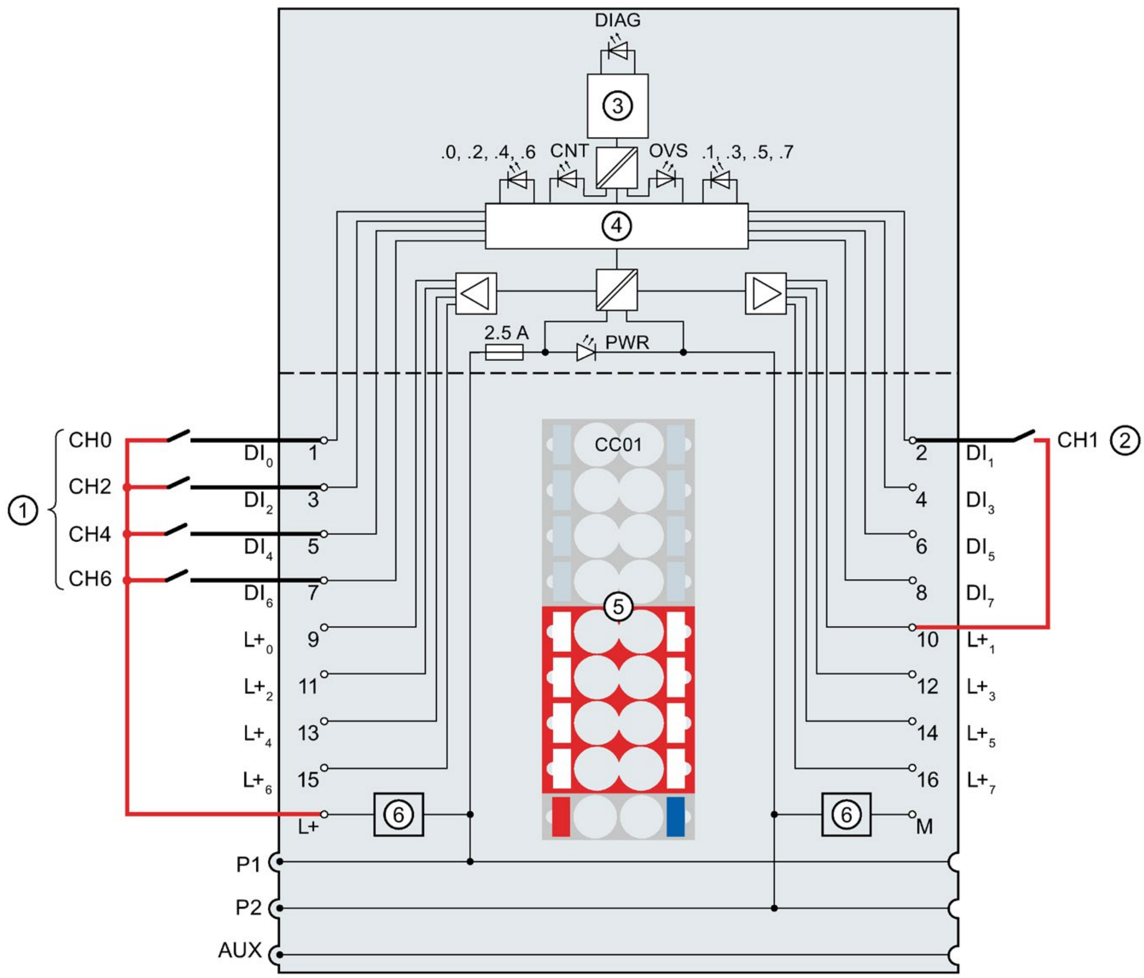
Information on wiring the BaseUnit can be found in the system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293).

Note

The module's load group must start with a light BaseUnit. Keep this in mind also during the configuration.

Wiring: 1 and 2-wire connection

The figure below shows the block diagram and an example of pin assignment for the DI 8×24VDC HS digital input module on the BaseUnit BU type A0 without AUX terminals (1 and 2-wire connection).

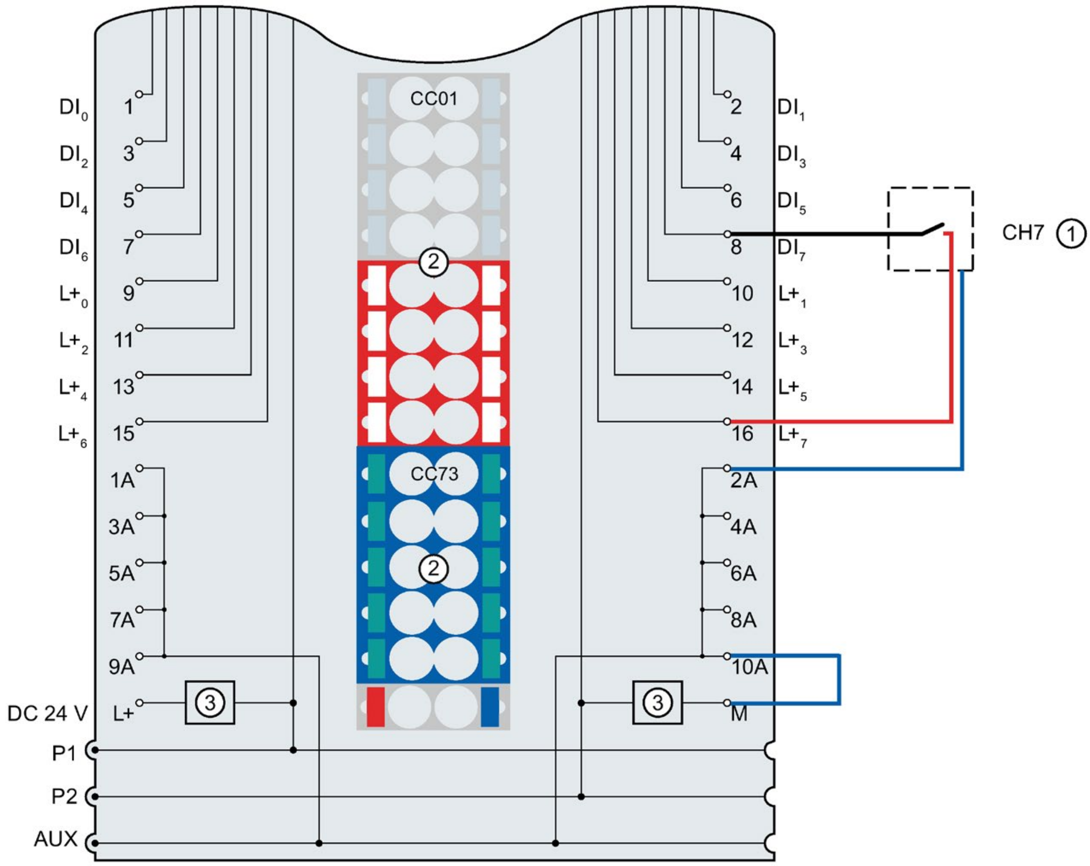


①	1-wire connection	$L+_n$	Encoder supply, channel n
②	2-wire connection	L+	24 V DC (infeed only with light BaseUnit)
③	Backplane bus interface	DIAG	LED error or diagnostics (green, red)
④	Input electronics	.0 to .7	LED channel status (green)
⑤	Color-coded label CCxx (optional)	PWR	LED power (green)
⑥	Supply voltage filter circuit (only available with light BaseUnit)	CNT	LED operating mode Count (green)
M	Ground	OVS	LED operating mode Oversampling (green)
DI_n	Input signal, channel n	P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)

Figure 3-1 Pinout and block diagram for 1 and 2-wire connection of encoders

Wiring: 3-wire connection

The figure below shows an example of pin assignment for the DI 8×24VDC HS digital input module on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color-coded labels CCxx (optional)
③	Supply voltage filter circuit (only available with light BaseUnit)
DI_n	Input signal, channel n
$L+_n$	Encoder supply, channel n
DC 24 V	Supply voltage L+ (infeed only with light BaseUnit)
M	Ground
1A ... 10A	AUX terminals
P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)

Figure 3-2 Pinout and block diagram for 3-wire connection of encoders

3.2 Parameters/address space

3.2.1 High-speed inputs

Function

In operating mode DI, use all eight channels as digital high-speed inputs. High-speed inputs make sense when rapid reactions to input signals are needed (reaction time < 2 ms).

Requirement

Low reaction times require a cycle time of less than 750 μs.

3.2.2 Parameters

The effective range of the parameters depends on the type of configuration. The following configurations are possible:

- Central operation on an ET 200SP CPU or on an ET 200SP Open Controller
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

In addition to configuration via the configuration software, you can also configure parameters in RUN mode (dynamic) via the user program. When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of parameter data record for DI operating mode (Page 65).

The following parameter settings are possible for each operating mode:

Table 3- 1 Configurable parameters in DI operating mode

Parameters	Value range	Default	Reconfiguration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0229 for STEP 7; PROFINET IO GSD file	GSD file PROFIBUS DP
Operating mode[1]	• DI / Oversampling • Counting	—	no	Module	Module
Diagnostics No supply voltage L+	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	yes	Module	Module
Channel activated	• Disable • Enable	Enable	yes	Channel	Channel
Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	yes	Channel	Module [2]
Pulse stretching	• None • 0.05 s • 0.1 s • 0.2 s • 0.5 s • 1 s • 2 s	None	yes	Channel	— [3]
Hardware interrupt: rising edge	• Disable • Enable	Disable	yes	Channel	— [3]

Parameters	Value range	Default	Reconfiguration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0229 for STEP 7; PROFINET IO GSD file	GSD file PROFIBUS DP
Hardware interrupt: falling edge	• Disable • Enable	Disable	yes	Channel	— [3]
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module	Module

[1] When configuring with HSP0229 for STEP 7 or with a GSD file, the operating mode is specified by selecting the module name.

[2] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If your PROFIBUS Master supports the "Read / write data record" function, you can set this parameter via data record 128.

[3] If your PROFIBUS Master supports the "Read / write data record" function, you can set this parameter for each channel via data record 128.

3.2.3 Explanation of parameters

Operating mode

At the module level, specifies the operating mode in which the module's channels are operated:

- DI / Oversampling (Page 49)
- Counting (Page 30)

When configuring with HSP0229 for STEP 7 or with a GSD file, the operating mode is specified by selecting the module name.

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Channel activated

Determines whether a channel is enabled or disabled. If a digital input is disabled, the module ignores its signals.

Pulse stretching

Pulse stretching is a function used to change a digital input signal. A pulse on a digital input is stretched to at least the configured length. If the input pulse is already longer than the configured length, the pulse is not changed. With Pulse stretching, you can reliably detect very short input signals without having to use a correspondingly short cycle time.

In isochronous mode, the terminal signal is read in at the time T_i (time for reading the input data). In some cases, pulses that are shorter than the cycle time (send clock) are not detected.

If you want to detect short signals isochronously, the Oversampling operating mode is recommended. Oversampling also provides more precise information about the time at which a signal occurs.

Principle of pulse stretching

The figure below uses examples to show whether and how input pulses are changed.

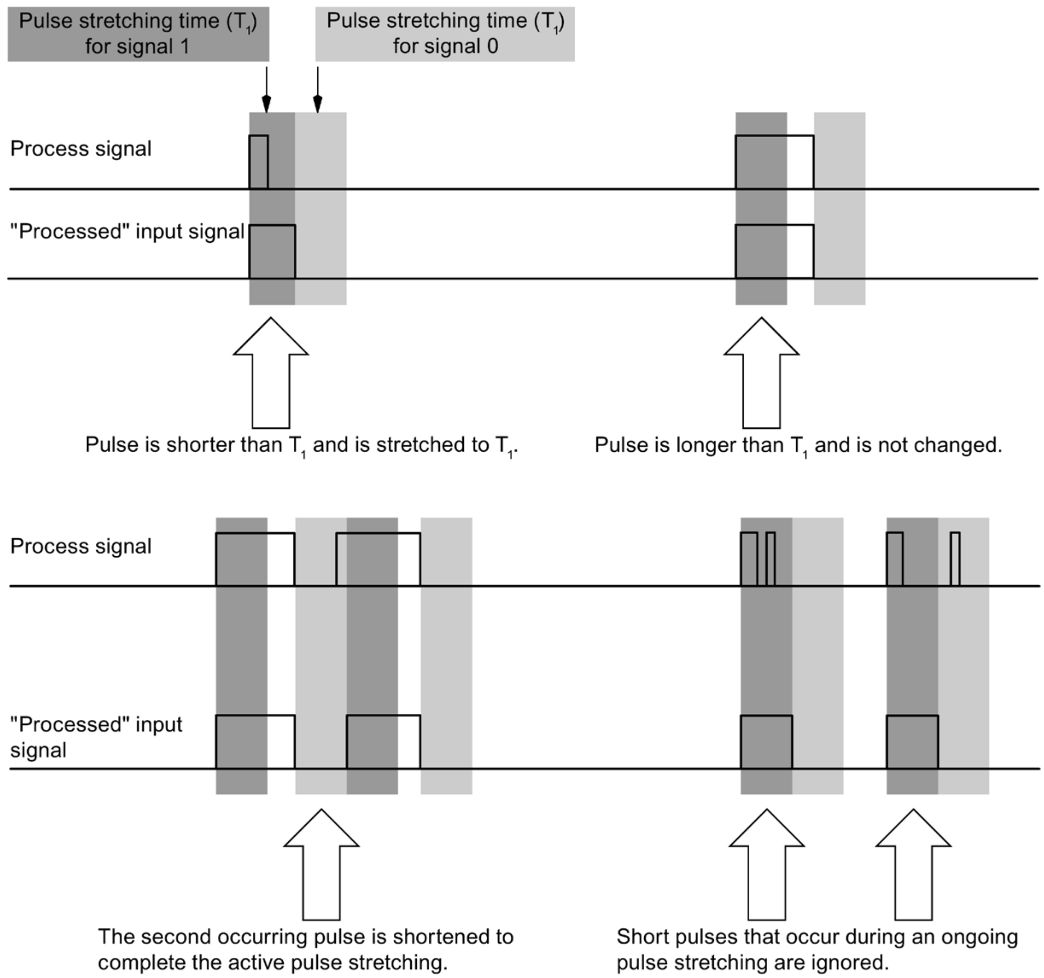


Figure 3-3 Principle of pulse stretching

Input delay

This parameter can be used to avoid signal faults. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Isochronous configuration is only possible if there is no input delay configured for at least one channel. In isochronous mode, the terminal signal is read in at the time T_i (time for reading the input data). The read time T_i refers to the channel for which no input delay time was configured.

For input channels with longer input delays, the read time is moved accordingly. This means individual channels can be assigned input delays, if necessary, without having a negative impact on the possible cycle time.

Note

If you select the "None" or "0.05 ms" option for the input delay, you have to use shielded cables for connection of the digital inputs.

Hardware interrupt: rising edge

Specifies whether a hardware interrupt is generated for a rising edge.

Hardware interrupt: falling edge

Specifies whether a hardware interrupt is generated for a falling edge.

Potential group

Specifies whether a light-colored BaseUnit with incoming supply voltage is located on this slot (see ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual).

3.2.4 Address space

Address space with value status (Quality Information, QI)

The figure below shows the assignment of the address space with value status (Quality Information (QI)). "IB x" represents the start address of input byte x.

The addresses for the value status are only available if the value status is enabled.

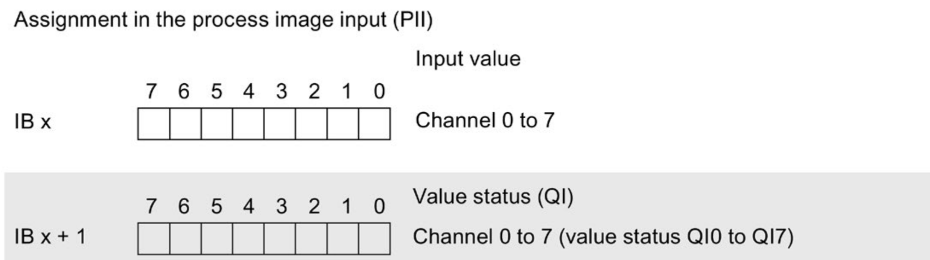

Figure 3-4 Address space with value status

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 7 in this byte are each assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

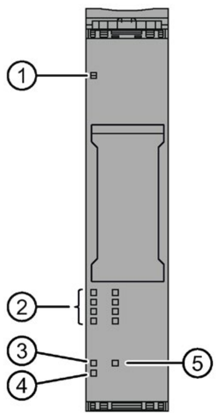
If a fault/error occurs on a channel with this module, the value status for all channels is 0.

3.3 Interrupts/diagnostics alarms

3.3.1 Status and error display

LED display

The figure below shows the LED display of the DI 8×24VDC HS.



① DIAG (green/red)
② Channel status (green)
③ CNT (green)
④ PWR (green)
⑤ OVS (green)

Figure 3-5 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedial measures for dealing with diagnostic interrupts can be found in the section Diagnostics alarms (Page 29).

DIAG LED

Table 3- 2 DIAG LED fault/error display

DIAG LED	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
■ On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 3- 3 Status display of the channel status LED

Channel status LED	Meaning
□ Off	Process signal = 0
■ On	Process signal = 1

CNT LED

Table 3- 4 Status display of the CNT LED

CNT LED	Meaning
□ Off	Counting operating mode disabled
■ On	Counting operating mode enabled

OVS LED

Table 3- 5 Status display of the OVS LED

OVS LED	Meaning
□ Off	Oversampling operating mode disabled
■ On	Oversampling operating mode enabled

PWR LED

Table 3- 6 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

3.3.2 Interrupts

The digital input module DI 8×24VDC HS supports hardware and diagnostics alarms in the DI mode.

Diagnostic interrupts

The module generates a diagnostics interrupt at the following events:

- Channel temporarily unavailable
- Short-circuit
- Parameter assignment error
- No load voltage
- Hardware interrupt lost

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- At rising edge (signal change from 0 to 1)
- At falling edge (signal change from 1 to 0)

If an interrupt occurs, a corresponding interrupt OB is called in the CPU of the IO controller.

S7-1500

Detailed information on the event is available in the STEP 7 online help.

The block interface is shown here with optimized block access, which is set in the TIA Portal by default.

Name	Data type	Comment
LADDR	HW_IO	Hardware identifier of the module triggering the interrupt
USI	WORD	USI (High/Low)
IChannel	USInt	Channel that triggered the hardware interrupt
EventType	Byte	Error event

S7-300/400 or a different CPU

The module generates a hardware interrupt at the following events:

- At rising edge (signal change from 0 to 1)
- At falling edge (signal change from 1 to 0)

If an interrupt occurs, a corresponding interrupt OB is called in the CPU of the IO controller.

You will find detailed information on the event in the hardware interrupt organization block with the "RALRM" (read additional interrupt information) instruction and in the STEP 7 online help.

The channel of the module that triggered the hardware interrupt is entered in the start information of OB40 in the OB40_POINT_ADDR tag. The following figure shows the assignment to the bits of double word 8 in local data.

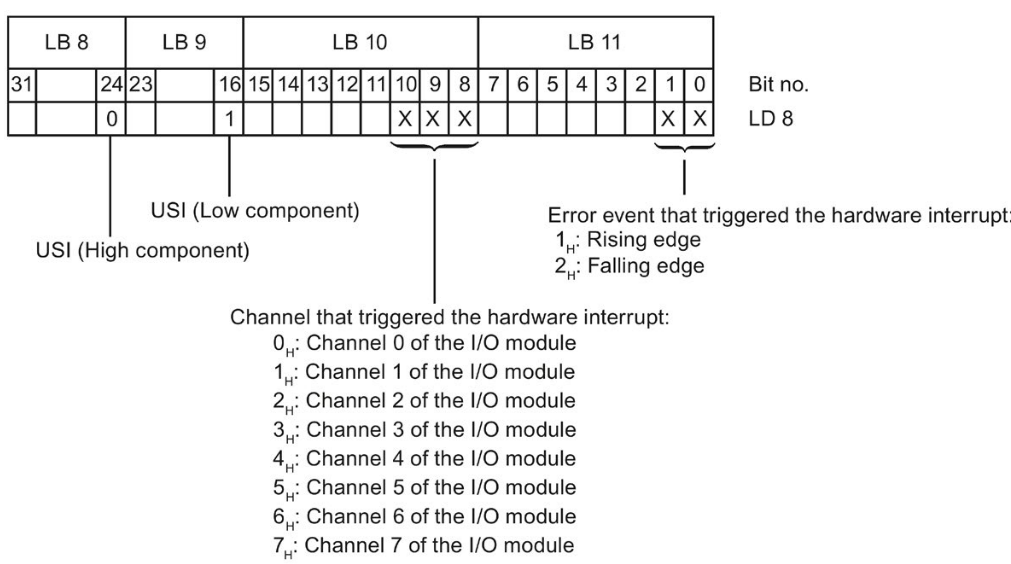


Figure 3-6 OB40_POINT_ADDR tag

Structure of the additional interrupt information

Table 3- 7 Structure of USI = W#16#0001

Data block name		Content	Comment	Bytes
USI		W#16#0001	User Structure Identifier: Additional interrupt info for hardware interrupts of the I/O module	2
The channel that triggered the hardware interrupt follows.				
	Channel	B#16#00 to B#16#07	Channel 0 to 7 of the I/O module	1
It follows the error event that triggered the hardware interrupt.				
	Error event	B#16#01	Rising edge	1
		B#16#02	Falling edge	

3.3.3 Diagnostics alarms

A diagnostic interrupt is output for each diagnostics event and the DIAG LED on the module flashes. The diagnostic interrupts can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 3- 8 Diagnostic interrupts, their meaning and how to deal with them

Diagnostic interrupt	Error code	Meaning	Remedy
Short-circuit	1_H	Short-circuit to ground at encoder supply	Correct process wiring
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel/module. • Incorrect parameter assignment.	Correct parameter assignment
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Hardware interrupt lost	16_H	• Module cannot send an interrupt because a previous interrupt has not been processed • Possible cause: Too many hardware interrupts in too short a time	Change interrupt processing in the CPU and re-assign module parameters correspondingly
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module reads no process values in this state.	• Wait for firmware update. • Restart the firmware update.

Counting operating mode (CNT) 4

4.1 Connecting

4.1.1 Wiring and block diagrams

This section contains the block diagram for the DI 8×24VDC HS module with the pin assignments for 1, 2 and 3-wire connection in counting operating mode. You may use and combine the different wiring options for all channels.

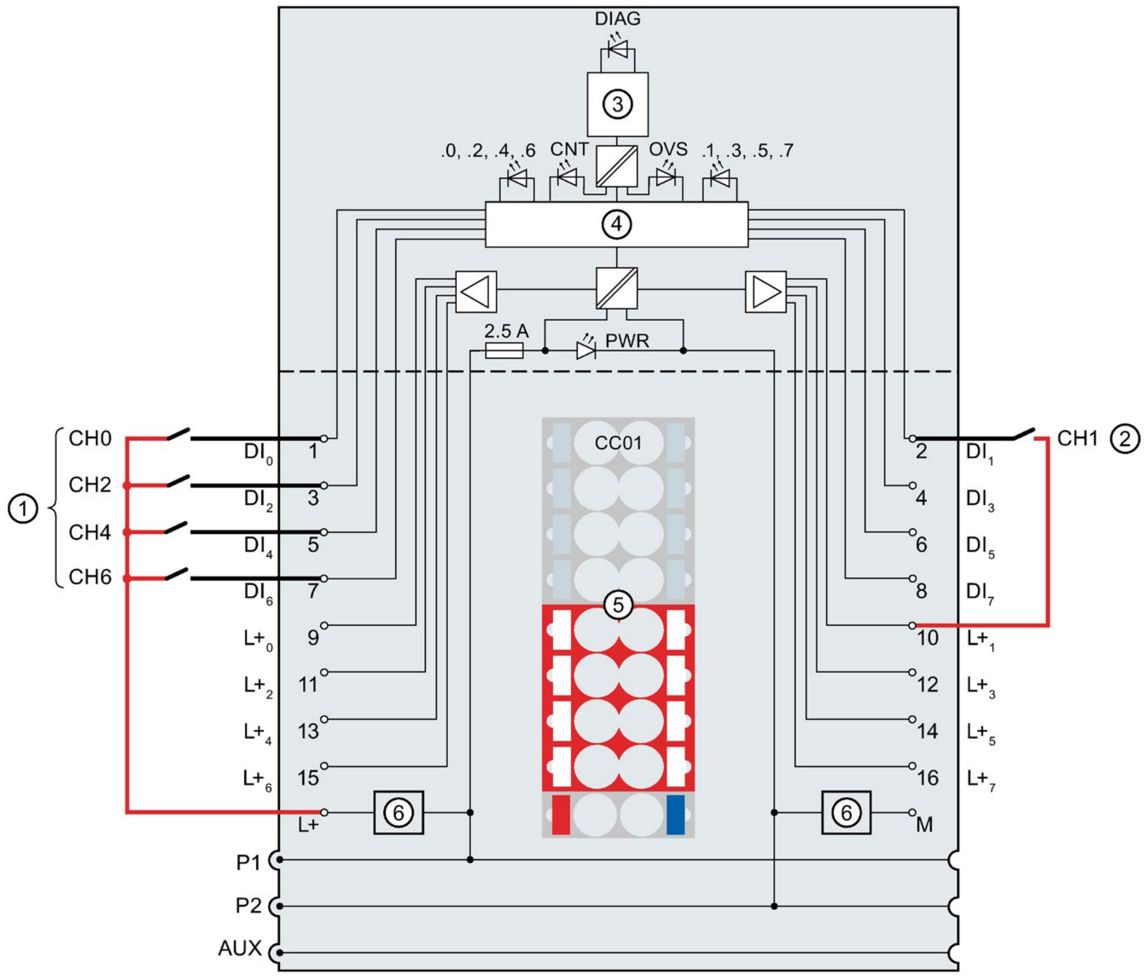
Information on wiring the BaseUnit can be found in the system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293).

Note

The module's load group must start with a light BaseUnit. Keep this in mind also during the configuration.

Wiring: 1 and 2-wire connection

The figure below shows the block diagram and an example of pin assignment for the DI 8×24VDC HS digital input module on the BaseUnit BU type A0 without AUX terminals (1 and 2-wire connection).

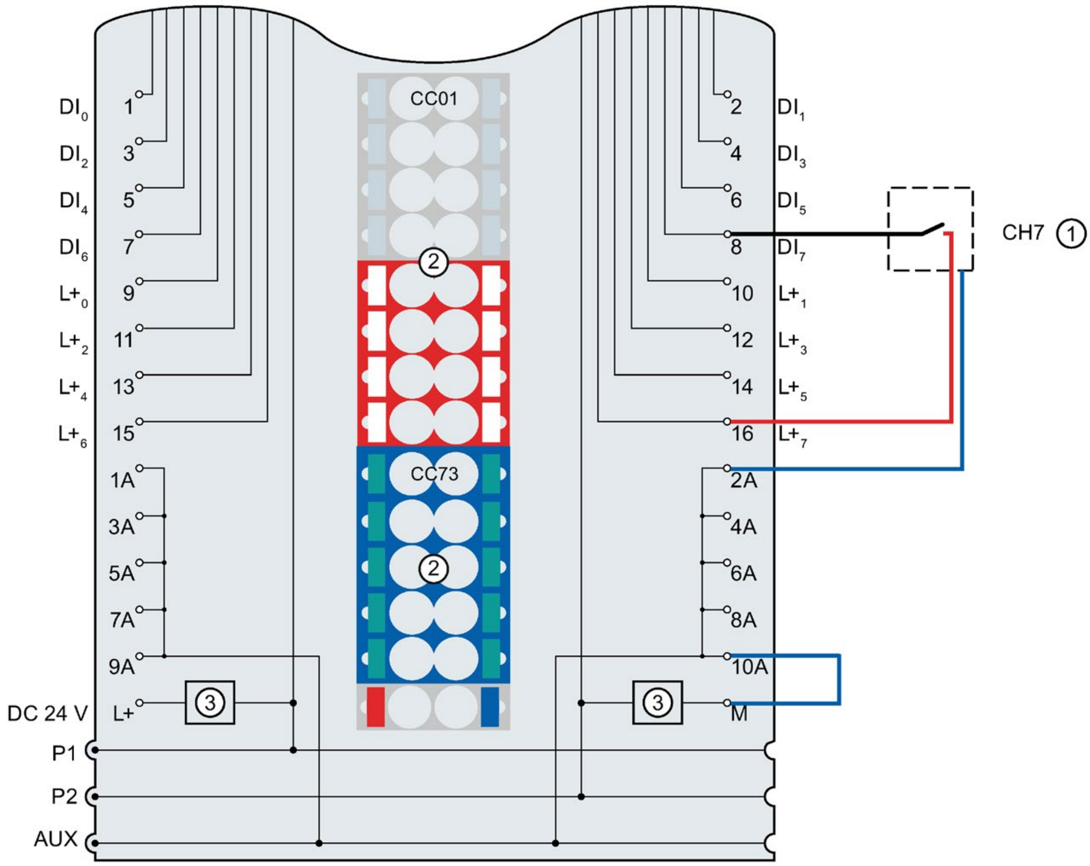


①	1-wire connection	DIAG	LED error or diagnostics (green, red)
②	2-wire connection	.0 to .7	LED channel status (green)
③	Backplane bus interface	PWR	LED power (green)
④	Input electronics	CNT	LED operating mode Count (green)
⑤	Color-coded label CCxx (optional)	OVS	LED operating mode Oversampling (green)
⑥	Supply voltage filter circuit (only available with light BaseUnit)	DI_0 - DI_3	Counter input, channels 0-3
M	Ground	DI_4	Direction input or gate input for DI_0, channel 4
$L+_n$	Encoder supply, channel n	DI_5	Direction input or gate input for DI_1, channel 5
L+	24 V DC (infeed only with light BaseUnit)	DI_6	Direction input or gate input for DI_2, channel 6
P1,	Internal self-configuring voltage buses	DI_7	Direction input or gate input for DI_3, channel 7
P2,	Connection to the left (dark BaseUnit)		
AUX	Connection to the left interrupted (light BaseUnit)		

Figure 4-1 Pinout and block diagram for 1 and 2-wire connection of encoders

Wiring: 3-wire connection

The figure below shows an example of pin assignment for the DI 8×24VDC HS digital input module on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color-coded labels CCxx (optional)
③	Supply voltage filter circuit (only available with light BaseUnit)
DI_n	Input signal, channel n
$L+_n$	Encoder supply, channel n
DC 24 V	Supply voltage L+ (infeed only with light BaseUnit)
M	Ground
1A ... 10A	AUX terminals
P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)

Figure 4-2 Pinout and block diagram for 3-wire connection of encoders

4.2 Parameters/address space

4.2.1 Counting

Function

Counting refers to the detection and summation of events. The respective counters of the module detect encoder signals and pulses and evaluate them accordingly, for example:

- For counting general piece goods up to a maximum limit
- For applications with recurring counting processes

You can count with DI_0 through DI_3. You can specify each counter's characteristics using the functions described below.

Counter limits

The counting limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program.

The maximum possible counting limit is 2147483647 (2^{31}–1). The minimum possible counting limit is –2147483648 (–2^{31}).

You can continue or stop counting upon violation of a counting limit (automatic gate stop) Upon high and low limit violations of the counter value, an event bit is set in the feedback interface (Page 41) in each case.

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime with the user program.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are recordd.

The control of the hardware gate takes place externally via the digital inputs DI_4 through DI_7. The software gate is controlled via the user program. Use of the hardware gate can be enabled through parameter assignment.

Count direction

The counting direction is specified either via suitable external pulse signals at the each counter's control input or via the configuration.

Comparison values

You define two comparison values that can control the STS_DQ feedback bit, independent of the user program. If the current counter value meets the configured comparison condition, the STS_DQ reset bit is set. You can use the STS_DQ reset bit in order to control a digital output module's digital output.

The comparison values are configurable and can be modified during runtime with the user program. When a comparison event occurs, in each case an event bit is set in the feedback interface (Page 41).

4.2.2 Parameters

The effective range of the parameters depends on the type of configuration. The following configurations are possible:

- Central operation on an ET 200SP CPU or on an ET 200SP Open Controller
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

In addition to configuration via the configuration software, you can also configure parameters in RUN mode (dynamic) via the user program. When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of parameter data record for Counting operating mode (Page 69).

The following parameter settings are possible for each operating mode:

Table 4- 1 Configurable parameters in Counting operating mode

Parameters	Value range	Default	Reconfiguration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0229 for STEP 7; PROFINET IO GSD file	GSD file PROFIBUS DP
Operating mode[1]	• DI / Oversampling • Counting	—	No	Module	Module
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameters	Value range	Default	Reconfig-uration in RUN	Effective range with configuration soft-ware	
				HSP0127 for STEP 7 (TIA Portal); HSP0229 for STEP 7; PROFINET IO GSD file	GSD file PROFIBUS DP
Input delay	• 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	Yes	Channel	Module [2]
Reaction to viola-tion of a counting limit	• Stop counting • Continue counting	Stop counting	Yes	Channel	Channel
Edge selection	• At rising edge • At falling edge	At rising edge	Yes	Channel	Channel
Count direction	• Up • Down	Up	Yes	Channel	Channel
Set output	• Off (DQ = 0) • Off (DQ = 1) • Between comparison value 0 and 1 • Not between compari-son value 0 and 1	Off (DQ = 0)	Yes	Channel	Channel
Set function of DI	• Digital input • Gate start/stop • Count direction	Digital input	Yes	Channel	Channel
High counting limit	-2147483648...2147483647	2147483647	Yes	Channel	Channel
Low counting limit	-2147483648...2147483647	0	Yes	Channel	— [3]
Start value	-2147483648...2147483647	0	Yes	Channel	— [3]
Comparison value 1	-2147483648...2147483647	10	Yes	Channel	Channel

Parameters	Value range	Default	Reconfig-uration in RUN	Effective range with configuration soft-ware	
				HSP0127 for STEP 7 (TIA Portal); HSP0229 for STEP 7; PROFINET IO GSD file	GSD file PROFIBUS DP
Comparison value 0	-2147483648...2147483647	0	Yes	Channel	— [3]
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module	Module

[1] When configuring with HSP0229 for STEP 7 or with a GSD file, the operating mode is specified by selecting the module name.

[2] If your PROFIBUS Master supports the "Read / write data record" function, you can set this parameter for each channel via data record 128.

[3] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If your PROFIBUS Master supports the "Read / write data record" function, you can set this parameter via data record 128.

4.2.3 Explanation of parameters

Operating mode

Selection of the operating mode in which all of the module's channels are operated.

- DI (Page 15) / Oversampling (Page 49)
- Counting

When configuring with HSP0229 for STEP 7 or with a GSD file, the operating mode is specified by selecting the module name.

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Channel activated

Determines whether a channel is enabled or disabled. If a digital input is disabled, the module ignores its signals.

Input delay

You use this parameter to suppress signal interferences. The module only detects changes to the signal if the changed signal is constantly pending longer than the set input delay time.

Note

If you select the "0.05 ms" value range for the input delay, you have to use shielded cables for connection of the digital inputs.

Reaction to violation of a counting limit

Selection of the reaction to violation of the counter high limit in the upward direction or the counter low limit in the downward direction:

- Stop counting:
  After a counting limit is violated, the internal gate is closed. This stops the counting process. The counter value is set to the opposite counting limit. To restart counting, you must close and reopen the software/hardware gate.
- Continue counting:
  After a counting limit is violated, the counter value is set to the opposite counting limit and counting continues.

Edge selection

Selects the edge that is counted:

- At rising edge:
  The respective counter counts all rising edges at the digital input.
- At falling edge:
  The respective counter counts all falling edges at the digital input.

Note

If the "Reverse direction" option is selected in "Set function of DI" and the counting direction in the process changes, the counting edge is automatically adjusted (opposite edges).

Count direction

Count direction selection:

- Up:
  The respective counter counts up.
- Down:
  The respective counter counts down.

Note

This parameter has no effect if the "Reverse direction" option is selected in "Set function of DI".

Set output

Selects the function that controls the response of the STS_DQ feedback bit (Page 41): You use the feedback bit STS_DQ to control a digital output of a digital output module.

- Off (DQ = 0):
  STS_DQ is independent of the counter value and permanently not set.
- Off (DQ = 1):
  STS_DQ is independent of the counter value and permanently set.
- Between comparison value 0 and 1:
  STS_DQ is set if counter value ≥ comparison value 0 and counter value ≤ comparison value 1.
- Not between comparison value 0 and 1:
  STS_DQ is set if counter value < comparison value 0 or counter value > comparison value 1.

Set function of DI

Selects the function of DI_{n+4}, which controls the assigned counter input DI_n:

- Digital input:
  No function is assigned to DI_{n+4}. The signal status of DI_{n+4} is read by the CPU using the feedback interface (Page 41).
- Gate start/stop:
  Setting DI_{n+4} opens the hardware gate for DI_n. Resetting DI_{n+4} closes the hardware gate for DI_n.
- Count direction:
  DI_{n+4} reverses the counting direction at DI_n, in order to adjust it to the process. If DI_{n+4} is not set, DI_n counts up. If DI_{n+4} is set, DI_n counts down.

Counter high limit

Sets counter high limit.

The following applies:

- Counter high limit > counter low limit
- Counter high limit ≤ 2147483647 (2^{31} - 1)

Counter low limit

Sets the counter low limit.

The following applies:

- Counter low limit < counter high limit
- Counter low limit ≥ -2147483648 (-2^{31})

Start value

Sets the start value.

The following applies:

- Start value ≥ counter low limit
- Start value ≤ counter high limit

Comparison value 1

Sets the second comparison value.

The following applies:

- Comparison value 1 > comparison value 0
- Comparison value 1 ≤ counter high limit

Comparison value 0

Sets the first comparison value.

The following applies:

- Comparison value 0 < comparison value 1
- Comparison value 0 ≥ counter low limit

Potential group

Specifies whether a light-colored BaseUnit with incoming supply voltage is located on this slot (see ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual).

4.2.4 Address space

4.2.4.1 Assignment of the control interface

Control interface

The user program uses the control interface to influence the behavior of the module's counter. The figure below shows the address space allocation for the control interface in the process image of the outputs.

"QB x" represents the start address of output byte x.

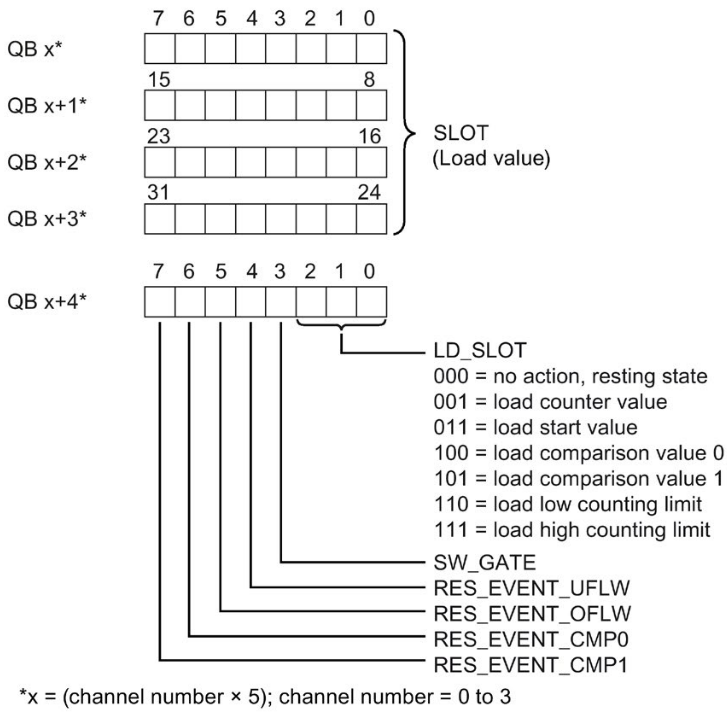


Figure 4-3 Assignment of the control interface

Notes on the control bits

Control bit	Notes
SLOT	This value is used to specify the loaded value for each channel. Use the LD_SLOT load request to evaluate the loaded value.
LD_SLOT	This load request is used to specify the meaning of the SLOT (loaded value) value for each channel. The user program performs the respective action, as soon as LD_SLOT changes. When the loading request LD_SLOT = 011_B is entered and the software gate is opened, each counting operation begins with the start value. If another load request is entered and the software gate is opened, counting continues with the current count at each start of the counting operation. These two situations are also in effect when the hardware gate is configured and the software gate is closed.
SW_GATE	With this bit, you open and close the software gate of the respective channel. Together, the software gate and the hardware gate form the internal gate. The module only counts if the internal gate is open. 0 means: Software gate closed 1 means: Software gate open
RES_EVENT_UFLW	Use this bit to initiate the resetting of the saved event in the EVENT_UFLW feedback bit for the respective channel.
RES_EVENT_OFLW	Use this bit to initiate the resetting of the saved event in the EVENT_OFLW feedback bit for the respective channel.
RES_EVENT_CMP0	Use this bit to initiate the resetting of the saved event in the EVENT_CMP0 feedback bit for the respective channel.
RES_EVENT_CMP1	Use this bit to initiate the resetting of the saved event in the EVENT_CMP1 feedback bit for the respective channel.

4.2.4.2 Assignment of the feedback interface

Feedback interface

The user program receives current values and status information from the module via the feedback interface. The figure below shows the address space allocation for the feedback interface in the process image of the inputs.

Note

In isochronous mode, current values and the status information in the feedback interface is updated at the time T_i (time for reading the input data).

"IB x" represents the start address of input byte x.

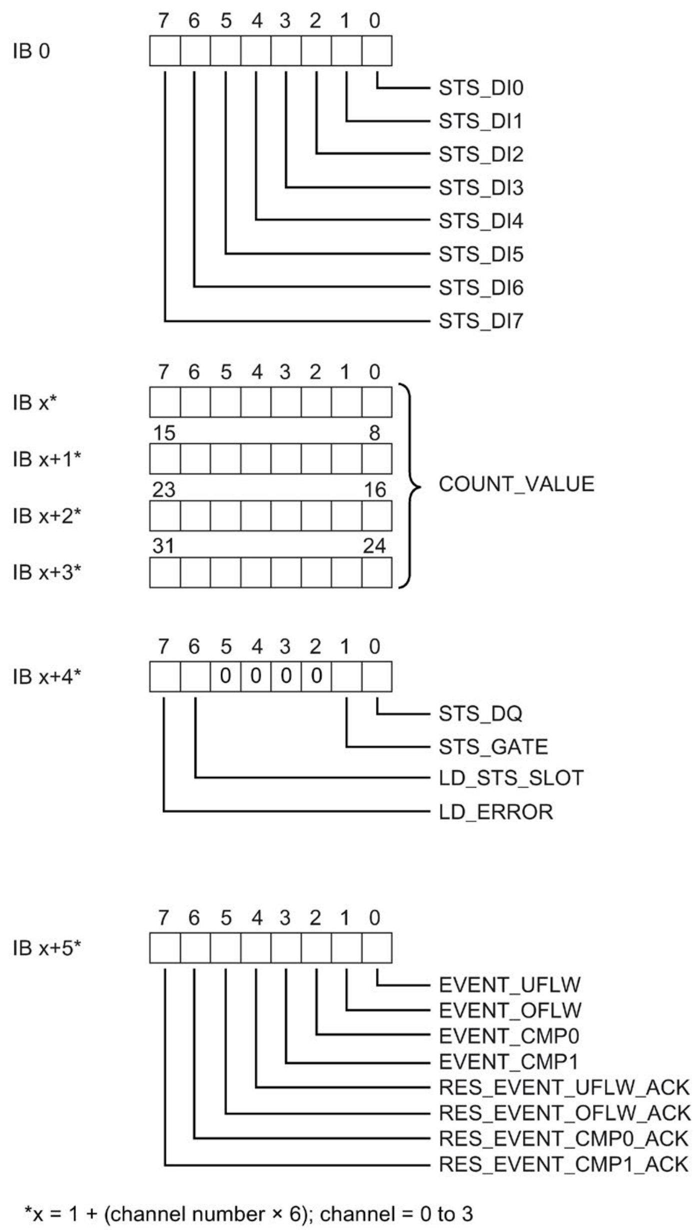

Figure 4-4 Assignment of the feedback interface

Notes on the feedback bits

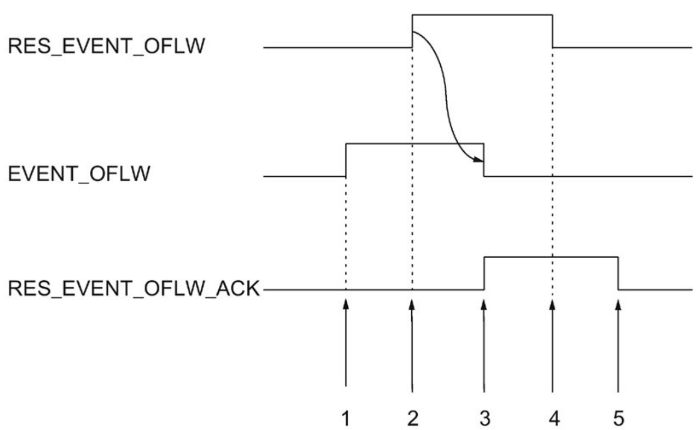
Feedback bit	Notes
STS_DIn	This bit indicates the status of the respective digital input DI_n.
COUNT_VALUE	This value returns the current counter value for the respective channel.
STS_DQ	This bit depends on the "Set output" parameter of the respective channel. You can use STS_DQ in each case, in order to control a digital output module's digital output.
STS_GATE	Together, the software gate and the hardware gate form the internal gate. This bit indicates the status of the internal gate for the respective channel. The module only counts if the internal gate is open. 0 means: Gate closed 1 means: Gate open Note: If you change a channel parameter in RUN mode via data record 128, all of the changed channel's values are retransferred to the module. In doing so, the internal gate of the respective channel is closed and the counter value is set to the start value. To restart counting, you need to close and reopen the software gate in each case.
LD_STS_SLOT	This bit indicates for the respective channel, by mean of a status change (toggling), that the load request for SLOT (LD_SLOT) has been detected and executed.
LD_ERROR	This bit indicates for the respective channel that an error occurred (latching) during loading via the control interface. The loaded value was not applied. One of the following conditions has not been met: • Counter low limit ≤ counter value (If this condition is not met, the start value is loaded as the current counter value.) • Counter low limit ≤ start value • Counter low limit ≤ comparison value 0/1 • Counter high limit ≥ counter value (If this condition is not met, the start value is loaded as the current counter value.) • Counter high limit ≥ start value • Counter high limit ≥ comparison value 0/1 • Counter low limit < counter high limit • Comparison value 0 < comparison value 1 • Do not write a reserved load request in LD_SLOT
EVENT_UFLW	For the respective channel, this bit indicates the saved state which shows that there was a counter value underflow (a violation of the counter low limit). You reset the status by acknowledgment with RES_EVENT_UFLW.
EVENT_OFLW	For the respective channel, this bit indicates the saved state which shows that there was a counter value overflow (a violation of the counter high limit). You reset the status by acknowledgment with RES_EVENT_OFLW.
EVENT_CMP0	For the respective channel, this bit indicates the saved status which shows that a comparison event with comparison value 0 has occurred. You reset the status by acknowledgment with RES_EVENT_CMP0. The EVENT_CMP0 bit is not set when you set the counter value to the start value.
EVENT_CMP1	For the respective channel, this bit indicates the saved status which shows that a comparison event with comparison value 1 has occurred. You reset the status by acknowledgment with RES_EVENT_CMP1. The EVENT_CMP1 bit is not set when you set the counter value to the start value.

Feedback bit	Notes
RES_EVENT_UFLW_ACK	This bit indicates for the respective channel that the reset of event bit EVENT_UFLW is active.
RES_EVENT_OFLW_ACK	This bit indicates for the respective channel that the reset of event bit EVENT_OFLW is active.
RES_EVENT_CMP0_ACK	This bit indicates for the respective channel that the reset of event bit EVENT_CMP0 is active.
RES_EVENT_CMP1_ACK	This bit indicates for the respective channel that the reset of event bit EVENT_CMP1 is active.

Complete acknowledgment principle

Saving bits are acknowledged according to the complete acknowledgment principle.

The figure below shows an example of the sequence of the complete acknowledgment principle in the event of an overflow:



① The EVENT_OFLW feedback bit is set as a saving event upon overflow.
② You set the RES_EVENT_OFLW control bit to trigger EVENT_OFLW reset.
③ The RES_EVENT_OFLW_ACK feedback bit is set when reset of EVENT_OFLW is detected.
④ You then rest the control bit RES_EVENT_OFLW .
⑤ The RES_EVENT_OFLW_ACK feedback bit is reset.

Figure 4-5 Acknowledgment principle

Note

If you have initiated the reset of an event bit, you must wait for the respective feedback bit. Then you can initiate another reset.

Note

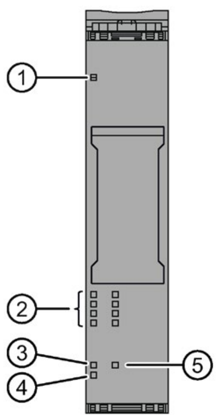
Opening the software gate or hardware gate (0-1 transition) resets all event bits.

4.3 Interrupts/diagnostic messages

4.3.1 Status and error display

LED display

The figure below shows the LED display of the DI 8×24VDC HS.



① DIAG (green/red)
② Channel status (green)
③ CNT (green)
④ PWR (green)
⑤ OVS (green)

Figure 4-6 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedial measures for dealing with diagnostic interrupts can be found in the section Diagnostics alarms (Page 48).

DIAG LED

Table 4- 2 DIAG LED fault/error display

DIAG LED	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
■ On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 4- 3 Status display of the channel status LED

Channel status LED	Meaning
□ Off	Process signal = 0
■ On	Process signal = 1

CNT LED

Table 4- 4 Status display of the CNT LED

CNT LED	Meaning
□ Off	Counting operating mode disabled
■ On	Counting operating mode enabled

OVS LED

Table 4- 5 Status display of the OVS LED

OVS LED	Meaning
□ Off	Oversampling operating mode disabled
■ On	Oversampling operating mode enabled

PWR LED

Table 4- 6 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

4.3.2 Interrupts

The digital input module DI 8×24VDC HS supports diagnostics alarms in the Counting mode.

Diagnostic interrupts

The module generates a diagnostics interrupt at the following events:

- Channel temporarily unavailable
- Short-circuit
- Parameter assignment error
- No load voltage

4.3.3 Diagnostics alarms

A diagnostic interrupt is output for each diagnostics event and the DIAG LED on the module flashes. The diagnostic interrupts can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 4- 7 Diagnostic interrupts, their meaning and how to deal with them

Diagnostic interrupt	Error code	Meaning	Remedy
Short-circuit	1_H	Short-circuit to ground at encoder supply	Correct process wiring
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct parameter assignment
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module reads no process values in this state.	• Wait for firmware update. • Restart the firmware update.

Oversampling (OVS) operating mode 5

5.1 Connecting

5.1.1 Wiring and block diagrams

This section contains the block diagram for the DI 8×24VDC HS module with the pin assignments for 1, 2 and 3-wire connection in Oversampling operating mode. You may use and combine the different wiring options for all channels.

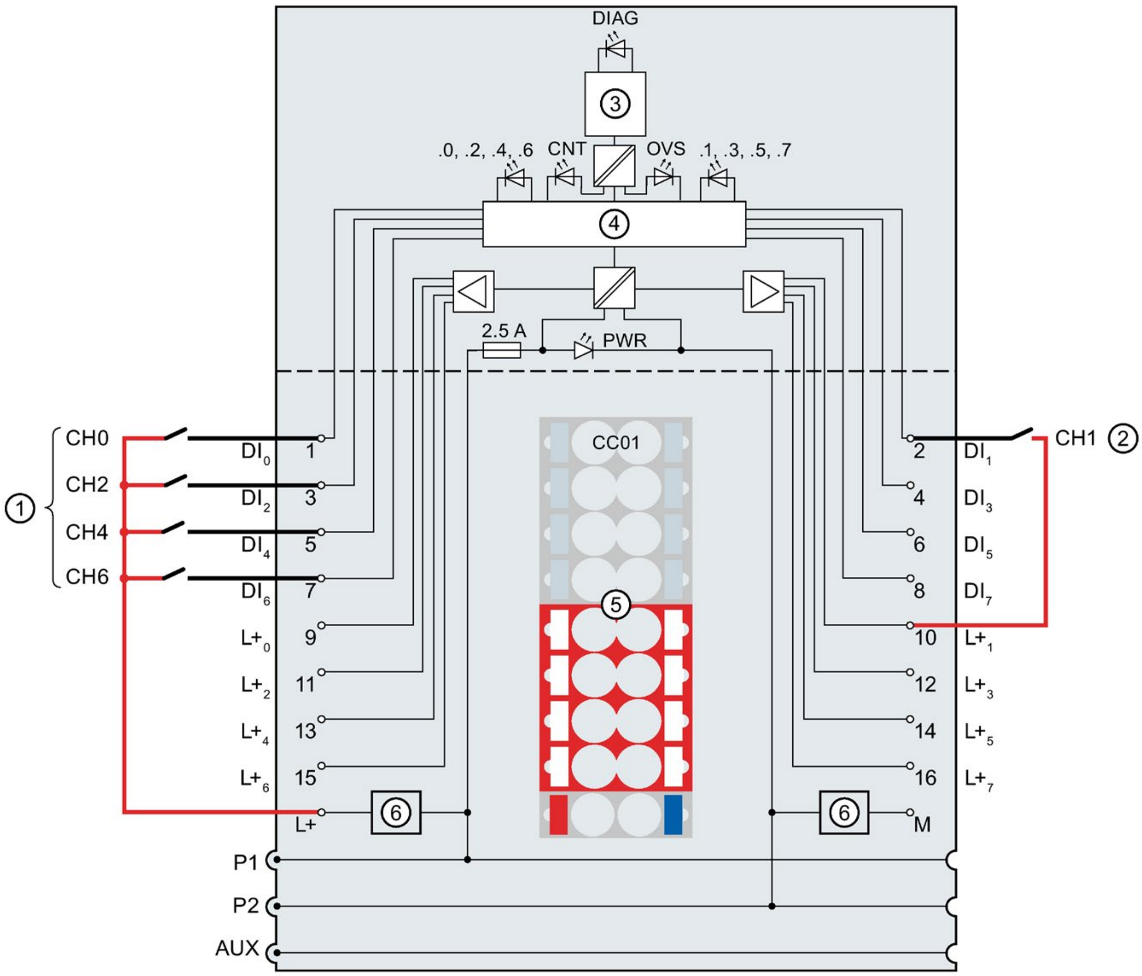
Information on wiring the BaseUnit can be found in the system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293).

Note

The module's load group must start with a light BaseUnit. Keep this in mind also during the configuration.

Wiring: 1 and 2-wire connection

The figure below shows the block diagram and an example of pin assignment for the DI 8×24VDC HS digital input module on the BaseUnit BU type A0 without AUX terminals (1 and 2-wire connection).

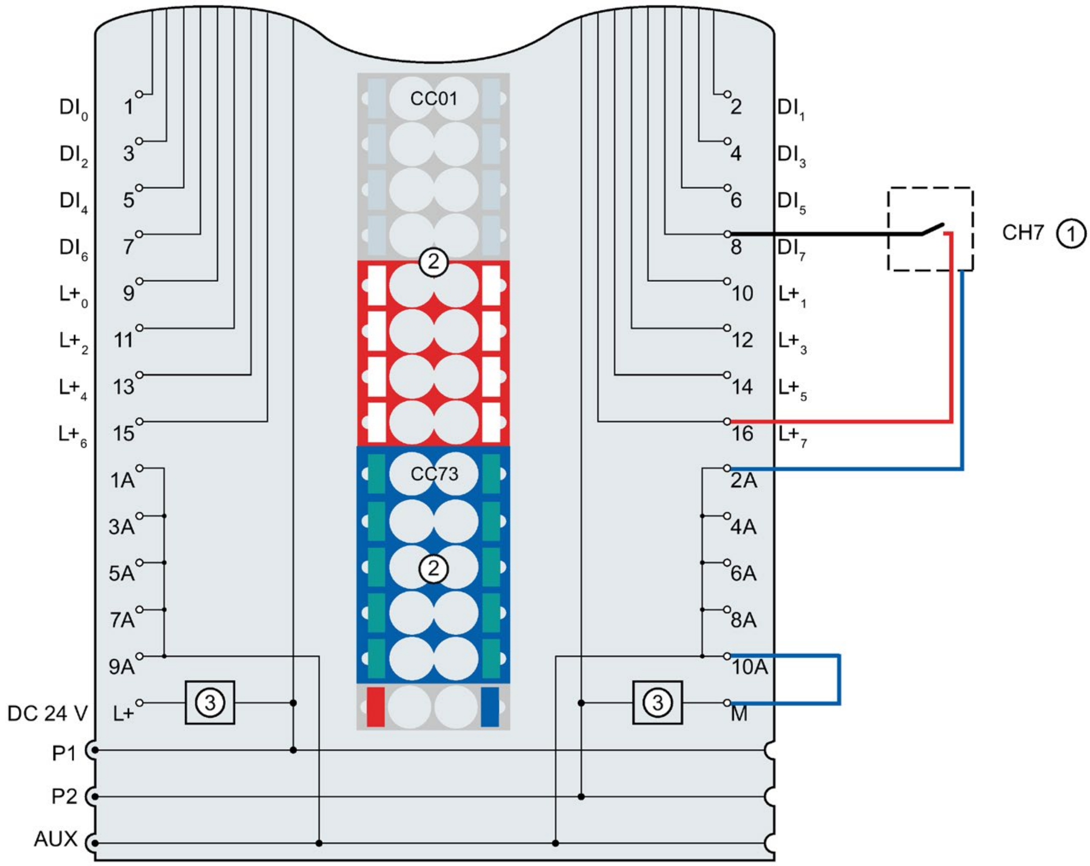


①	1-wire connection	$L+_n$	Encoder supply, channel n
②	2-wire connection	L+	24 V DC (infeed only with light BaseUnit)
③	Backplane bus interface	DIAG	LED error or diagnostics (green, red)
④	Input electronics	.0 to .7	LED channel status (green)
⑤	Color-coded label CCxx (optional)	PWR	LED power (green)
⑥	Supply voltage filter circuit (only available with light BaseUnit)	CNT	LED operating mode Count (green)
M	Ground	OVS	LED operating mode Oversampling (green)
DI_n	Input signal, channel n	P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)

Figure 5-1 Pinout and block diagram for 1 and 2-wire connection of encoders

Wiring: 3-wire connection

The figure below shows an example of pin assignment for the DI 8×24VDC HS digital input module on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color-coded labels CCxx (optional)
③	Supply voltage filter circuit (only available with light BaseUnit)
DIn	Input signal, channel n
L+n	Encoder supply, channel n
DC 24 V	Supply voltage L+ (infeed only with light BaseUnit)
M	Ground
1A ... 10A	AUX terminals
P1, P2, AUX	Internal self-configuring voltage buses Connection to the left (dark BaseUnit) Connection to the left interrupted (light BaseUnit)

Figure 5-2 Pinout and block diagram for 3-wire connection of encoders

5.2 Parameters/address space

5.2.1 Oversampling

Function

Oversampling is the acquisition of data in constant bus cycle segments (sub-cycles), whereby n sub-cycles correspond to one PROFINET bus cycle.

Oversampling is useful whenever you require acquisition of data with high time resolution but without using an extremely short PROFINET bus cycle and thus fast CPU cycles.

With the oversampling function, a PROFINET bus cycle is divided into constant bus sub-cycles:

- Each subcycle detects an 8-bit value.
- A subcycle is at least 7.8125 μs in length.
- Subcycles are possible in steps from 2 to 32 (sampling rate).

Requirement

Oversampling is only possible when isochronous mode is set.

Configuration

You configure oversampling with the following parameter:

- Sampling rate

Note

Do not use a reduction ratio for blocks in the case of configuration with oversampling in the runtime groups of your user program. This will ensure that the data processing in the user program of the CPU is synchronized with the acquisition on the module.

Sampling interval

The duration of a subcycle is the sampling interval. The cycle time T (send clock) for isochronous mode is specified in the configuration software. This time, divided by the configured sampling rate n_{Sample}, yields the sampling interval t_{Sample} of the module.

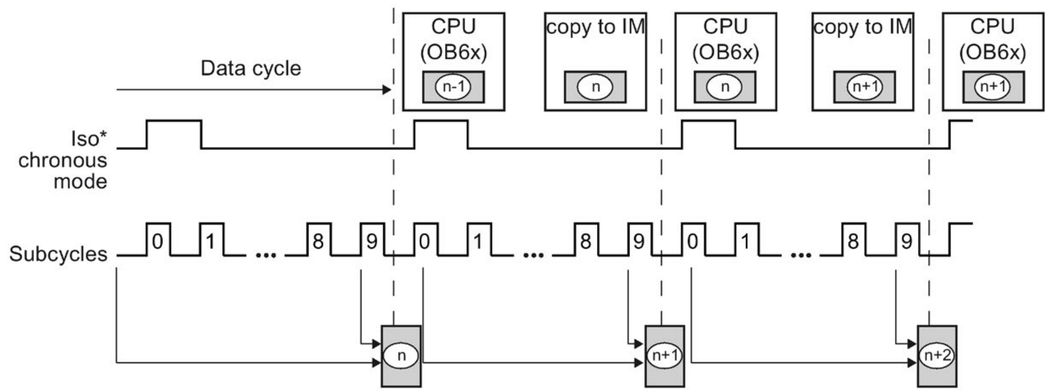
Example calculation:

$$t_{Sample} = \frac{T}{n_{Sample}} = \frac{1\ \text{ms}}{16} = 62{,}5\ \mu\text{s}$$

Figure 5-3 Example of calculating the sampling interval

Chronological sequence

The figure below shows the chronological sequence for oversampling. The detected input data of a data cycle (send clock) is copied to the interface module in the next cycle data and are available to the CPU in the data cycle after the next one.



n	Detected value from cycle n
Sub-cycle	8 bits apiece x 32 (max.) = max. 32 bytes of input data per data cycle

Figure 5-4 Oversampling

Note

Do not use a reduction ratio for the send clock in this operating mode for blocks in your user program (for example, OB61). This will ensure that the data processing in the user program of the CPU is synchronized with the acquisition on the module.

5.2.2 Parameters

In distributed mode, you can use the Oversampling operating mode on the PROFINET IO in an ET 200SP system.

In addition to configuration via the configuration software, you can also configure parameters in RUN mode (dynamic) via the user program. When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of parameter data record for Oversampling operating mode (Page 74).

The following parameter settings are possible:

Table 5- 1 Configurable parameters in the Oversampling operating mode

Parameters	Value range	Default	Reconfiguration in RUN	Effective range with configuration software
				HSP0127 for STEP 7 (TIA Portal); HSP0229 for STEP 7
Operating mode[1]	• DI / Oversampling • Counting	—	no	Module
Sampling rate	• 2 values / cycle • 3 values / cycle • ... • 32 values / cycle	—	yes	Module
Diagnostics No supply voltage L+	• Disable • Enable	Disable	yes	Module
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	yes	Module
Channel activated	• Disable • Enable	Enable	yes	Channel
Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	None	yes	Channel
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module

[1] When configuring with HSP0229 for STEP 7, the operating mode is specified by selecting the module name.

5.2.3 Explanation of parameters

Operating mode

At the module level, specifies the operating mode in which the module's channels are operated.

- DI (Page 15) / Oversampling
- Counting (Page 30)

When configuring with HSP0229 for STEP 7, the operating mode is specified by selecting the module name.

Sampling rate

Specifies the number of subcycles per isochronous data cycle.

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Channel activated

Determines whether a channel is enabled or disabled. If a digital input is disabled, the module ignores its signals.

Input delay

This parameter can be used to avoid signal faults. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Isochronous configuration is only possible if there is no input delay configured for at least one channel. In isochronous mode, the terminal signal is read in at the time T_i (time for reading the input data). The read time T_i refers to the channel for which no input delay time was configured.

For input channels with longer input delays, the read time is moved accordingly. This means individual channels can be assigned input delays, if necessary, without having a negative impact on the possible cycle time.

Note

If you select the "None" or "0.05 ms" option for the input delay, you have to use shielded cables for connection of the digital inputs.

Potential group

Specifies whether a light-colored BaseUnit with incoming supply voltage is located on this slot (see ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual).

5.2.4 Address space

Address space

The figure below shows the assignment of the address space. "IB x" represents the start address of input byte x.

In the respective bit, the subcycles are counted from left to right. Up to 32 subcycles are possible. If fewer than 32 subcycles are configured, the bits that are consequently unused are set to 0.

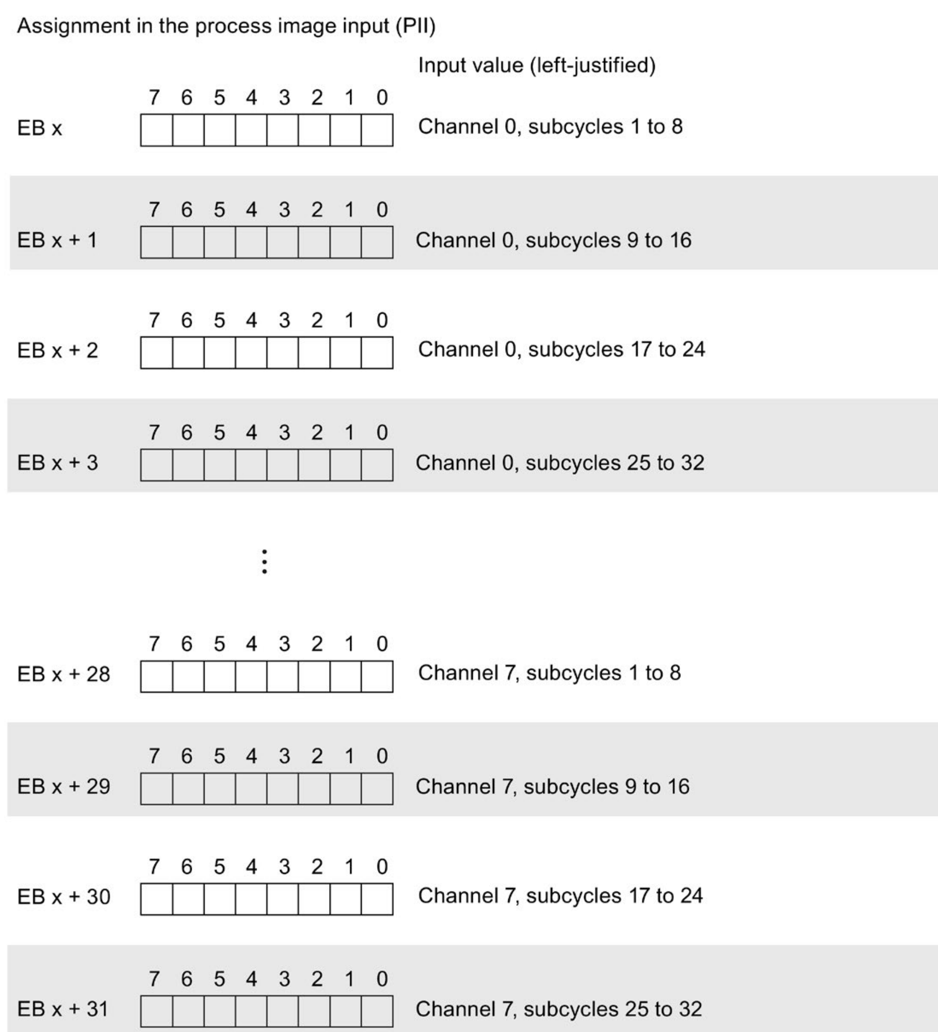


Figure 5-5 Address space for oversampling

Note

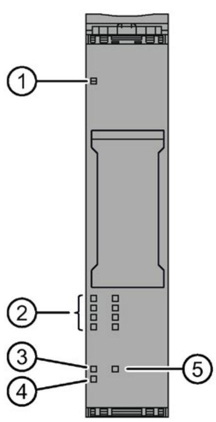
While you are changing parameters in RUN mode, corruption of input data can occur.

5.3 Interrupts/diagnostic messages

5.3.1 Status and error display

LED display

The figure below shows the LED display of the DI 8×24VDC HS.



① DIAG (green/red)
② Channel status (green)
③ CNT (green)
④ PWR (green)
⑤ OVS (green)

Figure 5-6 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedial measures for dealing with diagnostic interrupts can be found in the section Diagnostics alarms (Page 60).

DIAG LED

Table 5- 2 DIAG LED fault/error display

DIAG LED	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
■ On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 3 Status display of the channel status LED

Channel status LED	Meaning
□ Off	Process signal = 0
■ On	Process signal = 1

CNT LED

Table 5- 4 Status display of the CNT LED

CNT LED	Meaning
□ Off	Counting operating mode disabled
■ On	Counting operating mode enabled

OVS LED

Table 5- 5 Status display of the OVS LED

OVS LED	Meaning
□ Off	Oversampling operating mode disabled
■ On	Oversampling operating mode enabled

PWR LED

Table 5- 6 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

5.3.2 Interrupts

The digital input module DI 8×24VDC HS supports diagnostics alarms in the Oversampling mode.

Diagnostic interrupts

The module generates a diagnostics interrupt at the following events:

- Short-circuit
- Parameter assignment error
- No load voltage
- Channel temporarily unavailable

5.3.3 Diagnostics alarms

A diagnostic interrupt is output for each diagnostics event and the DIAG LED on the module flashes. The diagnostic interrupts can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 7 Diagnostic interrupts, their meaning and how to deal with them

Diagnostic interrupt	Error code	Meaning	Remedy
Short-circuit	1_H	Short-circuit to ground at encoder supply	Correct process wiring
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct parameter assignment
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module reads no process values in this state.	• Wait for firmware update. • Restart the firmware update.

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DI 8x24VDC HS

The following table shows the technical specifications as of 09/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7131-6BF00-0DA0/td?dl=en)

Article number	6ES7131-6BF00-0DA0
General information	
Product type designation	DI 8x24 V DC HS
Firmware version	V1.0.2
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
• STEP 7 configurable/integrated as of version	V5.5 SP3 / -
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	Yes
• Oversampling	Yes
• MSI	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7131-6BF00-0DA0
Input current	
Current consumption, max.	70 mA; without sensor supply
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes; per module, electronic
• Output current, max.	700 mA
Power loss	
Power loss, typ.	1.5 W
Address area	
Address space per module	
• Address space per module, max.	45 byte
• Inputs	32 byte; 1 byte + 1 byte for QI information in DI mode; 32 bytes in Oversampling mode; 25 bytes in Counter mode
• Outputs	20 byte; In count mode
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals
• 4-wire connection	BU type A0 + external terminals
Digital inputs	
Number of digital inputs	8
Source/sink input	P-reading
Pulse extension	Yes
• Length	2 s; 50 ms, 100 ms, 200 ms, 500 ms, 1 s, 2 s
Digital input functions, parameterizable	
• Gate start/stop	Yes
• Freely usable digital input	Yes
• Counter	Yes
– Number, max.	4
– Counting frequency, max.	10 kHz
– Counting width	32 bit
– Counting direction up/down	Yes
• Digital input with oversampling	Yes
– Number, max.	8
– Values per cycle, max.	32
– Resolution, min.	7.8125 μs

Article number	6ES7131-6BF00-0DA0
Input voltage	
• Type of input voltage	DC
• Rated value (DC)	24 V
• for signal "0"	-30 to +5V
• for signal "1"	+11 to +30V
Input current	
• for signal "1", typ.	6 mA
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; none / 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms
for interrupt inputs	
– parameterizable	Yes
for technological functions	
– parameterizable	Yes
Cable length	
• shielded, max.	50 m
• unshielded, max.	50 m
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	1.5 mA
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Bus cycle time (TDP), min.	125 μs
Jitter, max.	5 μs
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Monitoring of encoder power supply	Yes; Module-wise
• Wire-break	No
• Short-circuit	Yes; Module-wise

Article number	6ES7131-6BF00-0DA0
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	28 g

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data records A

A.1 Parameter assignment and structure of parameter data record for DI operating mode

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment can result in a brief exit from clocked mode and renewed synchronization with the fieldbus cycle.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You can find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

*x = 8 + (channel number × 2); channel number = 0 to 7

Figure A-6 Structure byte x to x+1 for the channels 0 to 7

A.2 Parameter assignment and structure of parameter data record for Counting operating mode

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment can result in a brief exit from clocked mode and renewed synchronization with the fieldbus cycle.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You can find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

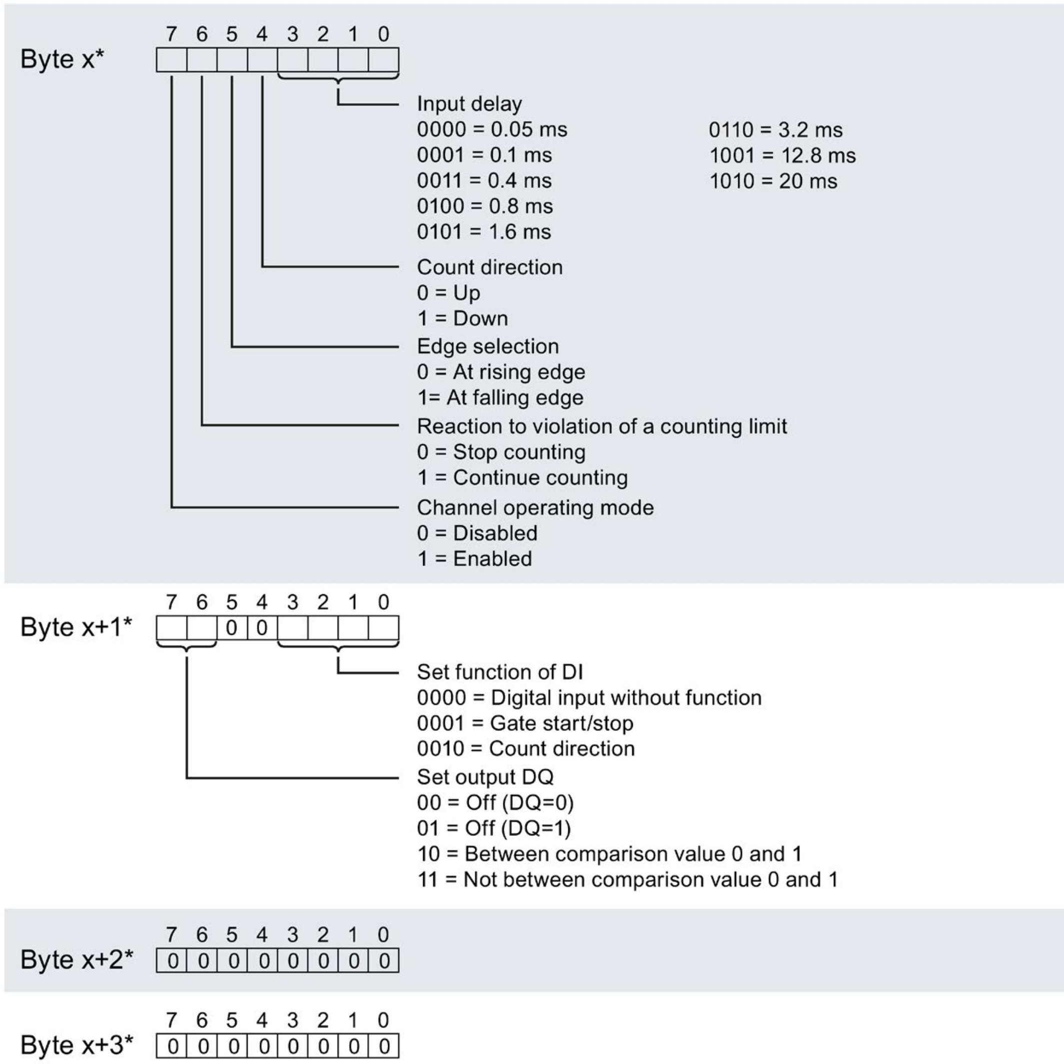
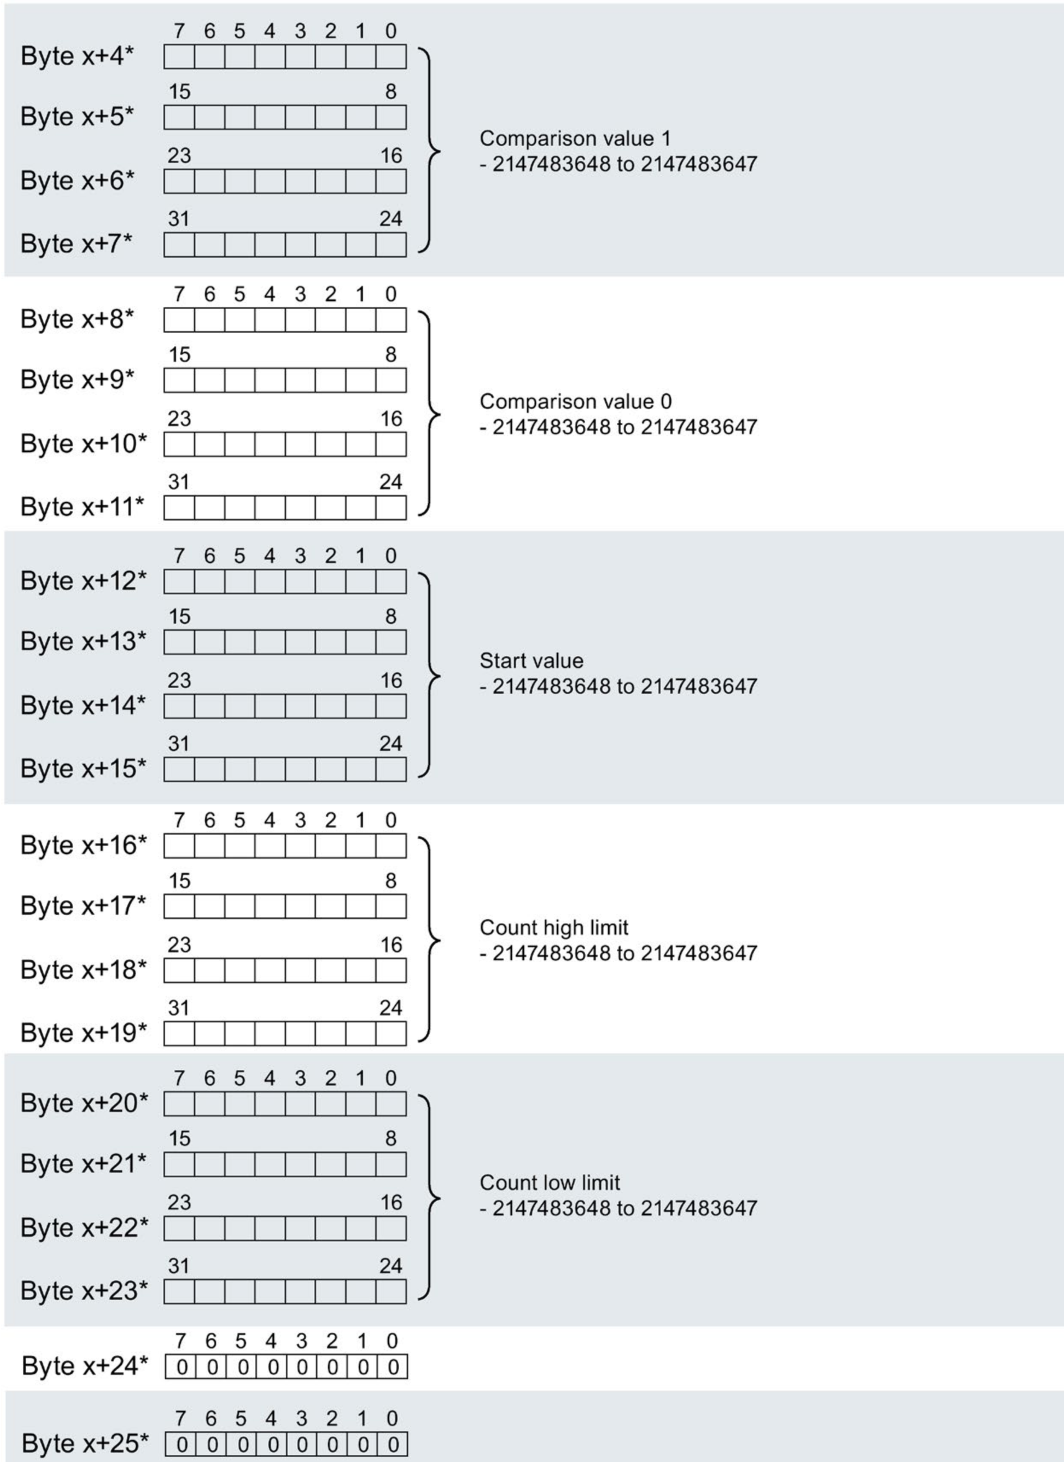
Channel parameter block

The figure below shows the structure of the parameters for channels 0 to 3. You enable a parameter by setting the corresponding bit to "1".





*x = 8 + (channel number × 26); channel number = 0 to 3

Figure A-12 Structure byte x to x+25 for the channels 0 to 3

A.3 Parameter assignment and structure of parameter data record for Oversampling operating mode

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Note

Changing parameters in RUN

If you change parameters in RUN mode, falsifications can occur in the input data.

A parameter data record that has content different from the startup parameter assignment can result in a brief exit from clocked mode and renewed synchronization with the fieldbus cycle.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You can find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7131-6BF60-0AA0 to 6ES7131-6BF61-0AA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

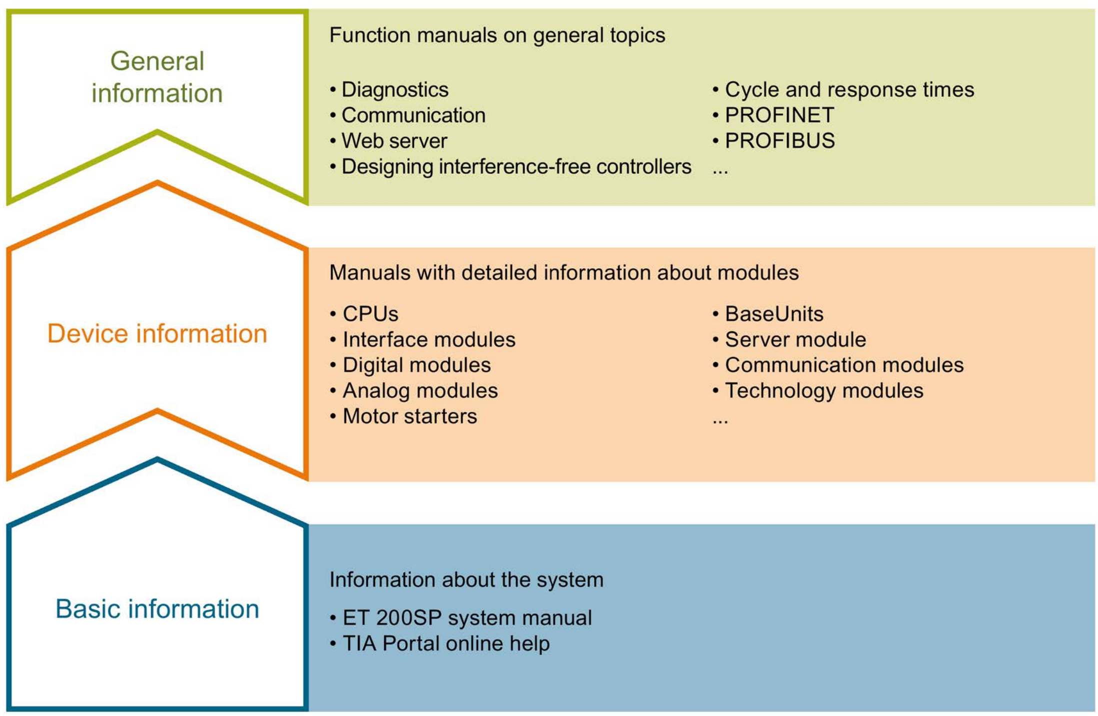
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

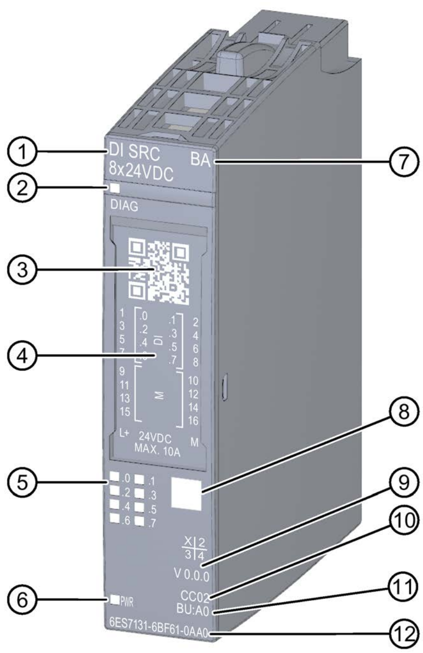
2

2.1 Properties

Part number

6ES7131-6BF61-0AA0

View of the module



①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color coding module type
③	2D matrix code	⑨	Function and firmware version
④	Wiring diagram	⑩	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the DI 8×24VDC SRC BA module

Properties

The module has the following technical properties:

- 8 digital inputs
- Source input (NPN, M reading)
- Supply voltage L+
- Configurable input delay 0.05 ms to 20 ms (per channel)
- Configurable diagnostics (per module)
- Suitable for connection of switches and 2-wire sensors according to IEC 61131, type 1 and 3

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X

Accessories

The following accessories are supplied with the module and can also be ordered separately as spare parts:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DI 8x24VDC SRC BA module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection.

Information about wiring of the BaseUnit is available in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

You may use and combine the different wiring options for all channels.

Note

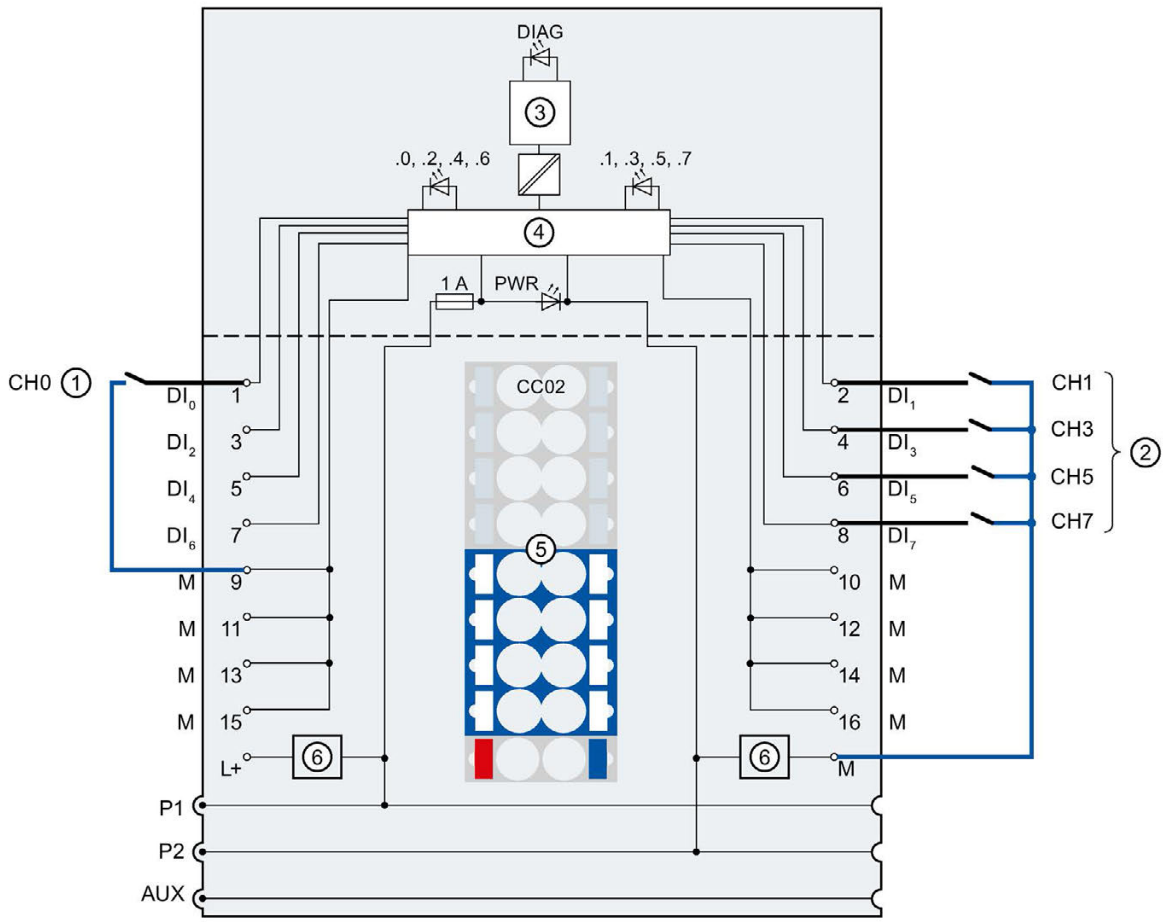
The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Note

The input channels provide values even without connected supply voltage L+. The characteristic type 2 is only maintained with connected supply voltage L+.

Connection: 1-wire and 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input module DI 8x24VDC SRC BA on the BaseUnit BU type A0 without AUX terminals (1-wire and 2-wire connection).

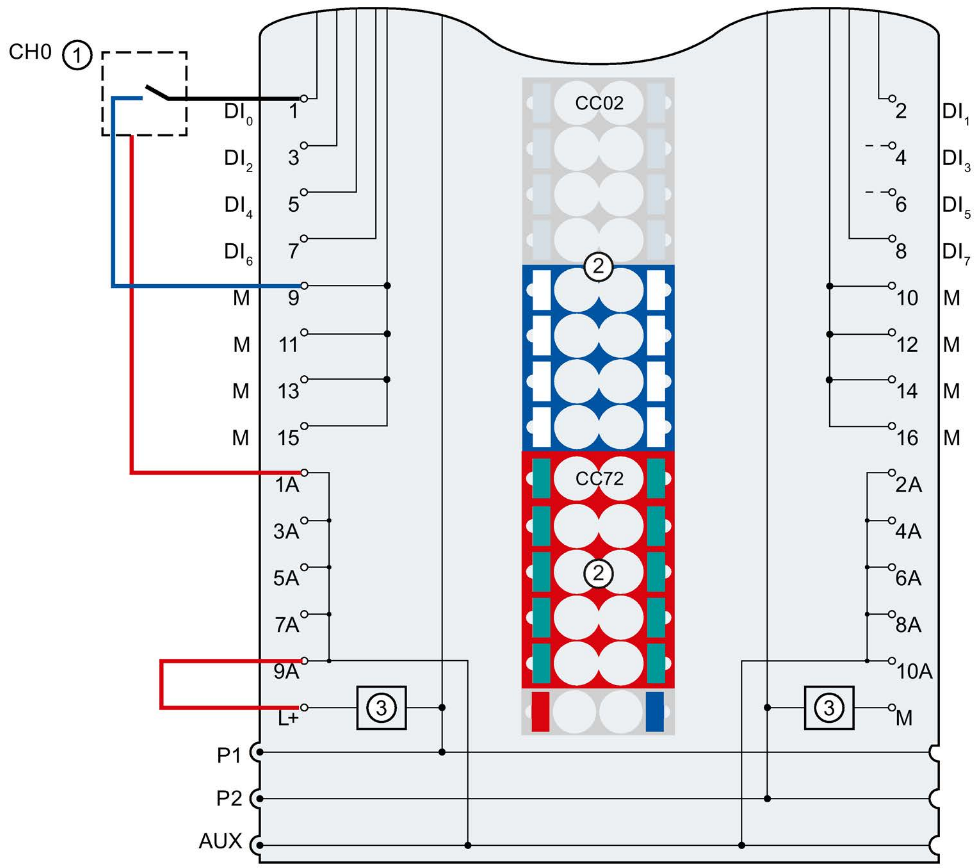


①	1-wire connection	DIn	Input signal, channel n
②	2-wire connection	24 V DC	Encoder supply, channel n
③	Backplane bus interface	L+	24 V DC (feed for light-colored BaseUnit only)
④	Input electronics	M	Ground
⑤	Color identification label CCxx (optional)	DIAG	Error or Diagnostics LED (green, red)
⑥	Filter connection supply voltage (only when light-colored BaseUnit is present)	.0 to .7	Channel status LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of encoders

Connection: 3-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input DI 8x24VDC SRC BA on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color identification labels CCxx (optional)
③	Filter connection supply voltage (only when light-colored BaseUnit is present)
DIn	Input signal, channel n
24 V DC	Encoder supply, channel n
L+	24 V DC (feed for light-colored BaseUnit only)
M	Ground
1 A to 10 A	AUX terminals
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Wiring and block diagram for 3-wire connection of encoders

4 Parameters/address space

4.1 Parameters

DI 8×24VDC SRC BA parameters

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records (see chapter Parameter assignment and structure of the parameter data record (Page 28)).

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Value range	Default	Reconfig-uration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	Yes	Channel	Module
Potential group	• Use potential group of the left module (mod-ule plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored Ba-seUnit)	Use potential group of the left module	No	Module	Module

[1] Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP. The parame-ter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maxi-mum of 244 bytes for each ET 200SP station. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 16 bytes.

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Input delay

This parameter can be used to suppress signal interference. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DI 8x24VDC SRC BA

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	**Short designation/module name in the GSD file**	**Configuration software, e.g. with STEP 7 (TIA Portal)**		
		Integrated in hardware catalog STEP 7	**GSD file PROFINET IO**	**GSD file PROFIBUS DP**
1 x 8-channel without value status	DI 8x24VDC SRC BA V0.0	V14, SP1 or higher with HSP 0222	X	X

Address space of the digital input module DI 8x24VDC SRC BA

The figure below shows the assignment of the address space for DI 8x24VDC SRC BA.

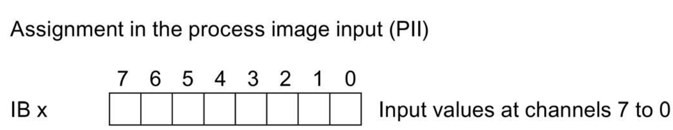


Figure 4-1 Address space of the digital input module DI 8x24VDC SRC BA

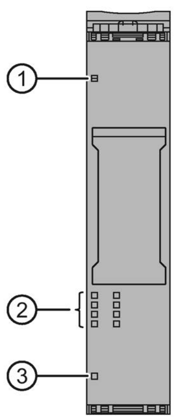
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC SRC BA.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The tables below explain the meaning of the Status and error displays. Remedial measures for diagnostics alarms can be found in section Diagnostics alarms (Page 23).

LED DIAG

Table 5- 1 Error display of the LED DIAG

LED DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned
Flashes	Module diagnostics is available

LED channel status

Table 5- 2 Status display of the LED channel status

LED channel status	Meaning
Off	Process signal = 0
On	Process signal = 1

LED PWR

Table 5- 3 Status display of the LED PWR

LED PWR	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The DI 8×24VDC SRC BA digital input module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following event:

- Parameter assignment error
- No supply voltage

Detailed information on the event is available in the STEP 7 online help.

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Remedy
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DI 8×24VDC SRC BA

Article number	6ES7131-6BF61-0AA0
General information	
Product type designation	DI 8x24 VDC SRC BA
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC02
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3 / -
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	No
• Oversampling	No
• MSI	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Encoder supply	
Short-circuit protection	No
Power loss	
Power loss, typ.	1.5 W

Article number	6ES7131-6BF61-0AA0
Address area	
Address space per module	
• Inputs	1 byte
Hardware configuration	
Automatic encoding	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals
• 4-wire connection	BU type A0 + Potential isolation module
Digital inputs	
Number of digital inputs	8
Digital inputs, parameterizable	Yes
Source/sink input	m-reading
Input characteristic curve in accordance with IEC 61131, type 1	Yes
Input voltage	
• Type of input voltage	DC
• Rated value (DC)	24 V
• for signal "0"	30 V to -5 V (reference potential is L+)
• for signal "1"	-11 V to -30 V (reference potential is L+)
Input current	
• for signal "1", typ.	6 mA
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms (in each case + delay of 30 to 500 μs, depending on line length)
– at "0" to "1", min.	0.05 ms
– at "0" to "1", max.	20 ms
– at "1" to "0", min.	0.05 ms
– at "1" to "0", max.	20 ms
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	200 m

Article number	6ES7131-6BF61-0AA0
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	1.5 mA
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Monitoring of encoder power supply	No
• Wire-break	No
• Short-circuit	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m

Article number	6ES7131-6BF61-0AA0
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	28 g

Dimensional drawing

See the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

The module parameters can be re-assigned in RUN (for example, the input delay of selected channels can be edited in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics for the entire module.

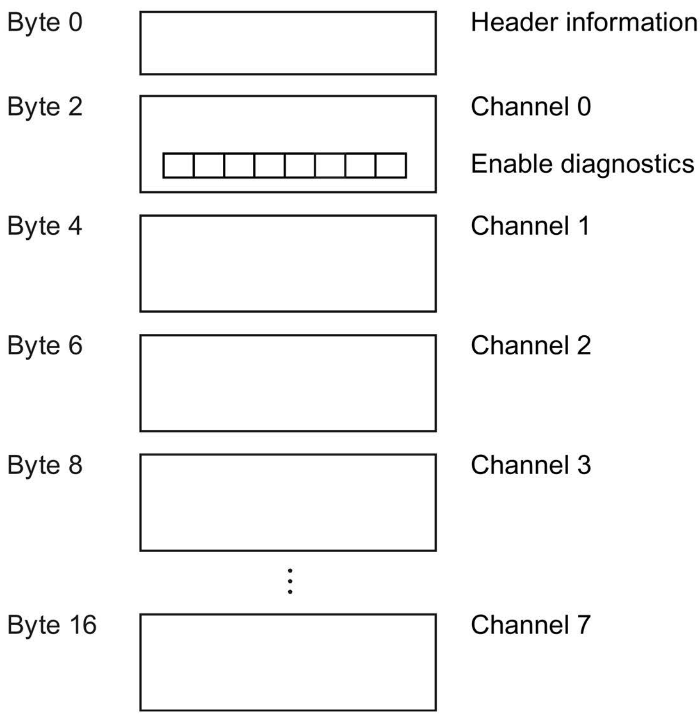


Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

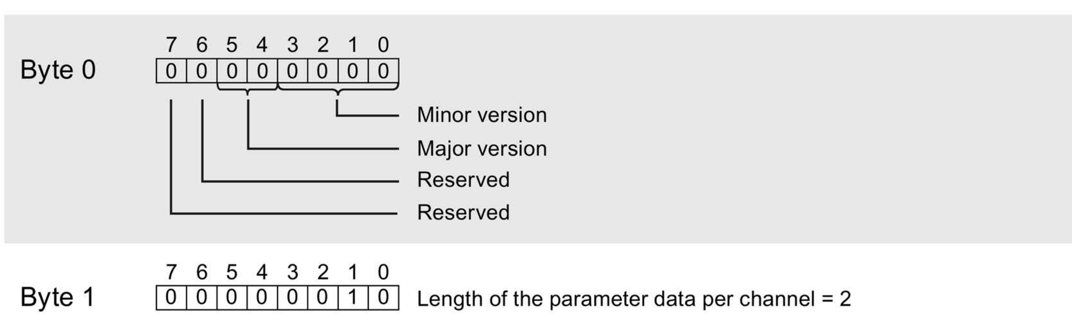

Figure A-2 Header information

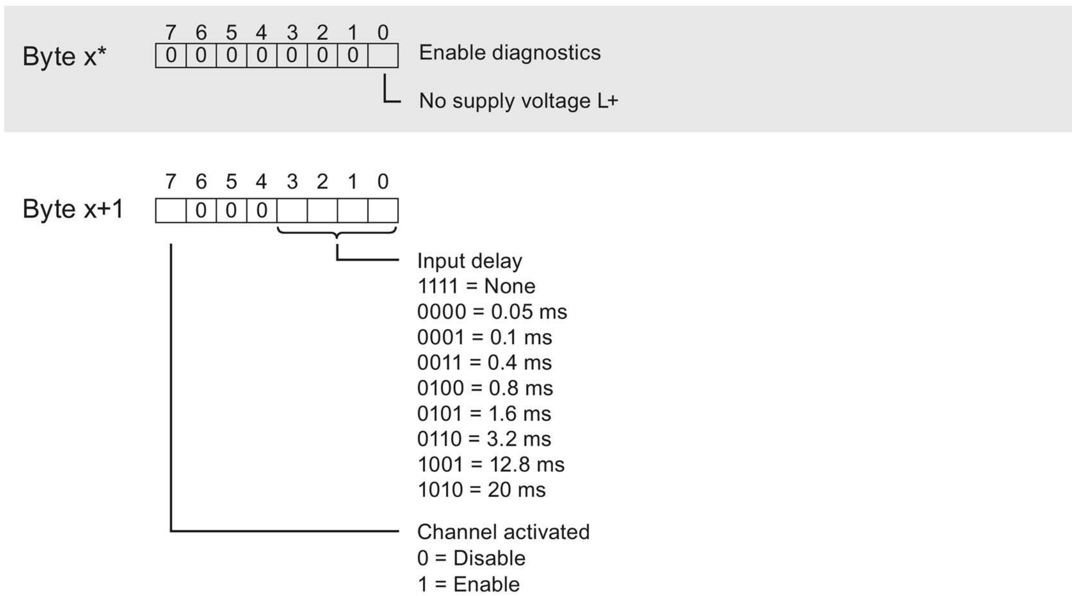
Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

Enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 2); channel number = 0 to 7

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	07	Invalid coding for input filter time.	Check the parameters of the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7131-6BF00-0BA0 to 6ES7131-6BF01-0BA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

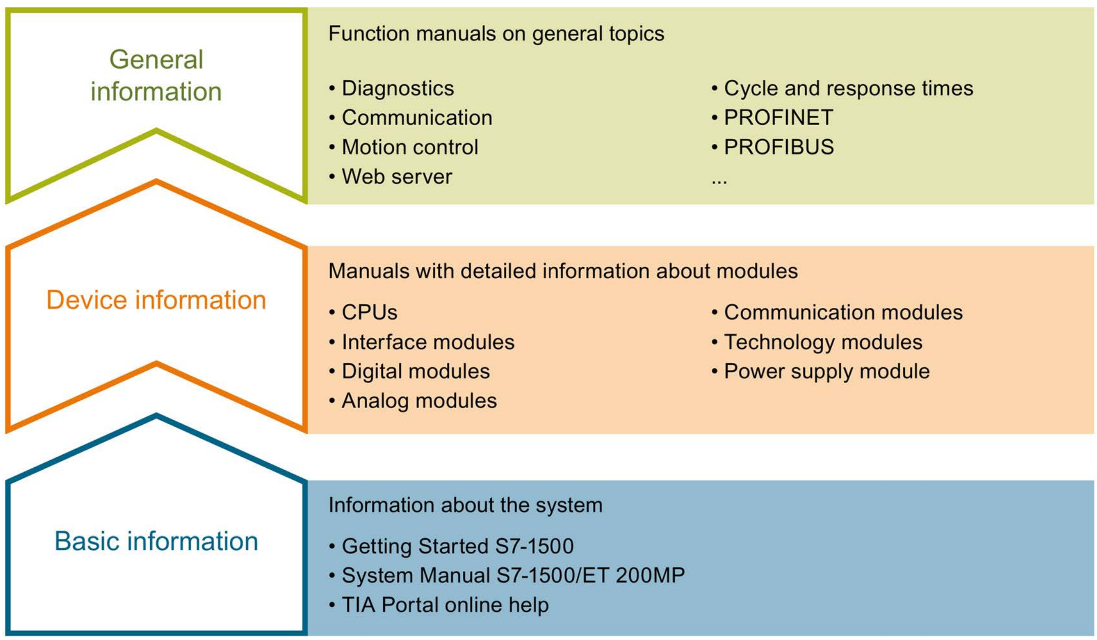
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC S7-1500 and ET 200MP systems, e.g. diagnostics, communication, motion control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/68052815).

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86140384).

SIMATIC S7-1500 comparison list for programming languages

The comparison list contains an overview of which instructions and functions you can use for which controller families.

You can find the comparison list on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86630375).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal.

General function overview:

- Network browsing and creation of a table showing the accessible devices in the network.
- Flashing of device LEDs or HMI display to locate a device
- Downloading of addresses (IP, subnet, gateway) to a device
- Downloading the PROFINET name (station name) to a device
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your PG/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- Performing a CPU memory reset
- Resetting devices to factory settings
- Downloading a firmware update to a device

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the PROFINET network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET network and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑫ Article number

Figure 2-1 View of the module DI 8×24VDC ST

Properties

The module has the following technical properties:

- Digital input module with 8 inputs
- Supply voltage L+
- Sink input (PNP)
- Configurable input delay 0.05 ms to 20 ms (per channel)
- Configurable diagnostics (per module)
- Suitable for connection of switches and 2-wire sensors in accordance with IEC 61131, type 1 and 3

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
PROFIenergy	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You will find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring up 3

3.1 Wiring and block diagram

This section includes the block diagram of the DI 8x24VDC ST module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection.

Information about wiring of the BaseUnit is available in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

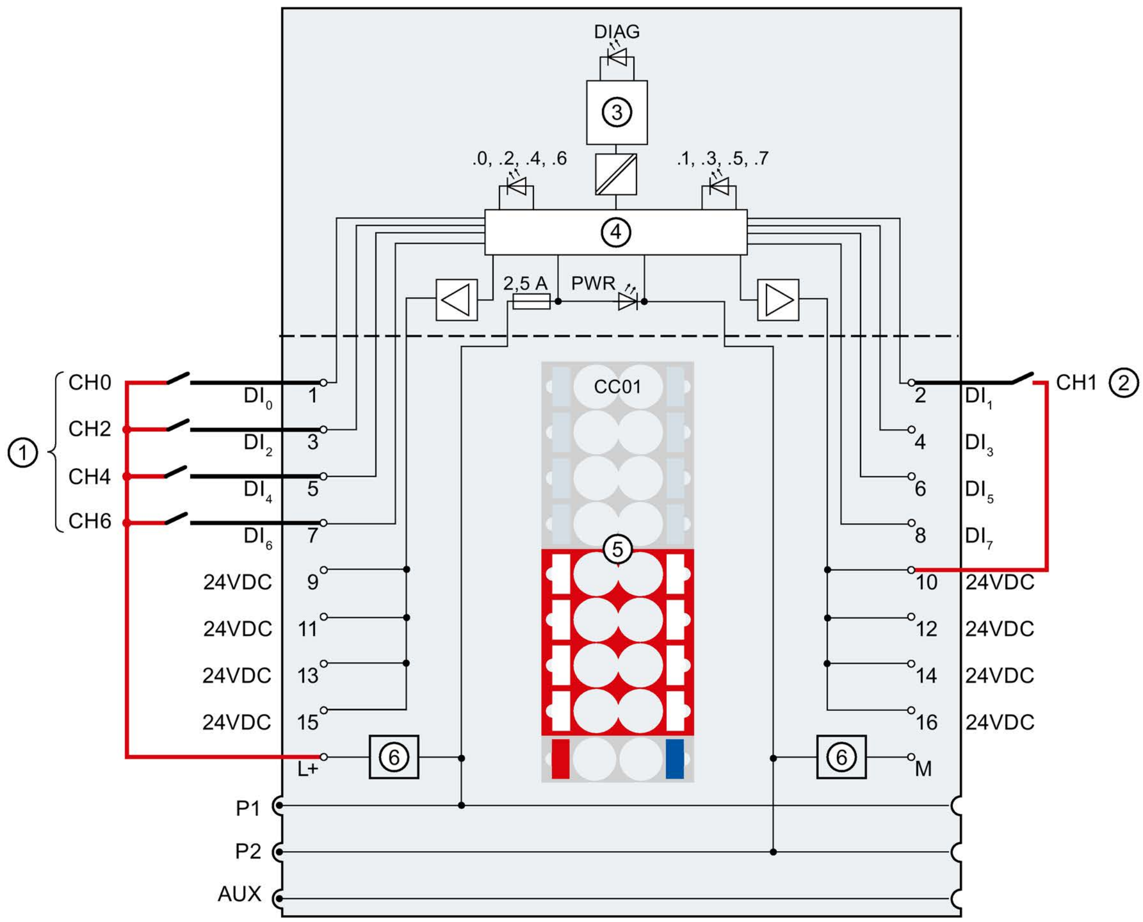
You may use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Connection: 1-wire and 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input module DI 8x24VDC ST on the BaseUnit BU type A0 without AUX terminals (1-wire and 2-wire connection).

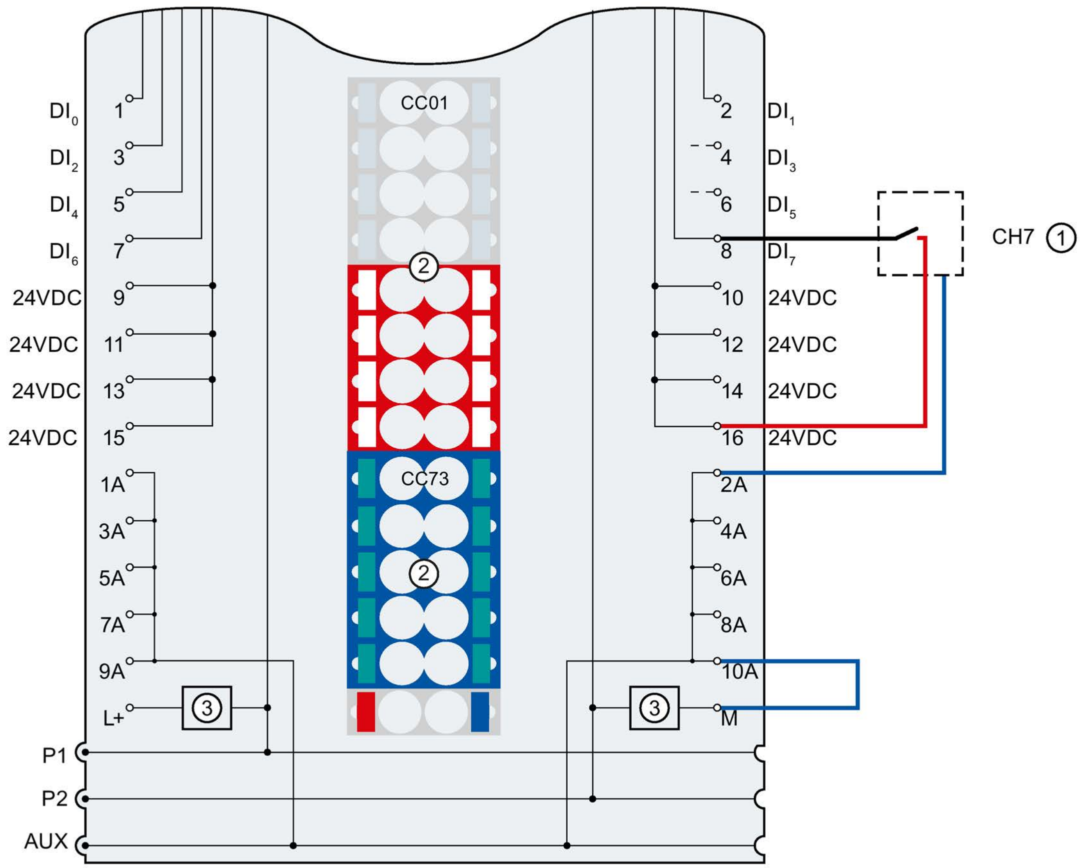


①	1-wire connection	DIn	Input signal, channel n
②	2-wire connection	24 V DC	Encoder supply, channel n
③	Backplane bus interface	L+	24 V DC (feed for light-colored BaseUnit only)
④	Input electronics	M	Ground
⑤	Color identification label CCxx (optional)	DIAG	Error or Diagnostics LED (green, red)
⑥	Filter connection supply voltage (only when light-colored BaseUnit is present)	.0 to .7	Channel status LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of encoders

Connection: 3-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input DI 8x24VDC ST on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color identification labels CCxx (optional)
③	Filter connection supply voltage (only when light-colored BaseUnit is present)
DI_n	Input signal, channel n
L+	24 V DC (feed for light-colored BaseUnit only)
M	Ground
1 A to 10 A	AUX terminals
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Wiring and block diagram for 3-wire connection of encoders

Parameters/address space 4

4.1 Parameters

Parameters for DI 8x24VDC ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of the parameter data record (Page 28).

The following parameter settings are possible:

Table 4- 1 Settable parameters and their defaults (GSD file)

Parameters	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [2]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	yes	Module	Module
Diagnostics wire break[1]	• Disable • Enable	Disable	yes	Module	Module
Channel enabled	• Disable • Enable	Enable	yes	Channel	Channel

Parameters	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [2]
Input delay	• none • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	no	Module	Module

[1] If you use a simple switch, you need to connect a resistor in parallel so that the wire break diagnostics is enabled in the open state (sensor resistance for the wire break diagnostics: 25 kΩ to 45 kΩ).

[2] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 16 bytes.

4.2 Explanation of the parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

Diagnostics wire break

Enabling of the diagnostics if the module has no current flow or the current is too weak to be measured at the relevant input.

Channel activated

Determines whether a channel is enabled or disabled.

Input delay

This parameter can be used to avoid signal faults. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DI 8x24VDC ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DI 8x24VDC ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 8-channel with value status	DI 8x24VDC ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 7 in this byte are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the DI 8×24VDC ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

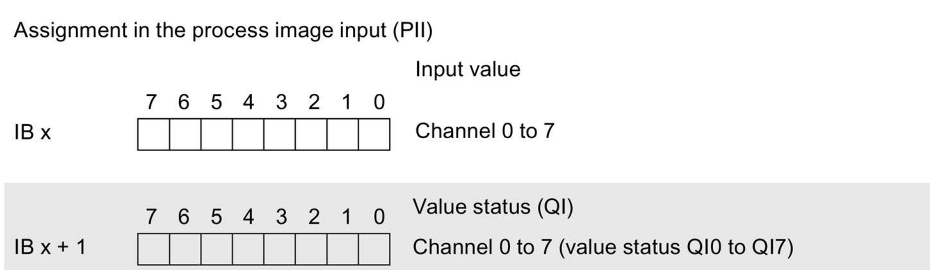


Figure 4-1 Address space of the DI 8×24VDC ST with value status

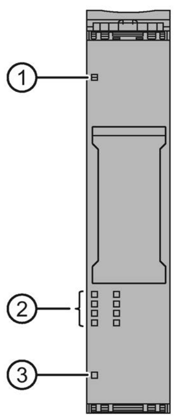
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 23).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
on	Module parameters assigned
Flashes	Module diagnostics is available

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
off	Process signal = 0
on	Process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
off	No supply voltage L+
on	Supply voltage L+ present

5.2 Interrupts

The DI 8×24VDC ST digital input module supports diagnostic interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt for the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- No supply voltage

5.3 Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and how to deal with them

Diagnostics alarm	Error code	Meaning	Remedy
Short-circuit	1_H	Short-circuit to ground at encoder supply	Correct the process wiring
Wire break	6_H	Impedance of encoder circuit too high.	Use a different encoder type or modify the wiring, for example, using cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor of 25 kilohms to 45 kilohms to the encoder contacts
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

Technical specifications 6

6.1 Technical specifications

Technical specifications of the DI 8×24VDC ST

Article number	6ES7131-6BF01-0BA0
General information	
Product type designation	DI 8x24 VDC ST
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3 or higher
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	No
• Oversampling	No
• MSI	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7131-6BF01-0BA0
Input current	
Current consumption, max.	50 mA; All channels are supplied from the encoder supply
Encoder supply	
Number of outputs	8
Output voltage encoder supply, min.	19.2 V
Short-circuit protection	Yes; per module
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes
Power loss	
Power loss, typ.	1 W; 24 V, 8 inputs supplied via encoder supply
Address area	
Address space per module	
• Inputs	1 byte; + 1 byte for QI information
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Submodules	
• Number of configurable submodules, max.	4
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals
• 4-wire connection	BU type A0 + Potential isolation module
Digital inputs	
Number of digital inputs	8
Digital inputs, parameterizable	Yes
Source/sink input	P-reading
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Input voltage	
• Type of input voltage	DC
• Rated value (DC)	24 V
• for signal "0"	-30 to +5V
• for signal "1"	+11 to +30V
Input current	
• for signal "1", typ.	2.5 mA

Article number	6ES7131-6BF01-0BA0
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms (in each case + delay of 30 to 500 µs, depending on line length)
– at "0" to "1", min.	0.05 ms
– at "0" to "1", max.	20 ms
– at "1" to "0", min.	0.05 ms
– at "1" to "0", max.	20 ms
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	1.5 mA
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Monitoring of encoder power supply	Yes; Module-by-module, optional protective circuit for preventing wire-break diagnostics in the case of simple encoder contacts: 25 kOhm to 45 kOhm
• Wire-break	Yes; Module-wise
• Short-circuit	Yes; Module-wise
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED

Article number	6ES7131-6BF01-0BA0
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	28 g

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

The module parameters can be re-assigned in RUN (for example, the input delay of selected channels can be edited in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

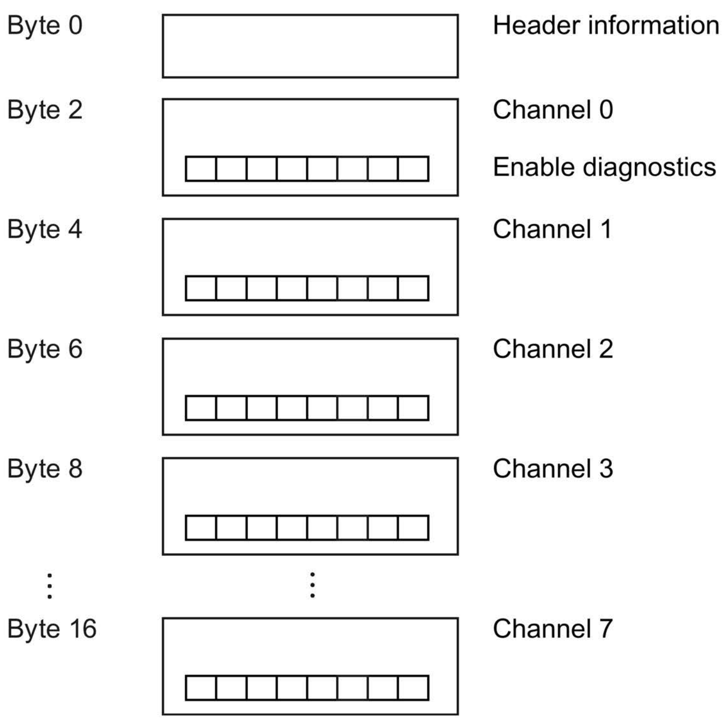


Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

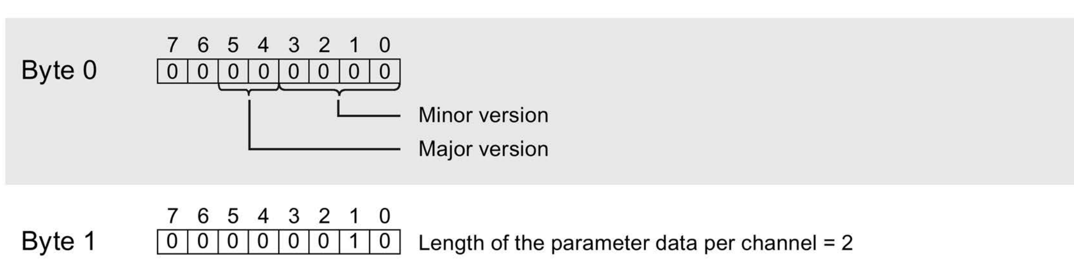

Figure A-2 Header information

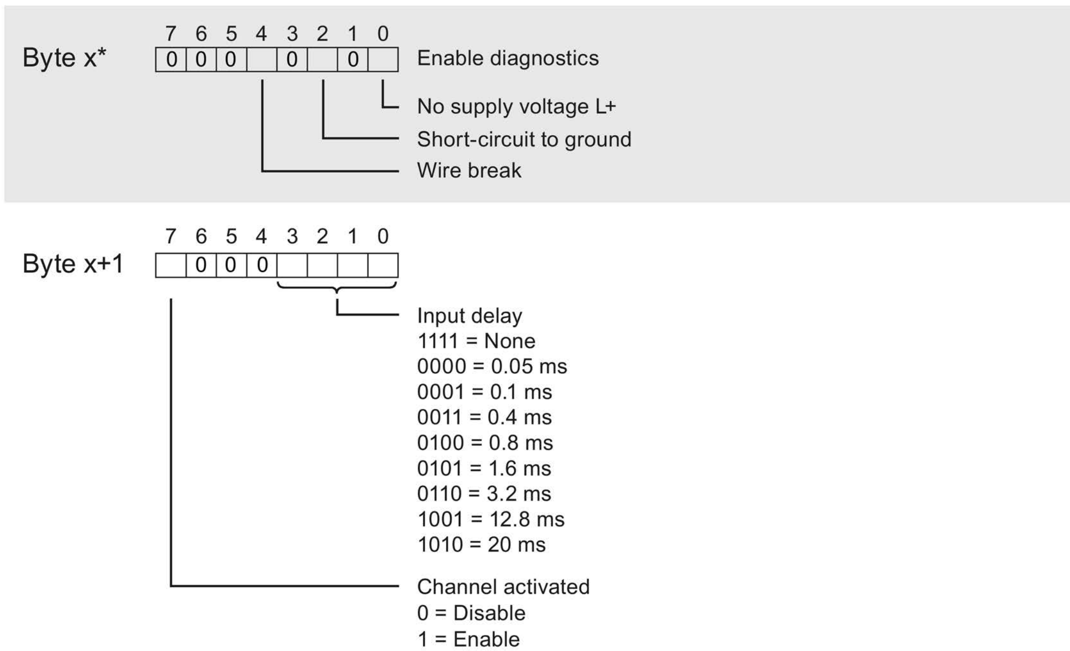
Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 2); channel number = 0 to 7

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	07	Invalid coding for input filter time.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7131-6BH00-0BA0 to 6ES7131-6BH0**1**-0BA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

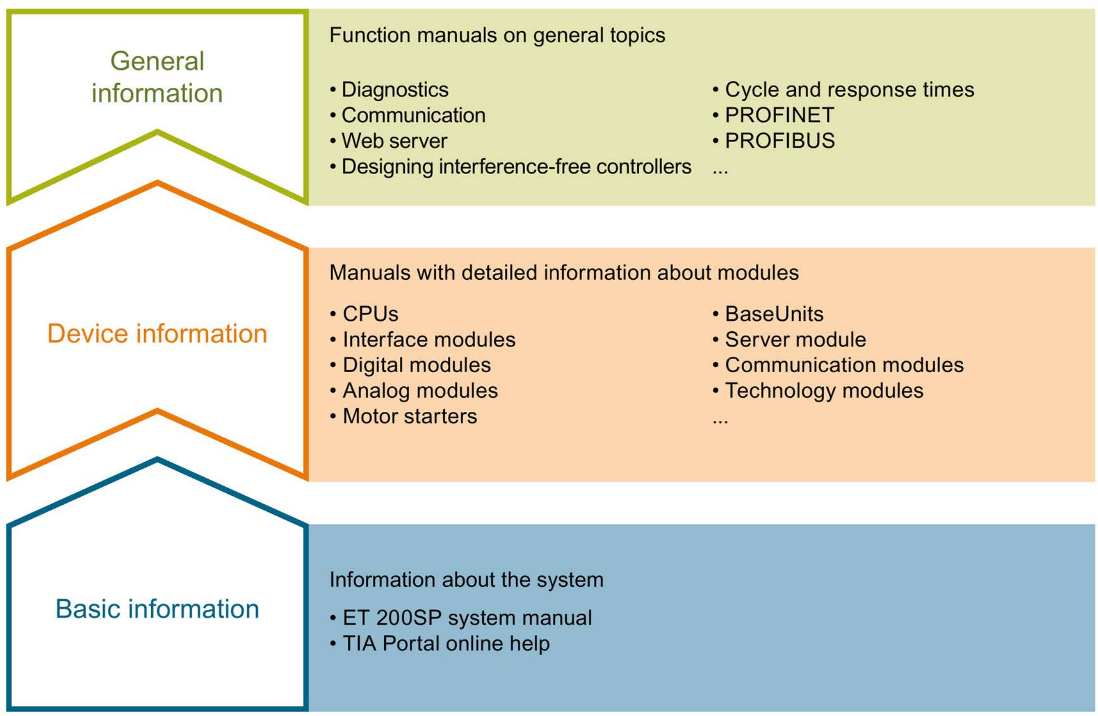
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑧ Color coding module type
⑨ Function and firmware version
⑩ Color code for selecting the color identification labels
⑪ BU type
⑫ Article number

Figure 2-1 View of the module DI 16×24VDC ST

Properties

The module has the following technical properties:

- Digital input module with 16 inputs
- Sink input, (PNP, P-reading)
- Supply voltage L+
- Configurable input delay 0.05 to 20 ms (per channel)
- Configurable diagnostics (per module)
- Suitable for connection of switches and 2-wire sensors in accordance with IEC 61131, type 3

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Connecting 3

3.1 Wiring and block diagram

This section includes the block diagram of the DI 16x24VDC ST module with the terminal assignments for a 1-wire connection.

Information on wiring the BaseUnit can be found in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

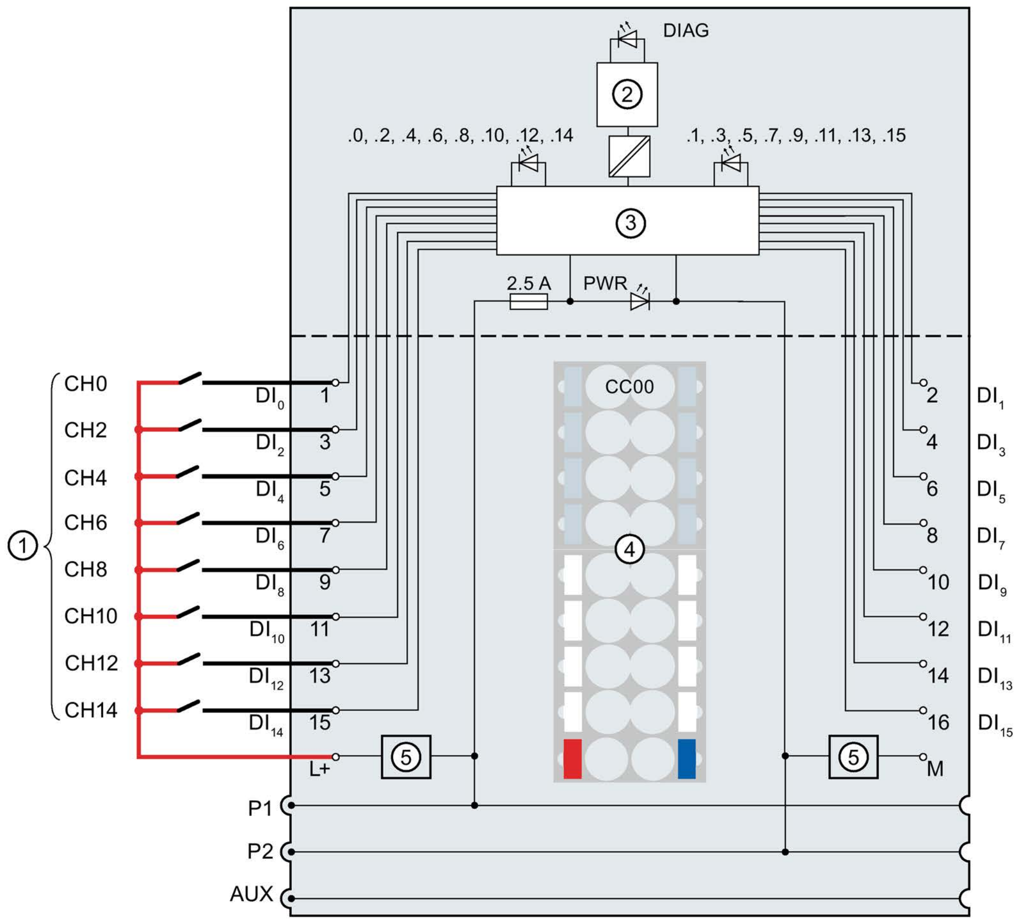
The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Note

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

Wiring: 1-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input module DI 16x24VDC ST on the BaseUnit BU type A0 without AUX terminals (1-wire connection).



①	1-wire connection	DIn	Input signal, channel n
②	Backplane bus interface	L+	24 V DC (infeed only with light-colored BaseUnit)
③	Input electronics	M	Ground
④	Color-coded label with color code CC00 (optional)	DIAG	Error or diagnostics LED (green, red)
⑤	Filter connection supply voltage (only when light-colored BaseUnit is present)	.0 to .15	Channel status LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire connection of encoders

Parameters/address space 4

4.1 Parameters

Parameters for DI 16x24VDC ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of parameter data record (Page 28).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassignment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [2]
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics wire break[1]	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameters	Range of values	Default	Parameter reassignment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [2]
Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] If you use a floating switch, you need to connect a resistor in parallel so that the wire break diagnostics is enabled in the open state (sensor resistance for the wire break diagnostics: 25 kΩ to 45 kΩ).

[2] Due to the limited number of parameters with a maximum of 244 bytes per ET 200SP station for a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 32 bytes.

4.2 Declaration of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Wire break

Enabling diagnostics if the line to the encoder is interrupted.

Channel activated

Determines whether a channel is activated or deactivated.

Input delay

This parameter can be used to suppress signal interference. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

ET 200SP manual (https://support.industry.siemens.com/cs/ww/en/view/91696622)

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image input.

Configuration options of DI 16x24VDC ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 16-channel without value status	DI 16x24VDC ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 16-channel with value status	DI 16x24VDC ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional two bytes are allocated in the input address space if you enable the value status for the digital module. Bits 0 to 15 in these bytes are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the DI 16x24VDC ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

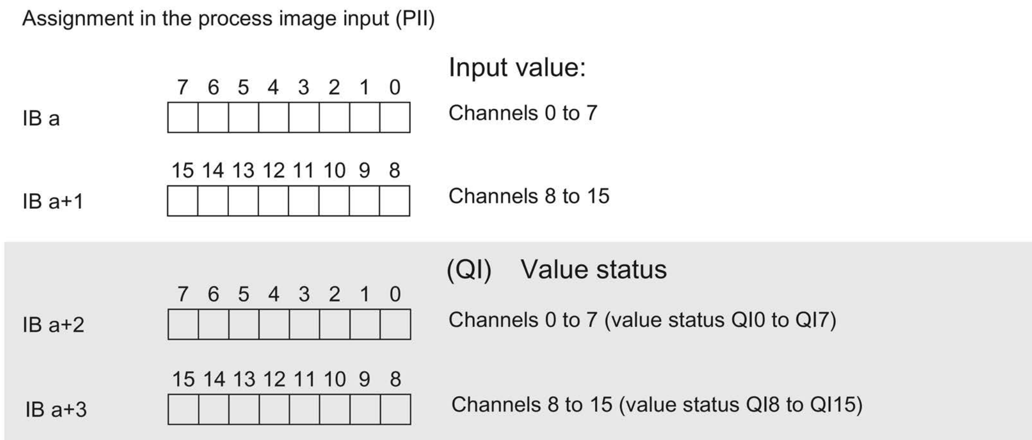


Figure 4-1 Address space of the DI 16×24VDC ST with value status

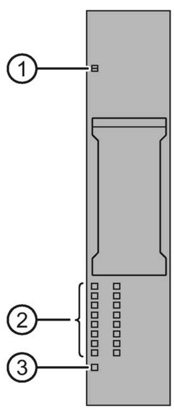
Interrupts/diagnostic alarms 5

5.1 Status and error display

LED display

The figure below shows the LED displays (status and error displays) of the DI 16x24VDC ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostic messages (Page 23).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned
Flashes	Module diagnostics is available

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Process signal = 0
On	Process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The DI 16×24VDC ST digital input module supports diagnostic interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Wire break
- Parameter assignment error
- Supply voltage missing

5.3 Diagnostic messages

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Wire break	6_H	Impedance of encoder circuit too high.	Use a different encoder type or modify the wiring, for example, use cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor of between 25 and 45 kOhms to the encoder contacts
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

Technical specifications 6

6.1 Technical specifications

Technical specifications of the DI 16×24VDC ST

Article number	6ES7131-6BH01-0BA0
General information	
Product type designation	DI 16x24 VDC ST
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	No
• Oversampling	No
• MSI	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7131-6BH01-0BA0
Input current	
Current consumption, max.	90 mA
24 V encoder supply	
• 24 V	No
Power loss	
Power loss, typ.	1.7 W
Address area	
Address space per module	
• Inputs	2 byte; + 2 bytes for QI information
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Submodules	
• Number of configurable submodules, max.	4
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0 + Potential isolation module
• 3-wire connection	BU type A0 + Potential isolation module
• 4-wire connection	BU type A0 + Potential isolation module
Digital inputs	
Number of digital inputs	16
Digital inputs, parameterizable	Yes
Source/sink input	P-reading
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Input voltage	
• Type of input voltage	DC
• Rated value (DC)	24 V
• for signal "0"	-30 to +5V
• for signal "1"	+11 to +30V
Input current	
• for signal "1", typ.	2.5 mA

Article number	6ES7131-6BH01-0BA0
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms (in each case + delay of 30 to 500 µs, depending on line length)
– at "0" to "1", min.	0.05 ms
– at "0" to "1", max.	20 ms
– at "1" to "0", min.	0.05 ms
– at "1" to "0", max.	20 ms
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	1.5 mA
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Monitoring of encoder power supply	No
• Wire-break	Yes; Module-by-module, optional protective circuit for preventing wire-break diagnostics in the case of simple encoder contacts: 25 kOhm to 45 kOhm
• Short-circuit	No
• Group error	Yes

Article number	6ES7131-6BH01-0BA0
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	28 g

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

The module parameters can be re-assigned in RUN (for example, the input delay of selected channels can be edited in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

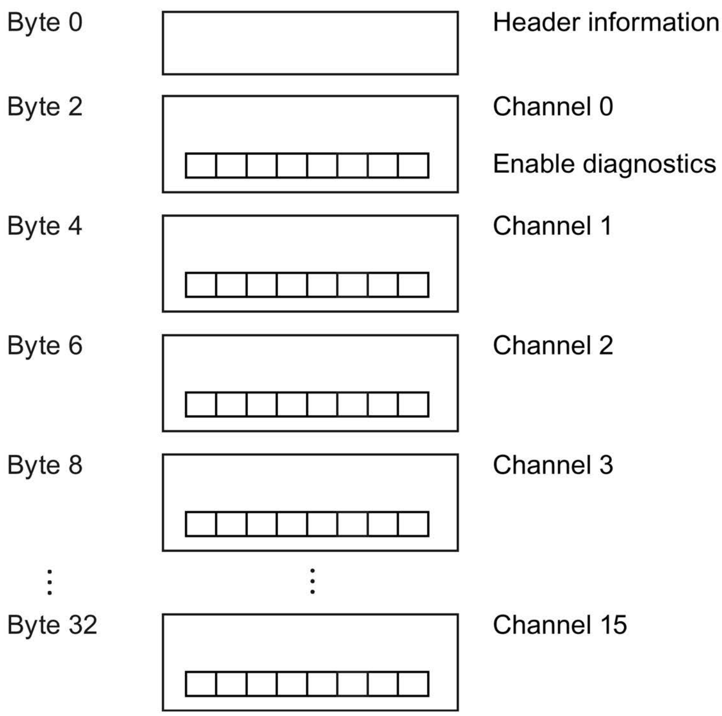


Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

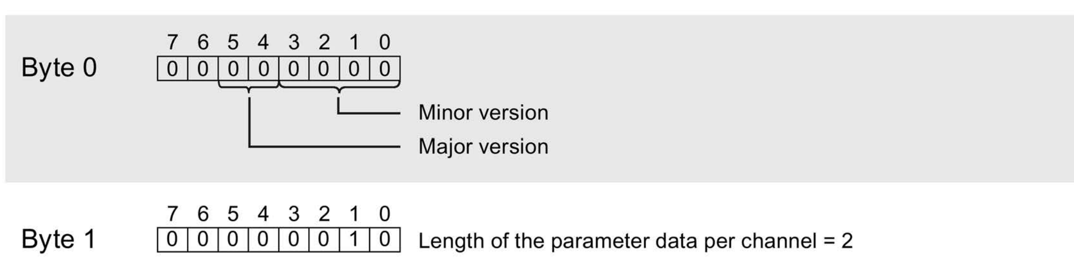

Figure A-2 Header information

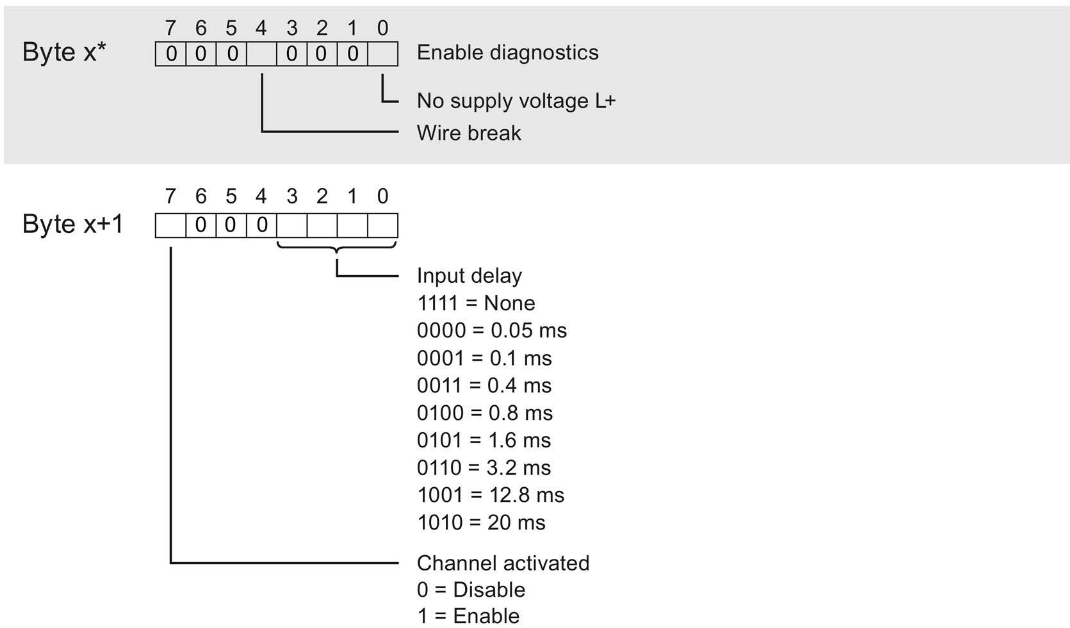
Parameters

The figure below shows the structure of the parameters for channels 0 to 15.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 2); channel number = 0 to 15

Figure A-3 Structure byte x to x+1 for the channels 0 to 15

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	07	Invalid coding for input filter time.	Check the parameters of the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Guide to documentation

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the ET 200SP distributed I/O system consists of a system manual, function manuals and product manuals.

The STEP 7 information system (online help) also supports you during the configuration and programming of your automation system.

Overview of documentation for digital input module DI 8×NAMUR HF

The following table shows additional documentation that you need for using the DI 8×NAMUR HF digital input module.

Product overview

2

2.1 Properties

Order number

6ES7131-6TF00-0CA0

View of the module

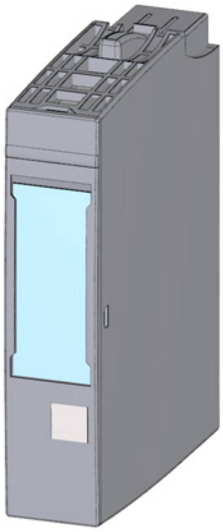

Figure 2-1 View of the DI 8×NAMUR HF module

Properties

The module has the following technical properties:

- 8 digital inputs each with a value status (quality information)
- 8.2 VDC sensor supply for individual connection and disconnection (PROFIenergy)
- Selectable diagnostics (per channel)
- Suitable for connecting NAMUR sensors and connected and unconnected mechanical contacts

The module supports the following technology functions:

- Pulse stretching
- Chatter monitoring
- Diagnostics for changeover contact sensor type

The module supports the following functions:

- Firmware update
- Identification data I&M0 to I&M3
- Reconfiguration in RUN

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories can be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connection

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

The figures below show the connections for input signal DI_0 for all sensor types.		
NAMUR sensors / IEC 60947-5-6 sensors  	NAMUR changeover contacts / IEC 60947-5-6 changeover contacts  	Single contact connected with 10 kΩ (mechanical normally open contact) Changeover contact connected with 10 kΩ (mechanical changeover contact)  	Single contact, unconnected (mechanical normally open contact with single contact)  	Changeover contact, unconnected (mechanical changeover contact) 
1 BaseUnit types that can be used are identified by the last two digits of the order number. See also "ET 200SP distributed I/O system" system manual.

Note

The first BaseUnit of a station must be a light-colored BaseUnit. Keep this in mind also during the configuration.

Firmware update

When updating the firmware, the L+ supply voltage must be applied to the module at the start and during the firmware update.

3.2 Block diagram

Block diagram

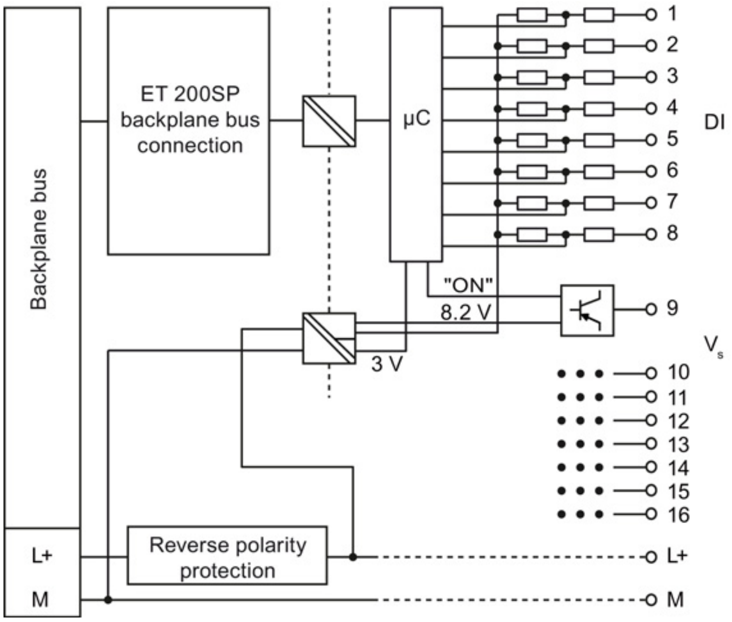

Figure 3-1 Block diagram DI 8×NAMUR HF

Parameters/address space 4

4.1 Parameters

DI 8xNAMUR HF parameters

The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using data records (refer to the section Parameter assignment and structure of parameter data record (Page 33)).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Value range	Default	Changing parameter settings in RUN	Effective range with configuration software, e.g. STEP 7 (TIA-Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: Missing supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Changeover error	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Chatter error	• Disable • Enable	Disable	Yes	Channel	-
Chatter monitoring: Monitoring window	• 0.5 s • 1 s to 100 s (can be set in 1 s-increments)	0.5 s	Yes	Channel	-
Chatter monitoring: Number of signal changes	• Deactivated • 2 to 32	Deactivated	Yes	Channel	-

Parameters	Value range	Default	Changing parameter settings in RUN	Effective range with configuration software, e.g. STEP 7 (TIA-Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Hardware interrupts	• Deactivated • Rising edge • Falling edge • Falling and rising edge	Deactivated	Yes	Channel	-
Sensor type	• Channel deactivated • NAMUR sensor • Single contact, unconnected • Single contact, connected with 10 kΩ • NAMUR changeover contact • Changeover contact, unconnected • Changeover contact, connected with 10 kΩ	NAMUR sensor	Yes	Channel	Channel
Pulse stretching	• None • 0.5 s • 1 s • 2 s	None	Yes	Channel	-
Inverted	• Disable • Enable	Disable	Yes	Channel	Channel
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module	Module

Changing parameter settings and effects on the technology functions

Reconfiguring a technology function resets its responses. Reconfiguring one technology function has no effect on other technology functions. Exception: Signal inversion and chatter monitoring, because an additional edge change is generated when signal inversion is disabled/enabled.

Technology functions

All technology functions, such as

- Pulse stretching
- Chatter monitoring
- Changeover errors
- Hardware interrupts

are executed only when there is an error-free signal (QI = 1). In other words, there is no diagnostics information on the channel (see also section Address space (Page 18)).

4.2 Explanation of parameters

Diagnostics: Missing supply voltage L+

The diagnostics alarm is enabled for missing or insufficient supply voltage L+.

Tip: To avoid a diagnostics overload, you should only enable "Diagnostics: Missing supply voltage" for an active channel.

Diagnostics: Short-circuit to ground

The diagnostics alarm is enabled if there is a short-circuit of the sensor supply to ground.

"Short-circuit to ground" diagnostics is available with the following sensor setting:

- NAMUR sensor
- NAMUR changeover contact

Diagnostics: Wire break

The diagnostics alarm is enabled if the line to the sensor is interrupted.

"Wire break" diagnostics is available with the following sensor setting:

- NAMUR sensor
- Single contact with 10 kΩ
- NAMUR changeover contact
- Changeover contact with 10 kΩ

Diagnostics: Changeover error

The diagnostics alarm is enabled when a changeover error occurs.

"Changeover error" diagnostics is available with the following sensor setting:

- NAMUR changeover contact
- Changeover contact, unconnected
- Changeover contact with 10 kΩ

Diagnostics: Chatter error

The diagnostics alarm is enabled when a chatter error occurs.

Chatter monitoring is a process control function for digital input signals. It detects and reports signal changes that are unexpected in process engineering, for example when an input signal fluctuates too often between "0" and "1". If signal characteristics like these occur, it is a sign that the sensors are faulty or that there are instabilities from a process engineering viewpoint.

Chatter monitoring: Monitoring window

Chatter monitoring: Setting of the monitoring window

Each input channel has a configurable monitoring window. The monitoring window is started the first time the input signal changes. If the input signal changes within the monitoring window more often than the configured number of signal changes, this is recognized as a chatter error. If no chatter error is detected within the monitoring window, the window is restarted at the next signal change.

Chatter monitoring: Number of signal changes

Chatter monitoring: Setting of the signal change

Settings for the tolerated number of signal changes during chatter monitoring within the monitoring window.

Number of signal changes = 0 deactivates the chatter monitoring function.

Hardware interrupts

Specifies whether the rising or falling edge or both edges trigger a hardware interrupt.

Sensor type

Specifies which sensor type is connected (see Table 3-1 Pin assignment for DI 8×NAMUR HF (Page 9)).

For the following sensor types

- NAMUR changeover contact
- Changeover contact, unconnected
- Changeover contact with 10 kΩ

the following applies: The normally open contact channel must be set according to the sensor type. The normally closed contact channel must be deactivated.

If "Channel deactivated" is shown, this means that the channel is not activated.

Pulse stretching

Sets whether and for how long pulse stretching is to take place.

Pulse stretching is a function for changing a digital input signal. A pulse at a digital input is extended to at least the configured length. If the input pulse is already longer than the configured length, then the pulse will not be changed.

Inverted

Specifies whether or not the input signal is to be inverted.

Inversion is only possible with the following sensor types:

- NAMUR sensor
- Single contact, unconnected
- Single contact with 10 kΩ

Potential group

Specifies that a BaseUnit with an incoming supply voltage is located in this slot (see ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual).

See also

Pin assignment (Page 9)

Pulse stretching (Page 16)

Diagnostics for changeover contact sensor type (Page 25)

4.3 Pulse stretching

Description

Pulse stretching is a function for changing a digital input signal. A pulse at a digital input is extended to at least the configured length. If the input pulse is already longer than the configured length, then the pulse will not be changed.

The pulse-stretched signal is the input signal for the hardware interrupt.

Principle of pulse stretching

The following figure uses examples to show if and how input pulses are changed.

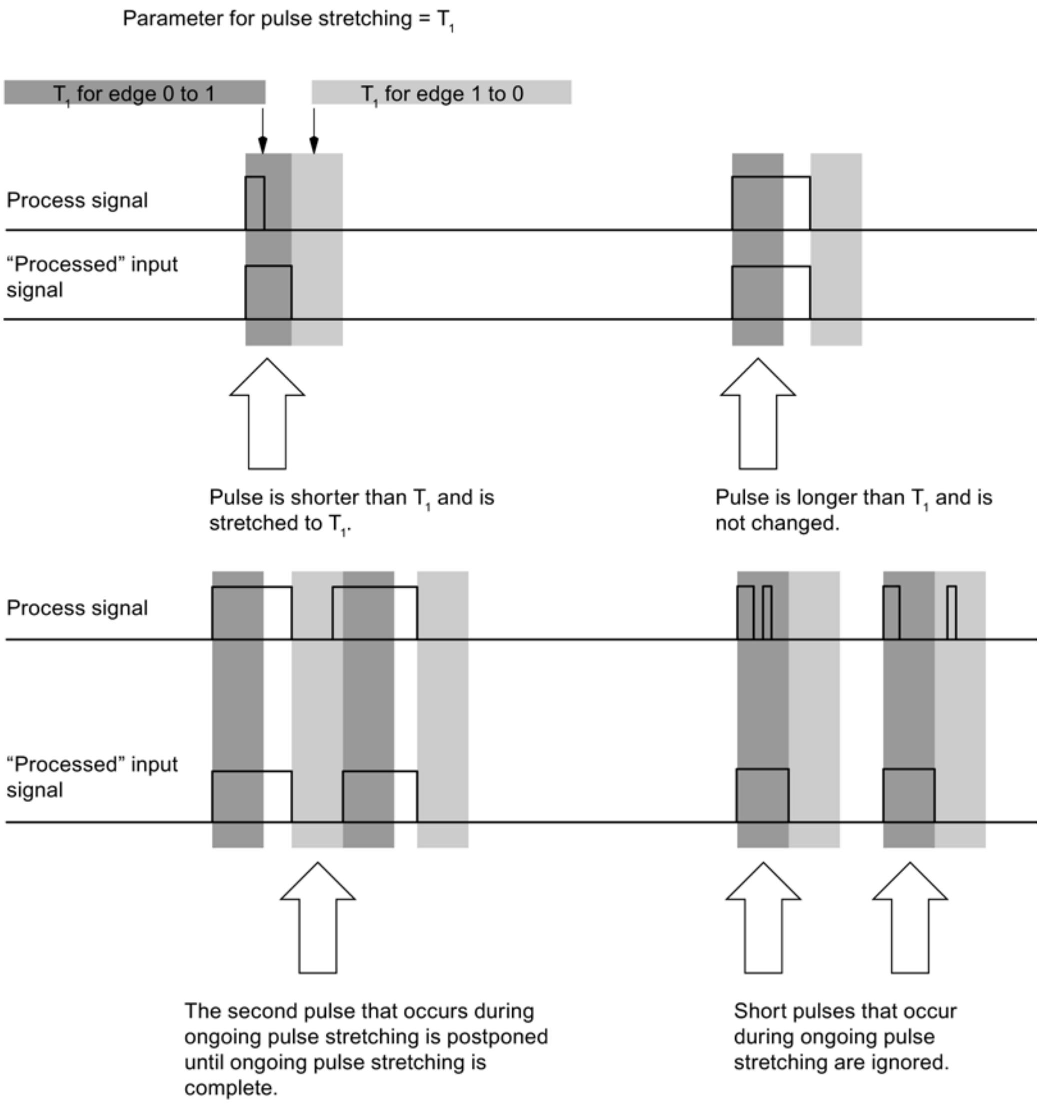

Figure 4-1 Principle of pulse stretching

Note

If you set pulse stretching for an input channel, this will also affect the chatter monitoring that is enabled for this channel. The "pulse-stretched" signal is the input signal for the chatter monitoring. You should therefore match the parameter settings for pulse stretching and chatter monitoring to one another. By selecting the appropriate values for the parameters you can adjust the functions optimally to your process.

Note

Pulse stretching in progress is reset in the event of an error in the value status (QI = 0, e.g. wire break).

4.4 Address space

Configuration options of the DI 8×NAMUR HF

Configuration with value status:

- DI 8×NAMUR HF QI

Evaluating the value status

As a result of configuration with value status (QI), an additional byte is allocated in the input address space. Each bit in this byte is assigned to a channel and returns information about the validity of the digital value.

Deactivated channels or channels that are not operating correctly return a value status of QI = 0.

With changeover contacts, the value status of a normally closed contact channel is always QI = 0. The validity of the signal must be checked on the normally open contact channel.

Address space of the digital input module DI 8×NAMUR HF

The following figure shows the assignment of address space for the DI 8×NAMUR HF with value status (Quality Information (QI)).

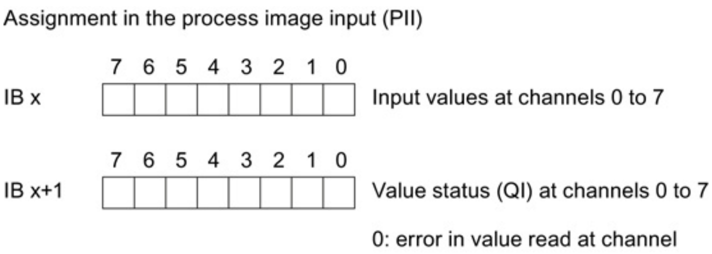

Figure 4-2 Address space of the DI 8×NAMUR HF digital input module with value status

Technology functions

All technology functions, such as

- Pulse stretching
- Chatter monitoring
- Changeover error
- Hardware interrupt

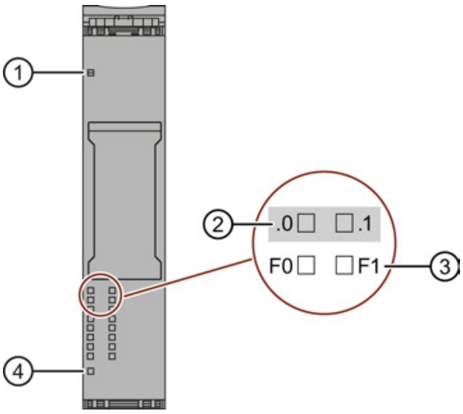
require a valid input signal that returns QI = 1 (no diagnostics detected). Otherwise, they will not run.

Interrupts/diagnostics alarms 5

5.1 Status and fault displays

LED displays

The figure below shows the LED displays (status and fault displays) of the DI 8×NAMUR HF.



① DIAG (green/red)
② Channel status (green)
③ Channel fault (red)
④ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The tables below explain the meaning of the status and fault displays. Corrective measures for diagnostics alarms can be found in chapter Diagnostics alarms (Page 24).

LED DIAG

Table 5- 1 LED DIAG fault display

LED DIAG	Meaning
Off	Supply voltage of the ET 200SP not OK
Flashing	Module not ready for operation (no parameters or invalid parameters assigned)
On	Module configured and no module diagnostics
Flashing	Module configured and module diagnostics

LED channel status/channel fault

The channel status LED shows the signal state of the user data of an input. If inversion is enabled, the channel status LED shows the inverted status of the signal applied to the terminal.

If there is a diagnostics event on the channel, the channel status LED is always off if diagnostics is enabled and therefore does not indicate the signal state of the user data of the input.

Table 5- 2 Channel status/channel fault LED status and fault display

LED		Meaning
Channel status	Channel fault	
Off	Off	Input returns "0" signal and no channel diagnostics or channel deactivated
On	Off	Input returns "1" signal and no channel diagnostics
Off	On	Channel activated and channel diagnostics
On	On	Not permitted (fault)

LED PWR

Table 5- 3 LED PWR status display

LED PWR	Meaning
□ Off	Supply voltage L+ is missing, is too low or polarity reversed
■ On	Supply voltage L+ present

5.2 Interrupts

Digital input module DI 8×NAMUR HF supports the following diagnostics and hardware interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt at the following events:

- Short-circuit to ground
- Wire break
- Supply voltage missing
- Changeover error
- Chatter error

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- Upon a rising edge (signal change from 0 to 1)
- Upon a falling edge (signal change from 1 to 0)

In the event of an interrupt, interrupt OBs run automatically in the CPU of the IO controller.

You will find detailed information on the event in the hardware interrupt organization block with the "RALRM" instruction (read additional interrupt info) and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of double word 8 in local data.

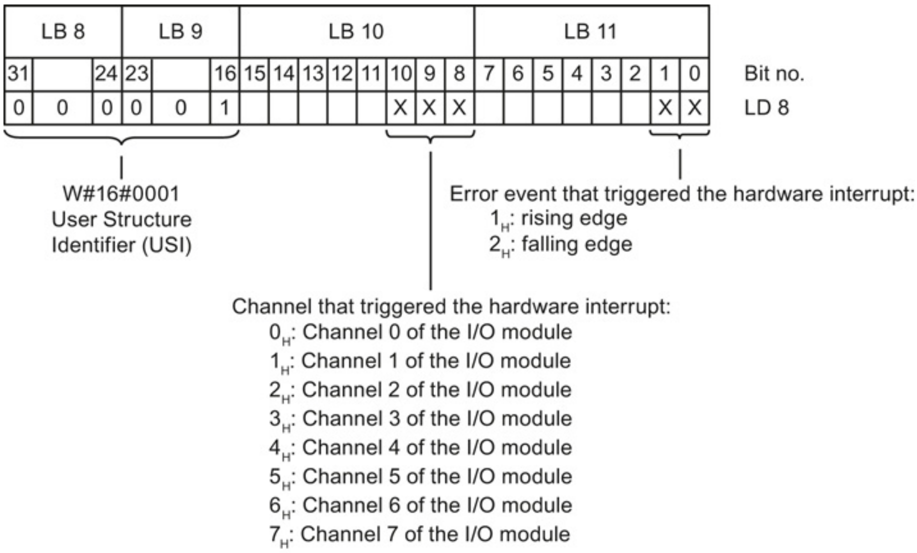


Figure 5-2 Organization block start information

Structure of the additional interrupt information

Table 5- 4 Structure of USI = W#16#0001

Data block name		Contents	Comment	Bytes
USI (User Structure Identifier)		W#16#0001	Additional interrupt information for hardware interrupts of the I/O module	2
The channel that triggered the hardware interrupt follows.				
	Channel	B#16#00 to B#16#07	Channel 0 to 7 of the I/O module	1
The event that triggered the hardware interrupt follows.				
	Event	B#16#01	Rising edge	1
		B#16#02	Falling edge	

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the LED DIAG flashes on the module. Diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the fault codes with the user program.

Table 5- 5 Diagnostics alarms, meaning and corrective measures

Diagnostics alarm	Fault code	Meaning	Remedy
Short-circuit (NAMUR changeover contact and NAMUR sensor only) Tip: Check the normally open and normally closed contact channels of the NAMUR changeover contact.	1_H	Short-circuit in the signal line to the sensor	Correct the process wiring
		Sensor defective	Replace the sensor
		Wrong sensor type configured	Correct the parameter assignment
		Load impedance too low	Use a sensor with a higher impedance
Wire break (only NAMUR changeover contact, NAMUR sensor, sensor connected with 10 kΩ and single contact connected with 10 kΩ) Tip: Check the normally open and normally closed contact channels of the NAMUR changeover contact	6_H	Signal line to a sensor interrupted	Correct the process wiring
		Sensor defective	Replace the sensor
		Wrong sensor type configured	Correct the parameter assignment
		Load impedance too high	Use a different sensor type or modify the wiring, for example, using cables with a larger cross-section
		Channel not connected (open)	Disable diagnostics, connect sensor contacts
Fault	9_H	Sensor supply defective	Replace the module
		Hardware failure	
No load voltage	11_H	Supply voltage L+ missing or too low	Check supply voltage L+ on the BaseUnit Check BaseUnit type
External fault (changeover sensors only)	$1A_H$	Changeover error: Validity check between normally closed and normally open contact channel negative	Check process wiring, change sensor
Fault 1 in actuator/sensor = signal chatters	$1D_H$	Chatter error: Signal chatters: too many signal changes within the monitoring window If no further chattering of the input signal is detected within three monitoring windows, an outgoing diagnostics alarm is triggered. The status of the value of the current signal in the process image is set to "valid".	Verify the chatter monitoring parameters
			Check process wiring, if necessary change sensor
Channel/component temporarily unavailable	$1F_H$	Firmware update is currently in progress or was canceled while running	Connect the supply voltage Restart the firmware update

5.4 Diagnostics for changeover contact sensor type

Diagnostics for changeover contact sensor type

With the changeover error diagnostics, the switchover between two input channels is checked. If there is a signal change in a changeover contact channel and there is no signal change at the other contact changeover channel after the tolerated switchover time, the diagnostics module returns a changeover error.

The tolerated switchover time between the two channels is set to the fixed value of 300 ms.

Changeover sensors are always assigned to two adjacent channels: The normally open contact channel should be set in accordance with the sensor type to channel 0, 2, 4, 6, and the respective corresponding normally closed contact channel 1, 3, 5, 7 deactivated.

Principle of changeover contact diagnostics

If the digital inputs of a channel group are configured as "changeover contacts", the module for this channel group carries out diagnostics for the changeover contact sensor type.

If the validity check is negative, the following applies:

- The module identifies the value status of the normally open contact channel as "invalid" (QI = "0"),
- The module creates a diagnostics entry for the normally open contact channel and
- A diagnostics interrupt is triggered if changeover error diagnostics is enabled.

The digital input signal and the value status are only updated for the normally open contact channel (channels 0, 2, 4, 6). The digital input signal is 0 and the value status is "invalid (QI = "0") for the normally closed contact channel (channels 1, 3, 5, 7). This channel is only used for a validity check of the sensor.

Please note the following special features for changeover contact diagnostics:

- If the normally open and normally closed contact signals are not plausible after 300 ms, a changeover error is output as diagnostics information.
- If there is already a fault (QI = 0, e.g. a wire break), the module will no longer perform diagnostics for changeover errors.
- There are different diagnostics options depending on the type of changeover contact (Dependencies when configuring with GSD files (Page 32)). Depending on the sensor type, a changeover error can have different causes.
  - In the case of connected changeover contacts, a changeover error may also be the result of a short-circuit (sensor is not defective; there is a short-circuit).
  - In the case of unconnected changeover contacts, a changeover error may also be the result of a wire break.
  - If a wire break or short-circuit can be detected with the particular sensor type but its diagnostics is not enabled, instead of the wire break or short-circuit diagnostics information, the changeover error diagnostics information is displayed if this is enabled.

Tip: Data records 0 to 7 and changeover sensor

Using the data records 1, 3, 5 and 7, you can configure a changeover sensor on an even channel (normally closed contact channel).

The corresponding normally open contact channel can be configured with the data records 0, 2, 4 and 6.

An even changeover contact channel must be followed by an odd, deactivated channel. Otherwise:

- you receive a parameter assignment error or
- the parameter assignment is rejected and the current parameter assignment retained.

Remedy: First, send data records 1, 3, 5 and 7 with deactivated, and then send data records 0, 2, 4 and 6 with changeover contact.

5.5 Chatter monitoring

Description

Chatter monitoring is a process control function for digital input signals. It detects and reports signal changes that are unexpected in process engineering, for example when an input signal fluctuates too often between "0" and "1". This period is known as the "monitoring window". If signal characteristics like these occur, it is a sign that the sensors are faulty or that there are instabilities from a process engineering viewpoint.

Activating chatter monitoring

You activate chatter monitoring by specifying a permitted number of input signal changes between "0" and "1" within the monitoring window. The number 0 deactivates the chatter monitoring function.

A chatter error detected by the chatter monitoring has a direct effect on the value status (QI).

Detecting a chatter error

Each input channel has a monitoring window that has been assigned parameters. The monitoring window is started the first time the input signal changes. If the input signal changes within the monitoring window more often than the configured number of signal changes, this is recognized as a chatter error. If no chatter error is detected within the monitoring window, the window is restarted at the next signal change.

Reporting a chatter error

If a chatter error occurs, the current signal status is entered in the process image and the value status of the signal is set to "invalid" (QI = 0). If "Chatter error" diagnostics is enabled, "Chatter error" is also entered as diagnostic information, triggering an incoming diagnostics interrupt.

You can evaluate and process the value status (QI) and the diagnostics information in the user program.

Resetting a chatter error

If no further chattering of the input signal is detected within three monitoring windows, an outgoing diagnostics interrupt is triggered. The status of the value of the current signal in the process image is set to "valid".

Note

Active chatter monitoring is reset if there is an error in the input signal (value status QI =0).

Principle

The following figure gives you another graphic illustration of the principle of chatter monitoring.

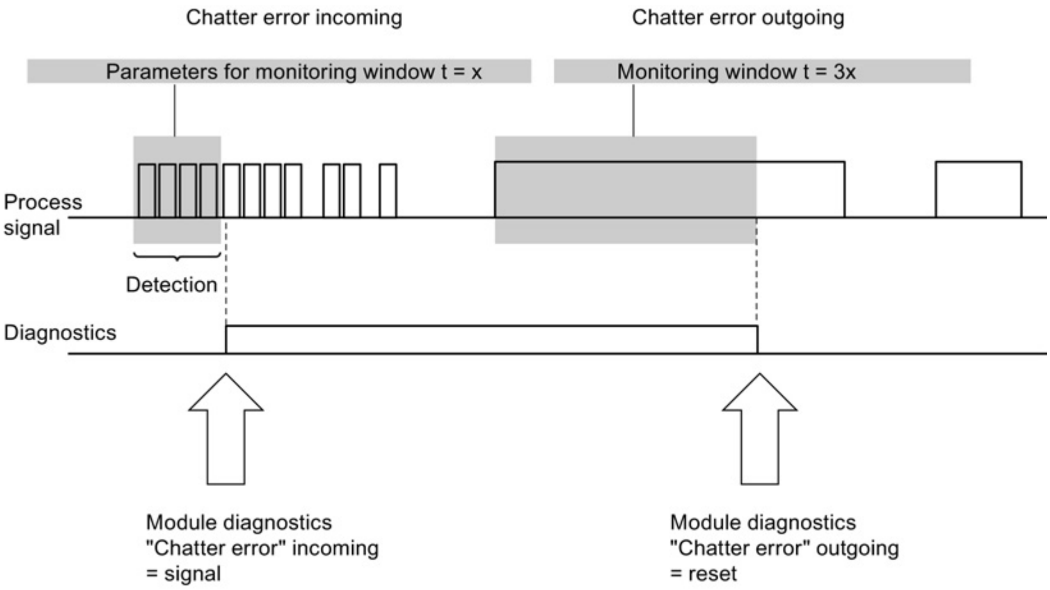

Figure 5-3 The principle of chatter monitoring

Chatter monitoring and "settling time" if a chatter error occurs

Does the monitoring time in the event of a fault restart as three monitoring windows if the signal continues to change?

The signal changes...	Result
once more often than set in the "Number of signal changes".	Monitoring time is restarted.
less often than set in the "Number of signal changes".	The monitoring time is not started again, in other words, the monitoring time runs once after a chatter error is detected. Even a change just before the time is up is tolerated.

Technical specifications 6

6.1 Technical specifications

DI 8×NAMUR HF technical specifications

	6ES7131-6TF00-0CA0
Product type designation	DI 8xNAMUR HF
General information	
Usable BaseUnits	BU type A0
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 / V13
STEP 7 can be configured/integrated as of version	V5.5 SP3 / V5.5 SP4
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	V2.3
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	20.4 V
Valid range, high limit (DC)	28.8 V
Reverse polarity protection	Yes
Sensor supply	
Number of outputs	8
Output current	
Short-circuit protection	Yes
Power loss	
Power loss, typ.	1.5 W
Address area	
Address space per module	
Address space per module, max.	1 byte; + 1 byte for QI information
Digital inputs	
Number of inputs	8
Digital inputs, configurable	Yes
Type	NAMUR
Pulse stretching	Yes; 0.5 s, 1 s, 2 s
Edge evaluation	Yes, rising edge, falling edge, edge change
Signal change chatter	Yes, 2 to 32 signal changes
Chatter monitoring window	Yes, 0.5 s, 1 s to 100 s in 1 s increments

	6ES7131-6TF00-0CA0
Input voltage	
Type of input voltage	DC
Rated value, DC	8.2 V
Input current	
For 10 k connected contact	
• For signal "0"	0.35 mA to 1.2 mA
• For signal "1"	2.1 to 7 mA
For unconnected contact	
• For signal "0", max. (permissible quiescent current)	0.5 mA
• For signal "1"	typ. 8 mA
For NAMUR sensors	
• For signal "0"	0.35 mA to 1.2 mA
• For signal "1"	2.1 to 7 mA
Input delay (for rated value of input voltage)	
Tolerated switchover time for changeover contacts	300 ms
For NAMUR inputs	
• with "0" to "1", max.	12 ms
• with "1" to "0", max.	12 ms
Cable length	
Cable length shielded, max.	200 m
Sensors	
Connectable sensors	
NAMUR sensor / changeover contact according to EN 60947	Yes
Single contact / changeover contact unconnected	Yes
Single contact / changeover contact connected with 10 kΩ	Yes
Interrupts/diagnostics/status information	
Interrupts	
Diagnostics interrupt	Yes; channel-based
Hardware interrupt	Yes, selectable, channels 0 to 7
Diagnostics alarms	
Diagnostics information can be read	Yes
Monitoring of supply voltage	Yes
Wire break	Yes
Short-circuit	Yes
Group error	Yes

	6ES7131-6TF00-0CA0
Diagnostics indicator LED	
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permissible potential difference	
Between different circuits	75 VDC / 60 VAC
Insulation	
Insulation tested with	707 VDC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	32 g

NAMUR sensors and connected contacts

Monitoring for short-circuit and wire break only for NAMUR sensors and connected contacts. The response ranges of the diagnostics correspond to IEC 60947-5-6.

Dimension drawing

See manual BaseUnits
(http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Dependencies when configuring with GSD files

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other, see the tables below.

Configuring with a PROFINET GSD file

The table lists the diagnostics information and its dependencies on the sensor types for PROFINET.

Sensor type	Diagnostics information					
	Missing supply voltage L+	Short-circuit to ground	Wire break	Chatter error	Changeover error	Inversion
NAMUR sensor	×	×	×	×	-	×
Single contact, unconnected	×	-	-	×	-	×
Single contact, connected with 10 kΩ	×	-	×	×	-	×
NAMUR changeover contact	×	×	×	×	×	-
Changeover contact, unconnected	×	-	-	×	×	-
Changeover contact, connected with 10 kΩ	×	-	×	×	×	-

Configuring with a PROFIBUS GSD file

The table lists the diagnostics information and its dependencies on the sensor types for PROFIBUS.

Sensor type	Diagnostics information				
	Missing supply voltage L+	Short-circuit to ground	Wire break	Changeover error	Inversion
NAMUR sensor	×	×	×	-	×
Single contact, unconnected	×	-	-	-	×
Single contact, connected with 10 kΩ	×	-	×	-	×
NAMUR changeover contact	×	×	×	×	-
Changeover contact, unconnected	×	-	-	×	-
Changeover contact, connected with 10 kΩ	×	-	×	×	-

A.2 Parameter assignment and structure of parameter data record

The data record 128 of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can change the parameter assignment of the module in your user program regardless of its configuration. This means that you can use all the functions of the module even if you configured it using PROFIBUS GSD.

With data records 0 to 7, you can configure the individual channels.

Parameter assignment in the user program

You can change the parameters of the module in RUN (e.g. switch diagnostics on can be changed in RUN).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128 or data records 0 to 7. The parameters set with STEP 7 will not be changed on the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

If you reconfigure a module and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing".

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128 and data records 0 to 7

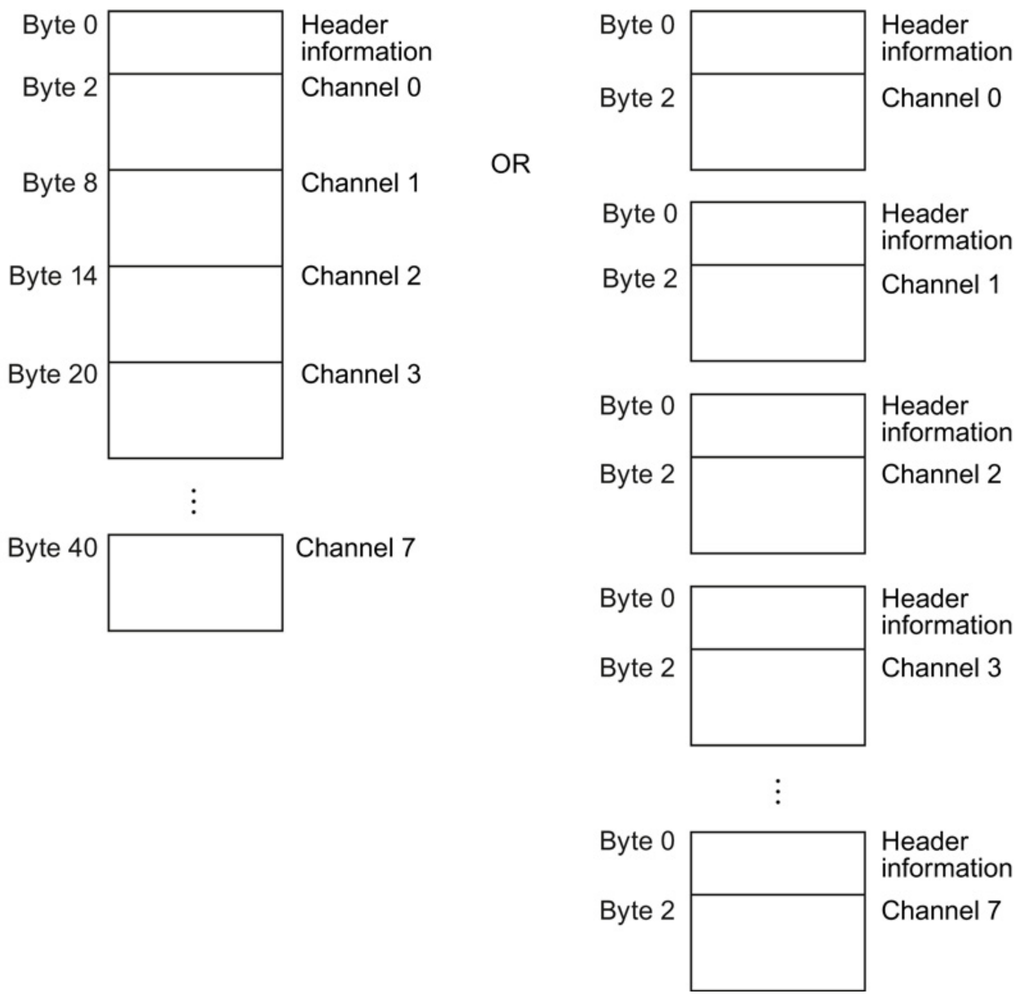

Figure A-1 Structure of data record 128 and data records 0 to 7

Header information

The figure below shows the structure of the header information.

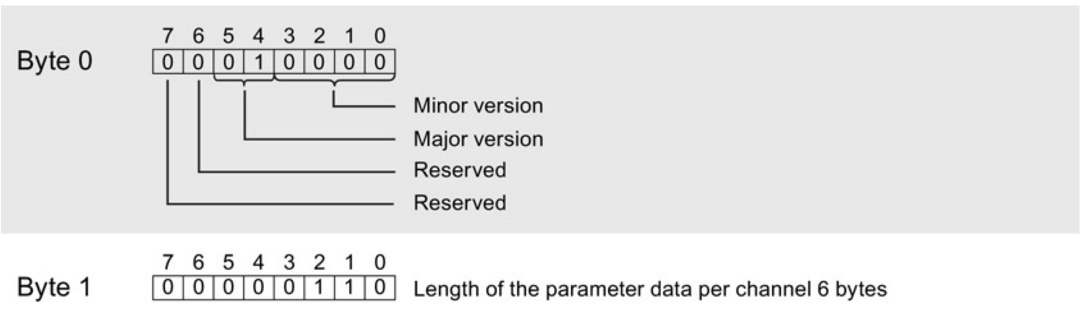

Figure A-2 DR 128 or DR 0 to 7: Bytes 0 and 1; header information

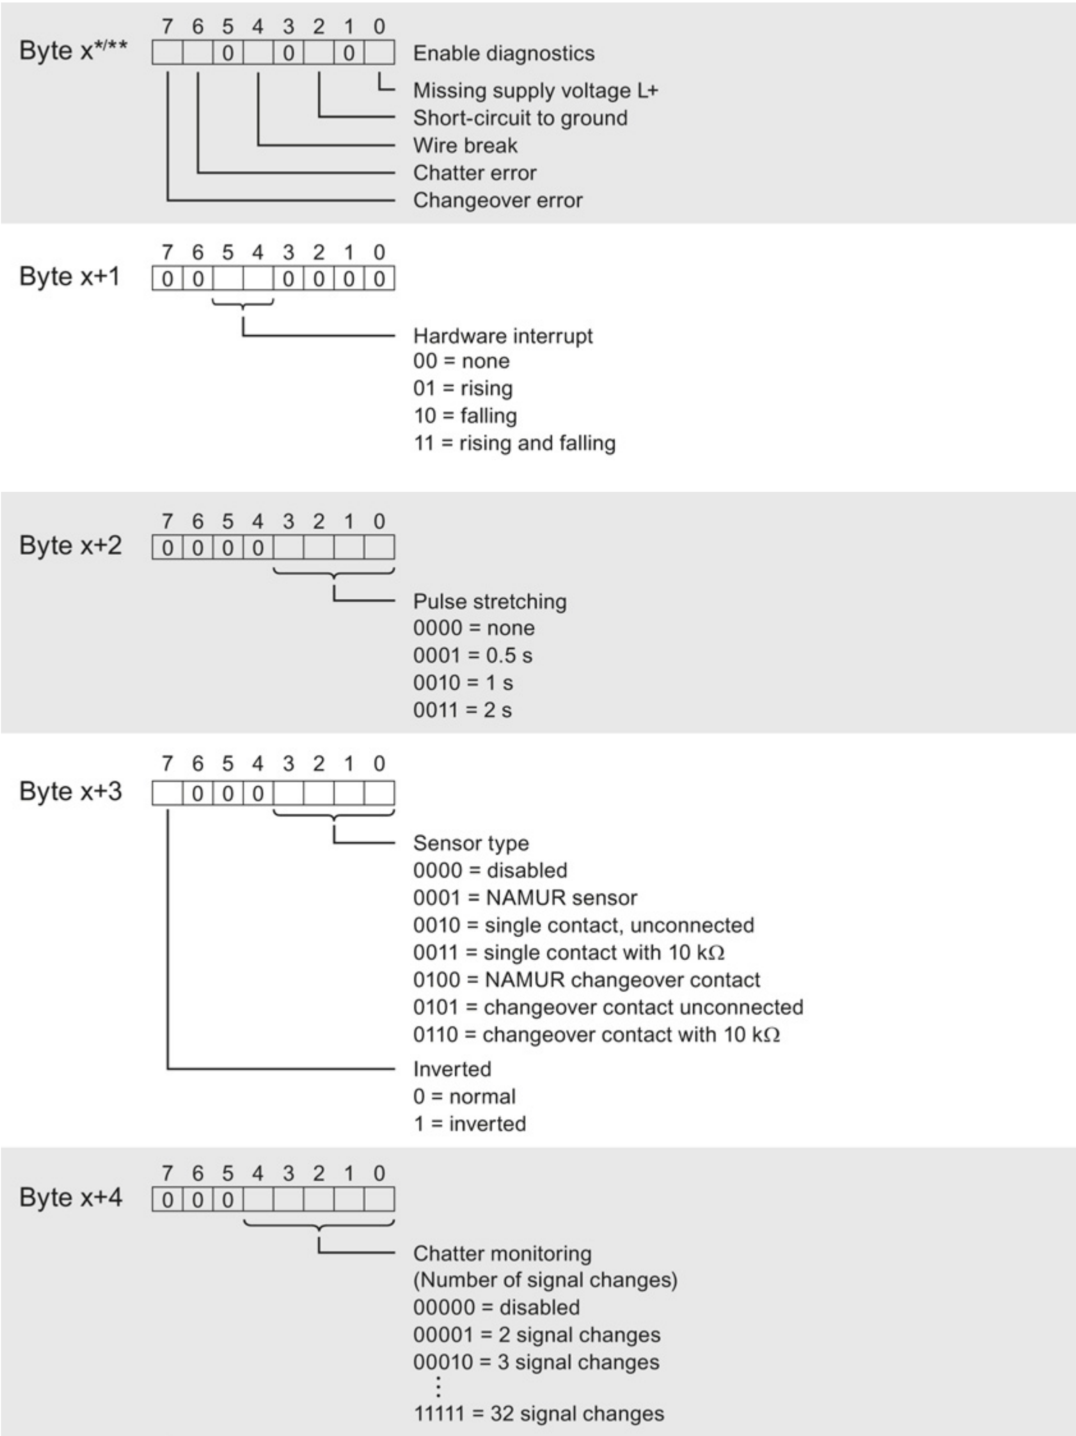
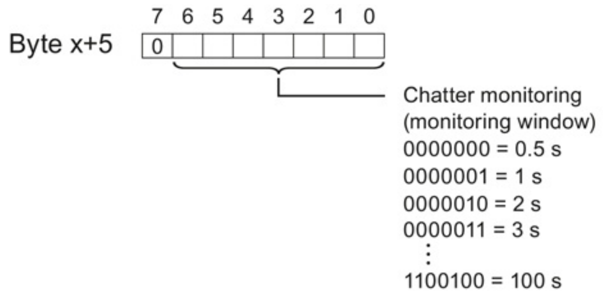
Parameters

The following figure shows the structure of the parameters for a channel. This structure also applies to channels 0 to 7.





* x = 2 + (channel number × 6); channel number = 0 to 7 for DR 128
** x = 2 for DR 0 to DR 7

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7131-6FD00-0BB1 to 6ES7131-6FD0**1**-0BB1. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

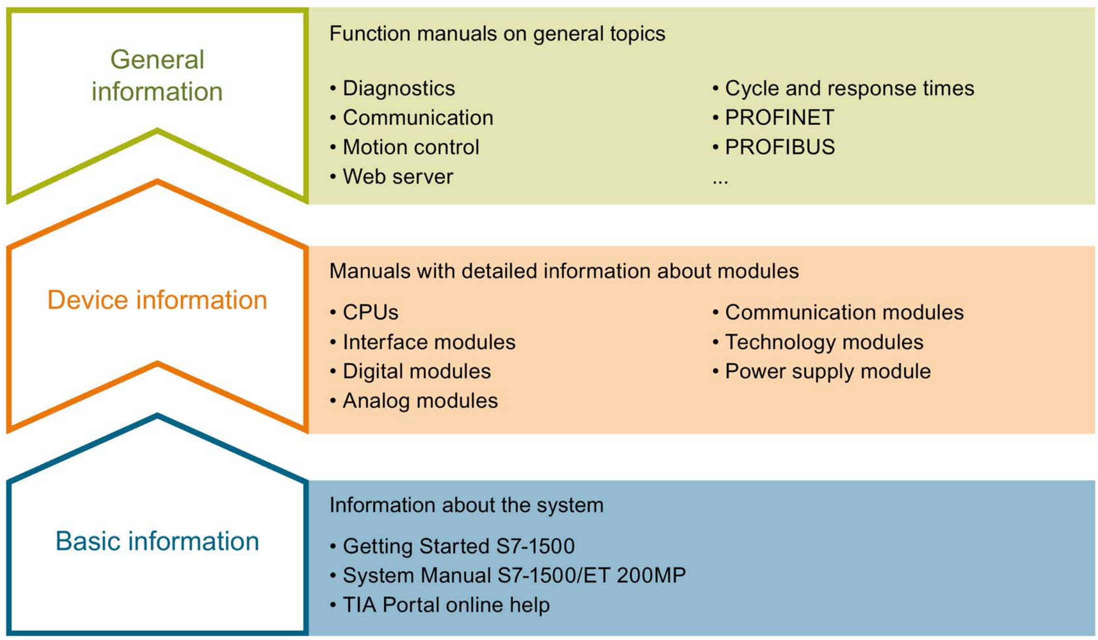
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

Guide to documentation 1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC S7-1500 and ET 200MP systems, e.g. diagnostics, communication, motion control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/68052815).

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86140384).

SIMATIC S7-1500 comparison list for programming languages

The comparison list contains an overview of which instructions and functions you can use for which controller families.

You can find the comparison list on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86630375).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal.

General function overview:

- Network browsing and creation of a table showing the accessible devices in the network.
- Flashing of device LEDs or HMI display to locate a device
- Downloading of addresses (IP, subnet, gateway) to a device
- Downloading the PROFINET name (station name) to a device
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your PG/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- Performing a CPU memory reset
- Resetting devices to factory settings
- Downloading a firmware update to a device

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the PROFINET network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET network and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the module DI 4x120..230VAC ST

Properties

The module has the following technical properties:

- 4 digital inputs
- Supply voltage L+
- Suitable for connection of switches and 2-wire sensors in accordance with IEC 61131, type 3

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0229 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DI 4x120..230VAC ST module with the terminal assignments for a 2-wire, 3-wire and 4-wire connection.

Information about wiring of the BaseUnit is available in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

You may use and combine the different wiring options for all channels.

NOTICE
Hazardous voltage, risk of fatal or serious injury
Always disconnect the system and module from the power supply before commencing work.

Note

Limiting overvoltage

You must ensure overvoltage is limited to 1 kV for the encoder supply.

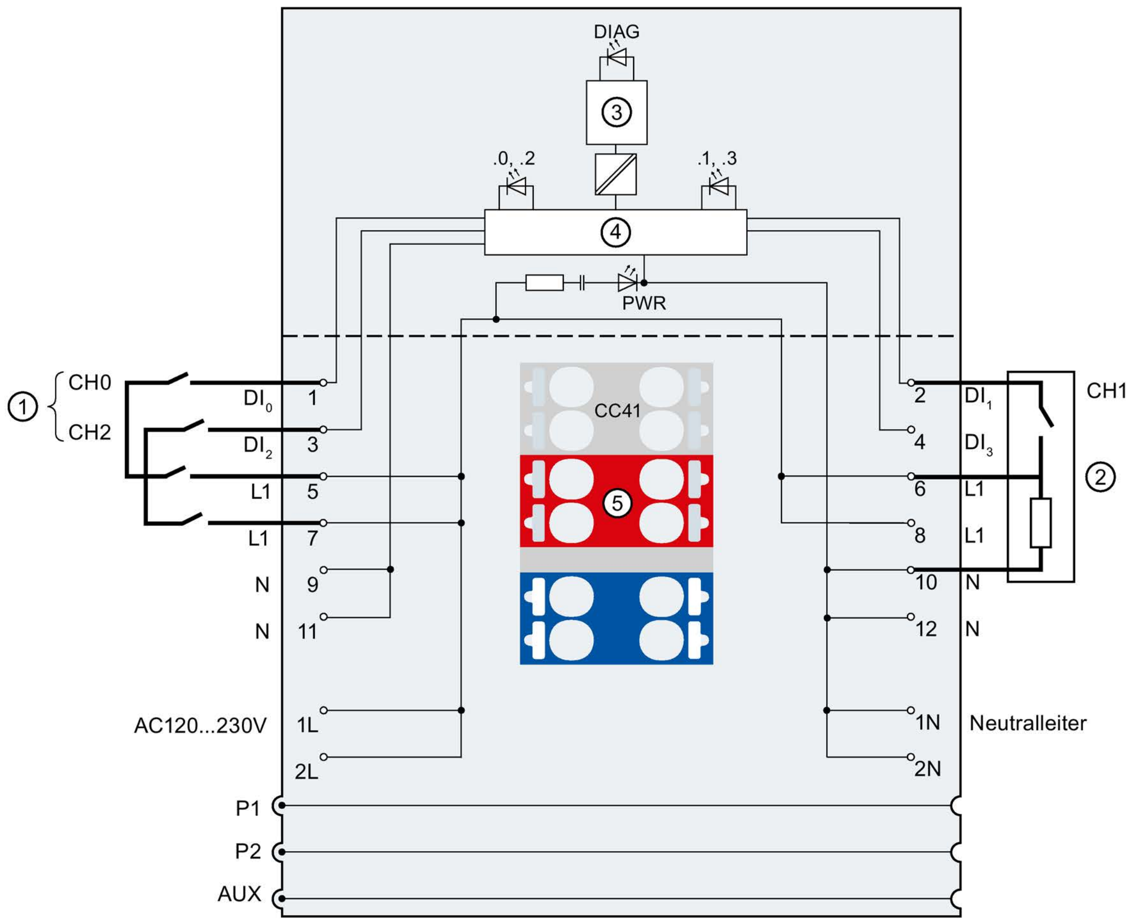
Note

Power limitation

To limit power, each input voltage must have a fuse with a maximum rating of 10 A tripping current. The fuse must be a quick-acting microfuse.

Connection: 2-wire and 3-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input module DI 4x120..230VAC ST on the BaseUnit BU type B1 without AUX terminals (2-wire and 3-wire connection).

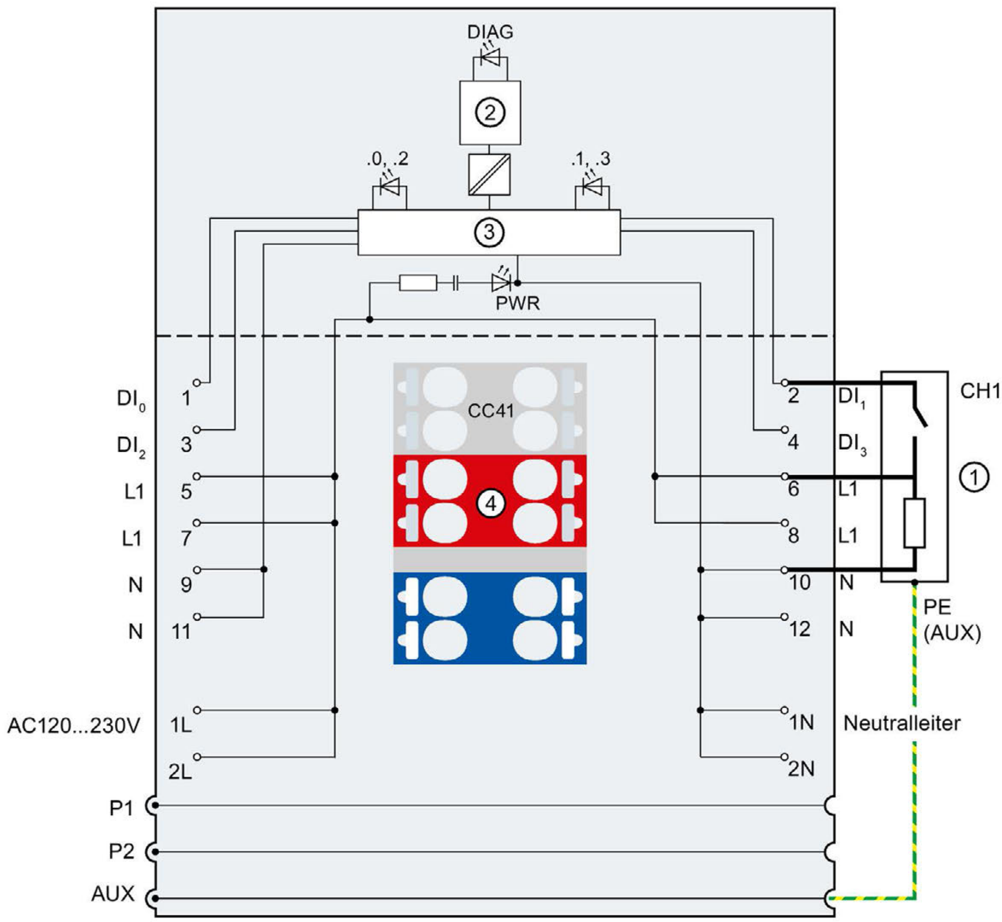


①	2-wire connection	DIn	Input signal, channel n
②	3-wire connection	L1	Encoder supply, channel n
③	Backplane bus interface	1L / 2L	Infeed 120 ... 230 V AC
④	Input electronics	1N / 2N	N-conductor connection
⑤	Color identification label CCxx (optional)	DIAG	Error or Diagnostics LED (green, red)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	PWR	Power LED (green)
.0 to .3	Channel status LED (green)		

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of encoders

Connection: 4-wire connection:

The following figure shows the block diagram and an example of the terminal assignment of the digital input DI 4x120..230VAC ST on the BaseUnit BU type B1 with AUX terminals (4-wire connection).



①	4-wire connection	DIn	Input signal, channel n
②	Backplane bus interface	L1	Encoder supply, channel n
③	Input electronics	1L / 2L	Infeed 120 ... 230 V AC
④	Color identification label CCxx (optional)	1N / 2N	N-conductor connection
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	DIAG	Error or diagnostics LED (green, red)
.0 to .3	Channel status LED (green)	PWR	Power LED (green)

Figure 3-2 Wiring and block diagram for 4-wire connection of encoders.

4 Parameters/address space

4.1 Parameters

Parameters of the DI 4x120..230VAC ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When performing the configuration in the user program, use the "WRREC" instruction to transfer the parameters to the module using data records (refer to the section Parameter assignment and structure of parameter data record (Page 26)).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

4.2 Explanation of parameters

Channel activated

Determines whether a channel is enabled or disabled.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DI 4x120..230VAC ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	DI 4x120..230VAC ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 4-channel with value status	DI 4x120..230VAC ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional two bytes are allocated in the input address space if you enable the value status for the digital module. Bits 0 to 3 in these bytes are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space of the digital input module DI 4x120..230VAC ST

The following figure shows the assignment of the address space for the DI 4x120..230VAC ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

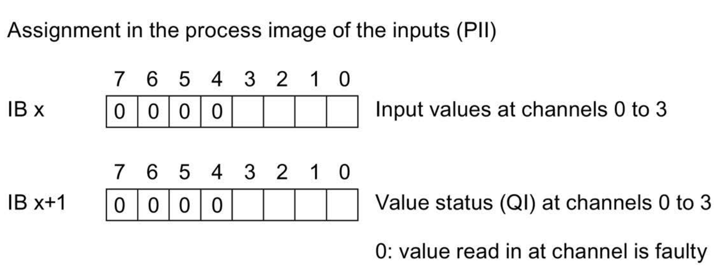


Figure 4-1 Address space of the DI 4x120..230VAC ST digital input module with value status

---

Note

Value status

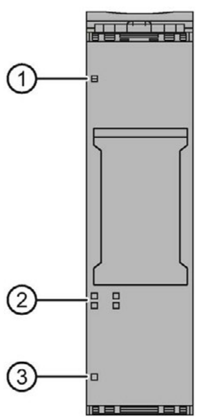
The value status is independent of the connected supply voltage 120 ... 230 V AC.

Interrupts/diagnostics alarms 5

5.1 Status and fault displays

LED displays

The figure below shows the LED displays (status and fault displays) of the DI 4x120..230VAC ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The tables below explain the meaning of the Status and fault displays.

LED DIAG

Table 5- 1 LED DIAG fault display

LED DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module parameters not assigned
On	Module parameters assigned
Flashing	Module diagnostics is available

LED channel status

Table 5- 2 Channel status LED status and fault display

LED channel status	Meaning
Off	Process signal = 0
On	Process signal = 1

LED PWR

Table 5- 3 LED PWR status display

LED PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ present

5.2 Diagnostics alarms

Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostic alarm, for example, in the diagnostics buffer of the CPU. You can analyze the error code with the user program.

Table 5- 4 Diagnostic alarm, meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment

5.3 Load voltage status

Load voltage status

The firmware of the module cannot detect the status of the load voltage.

If the "Load voltage status" function tied to the server module is used, a "1" is always displayed in the status bit for a slot with the DI 4×120..230VAC ST. Even when the load voltage is not applied.

Technical specifications 6

6.1 Technical specifications

DI 4×120..230VAC ST technical specifications

Article number	6ES7131-6FD01-0BB1
General information	
Product type designation	DI 4x120 … 230 V AC ST
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type B1
Color code for module-specific color identification plate	CC41
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DI	Yes
• Counter	No
• Oversampling	No
• MSI	No
Supply voltage	
Rated value (AC)	230 V
Reverse polarity protection	No
Input current	
Current consumption (rated value)	10 mA

Article number	6ES7131-6FD01-0BB1
Encoder supply	
Number of outputs	4
Short-circuit protection	No; when using BU type B1, a fuse with 10 A tripping current must be provided
Output current	
• up to 60 °C, max.	10 A
Power loss	
Power loss, typ.	1 W; Active power, load voltage 230 V, all inputs connected with 230 V, 50 Hz
Address area	
Address space per module	
• Inputs	1 byte; + 1 byte for QI information
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type B1
• 2-wire connection	BU type B1
• 3-wire connection	BU type B1
• 4-wire connection	BU type B1 + potential distributor module
Digital inputs	
Number of digital inputs	4
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Input voltage	
• Type of input voltage	120/230V AC (47 Hz to 63 Hz)
• Rated value (AC)	230 V
• for signal "0"	0V AC to 40V AC
• for signal "1"	74 V AC to 264 V AC
Input current	
• for signal "1", typ.	10.8 mA
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	No
– at "0" to "1", min.	1.5 ms
– at "0" to "1", max.	4 ms
– at "1" to "0", min.	10 ms
– at "1" to "0", max.	10 ms

Article number	6ES7131-6FD01-0BB1
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	No
• Hardware interrupt	No
Diagnostic messages	
• Monitoring the supply voltage	No
• Wire-break	No
• Short-circuit	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	2 545 V DC/2 s (routine test)
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

The module parameters can be reassigned in RUN without affecting the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

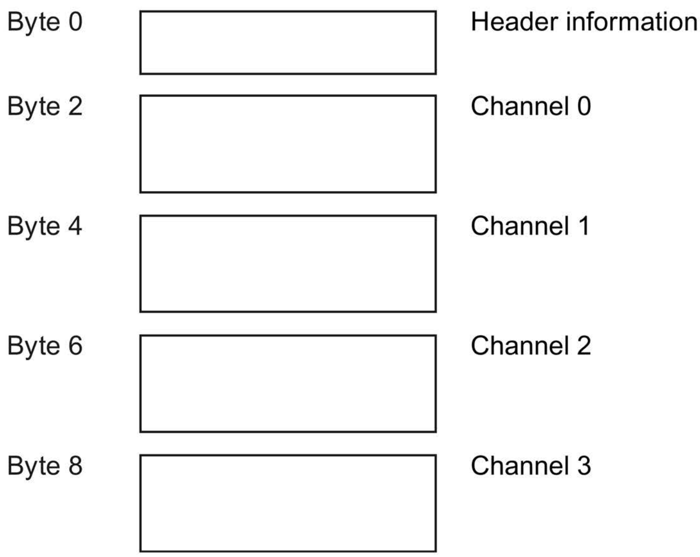

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

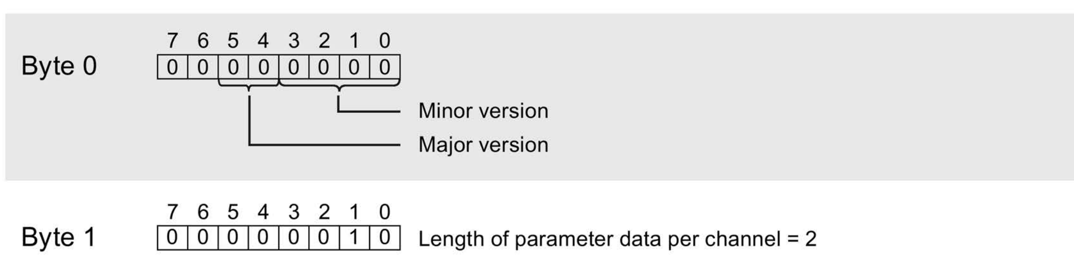

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".

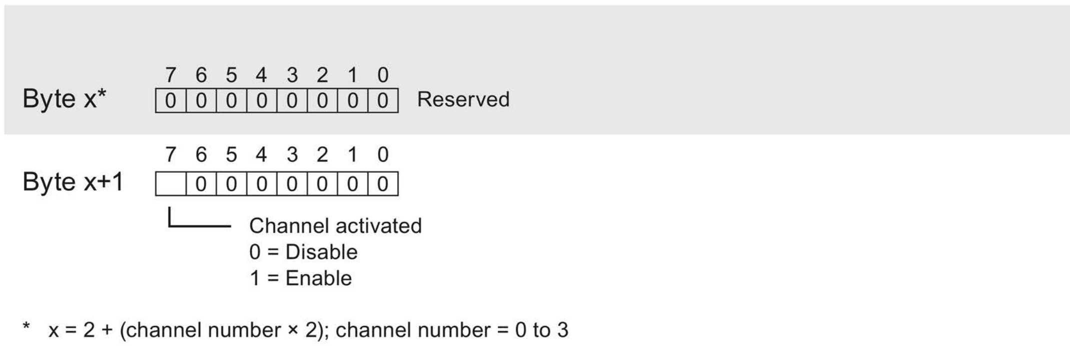

Figure A-3 Structure byte x to x+1 for the channels 0 to 3

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	07	Invalid coding for input filter time.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

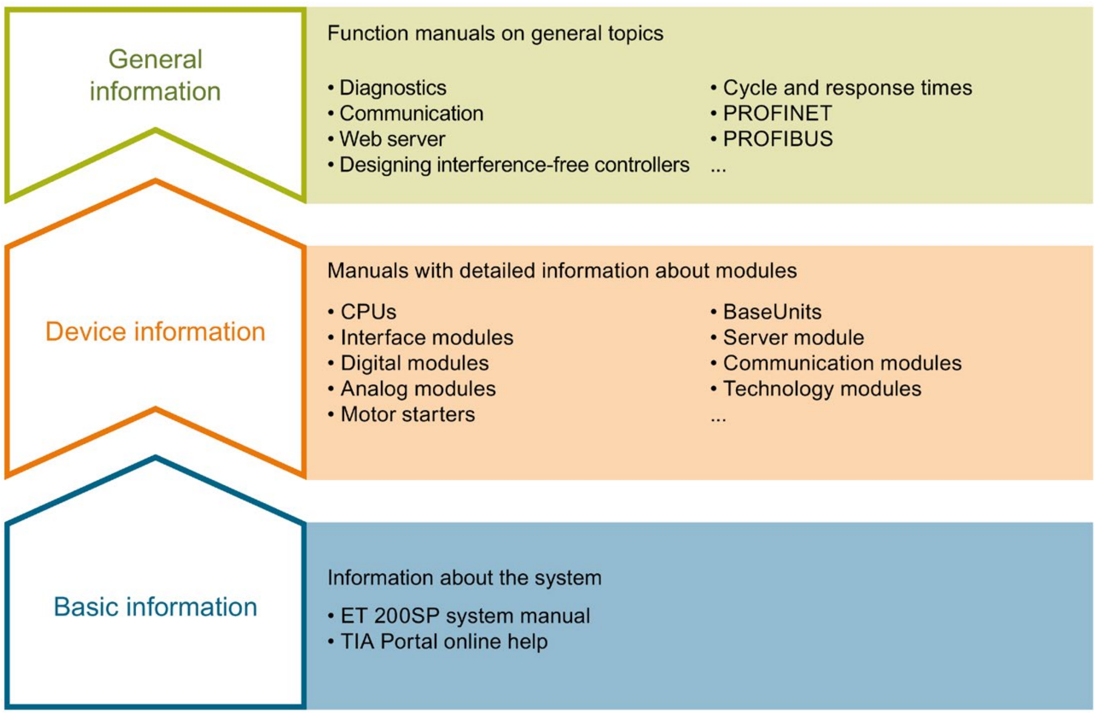
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

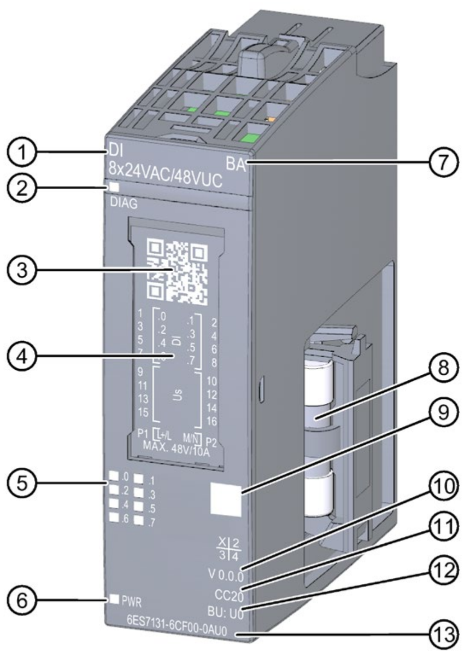
2

2.1 Properties

Article number

6ES7131-6CF00-0AU0

View of the module



①	Module type and name	⑧	Replaceable fuse
②	LED for diagnostics	⑨	Color coding module type
③	2D matrix code	⑩	Function and firmware version
④	Wiring diagram	⑪	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑫	BU type
⑥	LED for supply voltage	⑬	Article number
⑦	Function class		

Figure 2-1 View of the module DI 8x24VAC/48VUC BA

Note

Replace the fuse

1. Remove the module from the station.
2. Insert a screwdriver into the slotted top face of the fuse holder.
3. Lift out the fuse holder.
4. Replace the fuse.
5. Slide the fuse holder back into the module.

Properties

The module has the following technical properties:

- 8 digital inputs
- Suitable for connection of switches and 2-wire sensors in accordance with IEC 61131, type 1

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	as of V15 with HSP 0254	as of V5.5 SP3 with HSP 0229 V8.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	as of V15 with HSP 0254	as of V5.5 SP3 with HSP 0229 V8.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

You can find additional information on the accessories in the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DI 8x24VAC/48VUC BA module with the terminal assignments for a 1-wire and 2-wire connection.

Information about wiring of the BaseUnit is available in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

You may use and combine the different wiring options for all channels.

Note

Hazardous voltage, risk of fatal or serious injury

Always disconnect the system and module from the power supply before commencing work.

Note

Limiting overvoltage

You must ensure overvoltage is limited to 1 kV for the encoder supply.

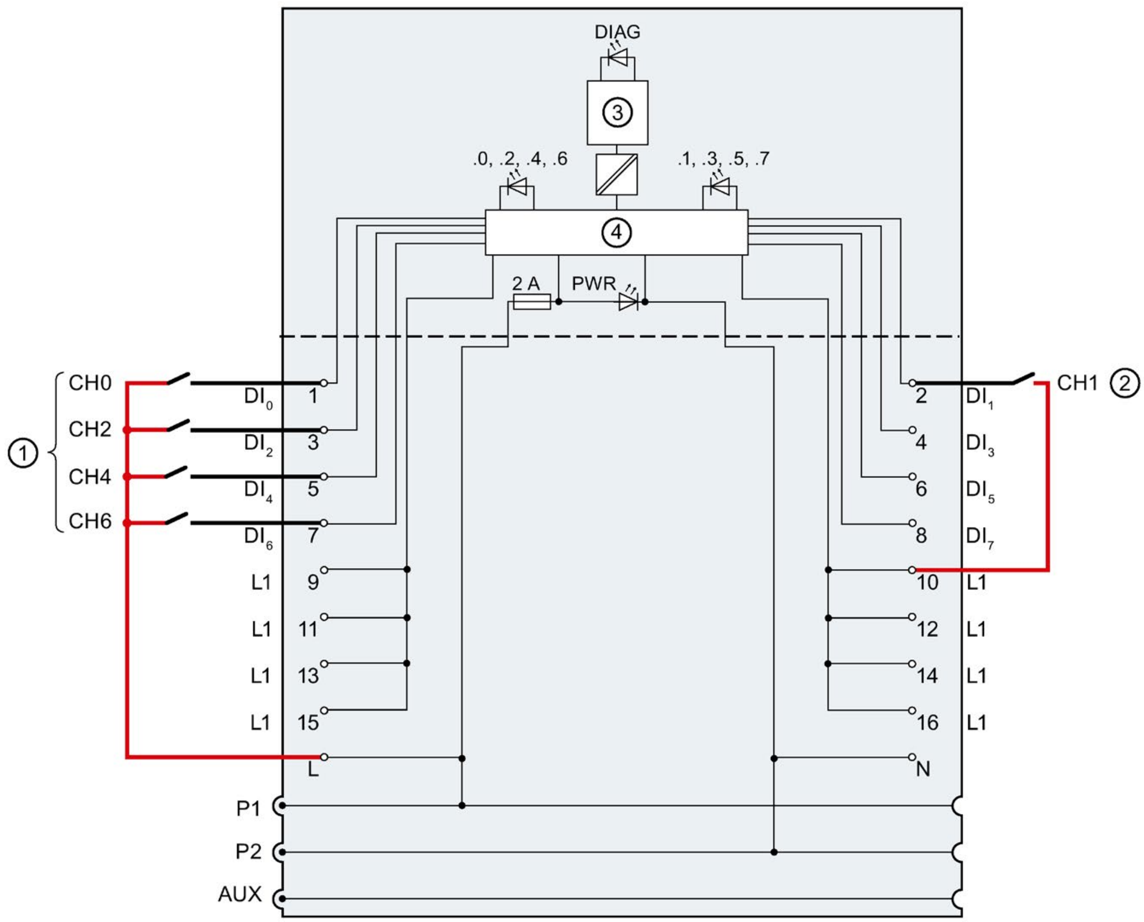
Note

Power limitation

To limit power, each input voltage must have a fuse with a maximum rating of 10 A tripping current. The fuse must be a quick-acting microfuse.

Connection: 1-wire and 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital output module DI 8x24VAC/48VUC BA on the BaseUnit BU type U0 (1-wire and 2-wire connection).



①	1-wire connection	DI_n	Input signal, channel n
②	2-wire connection	L1	Encoder supply, channel n
③	Backplane bus interface	L	Supply 24 V AC / 48 V UC
④	Input electronics	N	N-conductor connection
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)	DIAG	Error or diagnostics LED (green, red)
.0 to .7	Channel status LED (green)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of encoders

Parameter assignment/addressing 4

4.1 Parameters

Parameters of DI 8x24VAC/48VUC BA

During configuration of the module with STEP 7, define the properties of the module via various parameters. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When performing the configuration in the user program, use the "WRREC" instruction to transfer the parameters to the module using data records (refer to the section Parameter assignment and structure of parameter data record (Page 24)).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Value range	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics, No supply voltage L	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] The parameter length of the I/O module is 3 bytes.

4.2 Explanation of parameters

Diagnostics No supply voltage L

Enabling of the diagnostics for no or insufficient supply voltage L.

Channel activated

Determines whether a channel is enabled or disabled.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which is followed by a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image input.

Configuration options of DI 8x24VAC/48VUC BA

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DI 8x24VAC/48VUC BA	as of V15 with HSP 0254	X	X

Address space of the digital input module DI 8x24VAC/48VUC BA

The figure below shows the assignment of the address space for DI 8x24VAC/48VUC BA.

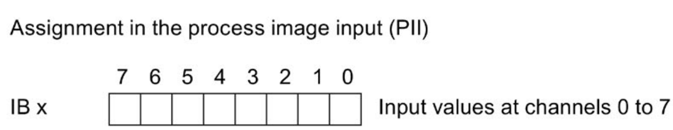


Figure 4-1 Address space of the digital input module DI 8x24VAC/48VUC BA

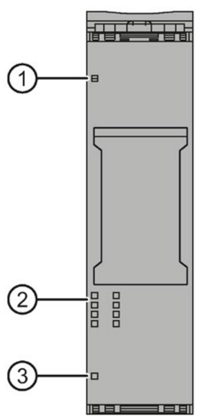
Interrupts/diagnostics alarms 5

5.1 Status and fault displays

LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VAC/48VUC BA.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The tables below explain the meaning of the Status and fault displays.

LED DIAG

Table 5- 1 LED DIAG fault display

LED DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module parameters not assigned
On	Module parameters assigned
Flashing	Module diagnostics is available

LED channel status

Table 5- 2 Channel status LED status and fault display

LED channel status	Meaning
Off	Process signal = 0
On	Process signal = 1

LED PWR

Table 5- 3 LED PWR status display

LED PWR	Meaning
Off	No supply voltage L
On	Supply voltage L present

5.2 Interrupts

The DI 8x24VAC/48VUC BA digital input module supports diagnostics interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Parameter assignment error
- No supply voltage

5.3 Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and how to deal with them

Diagnostics alarm	Error code	Meaning	Remedy
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L	• Check supply voltage L at the BaseUnit • Check BaseUnit type

6 Technical specifications

Technical specifications of the DI 8x24VAC ... 48VUC BA

Article number	6ES7131-6CF00-0AU0

Parameter data record

A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

The module parameters can be reassigned in RUN without affecting the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

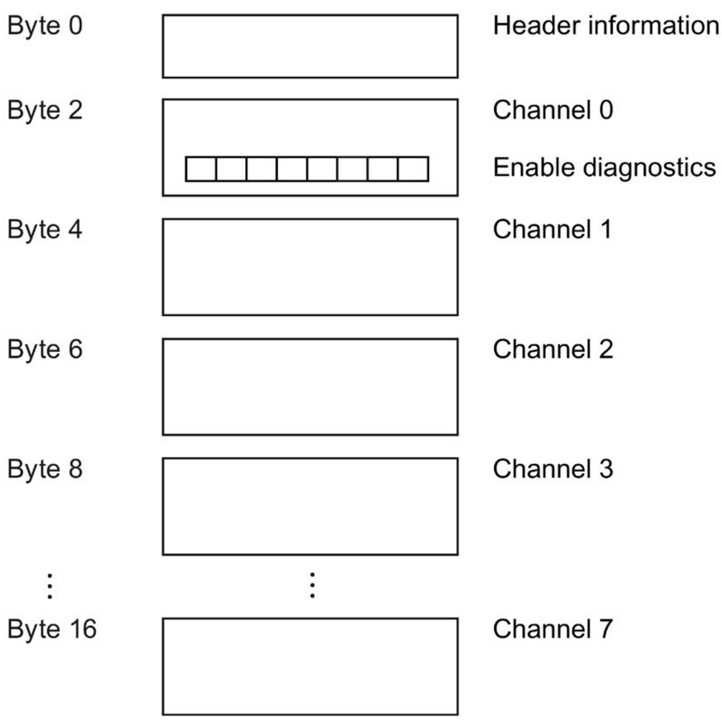

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

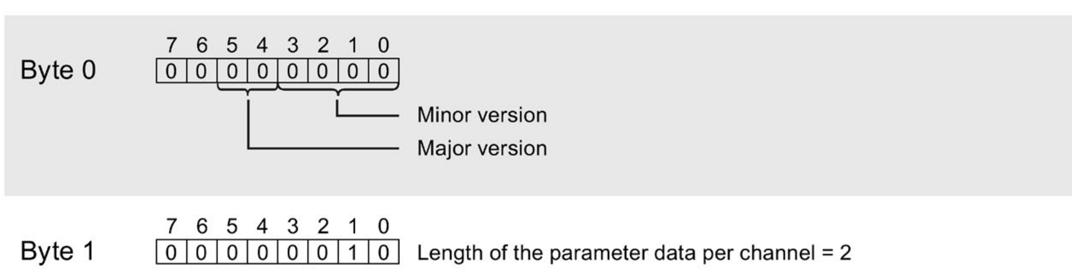

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

You enable a parameter by setting the corresponding bit to "1".

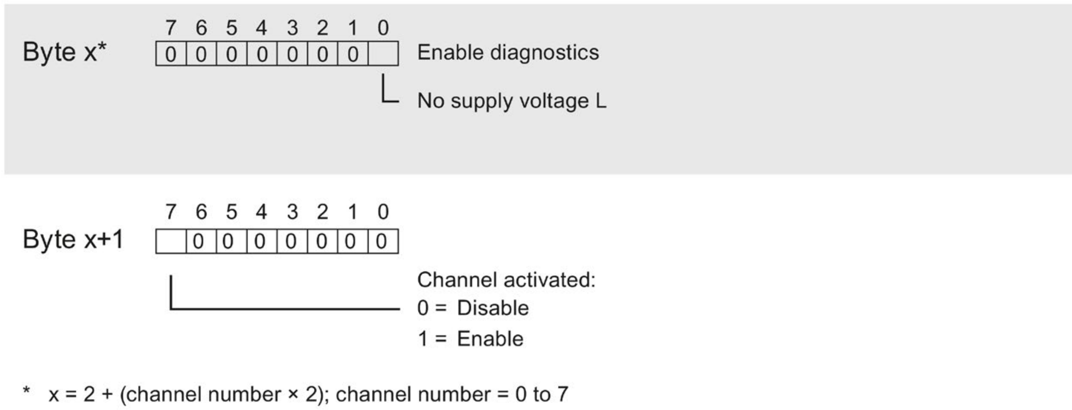

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	07	Invalid coding for input filter time.	Check the parameters of the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7132-6BF00-0AA0 to 6ES7132-6BF0**1**-0AA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

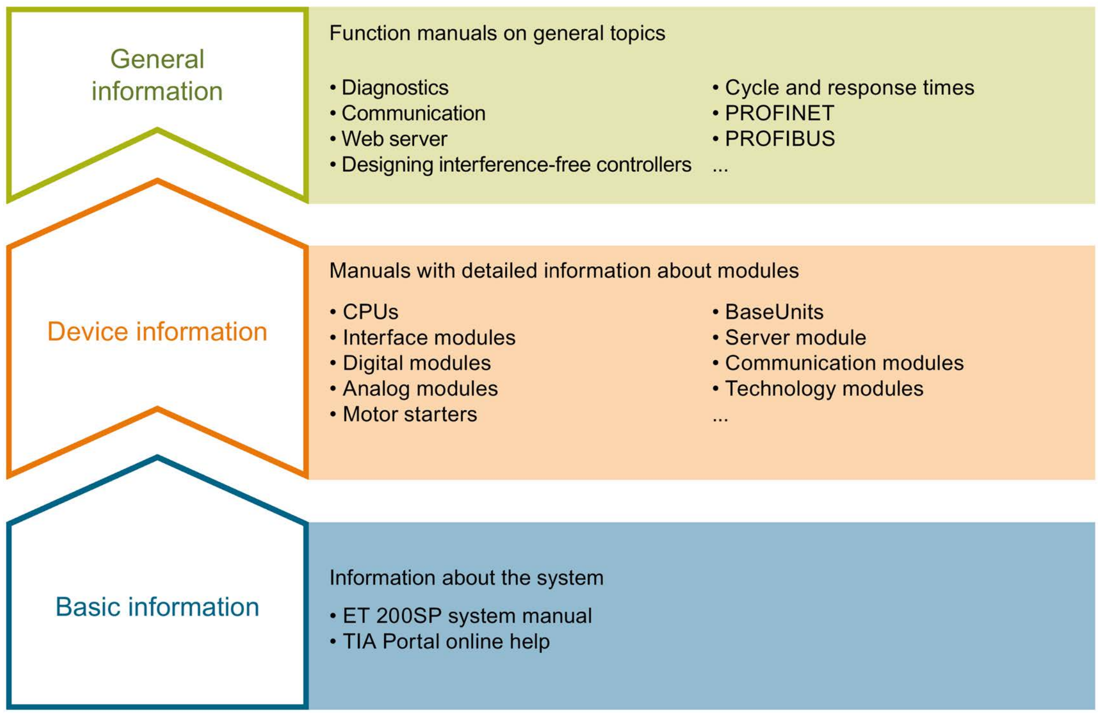
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 Product overview

2.1 Properties

Article number

⑫ Article number

Figure 2-1 View of the module DQ 8×24VDC/0.5A BA

Properties

The module has the following technical properties:

- Digital output module with 8 outputs
- Supply voltage L+
- Output current 0.5 A (per channel)
- Source output (PNP, P-switching)
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Safety-related shutdown

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 8x24VDC/0.5A BA module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection.

You can use and combine the different wiring options for all channels.

You can find information on wiring the BaseUnit in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

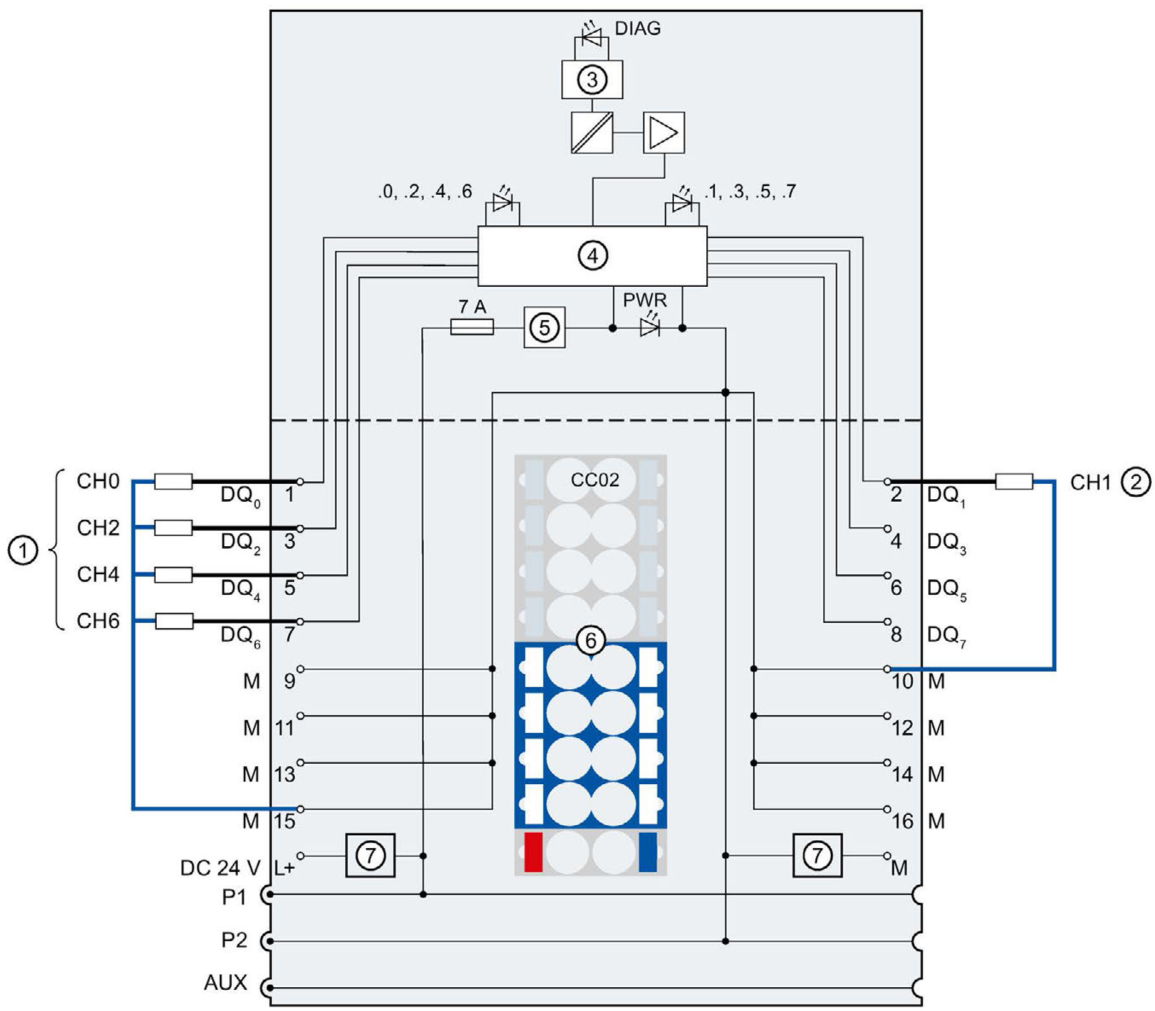
Note

Cross circuit at output

Be aware that voltage from a cross-circuit at the output can feed L+ to modules.

Wiring: 1 and 2-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 8×24VDC/0.5A BA on the BaseUnit BU type A0 without AUX terminals (1- and 2-wire connection).

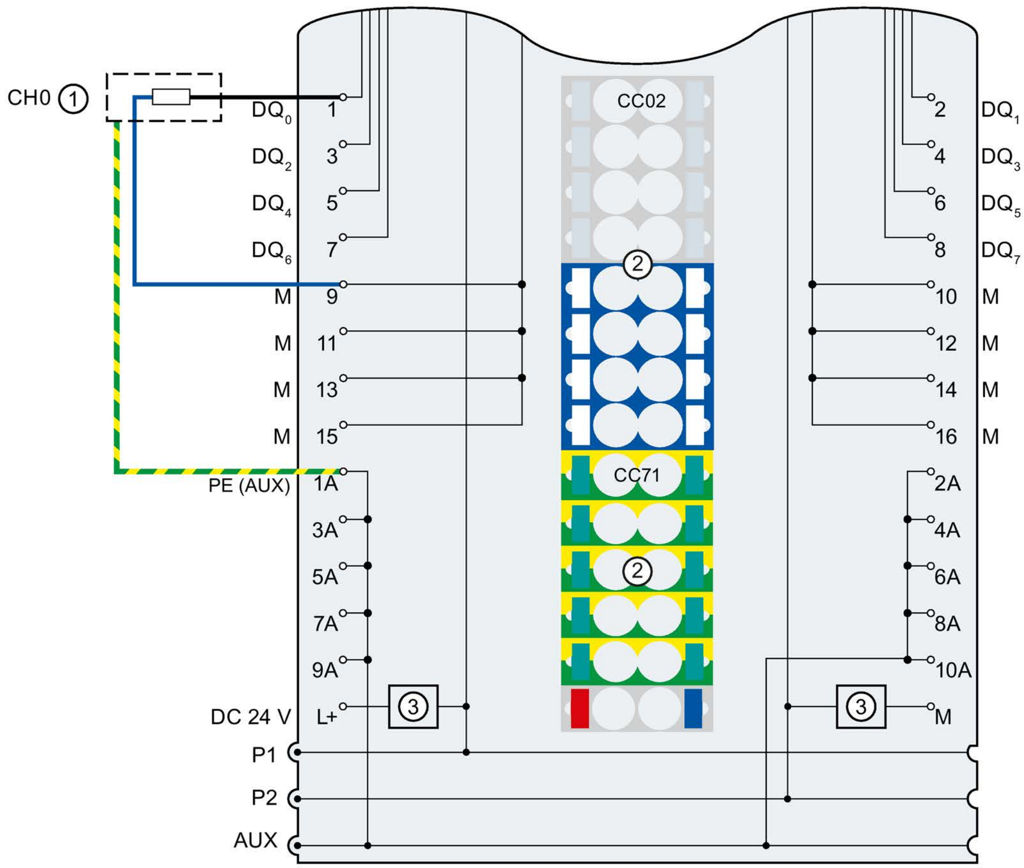


①	1-wire connection	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
②	2-wire connection	M	Ground
③	Backplane bus interface	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Output electronics	DQ_n	Output signal, channel n
⑤	Polarity reversal protection	DIAG	Error or diagnostics LED (green, red)
⑥	Color-coded label with color code CC02 (optional)	.0 to .7	Channel status LED (green)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	PWR	Power LED (green)

Figure 3-1 Block diagram and terminal assignment for 1- and 2-wire connection of actuators

Wiring: 3-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 8×24VDC/0.5A BA on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A to 10 A	AUX terminals
②	Color-coded labels with color codes CC02 and CC71 (optional)	PE (AUX)	Protective conductor connection
③	Filter connection supply voltage (only when light-colored BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
DQ_n	Output signal, channel n	M	Ground
		P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Terminal assignment for 3-wire connection of actuators

Parameters/address space 4

4.1 Parameters

Parameters for DQ 8x24VDC/0.5A BA

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records, see section Parameter assignment and structure of parameter data record (Page 29).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassignment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameters	Range of values	Default	Parameter reassign-ment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 16 bytes.

4.2 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DQ 8x24VDC 0.5A BA

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DQ 8x24VDC 0.5A BA V0.0	V14, SP1 or higher with HSP 0222	X	X

Address space of the digital output module DQ 8x24VDC 0.5A BA

The figure below shows the assignment of the address space for DQ 8x24VDC/0.5A BA

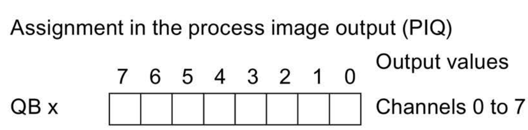

Figure 4-1 Address space of DQ 8x24VDC/0.5A BA

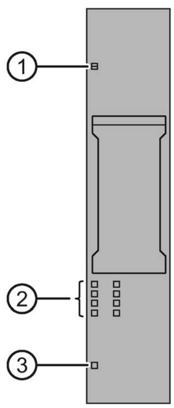
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

DQ 8x24VDC/0.5A BA.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 23).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module diagnostics is available

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated or activated and process signal = 0
On	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The DQ 8×24VDC/0.5A BA digital output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Parameter assignment error
- Supply voltage missing

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

Input current	
Current consumption, max.	45 mA; without load
Output voltage	
Rated value (DC)	24 V
Power loss	
Power loss, typ.	1 W
Address area	
Address space per module	
• Outputs	1 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals
• 4-wire connection	BU type A0 + Potential isolation module
Digital outputs	
Type of digital output	Source output (PNP, current-sourcing)
Number of digital outputs	8
Current-sourcing	Yes
Short-circuit protection	Yes; per channel, electronic
• Response threshold, typ.	1 A
Limitation of inductive shutdown voltage to	Typ. L+ (-50 V)
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	100 kΩ
Output current	
• for signal "1" rated value	0.5 A
• for signal "1" permissible range, max.	0.5 A
• for signal "0" residual current, max.	10 µA
Output delay with resistive load	
• "0" to "1", max.	100 µs; at rated load
• "1" to "0", max.	150 µs; at rated load

Article number	6ES7132-6BF01-0AA0
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	100 Hz
• with inductive load, max.	2 Hz
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per channel, max.	0.5 A
• Current per module, max.	4 A
Total current of the outputs (per module)	
horizontal installation	
– up to 30 °C, max.	4 A
– up to 40 °C, max.	4 A
– up to 50 °C, max.	4 A
– up to 60 °C, max.	4 A
vertical installation	
– up to 30 °C, max.	4 A; in all other mounting positions
– up to 40 °C, max.	4 A; in all other mounting positions
– up to 50 °C, max.	4 A; in all other mounting positions
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	No
• Short-circuit	No

Article number	6ES7132-6BF01-0AA0
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety-oriented group deactivation	Yes
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; in all other mounting positions
• vertical installation, max.	50 °C; in all other mounting positions
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Safety-related shutdown

Note

The digital output module DQ 8x24VDC/0.5A BA supports safety-related shutdown in connection with a fail-safe power module F-PM-E 24VDC/8A PPM ST:

- SIL according to IEC 61508: 2
- Highest attainable safety class in safety mode, performance level according to EN ISO 13849-1: d

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record A

A.1 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to reconfigure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

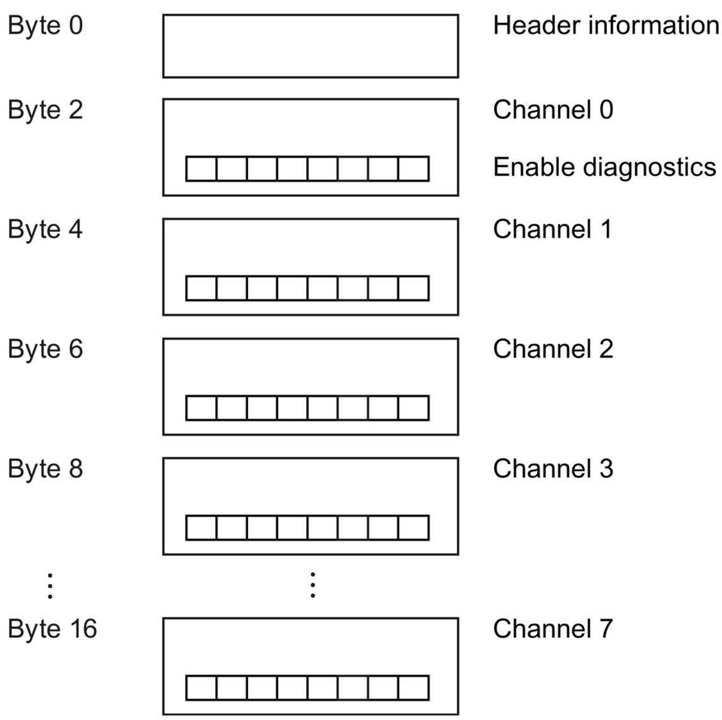

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

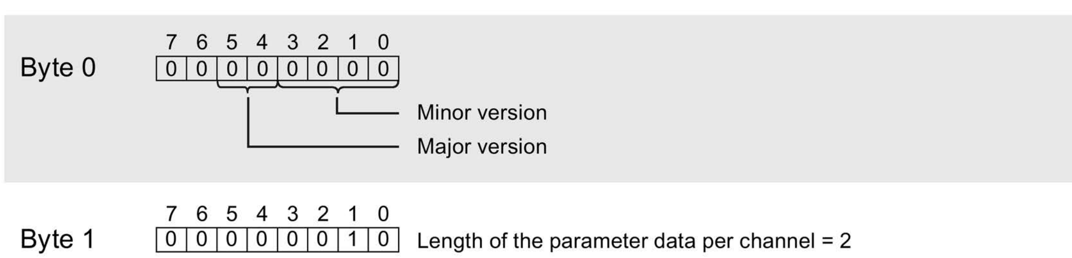

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

You enable a parameter by setting the corresponding bit to "1".

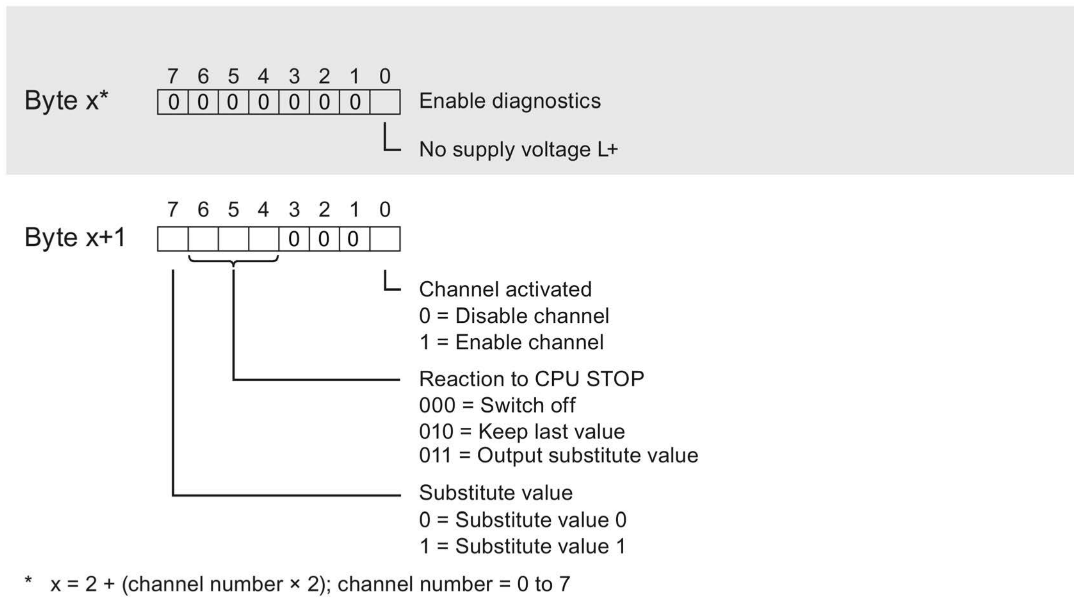

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF	80	B0	xx	Number of the data record un-known.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the pa-rameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

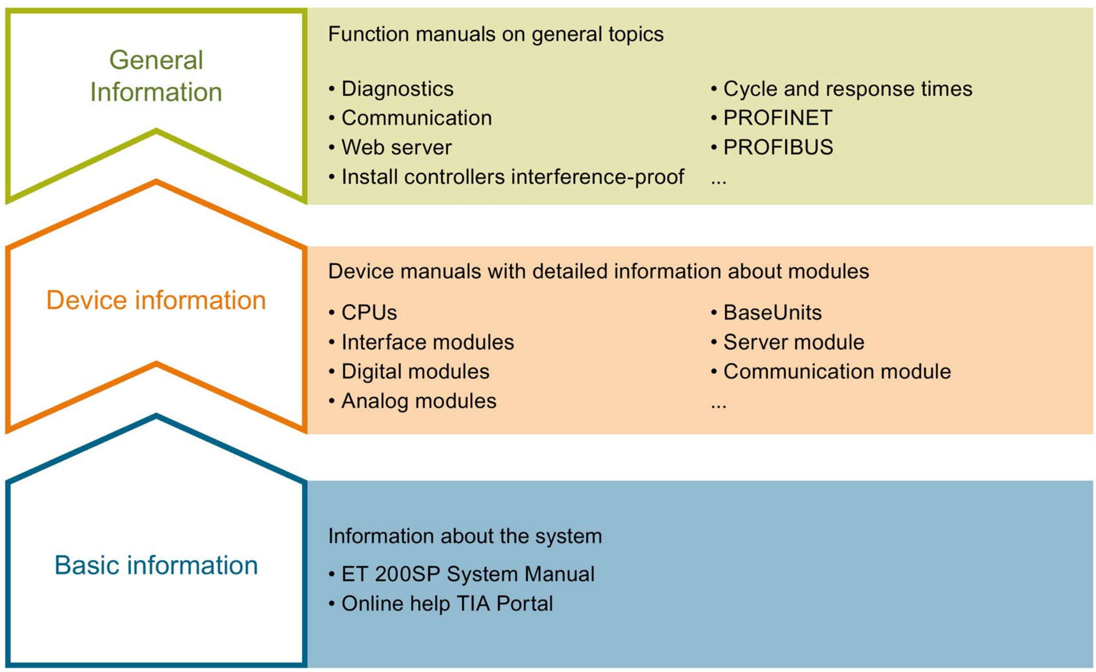
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

⑪ Article number

Image 2-1 View of the module DQ 4×24VDC/2A ST

Properties

The module has the following technical properties:

- Digital output module with 4 outputs
- Source output (PNP, P-switching)
- Supply voltage L+
- Output current 2 A (per channel)
- Total current 8 A (per module) (see derating: Technical specifications (Page 22))
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Safety-related shutdown

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of
Value status	1	V1.1.0

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/91696622).

Wiring up 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 4x24VDC/2A ST module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection. You can use and combine the different wiring options for all channels.

You can find information on wiring the BaseUnits in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Note

- The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Note

The fuse integrated in BaseUnit type A1 may be triggered in the digital output module, rendering the terminals unusable.

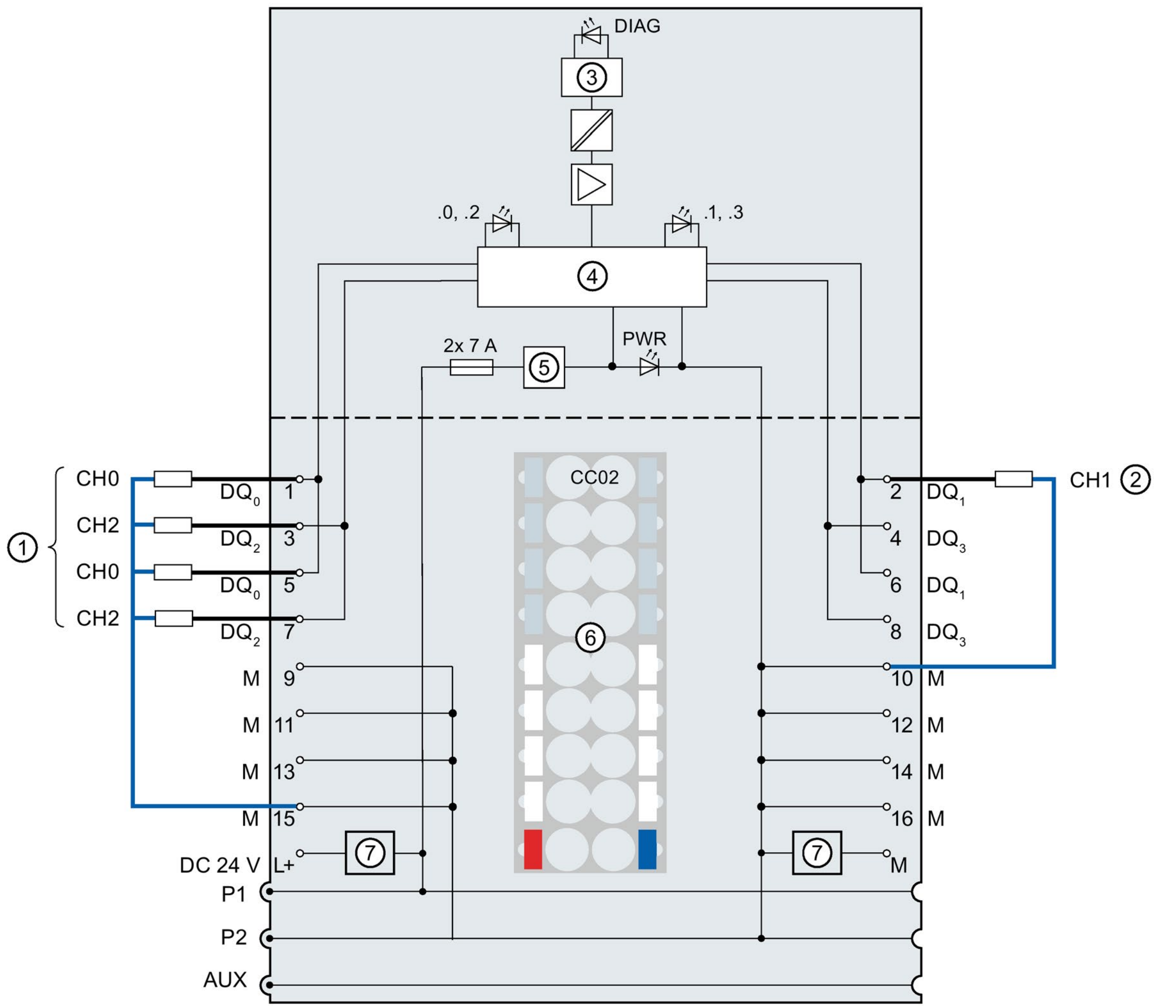
Note

Cross circuit at output

Be aware that voltage from a cross-circuit at the output can feed L+ to modules.

Wiring: 1 and 2-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 4×24VDC/2A ST on the BaseUnit BU type A0 without AUX terminals (1- and 2-wire connection).

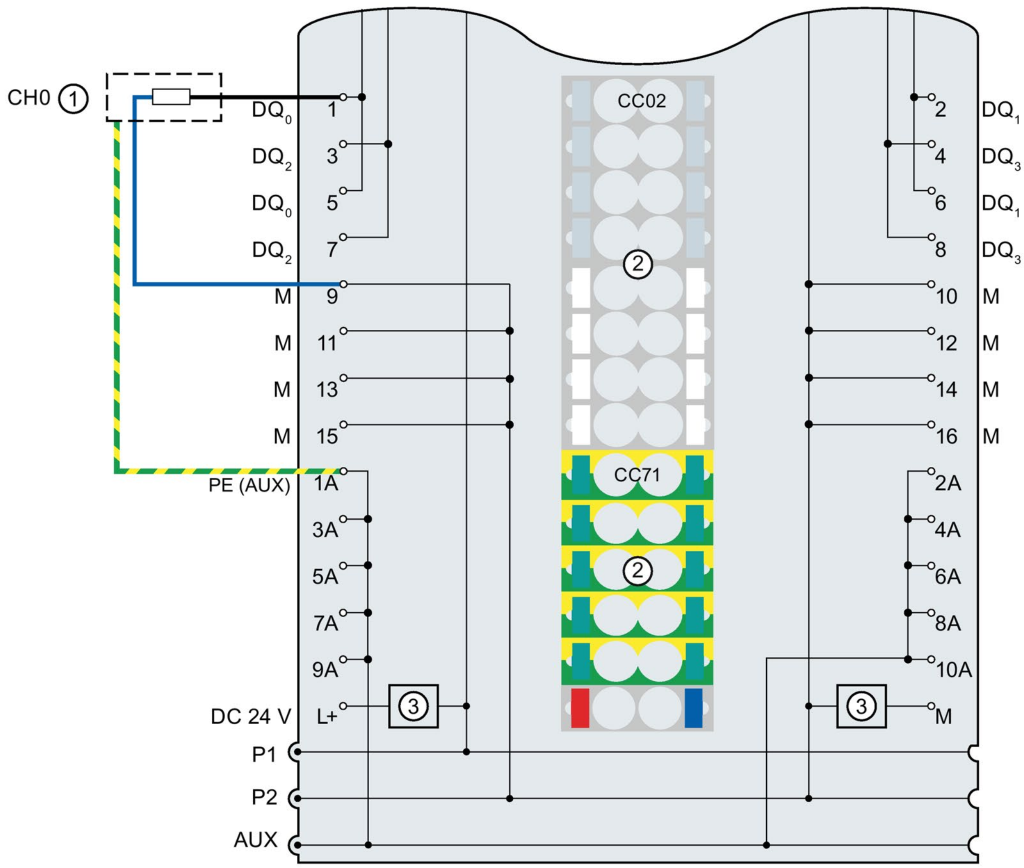


①	1-wire connection	DQ_n	Output signal, channel n
②	2-wire connection	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
③	Backplane bus interface	M	Ground
④	Output electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑤	Polarity reversal protection	DIAG	Error or diagnostics LED (green, red)
⑥	Color-coded label with color code CC02 (optional)	.0 to .3	Channel status LED (green)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	PWR	Power LED (green)

Image 3-1 Block diagram and terminal assignment for 1- and 2-wire connection of actuators

Wiring: 3-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 4×24VDC/2A ST on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection
②	Color-coded labels with color codes CC02 and CC71 (optional)
③	Filter connection supply voltage (only when light-colored BaseUnit is present)
DQn	Output signal, channel n

1 A to 10 A	AUX terminals
PE (AUX)	Protective conductor connection
24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
M	Ground
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Image 3-2 Terminal assignment for 3-wire connection of actuators

4 Parameters/address space

4.1 Parameters

Parameters for DQ 4x24VDC/2A ST

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of the parameter data record (Page 27).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassignment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics: No supply voltage L+	• Enable • Disable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to ground	• Enable • Disable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to L+	• Enable • Disable	Disable	Yes	Module	Module
Diagnostics: Wire break	• Enable • Disable	Disable	Yes	Module	Module
Channel activated	• Enable • Disable	Enable	Yes	Channel	Channel

Parameters	Range of values	Default	Parameter reassignment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 4 bytes.

Note

If one of the two parameters "Diagnostics: Short-circuit to L+" or "Diagnostics: Wire break" is enabled and one of these diagnostics occurs, the affected channel is switched off to avoid triggering an undefined load. Note that a diagnostic interrupt can only be generated when diagnostics are enabled. [1]

[1] as of module revision 06

4.2 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Diagnostics: Short-circuit to L+

Enabling of the diagnostics if a short-circuit of the actuator supply to L+ occurs.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP / substitute value

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of DQ 4x24VDC/2A ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, as of V13, SP1	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	DQ 4x24VDC/2A ST V1.0	X	X	X
1 x 4-channel without value status	DQ 4x24VDC/2A ST V1.1	X	X	X
1 x 4-channel with value status	DQ 4x24VDC/2A ST V1.1, QI	X	X	---

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the DQ 4×24VDC/2A ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

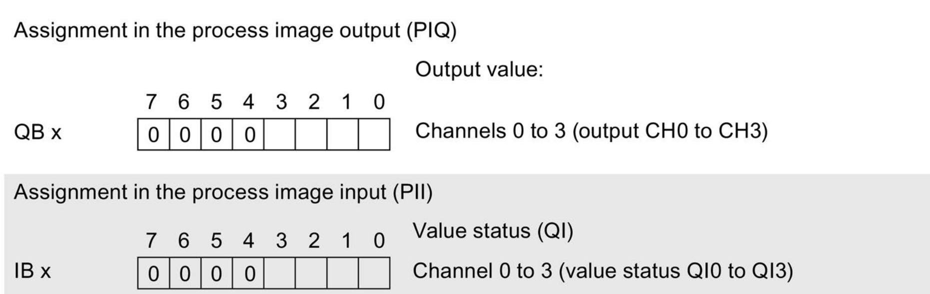


Image 4-1 Address space of the DQ 4×24VDC/2A ST with value status

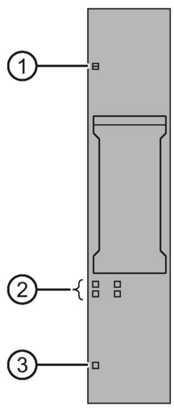
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The figure below shows the LED displays of the DQ 4x24VDC/2A ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Image 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 20).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
on	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
off	Channel deactivated or activated and process signal = 0
on	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
off	No supply voltage L+
on	Supply voltage L+ present

5.2 Interrupts

The DQ 4×24VDC/2A ST digital output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

You can connect 2 actuators per output.

The diagnostics of the two actuators influenced each other in the case of duplicate wiring.

This means:

- a wire break is only signaled if both actuators are affected
- a single short-circuit affects both actuators

Note

Parallel connection of two outputs

For parallel connection of two outputs for redundant control of a load, the channel diagnostics "Short-circuit to L+" and "Wire break" must be deactivated.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit	1_H	• Short-circuit of actuator supply to ground • Short-circuit of actuator supply to L+	Correct the process wiring
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, e.g. use cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor to the actuator contacts in the load resistance range
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

Technical specifications 6

6.1 Technical specifications

Technical specifications of the DQ 4×24VDC/2A ST

	6ES7132-6BD20-0BA0
General information	
Product type designation	ET 200SP, DQ 4x24VDC/2A ST, PU 1
Firmware version	V1.1
• FW update possible	Yes
Usable BaseUnits	BU type A0

Diagnostics	Yes
Monitoring of the supply voltage	Yes
Wire break	Yes; module by module
Short-circuit	Yes; module by module
Group error	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and backplane bus	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic insulation)
Insulation	
Insulation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	30 g

Safety-related shutdown

Note

The digital output module DQ 4x24VDC/2A ST supports safety-related shutdown in connection with a fail-safe power module F-PM-E 24VDC/8A PPM ST:

- SIL according to IEC 61508: 2
- Highest attainable safety class in safety mode, performance level according to EN ISO 13849-1: d

Residual current for signal state "0"

Note

Residual current for signal state "0"

Due to the Diagnostics: Wire break function, there is a low level of residual current in the "0" signal state at the output, which may cause the display diodes to flicker.

This residual current does not depend on the setting for the Diagnostics: Wire break parameter.

Derating trend

The following figure show the load current derating with horizontal and vertical mounting positions.

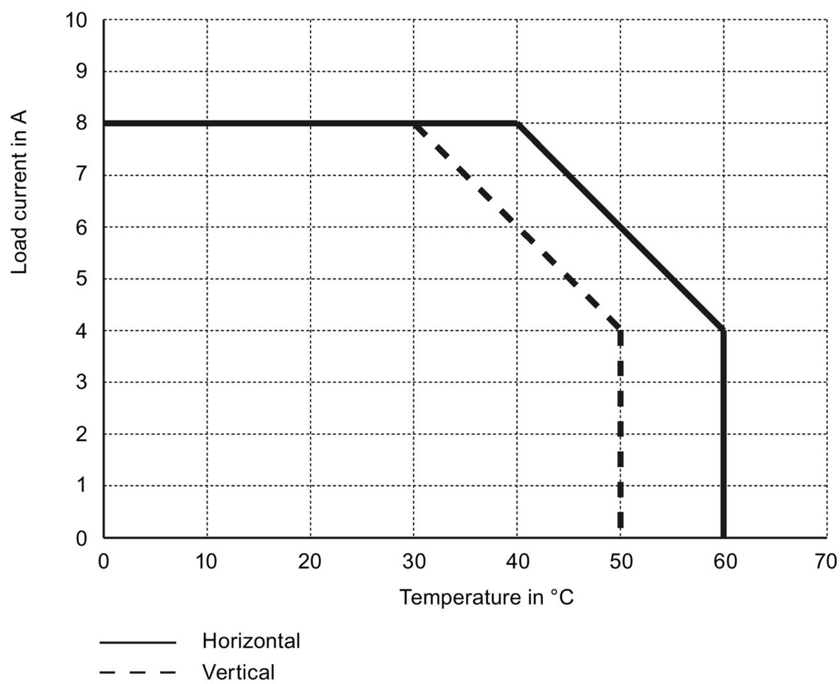

Image 6-1 Load current for mounting position

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

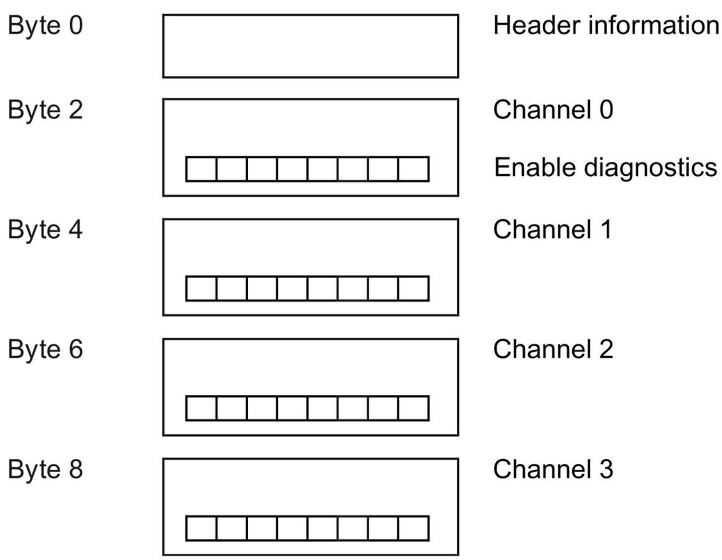

Image A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

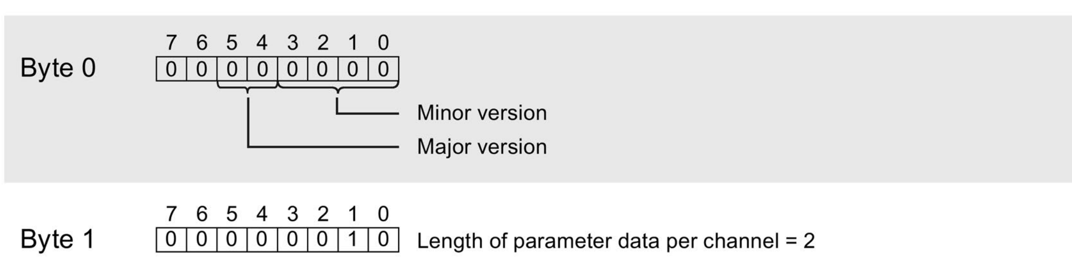

Image A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".

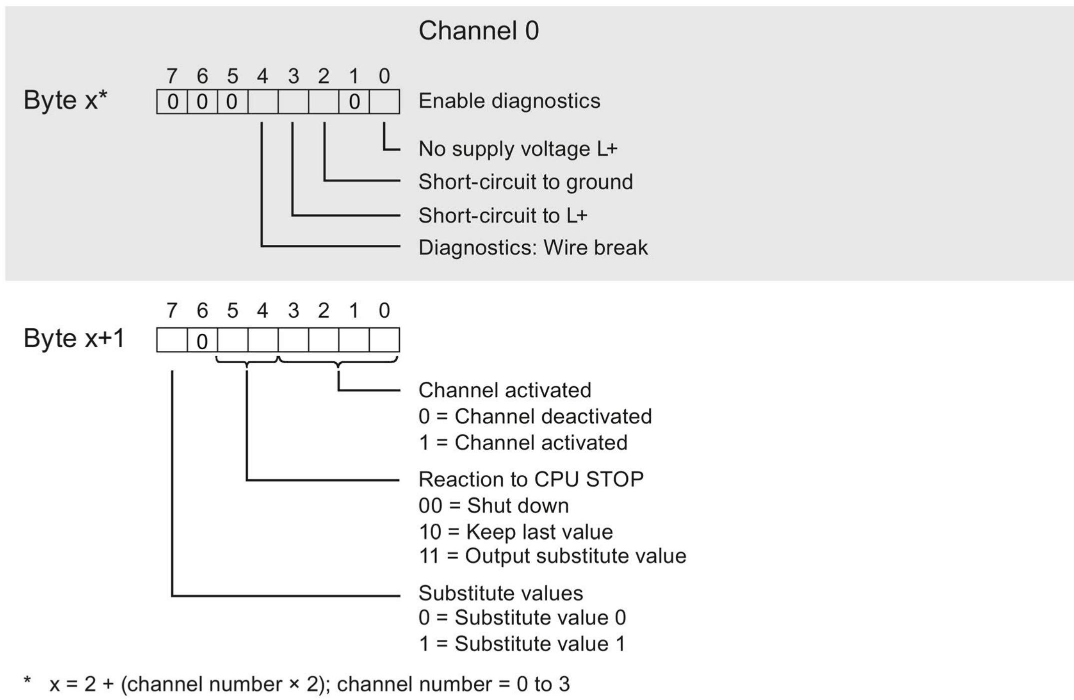

Image A-3 Structure byte x to x+1 for the channels 0 to 3

Error transmitting the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine whether the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	E0	xx	Wrong version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	E1	xx	Parameter error	Check the parameters of the module

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7132-6BF00-0BA0 to 6ES7132-6BF01-0BA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

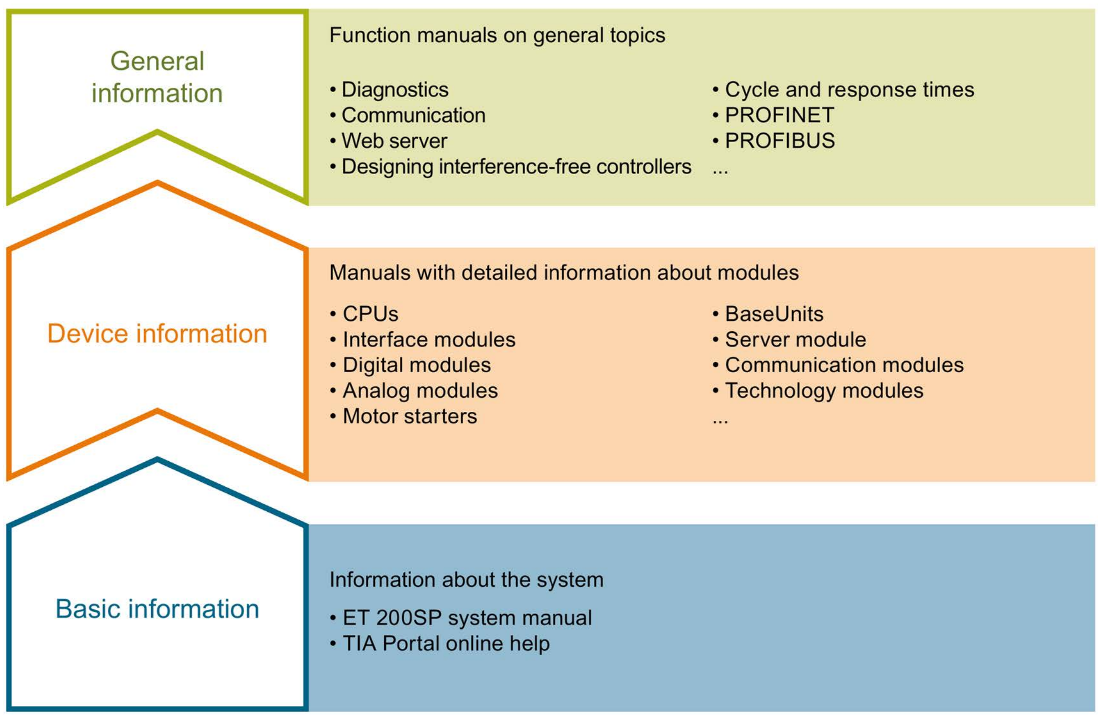
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 Product overview

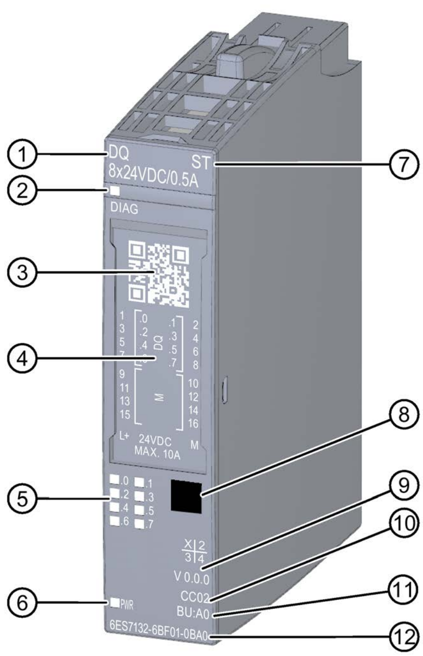
2.1 Properties

Article number

6ES7132-6BF01-0BA0 (number in package unit: 1 unit)

6ES7132-6BF01-2BA0 (number in package unit: 10 units)

View of the module



①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color coding module type
③	2D matrix code	⑨	Function and firmware version
④	Wiring diagram	⑩	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the module DQ 8×24VDC/0.5A ST

Properties

The module has the following technical properties:

- Digital output module with 8 outputs
- Supply voltage L+
- Output current 0.5 A per channel
- Source output (PNP)
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Safety-related shutdown

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
PROFIenergy	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring up 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 8x24VDC/0.5A ST module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection.

You can use and combine the different wiring options for all channels.

You can find information on wiring the BaseUnit in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

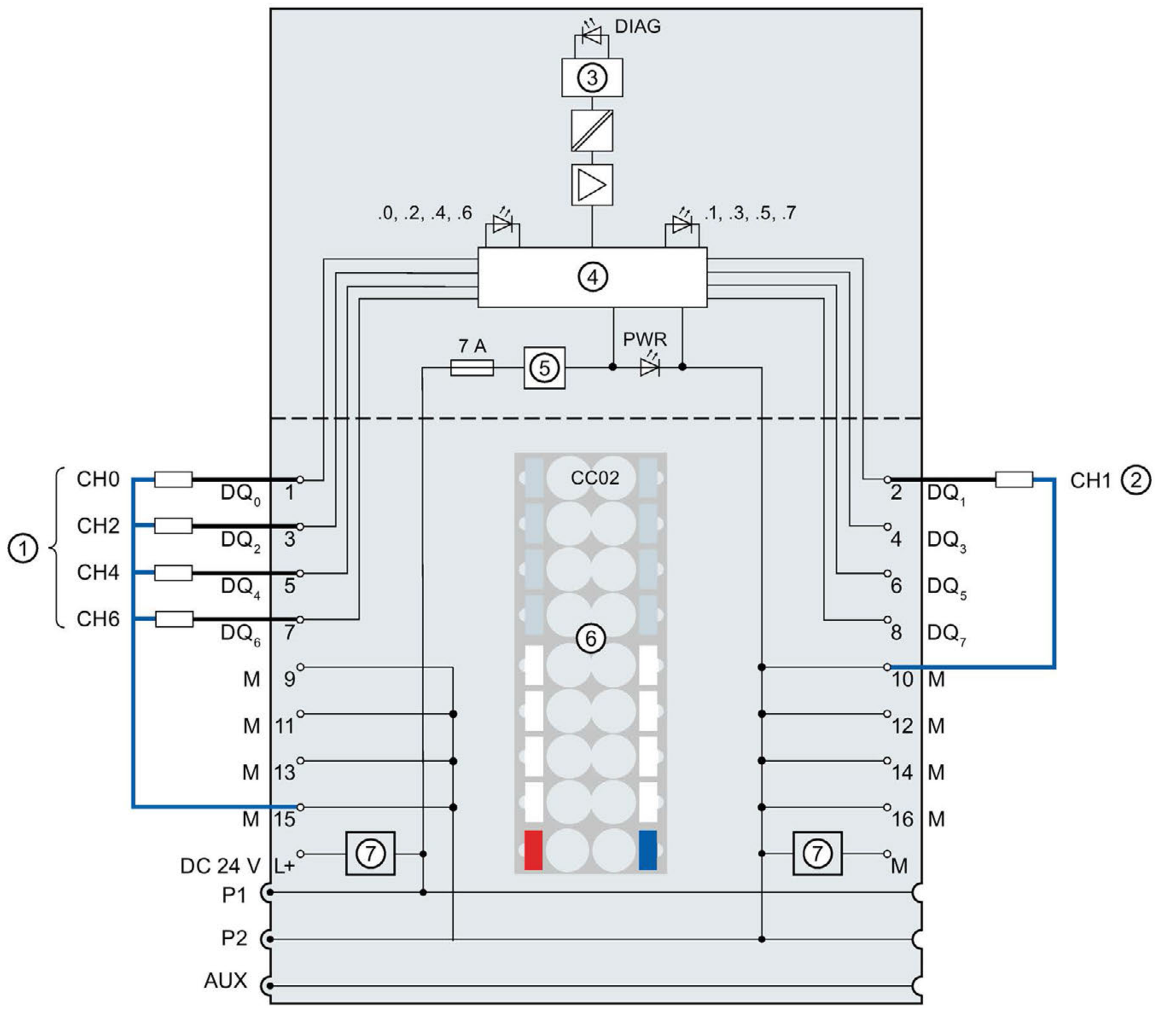
Note

Cross circuit at output

Be aware that voltage from a cross-circuit at the output can feed L+ to modules.

Wiring: 1 and 2-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 8×24VDC/0.5A ST on the BaseUnit BU type A0 without AUX terminals (1-wire and 2-wire connection).

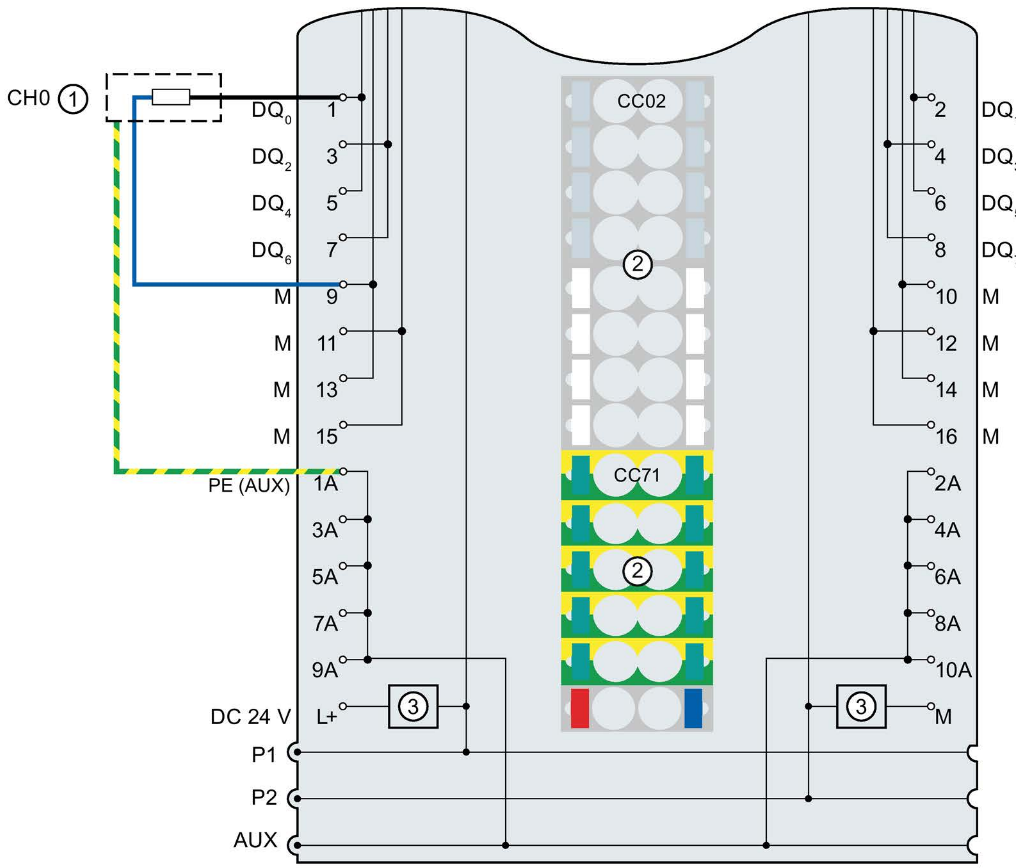


①	1-wire connection	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
②	2-wire connection	M	Ground
③	Backplane bus interface	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Output electronics	DQ_n	Output signal, channel n
⑤	Polarity reversal protection	DIAG	Error or diagnostics LED (green, red)
⑥	Color-coded label with color code CC02 (optional)	.0 to .7	Channel status LED (green)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	PWR	Power LED (green)

Figure 3-1 Block diagram and terminal assignment for 1- and 2-wire connection of actuators

Wiring: 3-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 8×24VDC/0.5A ST on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A to 10 A	AUX terminals
②	Color-coded labels with color codes CC02 and CC71 (optional)	PE (AUX)	Protective conductor connection
③	Filter connection supply voltage (only when light-colored BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
DQ_n	Output signal, channel n	M	Ground
		P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Terminal assignment for 3-wire connection of actuators

Parameters/address space 4

4.1 Parameters

Parameters for DQ 8x24VDC/0.5A ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records, see section Parameter assignment and structure of parameter data record (Page 29).

The following parameter settings are possible:

Table 4- 1 Settable parameters and their defaults (GSD file)

Parameters	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Short-circuit to L+	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Wire break	• Disable • Enable	Disable	yes	Module	Module
Channel activated	• Disable • Enable	Enable	yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	no	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 16 bytes.

Note

If both parameters "Diagnostics: short-circuit to L+" and "Diagnostics: wire break" are enabled and one of these diagnostic events occurs, the affected channel is switched off to avoid triggering an undefined load and the corresponding diagnostic alarm.

If both parameters "Diagnostics: short-circuit to L+" and "Diagnostics: wire break" are enabled and one of these diagnostic events occurs, the affected channel is switched off to avoid triggering an undefined load and the corresponding diagnostic alarm.

If the parameter "Diagnostics: short-circuit to L+" is enabled and "Diagnostics: wire break" is disabled, the signal status is retained at the affected channel when "Diagnostics: short-circuit to L+" occurs. A diagnostic alarm is triggered only for 0 signal.

4.2 Explanation of the parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Diagnostics short-circuit to L+

Enabling of the diagnostics if a short-circuit of the actuator supply to L+ occurs.

Diagnostics wire break

Enabling of the diagnostics if the line to the actuator is broken.

Channel activated

Determines whether a channel is enabled or disabled.

Reaction to CPU STOP

Specifies the behavior of the module if the CPU changes to STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DQ 8x24VDC 0.5A ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DQ 8x24VDC 0.5A ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 8-channel with value status	DQ 8x24VDC 0.5A ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 7 in this byte are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the DQ 8×24VDC/0.5A ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

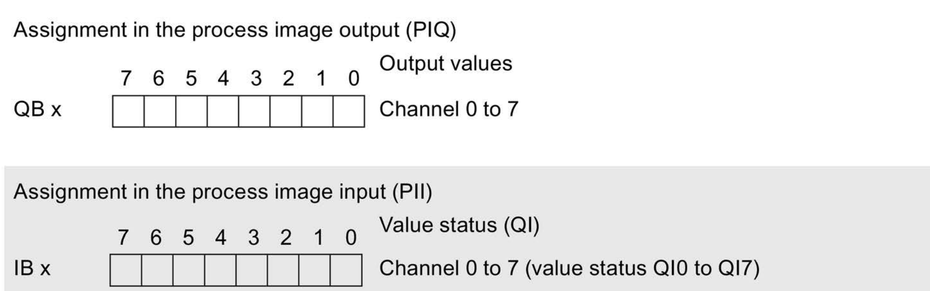


Figure 4-1 Address space of the DQ 8×24VDC/0.5A ST with value status

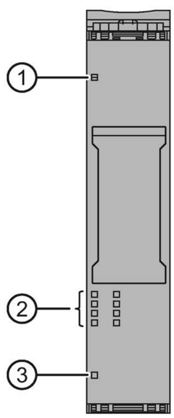
Interrupts/diagnostics alarms

5

5.1 Status and error display

LED display

DQ 8x24VDC/0.5A ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 23).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
□ off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
■ on	Module parameters assigned
Flashes	Module diagnostics is available

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
□ off	Channel deactivated or activated and process signal = 0
■ on	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
□ off	No supply voltage L+
■ on	Supply voltage L+ present

5.2 Interrupts

The digital output module DQ 8x24...24VDC/0.5A ST supports diagnostic interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt for the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- No supply voltage

5.3 Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and how to deal with them

Diagnostics alarm	Error code	Meaning	Remedy
Short-circuit	1_H	• Short-circuit of actuator supply to ground • Short-circuit of actuator supply to L+	Correct the process wiring
Wire break	6_H	Actuator circuit impedance too high.	Use a different actuator type or wire differently, e.g. use cables with a larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor to the actuator contacts in the load resistance range
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

Technical specifications 6

6.1 Technical specifications

Technical specifications of the DQ 8x24VDC/0.5A ST

Article number	6ES7132-6BF01-0BA0
General information	
Product type designation	DQ 8x24 VDC/0.5 A ST
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC02
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3 or higher
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	No
Redundancy	
• Redundancy capability	Yes

Article number	6ES7132-6BF01-0BA0
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V

• for signal "1" permissible range, max.	0.5 A
• for signal "0" residual current, max.	0.1 mA
Output delay with resistive load	
• "0" to "1", max.	50 μs; at rated load
• "1" to "0", max.	100 μs; at rated load
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	100 Hz
• with inductive load, max.	2 Hz
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per channel, max.	0.5 A
• Current per module, max.	4 A
Total current of the outputs (per module)	
horizontal installation	
– up to 30 °C, max.	4 A
– up to 40 °C, max.	4 A
– up to 50 °C, max.	4 A
– up to 60 °C, max.	4 A
vertical installation	
– up to 30 °C, max.	4 A; in all other mounting positions
– up to 40 °C, max.	4 A; in all other mounting positions
– up to 50 °C, max.	4 A; in all other mounting positions
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No

Article number	6ES7132-6BF01-0BA0
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; Module-wise
• Short-circuit to M	Yes; Module-wise
• Short-circuit to L+	Yes; Module-wise
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety-oriented group deactivation	Yes
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; in all other mounting positions
• vertical installation, max.	50 °C; in all other mounting positions
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m

Safety-related shutdown

Note

The digital output module DQ 8x24VDC/0.5A ST supports safety-related shutdown in connection with a fail-safe power module F-PM-E 24VDC/8A PPM ST:

- SIL according to IEC 61508: 2
- Highest attainable safety class in safety mode, performance level according to EN ISO 13849-1: d

Residual current for signal state "0"

Note

Residual current for signal state "0"

Due to the Diagnostics: Wire break function, there is a low level of residual current in the "0" signal state at the output, which may cause the display diodes to flicker.

This residual current does not depend on the setting for the Diagnostics: Wire break parameter.

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to reconfigure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

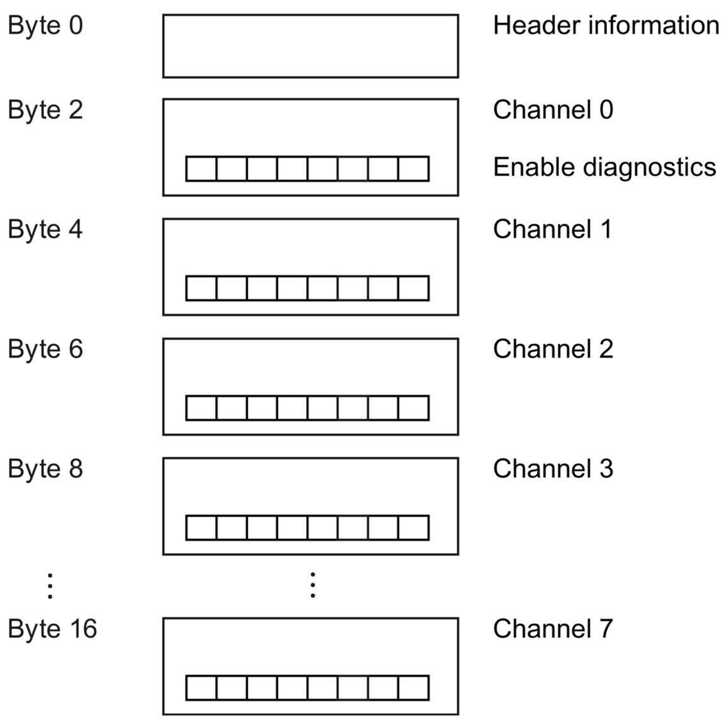

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

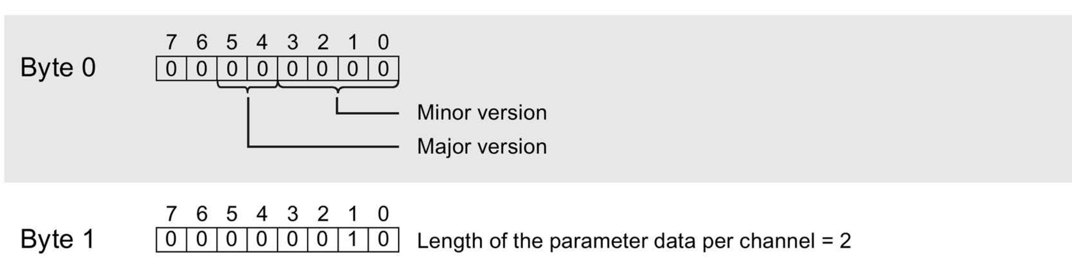

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

You enable a parameter by setting the corresponding bit to "1".

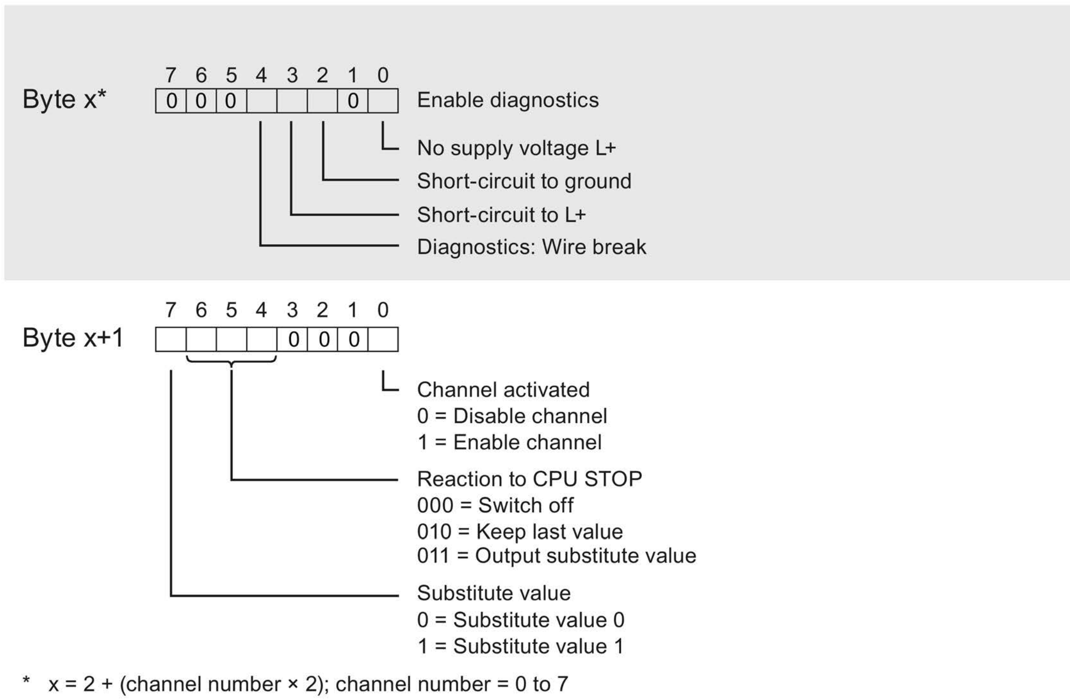

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Number in pack: 10 units (6ES7132-6BF00-2CA0)

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

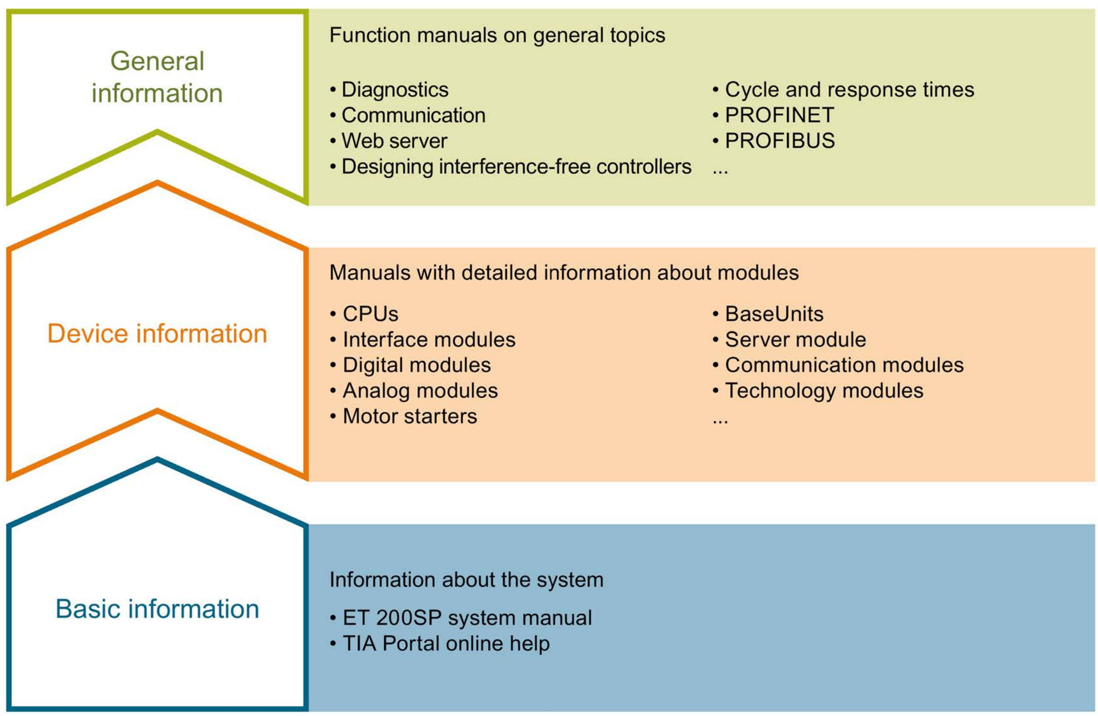
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the module DQ 8x24VDC/0,5A HF

Properties

The module has the following technical properties:

- Digital output module with 8 outputs
- Source output (PNP, P-switching)
- Supply voltage L+
- Output current 0.5 A (per channel)
- Configurable diagnostics (per channel)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Safety-related shutdown

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V1.0.0 or higher	V14 SP1 or higher	V5.5 SP3 or higher	X	X
Identification data I&M0 to I&M3	FS01	V1.0.0 or higher	V12 or higher	V5.5 SP3 or higher with HSP 0230 V1.0 or higher	X	X
Configuration in RUN	FS01	V1.0.0 or higher	V12 or higher	V5.5 SP3 or higher	X	X
PROFIenergy	FS01	V1.0.0 or higher	V14 SP1 or higher	V5.5 SP3 or higher	X	X
Value status	FS01	V1.1.0 or higher	V14 SP1 or higher	V5.5 SP3 or higher with HSP 0230 V2.0 or higher	X	X
Isochronous mode	FS01	V1.1.0 or higher	V14 SP1 or higher	V5.5 SP3 or higher	X	X
Module-internal shared input (MSI)	FS01	V1.2.0 or higher	V14 SP1 V13 or higher	V5.5 SP3 or higher	X	X
Configurable submodule/submodules for shared device	FS01	V2.0.0 or higher	V14 SP1 or higher	V5.5 SP3 or higher	X	X

Accessories

The following accessories are supplied with the module and can also be ordered separately as spare parts:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manual Distributed I/O System ET 200SP.

See also

ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293)

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 8x24VDC/0.5A HF module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection.

You can use and combine the different wiring options for all channels.

You can find information on wiring the BaseUnit in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Note

- The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

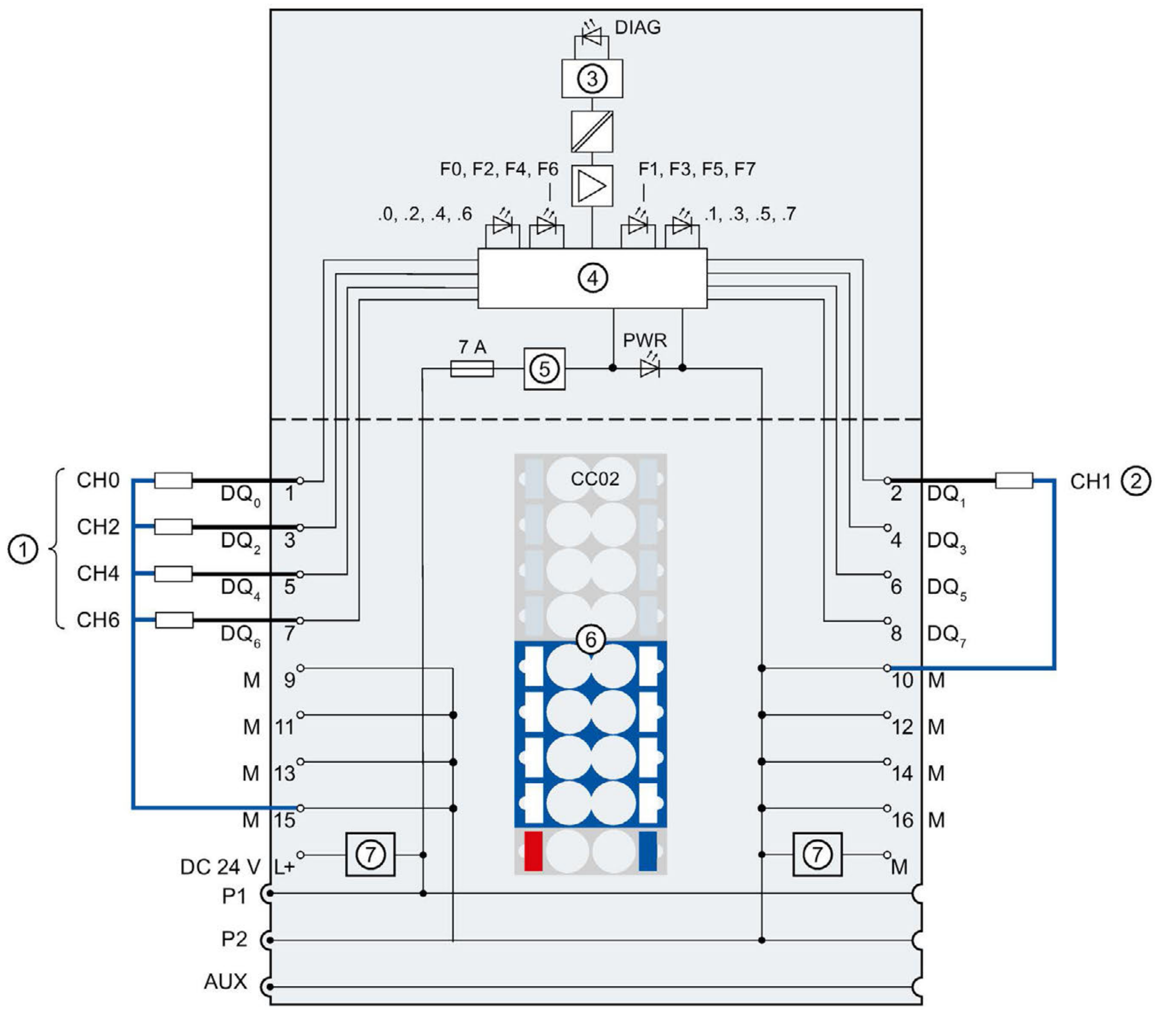
Note

Cross circuit at output

Be aware that voltage from a cross-circuit at the output can feed L+ to modules.

Wiring: 1 and 2-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 8×24VDC/0.5A HF on the BaseUnit BU type A0 without AUX terminals (1- and 2-wire connection).



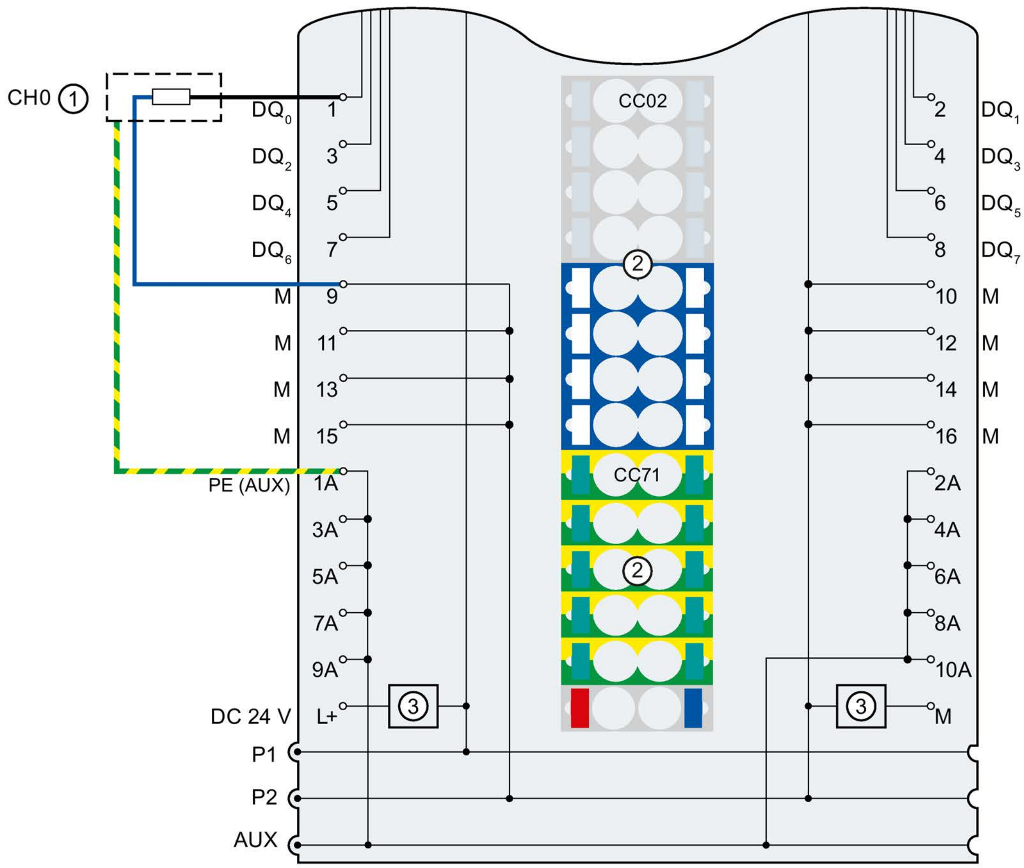
①	1-wire connection	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
②	2-wire connection	M	Ground
③	Backplane bus interface	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Output electronics	DQ_n	Output signal, channel n
⑤	Polarity reversal protection	DIAG	Error or diagnostics LED (green, red)
⑥	Color-coded label with color code CC02 (optional)	.0 to .7	Channel status LED (green)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	F0 to F7	Channel fault LED (red)

PWR	Power LED (green)

Figure 3-1 Block diagram and terminal assignment for 1- and 2-wire connection of actuators

Wiring: 3-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 8×24VDC/0.5A HF on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A to 10 A	AUX terminals
②	Color-coded labels with color codes CC02 and CC71 (optional)	PE (AUX)	Protective conductor connection
③	Filter connection supply voltage (only when light-colored BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
DQ_n	Output signal, channel n	M	Ground
		P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Terminal assignment for 3-wire connection of actuators

Parameters/address space 4

4.1 Parameters

Parameters of the DQ 8x24VDC/0.5A HF

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records (see chapter Parameter assignment and structure of the parameter data record (Page 35)).

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	Yes	Channel	Channel [1]
Diagnostics: Short-circuit to L	• Disable • Enable	Disable	Yes	Channel	
Diagnostics Wire break	• Disable • Enable	Disable	Yes	Channel	Channel
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module [1]
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 7 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter, however, with data records 64 to 71 or data record 128, see Appendix "Parameter data record".

Note

If one of the two parameters "Diagnostics: Short-circuit to L+" or "Diagnostics: Wire break" is enabled and one of these diagnostics occurs, the affected channel is switched off to avoid triggering an undefined load. Note that a diagnostic interrupt can only be generated when diagnostics are enabled. *

* as of module revision 05

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Diagnostics: Short-circuit to L+

Enabling of the diagnostics if a short-circuit of the actuator supply to L+ occurs.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

See system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of DQ 8x24VDC/0.5A HF

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, as of V13, SP1	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DQ 8x24VDC/0.5A HF V1.0	X	X	X
1 x 8-channel without value status	DQ 8x24VDC/0.5A HF V1.1	X	X	X
1 x 8-channel with value status	DQ 8x24VDC/0.5A HF V1.1, QI	X	X	---
1 x 8-channel without value status	DQ 8x24VDC/0.5A HF V1.2	X	X	X
1 x 8-channel with value status	DQ 8x24VDC/0.5A HF V1.2, QI	X	X	---
1 x 8-channel with value status for module-internal Shared Output with up to 4 submodules	DQ 8x24VDC/0.5A HF V1.2, MSO	X	X	---
1 x 8-channel without value status	DQ 8x24VDC/0.5A HF V2.0	---	X	X
1 x 8-channel with value status	DQ 8x24VDC/0.5A HF V2.0, QI	---	X	---
1 x 8-channel with value status for module-internal Shared Output with up to 4 submodules	DQ 8x24VDC/0.5A HF V2.0, MSO	---	X	---
2 x 4-channel without value status	DQ 8x24VDC/0.5A HF V2.0, S.2	---	X	---
2 x 4-channel with value status	DQ 8x24VDC/0.5A HF V2.0, S.2 QI	---	X	---
4 x 2-channel without value status	DQ 8x24VDC/0.5A HF V2.0, S.4	---	X	---
4 x 2-channel with value status	DQ 8x24VDC/0.5A HF V2.0, S.4 QI	---	X	---

---

Note

The following functions are only fully available when the submodule X.1 is configured and the IO controller to which submodule X.1 is assigned has established a connection to the IO device.

- Firmware update
- I&M identification data
- PROFIenergy

---

2 x 4- / 4 x 2-channel configuration

For the configuration, the channels of the module are divided into multiple submodules. The submodules can be assigned to different IO controllers when the module is used in a Shared Device.

The number of usable submodules is dependent on the interface module used. Read the information in the manual for the particular interface module.

Value status (Quality Information, QI)

The value status is always activated for the following module names:

- DQ 8x24VDC/0.5A HF QI
- DQ 8x24VDC/0.5A HF MSO

An additional bit is assigned to each channel for the value status. The bit for the value status indicates if the output value specified by the user program is actually pending at the module terminal (0 = value is incorrect).

Address space for configuration as 1 x 8-channel DQ 8x24VDC/0.5A HF

The figure below shows the address space assignment for configuration as a 1 x 8-channel module without value status

Assignment in the process image output (PIQ)

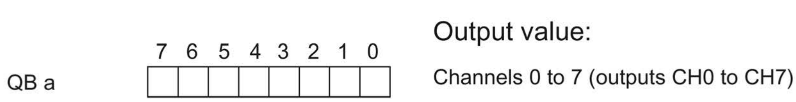


Figure 4-1 Address space for configuration as 8-channel DQ 8x24VDC/0.5A HF, QI without value status

Address space for configuration as 1 x 8-channel DQ 8x24VDC/0.5A HF, QI

The following figure shows the assignment of the address space for the configuration as 1 x 8-channel module with value status. You can freely assign the start address for the module. The addresses of the channels are derived from the start address.

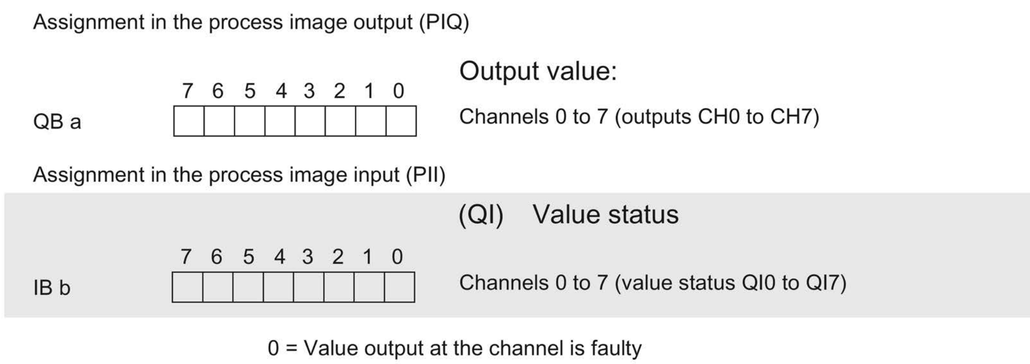

Figure 4-2 Address space for configuration as 8-channel DQ 8x24VDC/0.5A HF, QI with value status

Address space for configuration as 1 x 8-channel DQ 8x24VDC/0.5A HF, MSO

For the configuration as a 1 x 8-channel module (module-internal Shared Output, MSO), channels 0 to 7 of the module are copied to up to four submodules. Channels 0 to 7 are then available with identical values in various submodules. These submodules can be assigned to up to four IO controllers when the module is used in a shared device:

- The IO controller to which submodule 1 is assigned has write access to outputs 0 to 7.
- The IO controllers to which submodule 2, 3, or 4 is assigned have read access to outputs 0 to 7.

Value status (Quality Information,QI)

The meaning of the value status depends on the submodule on which it occurs.

For the 1st submodule (=basic submodule), the value status 0 indicates that the value is incorrect or that the IO controller of the basic submodule is in STOP state.

For the 2nd to 4th submodule (=MSO submodule), the value status 0 indicates that the value is incorrect or one of the following errors has occurred:

- The basic submodule is not yet configured (not ready).
- The connection between the IO controller and the basic submodule has been interrupted.
- The IO controller of the basic submodule is in STOP or POWER OFF state.

The following figure shows the assignment of the address space for submodules 1, 2, 3, and 4 and the value status.

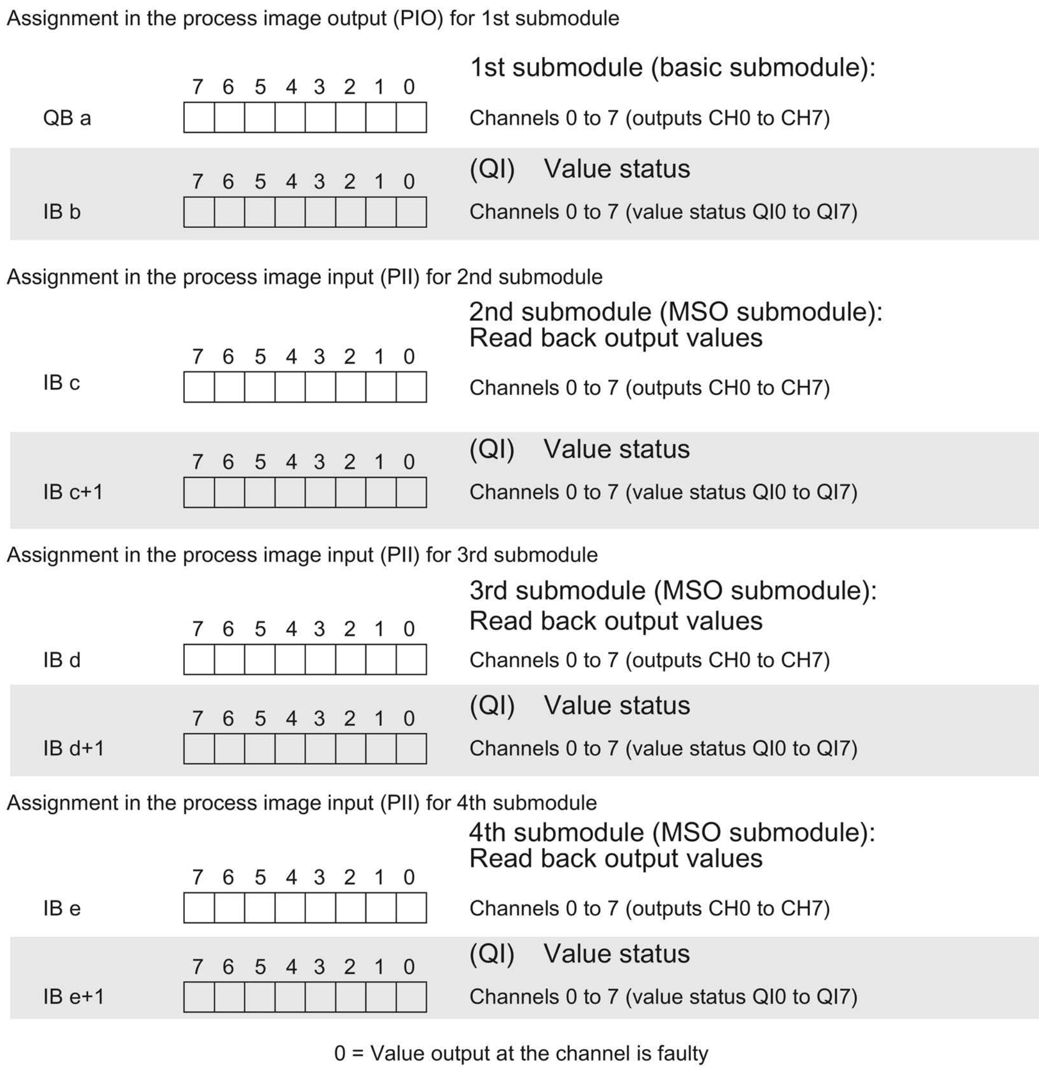

Figure 4-3 Address space for configuration as 1 x 8-channel DQ 8x24VDC/0.5A HF MSO with value status

Address space for configuration as 2 x 4-channel DQ 8x24VDC/0.5A HF V2.0, S.2

The figure below shows the address space assignment for configuration as a 2 x 4-channel module without value status.

Each of the two submodules has a freely assignable start address.

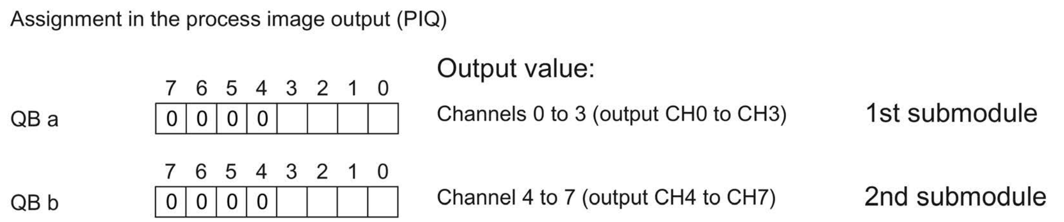

Figure 4-4 Address space for configuration as 2 x 4-channel DQ 8x24VDC/0.5A HF V2.0, S.2 without value status

Address space for configuration as 2 x 4-channel DQ 8x24VDC/0.5A HF V2.0, S.2 QI

The figure below shows the address space assignment for configuration as a 2 x 4-channel module with value status.

Each of the two submodules has a freely assignable start address.

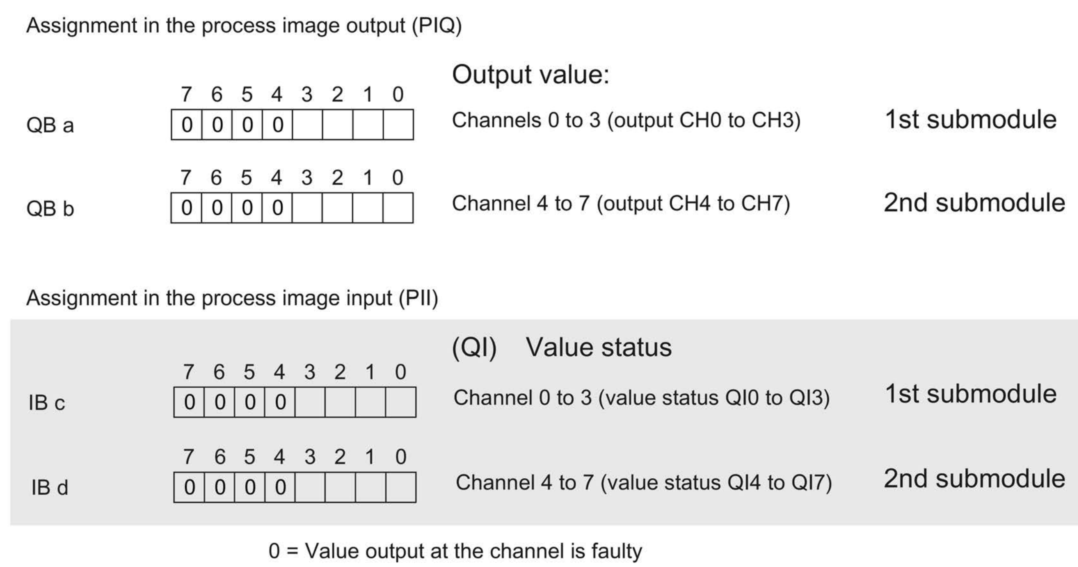

Figure 4-5 Address space for configuration as 2 x 4-channel DQ 8x24VDC/0.5A HF V2.0, S.2 QI with value status

Address space for configuration as 4 x 2-channel DQ 8x24VDC/0.5A HF V2.0, S.4

The figure below shows the address space assignment for configuration as a 4 x 2-channel module without value status.

Each of the four submodules has a freely assignable start address.

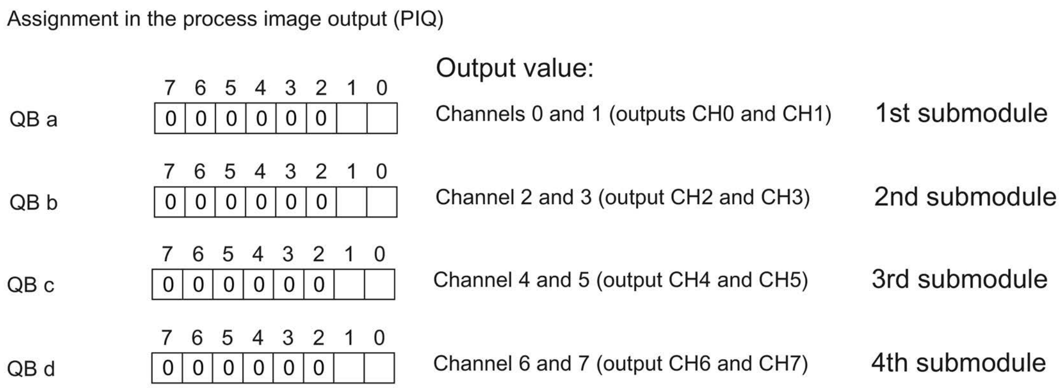

Figure 4-6 Address space for configuration as 4 x 2-channel DQ 8x24VDC/0.5A HF V2.0, S.4 without value status

Address space for configuration as 4 x 2-channel DQ 8x24VDC/0.5A HF V2.0, S.4 QI

The figure below shows the address space assignment for configuration as a 4 x 2-channel module with value status.

Each of the four submodules has a freely assignable start address.

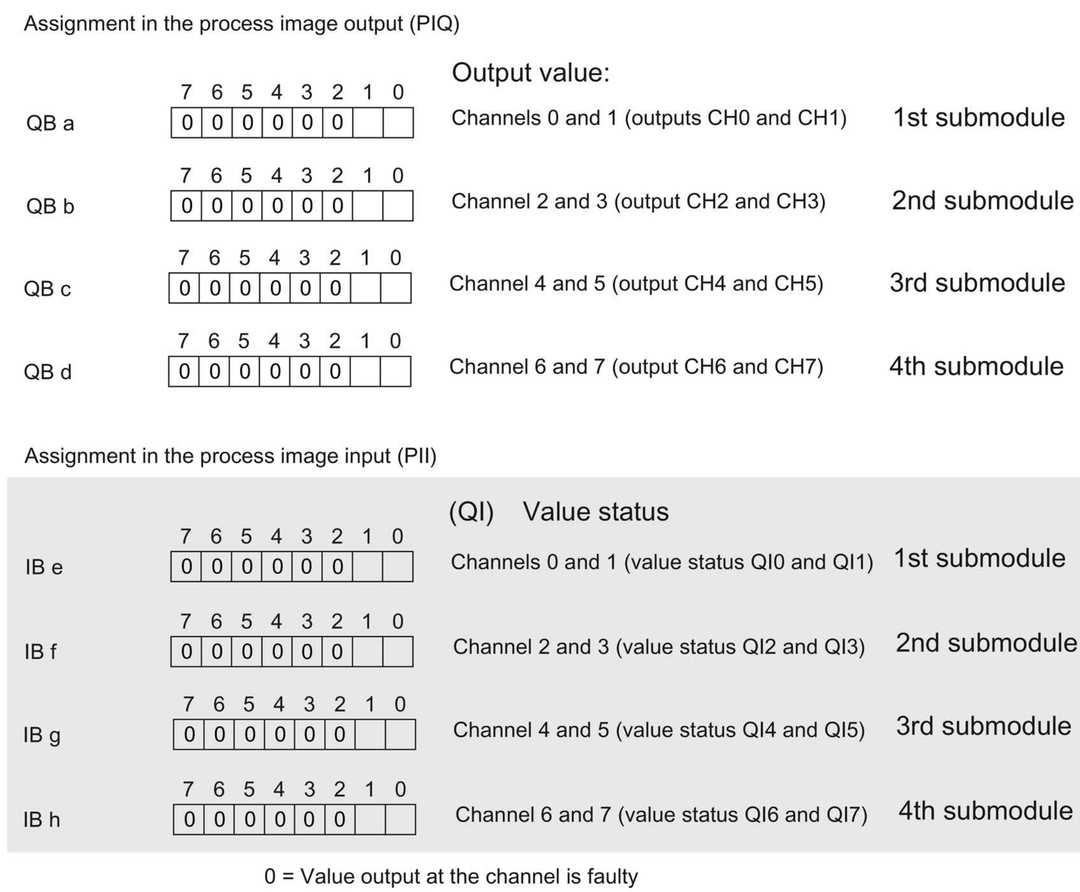

Figure 4-7 Address space for configuration as 4 x 2-channel DQ 8x24VDC/0.5A HF V2.0, S.4 QI with value status

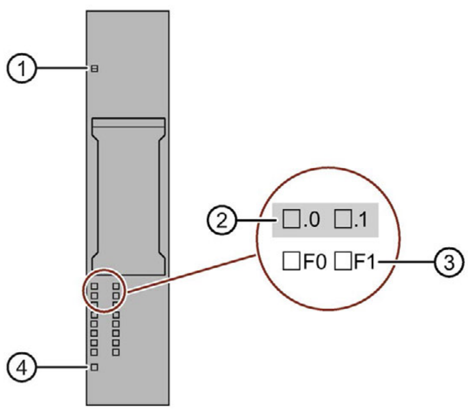
Interrupts/diagnostics alarms

5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the DQ 8x24VDC/0.5A HF:



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The tables below explain the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 30).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
■ On	Module parameters assigned and no module/channel diagnostics
Flashes	Module parameters assigned and module/channel diagnostics

LED channel status/channel error

Table 5- 2 Status / error display of the LED channel status / channel error

LED channel status	LED channel error	Meaning
□ Off	□ Off	Channel deactivated or process signal = 0 and no channel diagnostics
■ On	□ Off	Channel activated and process signal = 1 and no channel diagnostics
□ Off	■ On	Channel activated and channel diagnostics

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
□ Off	Missing supply voltage L+
■ On	Supply voltage L+ present

5.2 Interrupts

The DQ 8×24VDC/0.5A HF digital output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

Detailed information on the event is available in the STEP 7 online help.

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

Parallel connection of two outputs

For parallel connection of two outputs for redundant control of a load, the channel diagnostics "Short-circuit to L+" and "Wire break" must be deactivated.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit	1_H	• Short-circuit of actuator supply to ground [1] • Short-circuit of actuator supply to L+ [2]	Correct the process wiring
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, for example, use cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor to the actuator contacts in the load resistance range
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel/component temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

[1] only in switched state (output value 1)

[2] only in non-switched state (output value 0)

Note

In case of a short-circuit of the actuator supply to L+ at the activated channel, load distributions can occur which result in wire break diagnostics.

Technical specifications 6

6.1 Technical specifications

Technical specifications of the DQ 8x24VDC/0.5A HF

Article number	6ES7132-6BF00-0CA0
General information	
Product type designation	DQ 8x24 V DC/0.5 A HF
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC02
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1 / -
• STEP 7 configurable/integrated as of version	V5.5 / -
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	Yes
Redundancy	
• Redundancy capability	Yes

Article number	6ES7132-6BF00-0CA0
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Output voltage	
Rated value (DC)	24 V
Power loss	
Power loss, typ.	1 W
Address area	
Address space per module	
• Address space per module, max.	8 byte; 2 channels per submodule + QI information
Digital outputs	
Type of digital output	Source output (PNP, current-sourcing)
Number of digital outputs	8
Current-sinking	No
Current-sourcing	Yes
Short-circuit protection	Yes
• Response threshold, typ.	0.7 to 1.3 A
Limitation of inductive shutdown voltage to	Typ. L+ (-50 V)
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	12 kΩ
Output current	
• for signal "1" rated value	0.5 A
• for signal "0" residual current, max.	0.1 mA
Output delay with resistive load	
• "0" to "1", typ.	50 µs
• "1" to "0", typ.	100 µs
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	Yes

Article number	6ES7132-6BF00-0CA0
Switching frequency	
• with resistive load, max.	100 Hz
• with inductive load, max.	2 Hz
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per channel, max.	0.5 A
• Current per module, max.	4 A
Total current of the outputs (per module)	
horizontal installation	
– up to 60 °C, max.	4 A
vertical installation	
– up to 50 °C, max.	4 A; in all other mounting positions
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Execution and activation time (TCO), min.	48 µs
Bus cycle time (TDP), min.	500 µs
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; channel by channel
• Short-circuit	Yes; channel by channel
• Group error	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; green/red DIAG LED

Article number	6ES7132-6BF00-0CA0
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Safety-related shutdown

Note

The digital output module DQ 8x24VDC/0.5A HF supports safety-related shutdown in connection with a fail-safe power module F-PM-E 24VDC/8A PPM ST:

- SIL according to IEC 61508: 2
- Highest attainable safety class in safety mode, performance level according to EN ISO 13849-1: d

Residual current for signal state "0"

Note

Residual current for signal state "0"

Due to the Diagnostics: Wire break function, there is a low level of residual current in the "0" signal state at the output, which may cause the display diodes to flicker.

This residual current does not depend on the setting for the Diagnostics: Wire break parameter.

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

With data records 64 to 71, you can configure individual channels.

Parameter assignment in the user program

You have the option to reconfigure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The WRREC instruction is used to transfer the parameters to the module using data record 128 or data records 64 to 71. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

If you reconfigure a module and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing".

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, the STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Data record structure

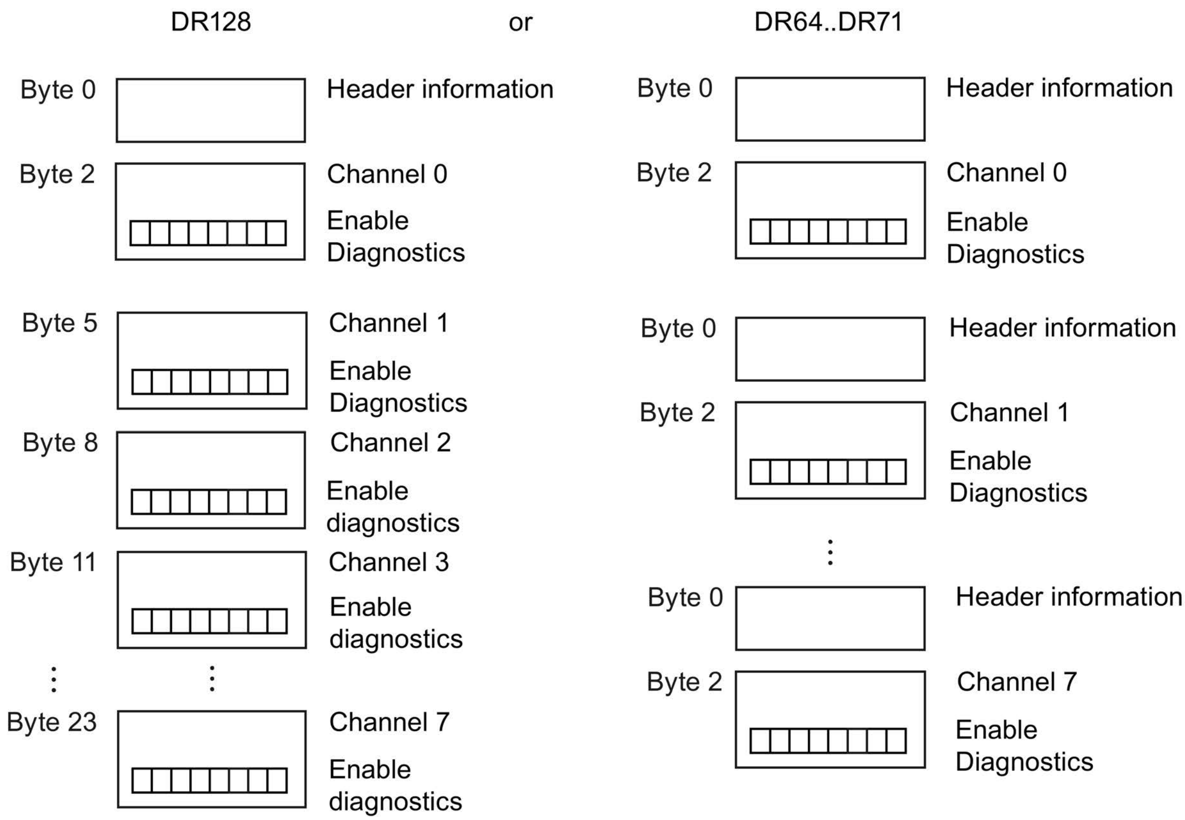


Figure A-1 Structure of data record 128 or data records 64 to 71

Header information

The figure below shows the structure of the header information.

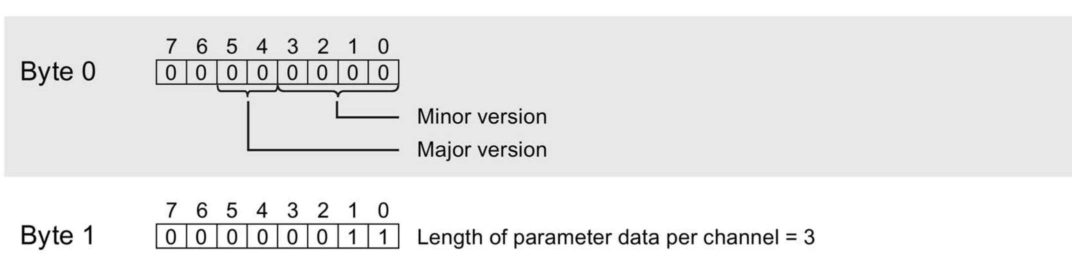

Figure A-2 Header information

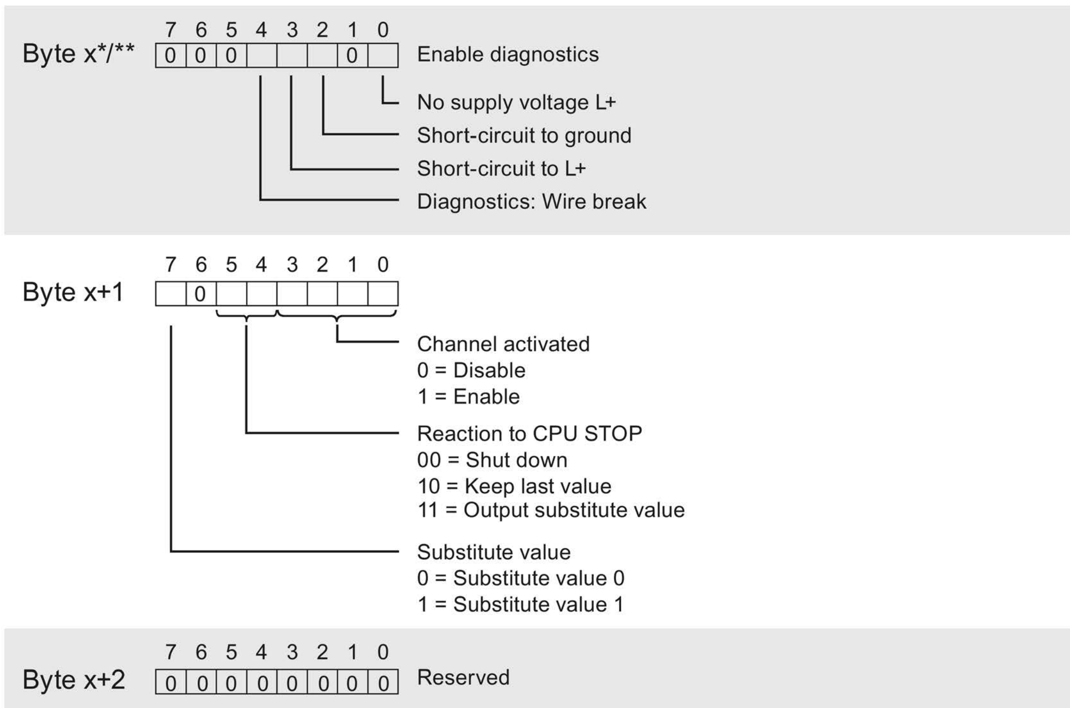
Parameter

The figure below shows the structure of the parameters for channels 0 to 7.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 3); channel number = 0 to 7 for DR 128
** x =2 for DR 64 to DR 71

Figure A-3 Structure of byte x to x+2 for channels 0 to 7

Error transmitting the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

<table>
<tr><th colspan="4">Error code in the STATUS parameter
(hexadecimal)</th><th rowspan="2">Meaning</th><th rowspan="2">Solution</th></tr>
<tr><th>Byte 0</th><th>Byte 1</th><th>Byte 2</th><th>Byte 3</th></tr>
<tr><td>DF</td><td>80</td><td>B0</td><td>xx</td><td>Number of the data record unknown</td><td>Enter a valid number for the data record.</td></tr>
<tr><td>DF</td><td>80</td><td>B1</td><td>xx</td><td>Length of the data record incorrect</td><td>Enter a valid value for the data record length.</td></tr>
<tr><td>DF</td><td>80</td><td>B2</td><td>xx</td><td>Slot invalid or unavailable</td><td>• Check the station to determine whether the module is plugged or pulled.
• Check assigned values for the parameters of the WREC instruction.</td></tr>
<tr><td>DF</td><td>80</td><td>E0</td><td>xx</td><td>Wrong version or error in the header information</td><td>Correct the version, length and number of parameter blocks.</td></tr>
<tr><td>DF</td><td>80</td><td>E1</td><td>xx</td><td>Parameter error</td><td>Check the parameters of the module</td></tr>

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7132-6BF60-0AA0 to 6ES7132-6BF6**1**-0AA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

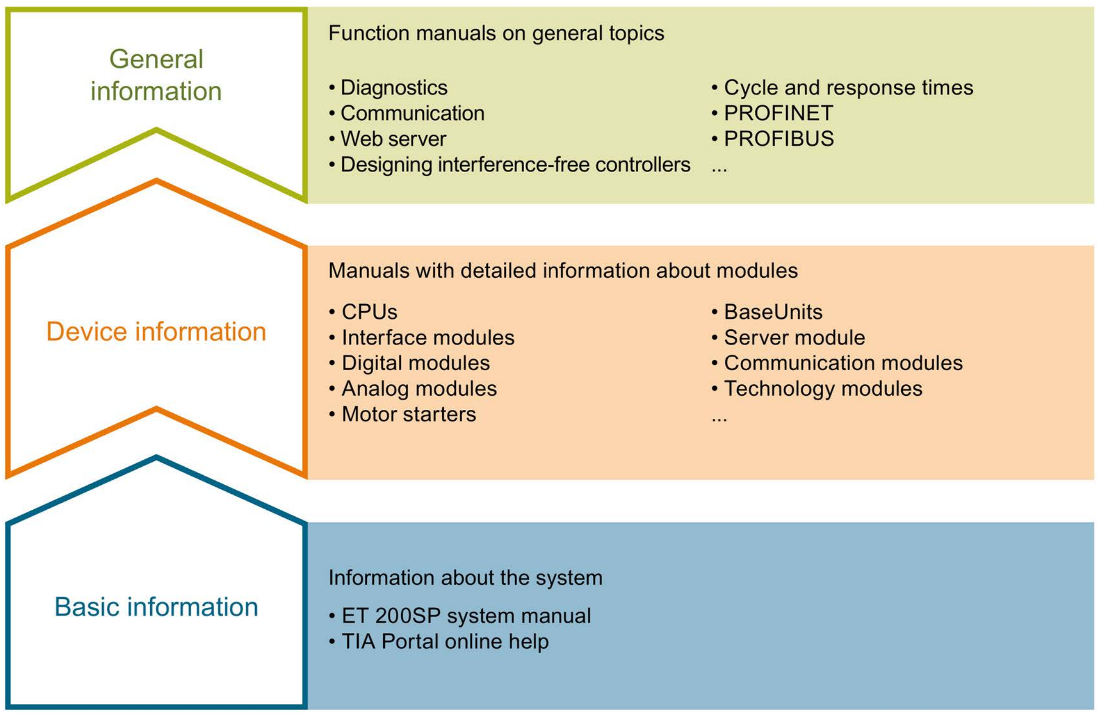
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

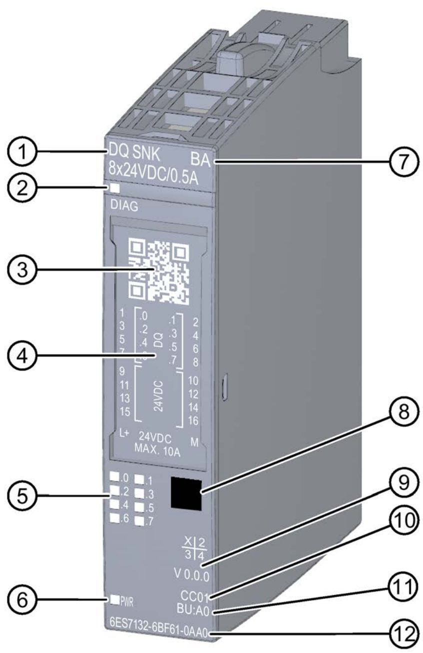
2.1 Properties

Part number

6ES7132-6BF61-0AA0

View of the module



①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color coding module type
③	2D matrix code	⑨	Function and firmware version
④	Wiring diagram	⑩	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the DQ 8×24VDC/0,5A SNK BA module

Properties

The module has the following technical properties:

- Digital output module with 8 outputs
- Sink output (NPN, M switching)

- Supply voltage L+
- Output current 0.5 A (per channel)
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X

Accessories

The following accessories are supplied with the module and can also be ordered separately as spare parts:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 8x24VDC/0.5A SNK BA module with the terminal assignments for a 1-wire and 2-wire connection.

Information about wiring of the BaseUnit is available in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

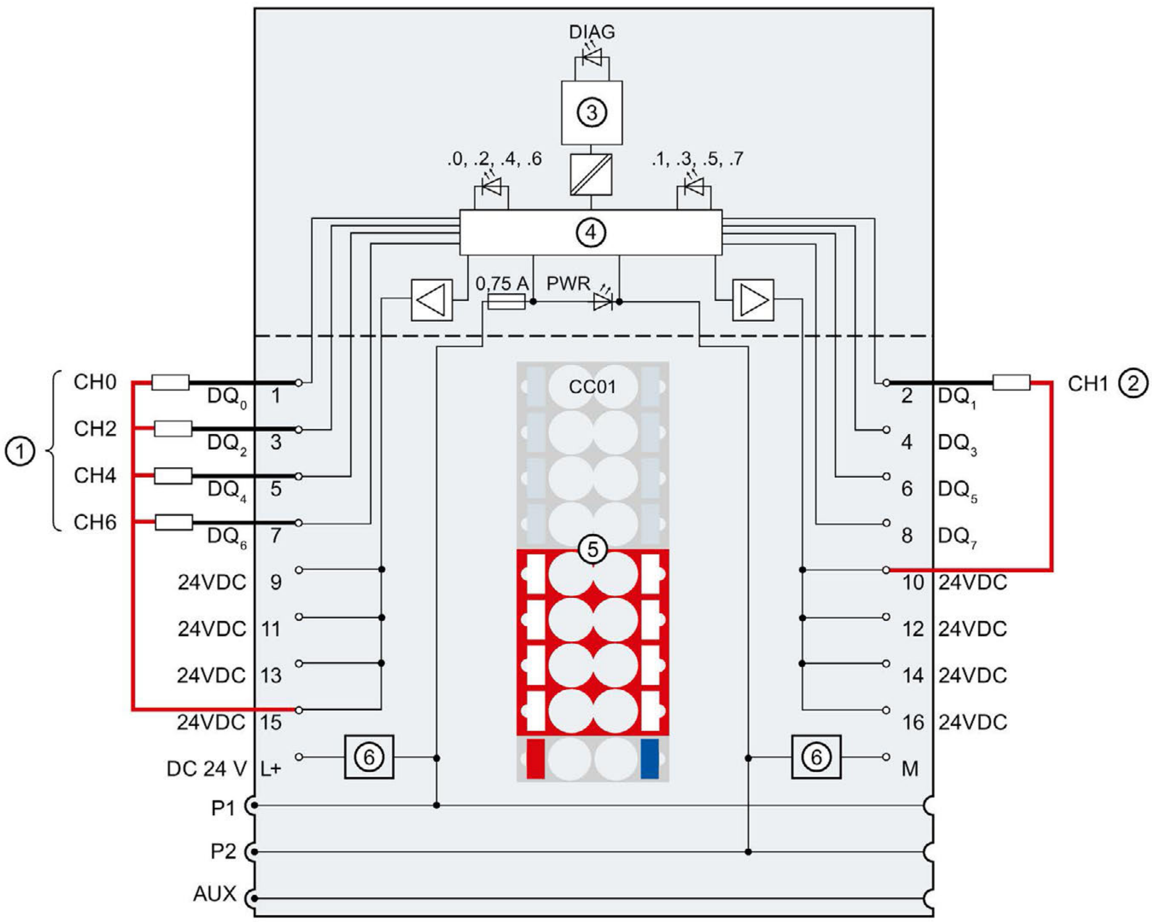
You may use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Connection: 1-wire and 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the digital input module DQ 8x24VDC/0.5A SNK BA on the BaseUnit BU type A0 without AUX terminals (1-wire and 2-wire connection).



①	1-wire connection	DQ_n	Output signal, channel n
②	2-wire connection	24 V DC	Encoder supply, channel n
③	Backplane bus interface	L+	24 V DC (feed for light-colored BaseUnit only)
④	Output electronics	M	Ground
⑤	Color identification label CCxx (optional)	DIAG	Error or Diagnostics LED (green, red)
⑥	Filter connection supply voltage (only when light-colored BaseUnit is present)	.0 to .7	Channel status LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored Ba-seUnit)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of actuators.

Parameters/address space 4

4.1 Parameters

DQ 8x24VDC/0,5A SNK BA parameters

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records (see chapter Parameter assignment and structure of the parameter data record (Page 27)).

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Value range	Default	Reconfigu-ration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP. The parameter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes for each ET 200SP station. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 16 bytes.

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of DQ 8x24VDC 0.5A SNK BA

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 8-channel without value status	DQ 8x24VDC/0,5A SNK BA V0.0	V14, SP1 or higher with HSP 0222	X	X

Address space of the digital output module DQ 8x24VDC/0,5A SNK BA

The figure below shows the assignment of the address space for DQ 8x24VDC/0,5A SNK BA

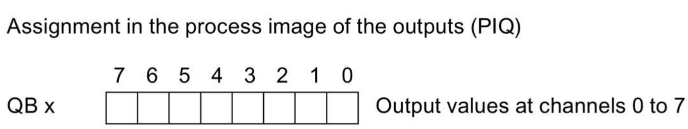

Figure 4-1 Address space of the digital output module DQ 8x24VDC/0,5A SNK BA

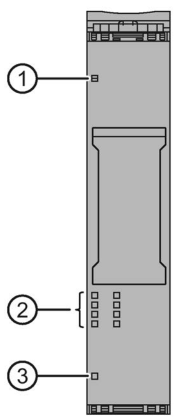
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the DQ 8x24VDC/0,5A SNK BA.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED displays

Meaning of the LED displays

The tables below explain the meaning of the Status and error displays. Remedial measures for diagnostics alarms can be found in section Diagnostics alarms (Page 22).

LED DIAG

Table 5- 1 Error display of the LED DIAG

LED DIAG	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
■ On	Module parameters assigned
Flashes	Module diagnostics is available

LED channel status

Table 5- 2 Status display of the LED channel status

LED channel status	Meaning
□ Off	Channel deactivated or activated and process signal = 0
■ On	Channel activated and process signal = 1

LED PWR

Table 5- 3 Status display of the LED PWR

LED PWR	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

5.2 Interrupts

The DQ 8×24VDC/0,5A SNK BA digital output module supports diagnostics alarms.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following event:

- Parameter assignment error
- No supply voltage

Detailed information on the event is available in the STEP 7 online help.

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Remedy
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DQ 8×24VDC/0,5A SNK BA

Article number	6ES7132-6BF61-0AA0
General information	
Product type designation	DQ 8x 24 V DC/0.5 A SNK BA, PU 1
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	No
Redundancy	
• Redundancy capability	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V

Article number	6ES7132-6BF61-0AA0
Output voltage	
Rated value (DC)	24 V
Power loss	
Power loss, typ.	1.5 W
Address area	
Address space per module	
• Outputs	1 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Digital outputs	
Type of digital output	Source output (PNP, current-sourcing)
Number of digital outputs	8
Current-sinking	Yes
Short-circuit protection	Yes
• Response threshold, typ.	1.5 A
Limitation of inductive shutdown voltage to	Typ. 47 V
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	3 400 Ω
Output current	
• for signal "1" rated value	0.5 A
• for signal "1" permissible range, max.	0.5 A
• for signal "0" residual current, max.	5 µA
Output delay with resistive load	
• "0" to "1", max.	300 µs
• "1" to "0", max.	600 µs
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	Yes

Article number	6ES7132-6BF61-0AA0
Switching frequency	
• with resistive load, max.	100 Hz
• with inductive load, max.	0.5 Hz
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per channel, max.	0.5 A
• Current per module, max.	4 A
Total current of the outputs (per module)	
horizontal installation	
– up to 60 °C, max.	4 A
vertical installation	
– up to 50 °C, max.	4 A; in all other mounting positions
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	No
• Short-circuit	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes

Article number	6ES7132-6BF61-0AA0
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; in all other mounting positions
• vertical installation, max.	50 °C; in all other mounting positions
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Dimensional drawing

Parameter data record

A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to re-configure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics for the entire module.

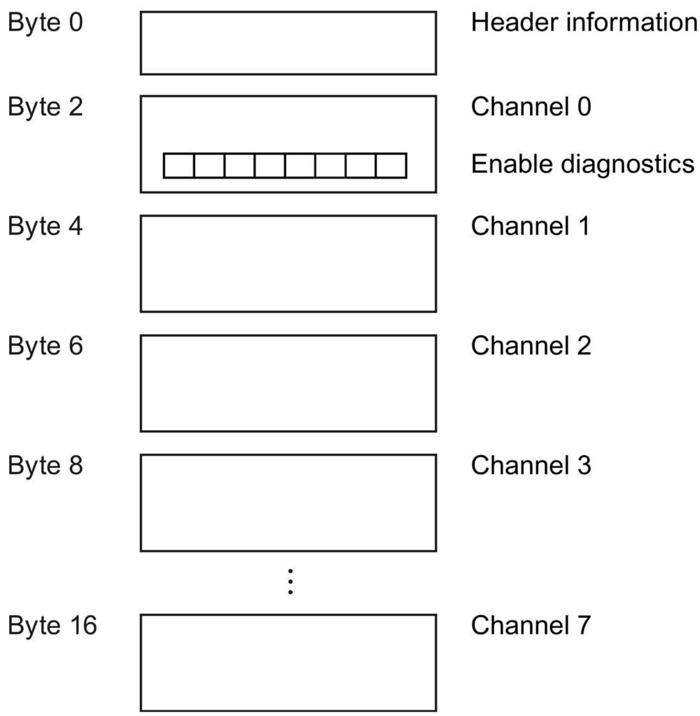

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

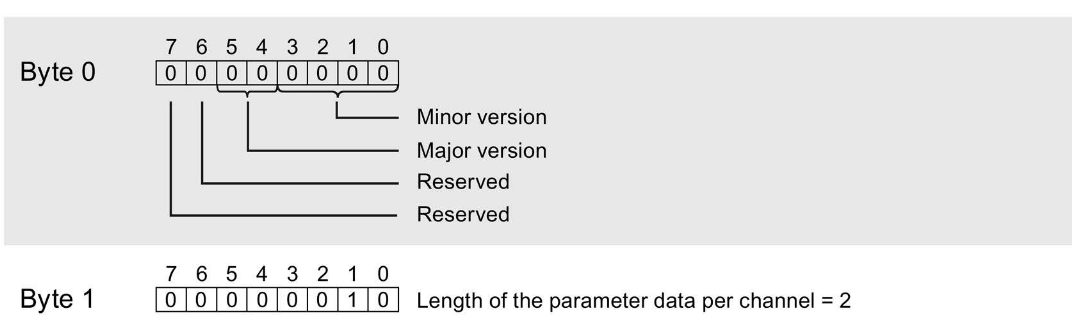

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

Enable a parameter by setting the corresponding bit to "1".

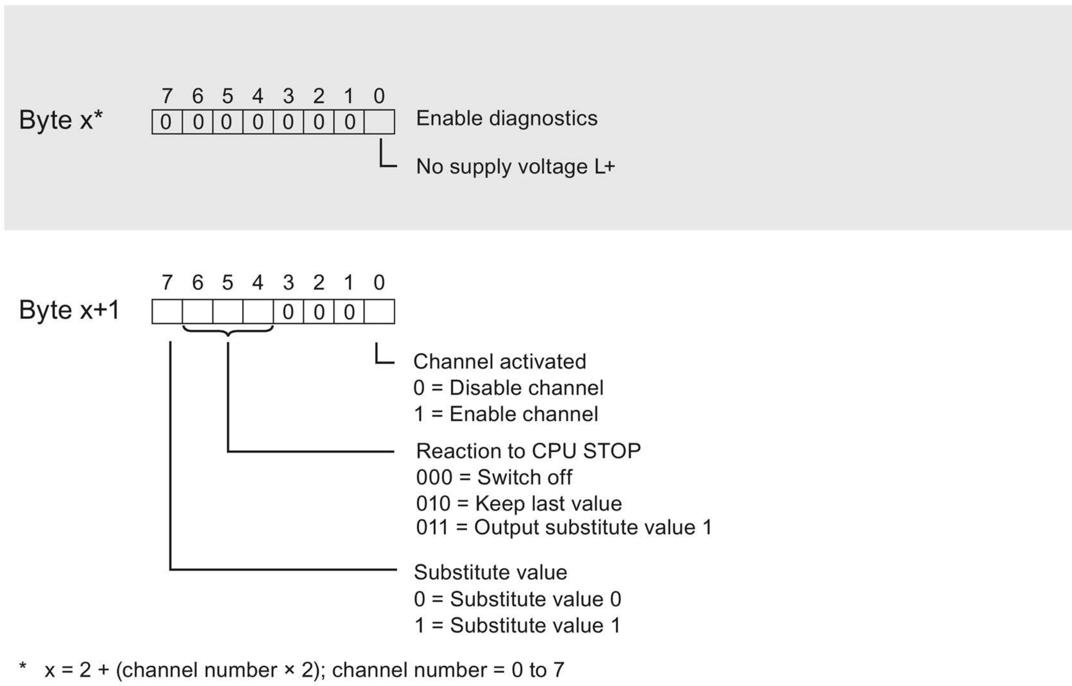

Figure A-3 Structure byte x to x+1 for the channels 0 to 7

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

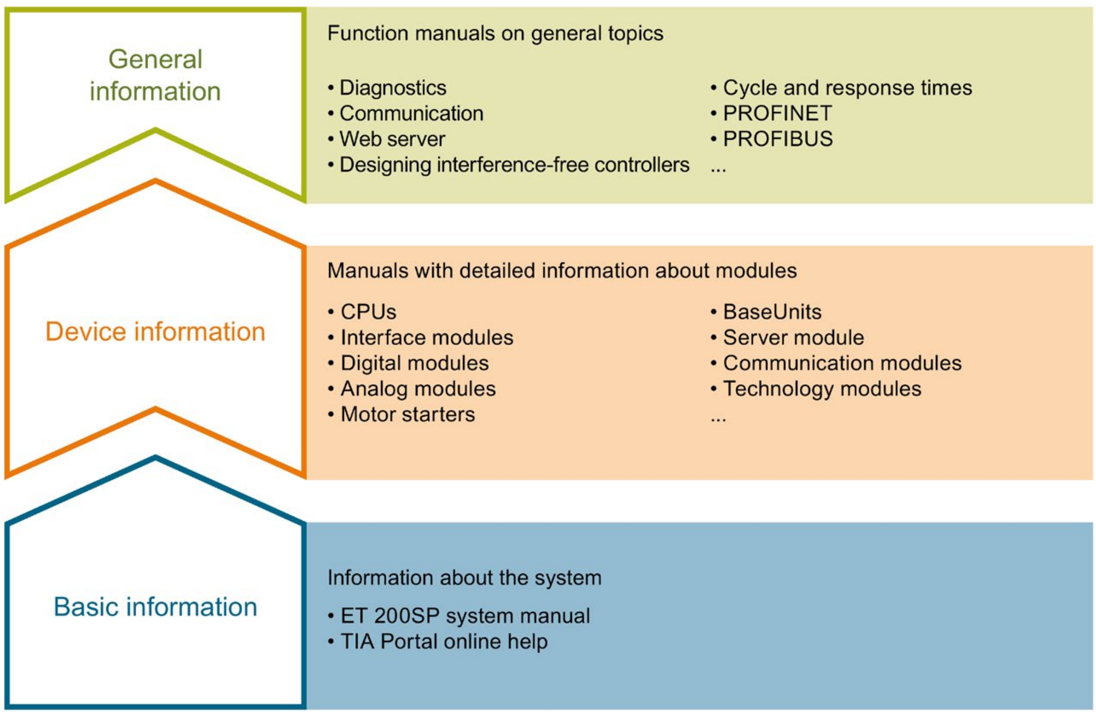
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer

- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).
