- Suitable for power control of heating systems or infrared sources in drying processes
- Wave packet control to prevent harmonic components
- Startup delay per channel to reduce system loads
- Output filter per channel for soft start or soft stop
- Two operating modes:
  – DQ
  – PC (PowerControl)
- with one of four control types each:
  – Phase control - phase-angle proportional (default)
  – Phase control - power-proportional
  – Wave packet control - half waves
  – Wave packet control - full waves

Table 2- 1 Operating modes of the DQ 4×24..230VAC/2A HF

Property		Operating mode			
		DQ		PC (PowerControl)	
		Without value status (QI)	With value status (QI)	Without value status (QI)	With value status (QI)
Number of channels		4			
Control type selection		Yes			
Configurable temperature shutdown		Yes			
Configurable startup delay		0 ms ... 10 s			
Configurable output filter down/up		0 ms ... 60 s			
Data length	Inputs	0 bytes	1 byte	0 bytes	1 byte
	Outputs	1 byte	1 byte	8 bytes	8 bytes

The module supports the following functions:

Table 2- 2 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V1.0.0 or higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V1.0.0 or higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X
Reconfiguration in RUN	FS01	V1.0.0 or higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X
PROFIenergy	FS01	V1.0.0 or higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X
Value status	FS01	V1.0.0 or higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label

You can find more information on accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

2.2 Functions

Introduction

Two operating mode are available for the module DQ 4×24..230VAC/2A HF:

- DQ mode
- PC mode (PowerControl)

In PC mode, control of the module outputs is analog. The value range is 0..1000_D (= 0.1% increments). The resolution of the process value is 16 bits per channel.

In DQ mode, output control is binary.

You configure the channels with the functions described below.

Control types

In PC mode, you can assign one of four control types to all channels of the module; you use these control types to control different processes in your plant.

The control the power in the control types:

- Phase control - power-proportional
- Wave packet control (half waves)
- Wave packet control (full waves)

You can use these control types, for example, for power control of heating systems or infrared sources in drying processes.

You control the average switch-on duration in the control type:

- Phase control - phase-angle proportional

You can use this control type, for example, to dim lamps that offer this feature.

You also assign the control types in DQ mode. The resolution of the process value here is only 1 bit per channel.

PC mode (PowerControl) operating principles

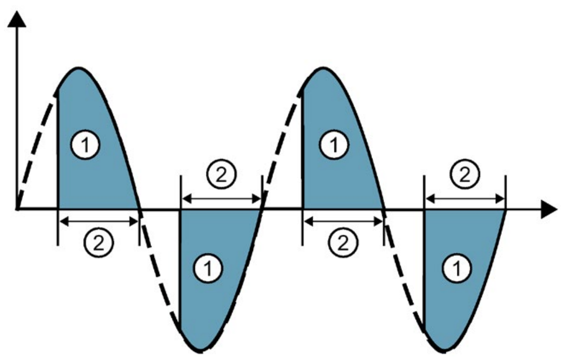
Phase control

The load voltage is reduced through phase control and raised from the starting voltage up to mains voltage in the zero crossing.
Depending on the application, phase control offers advantages compared to wave packet control, such as even heating or prevention of radiation source flickering in case of low setpoints.

You can configure the following during each half wave:

- For phase control - phase-angle proportional: The switch-on duration in proportion to the process value.
- For phase control - power-proportional: The output power.

The following graphic schematically shows the principle of phase control:



① Average power 80%, corresponds to a process value of 800 (power proportional)
② Average switch-on duration 67%, corresponds to a process value of 670 (phase angle proportional)

Figure 2-2 Principle of phase control

Note

Use of filters

To observe the EMC guidelines, you must filter the faults caused by phase control in the plant. A suitable filter, for example, is EPCOS SIFI-C B84113C.

For additional information about electromagnetic compatibility of the module, see the section Technical specifications (Page 44).

Phase control - power-proportional

This control type enables you to control the output power in the phase control in proportion to the maximum power.
This means, for example, that a 500 W heating element ideally consumes about 50 W of its maximum power at a process value of 10.0%.

Note that infrared sources may consume more power. The deviation from the setpoint is at its lowest in case of a linear and purely ohmic load.

Wave packet control

In case of wave packet control, the module connects the load voltage through to the load for entire half or full waves starting at the zero crossing.
The wave packets to be output are calculated dynamically. Unlike with fixed wave packet patterns, the changes of the output value are taken into consideration faster while ensuring the absence of direct voltage in the output voltage at the same time. This allows for the implementation of controllers with shorter dead times.

The process value hereby refers to the average switch-on duration over multiple alternating voltage periods of the load voltage.
The graphics below show you how basic wave packet control for half waves or full waves works.

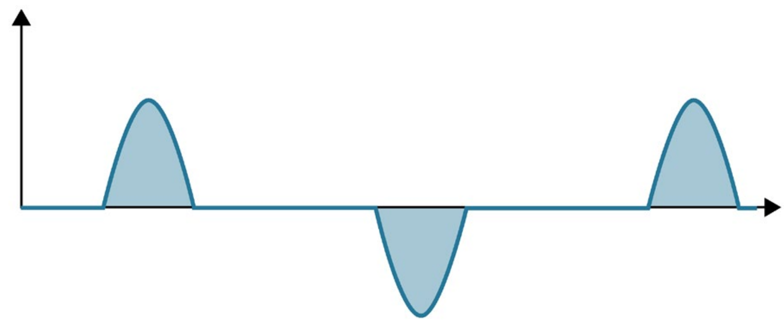


Figure 2-3 Principle of wave packet control - half waves

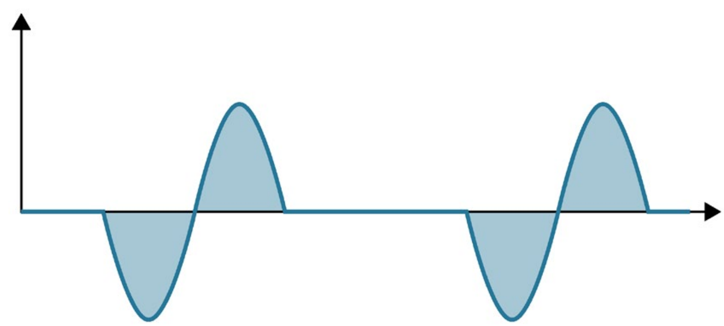

Figure 2-4 Principle of wave packet control - full waves

DQ mode 3

3.1 Wiring

3.1.1 Wiring and block diagram

This section includes the block diagram of the DQ 4x24..230VAC/2A HF module with the terminal assignments for a 1-wire and 2-wire connection.
You can use the different connection options for all channels and combine them at random.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

DANGER

Dangerous voltage. Risk of death or serious injury.

You must always disconnect the system and module from the power supply before commencing work.

Note

Limiting overvoltage

You must ensure overvoltage of the encoder supply is limited to 1 kV.

Note

Power limitation

To limit power, each input voltage must have a fuse with a maximum rating of 10 A tripping current. The fuse must be a quick-acting microfuse.

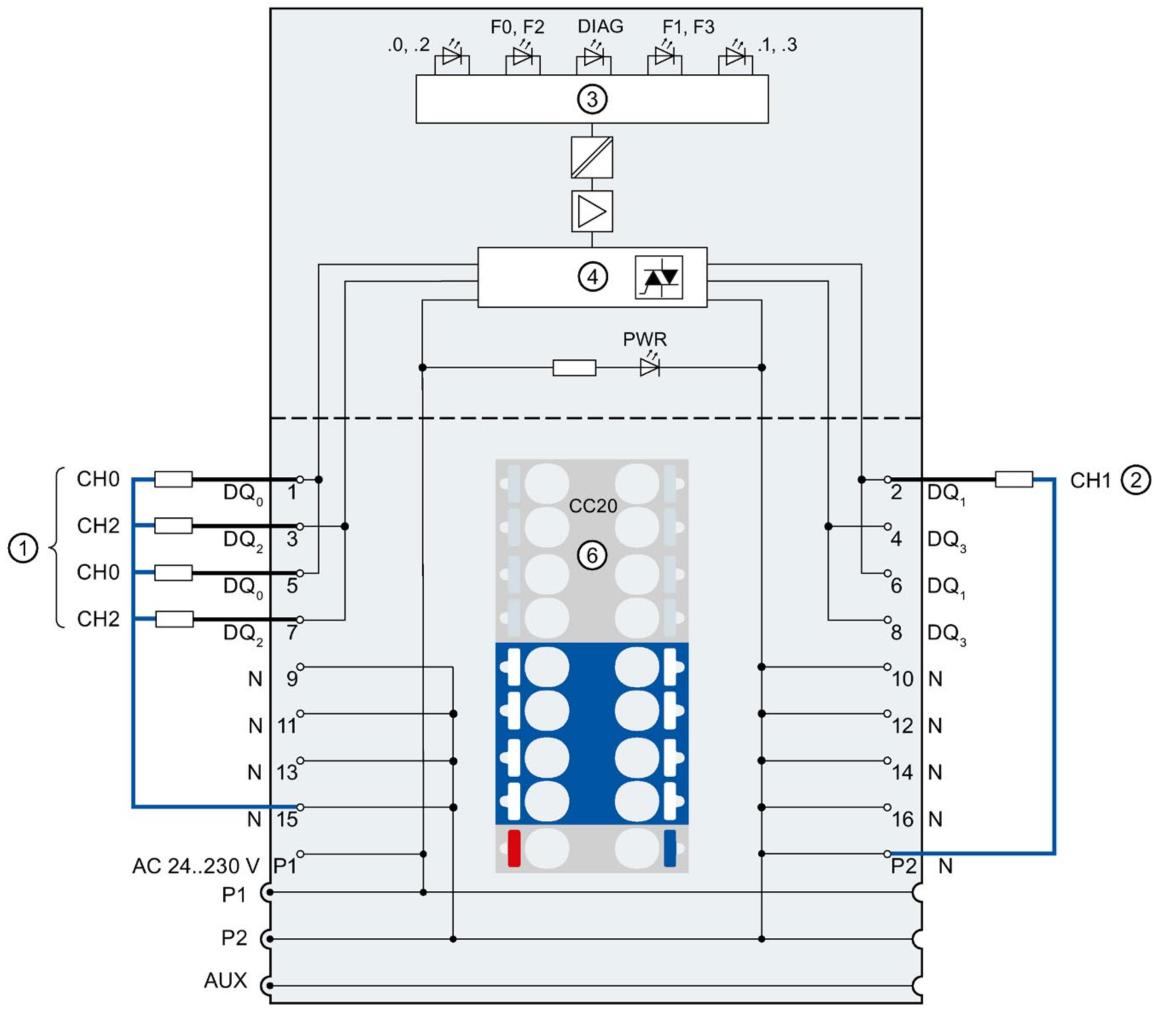
Note

Three-phase loads

Do not connect any three-phase loads to the module. The digital output is not suitable for three-phase loads.

Connection: 1-wire and 2-wire connection of actuators

The following figure shows the block diagram and an example of the terminal assignment of the digital output module DQ 4x24..230VAC/2A HF on the BaseUnit BU type U0.



①	1-wire connection	24..230 V AC	Supply voltage L (infeed for light-colored BaseUnit only)
②	2-wire connection	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Backplane bus interface	N	Neutral
④	Output electronics	DIAG	Error or diagnostics LED (green, red)
⑤	Polarity reversal protection	.0 to .3	Channel status LED (green)
⑥	Color-coded label CC20 (optional)	F0 to F3	Channel fault LED (red)
DQ_n	Output signal, channel n	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire and 2-wire connection of actuators.

3.2 Parameters/address space

3.2.1 Parameters

Parameters of the DQ 4×24..230VAC/2A HF

The following table lists the configurable parameters in DQ mode.

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When performing the configuration in the user program, use the "WRREC" instruction to transfer the parameters to the module using data records (refer to the section Parameter assignment and structure of parameter data record (Page 51)).

The following parameter settings are possible:

Table 3- 1 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP[1]
Module parameters					
Control type	• Phase control - phase-angle proportional • Phase control - power-proportional • Wave packet control - half waves • Wave packet control - full waves	Phase control - phase-angle proportional	Yes	Module	Module

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP[1]
Channel parameters					
Diagnostics No supply voltage L	• Disable • Enable	Disable	Yes	Channel	Module
Diagnostics Overtemperature	• Disable • Enable	Disable	Yes	Channel	Module
Diagnostics Wire break[2]	• Disable • Enable	Disable	Yes	Channel	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel
Temperature shut-down	• Output active even under overtempera-ture conditions • Output disabled under overtempera-ture conditions	Output active even under overtempera-ture conditions	Yes	Channel	Module
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Channel startup delay	• No delay • 100 ms • 1 s • 2 s • 3 s • 4 s • 5 s • 10 s	No delay	Yes	Channel	-
Channel output filter down	• No filter • 500 ms • 1 s • 5 s • 10 s • 30 s • 60 s	No filter	Yes	Channel	-

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP[1]
Channel output filter up	• No filter • 500 ms • 1 s • 5 s • 10 s • 30 s • 60 s	No filter	Yes	Channel	-
Potential group					
Potential group	• Use potential group of the left module (module plugged in-to a dark BaseUnit) • Enable new poten-tial group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 7 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter by using the data record 128, see the appendix "Parameter data set".

[2] For physical reasons, a wire break cannot be detected for actuators with two inputs and shared reference point. In this case, deactivate the diagnostics.

3.2.2 Explanation of parameters

Control type

At the module level, specifies the control type in which the module's channels are operated.

- Phase control - phase-angle proportional (default)
- Phase control - power-proportional
- Wave packet control - half waves
- Wave packet control - full waves

Diagnostics No supply voltage L

Enabling of the diagnostics for no or insufficient supply voltage L.

Diagnostics Overtemperature

Diagnostics enabled when overtemperature occurs in the module.

When you enable the Overtemperature diagnostics and the module detects that the maximum permissible module temperature is exceeded, the Overtemperature diagnostics is output.

Diagnostics Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Channel activated

Determines whether a channel is enabled or disabled.

Temperature shutdown

Determines whether a channel remains activate or is deactivated in case of overtemperature.

When the module has detected that the maximum permissible module temperature has been exceeded, the channel is either deactivated or remains active depending on the configuration.
To prevent damage to the module, the channel is automatically deactivated when temperature shutdown is configured.

You cannot control the channel until the temperature is once again in the valid range.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Channel startup delay

Specifies the duration of the startup delay of a channel.

You can set startup delays with values ranging from 100 ms to 10 s. This means the channels cannot be controlled before the set startup delay has expired.
Configure different startup delays for each channel to decouple the starting currents and thus reduce the network load.
Startup delays are also in effect when the module is to output substitute values. The startup delay starts after the module was started and when the load voltage returns.
This means that depending on your process, the initial switch on of lamps is always delayed by the configured time.

Channel output filter down/up

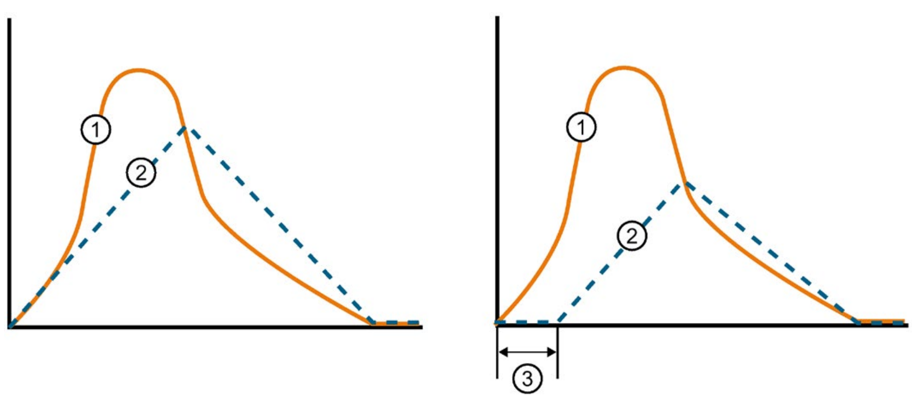
Specifies the down or up output filter of a channel.

For smooth operation or to increase the interference immunity of your application, use down or up output filters with values from 500 ms to 60 s.
Quick changes of the filter input values are converted into smoother signal changes at the filter output. This means, for example, that extreme currents in the heating phase of infrared sources are limited.

In addition, you can also use output filters to reduce shifts in the zero crossings of the power supply that can occur in isolating transformers.
This increases the accuracy of the module.

When you have configured a startup delay, the output filter is held at the reset state during this delay.
Once the startup delay has expired, the output filter starts its linear ramp directly at the value that was held during the startup delay.

Note that the configured filter times always refer to the process value jumps from 0% to 100% or from 100% to 0%.
This means the settling time of the filter is shorter for smaller jumps.



① Power without output filter
② Power with output filter (max. slope according to Output filters parameter)
③ Startup delay

Figure 3-2 Power trend or average switch-on duration in case of phase control phase-angle proportional with and without output filter

Each channel has its own output filters. These output filters always work with maximum resolution.

Output filters are also in effect when the module is to output substitute values, for example, after CPU STOP or in case of a communication failure.
This means all transitions are still smooth and infrared sources for hot gluing spots do not fail immediately, for example, but are shut down slowly to ensure that the surface of the gluing spots does not tear due to sudden cooling.

If you do not want to use output filters, use the parameter setting "No filter".

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

3.2.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of the DQ 4×24..230VAC/2A HF in DQ mode

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. When you configure the module by means of the GSD file, the configuration is available under different short designations/module names. The following configurations are possible:

Table 3- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, V14 or higher	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	DQ 4×24..230VAC/2A HF V1.0	X	X	X
1 x 4-channel with value status	DQ 4×24..230VAC/2A HF V1.0, QI	X	X	---

Note

The following functions are only fully available when the submodule X.1 is configured and the IO controller to which submodule X.1 is assigned has established a connection to the IO device.

- Firmware update
- I&M identification data
- PROFIenergy

Value status (quality information, QI)

The value status is always activated for the following module names:

- DQ 4×24..230VAC/2A HF V1.0, QI

An additional bit is assigned to each channel for the value status. The bit for the value status indicates if the output value specified by the user program is actually pending at the module terminal (0 = value is incorrect).

Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF V1.0

The figure below shows the address space allocation for the configuration **without** value status in DQ mode (DQ 4×24..230VAC/2A HF V1.0).

Assignment in the process image of the outputs (PIQ)

	7	6	5	4	3	2	1	0	
QB x	0	0	0	0					Output values at channels 0 to 3

Figure 3-3 Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF V1.0 without value status

Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF V1.0, QI

The figure below shows the address space allocation for the configuration **with** value status in DQ mode (DQ 4×24..230VAC/2A HF V1.0, QI).

Assignment in the process image of the outputs (PIQ)

	7	6	5	4	3	2	1	0	
QB x	0	0	0	0					Output values at channels 0 to 3

Assignment in the process image input (PII)

	7	6	5	4	3	2	1	0	
IB x	0	0	0	0					Value status (QI) at channels 0 to 3

0: Value output at channel is incorrect

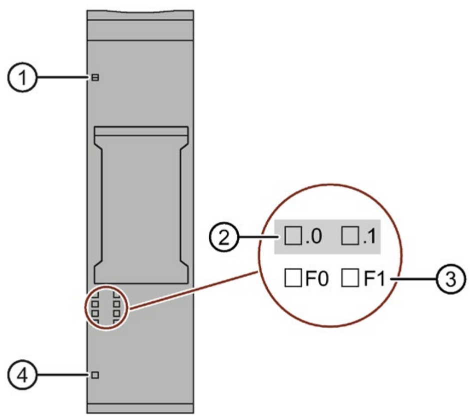
Figure 3-4 Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF V1.0 with value status

3.3 Interrupts/diagnostics alarms

3.3.1 Status and fault displays

LED display

The following figure shows you the LED display of the DQ 4×24..230VAC/2A HF.



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 3-5 LED displays

Meaning of the LEDs

The following tables explain the meaning of the status and error displays.

DIAG LED

Table 3- 3 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module/channel diagnostics
Flashes	Module parameters assigned and module/channel diagnostics

LED channel status/channel error

Table 3- 4 Status / error display of the LED channel status / channel error

Channel status LED	LED channel error	Meaning
□ Off	□ Off	Channel deactivated or process signal = 0 and no channel diagnostics
■ On	□ Off	Channel activated and process signal = 1 and no channel diagnostics
□ Off	■ On	Channel activated and channel diagnostics

PWR LED

Table 3- 5 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L
■ On	Supply voltage L present

3.3.2 Interrupts

The digital output module DQ 4x24...230VAC/2A HF supports diagnostic interrupts.

Diagnostics interrupts

In DQ mode, the module generates a diagnostics interrupt for the following events:

- Overtemperature
- Wire break
- Parameter assignment error
- Supply voltage missing
- Channel/component temporarily unavailable

Detailed information on the event is available in the STEP 7 online help.

3.3.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.
In DQ mode, the module outputs the following diagnostic alarms:

Table 3- 6 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Overtemperature	5_H	Possible causes: • Short-circuit or overload at the digital outputs • Ambient temperature outside the specification	• Correct the process wiring • Improve cooling • Check controlled loads
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, for example, use cables with larger cross-section
		Wirebreak between the module and actuator	Connect the cable
		Channel not connected (open)	Disable diagnostics
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	No or insufficient supply voltage L	• Check supply voltage L at the BaseUnit • Check BaseUnit type
Channel/component temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

4 PC mode

4.1 Wiring

4.1.1 Wiring and block diagram

This section includes the block diagram of the DQ 4x24..230VAC/2A HF module with the terminal assignments for a 1-wire and 2-wire connection.
You can use the different connection options for all channels and combine them at random.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

DANGER

Dangerous voltage. Risk of death or serious injury.

You must always disconnect the system and module from the power supply before commencing work.

Note

Limiting overvoltage

You must ensure overvoltage of the encoder supply is limited to 1 kV.

Note

Power limitation

To limit power, each input voltage must have a fuse with a maximum rating of 10 A tripping current. The fuse must be a quick-acting microfuse.

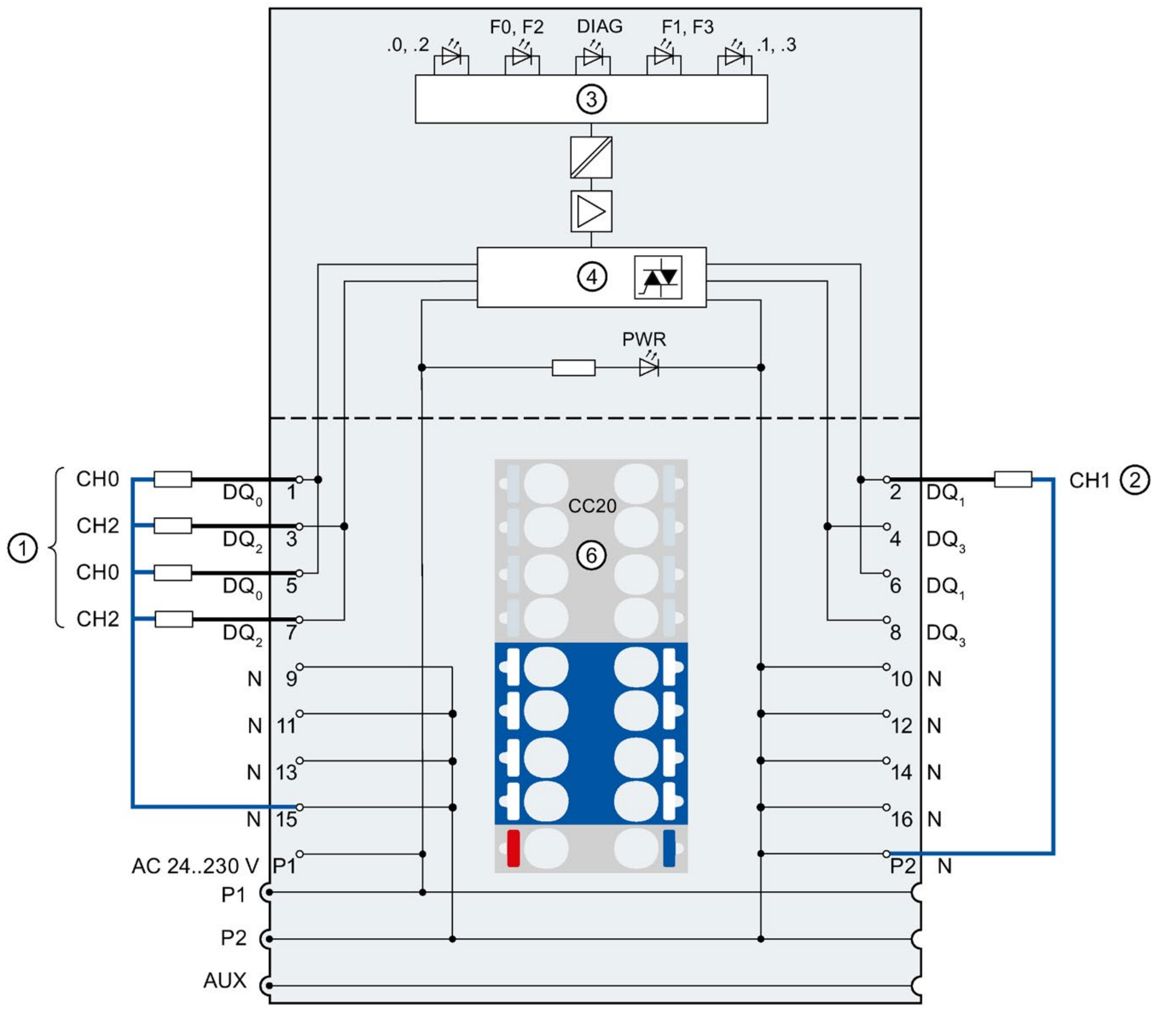
Note

Three-phase loads

Do not connect any three-phase loads to the module. The digital output is not suitable for three-phase loads.

Connection: 1-wire and 2-wire connection of actuators

The following figure shows the block diagram and an example of the terminal assignment of the digital output module DQ 4x24..230VAC/2A HF on the BaseUnit BU type U0.



①	1-wire connection	24..230 V AC	Supply voltage L (infeed for light-colored BaseUnit only)
②	2-wire connection	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Backplane bus interface	N	Neutral
④	Output electronics	DIAG	Error or diagnostics LED (green, red)
⑤	Polarity reversal protection	.0 to .3	Channel status LED (green)
⑥	Color-coded label CC20 (optional)	F0 to F3	Channel fault LED (red)
DQ_n	Output signal, channel n	PWR	Power LED (green)

Figure 4-1 Wiring and block diagram for 1-wire and 2-wire connection of actuators.

4.2 Parameters/address space

4.2.1 Parameters

Parameters of the DQ 4×24..230VAC/2A HF

The following table lists the configurable parameters in PC mode.

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When performing the configuration in the user program, use the "WRREC" instruction to transfer the parameters to the module using data records (refer to the section Parameter assignment and structure of parameter data record (Page 51)).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP[1]
Module parameters					
Control type	• Phase control - phase-angle proportional • Phase control - power-proportional • Wave packet control - half waves • Wave packet control - full waves	Phase control - phase-angle proportional	Yes	Module	Module

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP[1]

Potential group					
Potential group	• Use potential group of the left module (module plugged into a dark BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 7 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter by using the data record 128, see the appendix "Parameter data set".

[2] For physical reasons, a wire break cannot be detected for actuators with two inputs and shared reference point. In this case, deactivate the diagnostics.

[3] The Overflow and Channel substitute value [0.1%] diagnostics are only available if you configured the module in PC mode.

4.2.2 Explanation of parameters

Control type

At the module level, specifies the control type in which the module's channels are operated.

- Phase control - phase-angle proportional (default)
- Phase control - power-proportional
- Wave packet control - half waves
- Wave packet control - full waves

Diagnostics No supply voltage L

Enabling of the diagnostics for no or insufficient supply voltage L.

Diagnostics Overtemperature

Diagnostics enabled when overtemperature occurs in the module.

When you enable the Overtemperature diagnostics and the module detects that the maximum permissible module temperature is exceeded, the Overtemperature diagnostics is output.

Diagnostics Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Diagnostics overflow

Enabling of the diagnostics when the permitted value range of the process value is exceeded.

Channel activated

Determines whether a channel is enabled or disabled.

Temperature shutdown

Determines whether a channel remains activate or is deactivated in case of overtemperature.

When the module has detected that the maximum permissible module temperature has been exceeded, the channel is either deactivated or remains active depending on the configuration.
To prevent damage to the module, the channel is automatically deactivated when temperature shutdown is configured.

You cannot control the channel until the temperature is once again in the valid range.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Channel startup delay

Specifies the duration of the startup delay of a channel.

You can set startup delays with values ranging from 100 ms to 10 s. This means the channels cannot be controlled before the set startup delay has expired.
Configure different startup delays for each channel to decouple the starting currents and thus reduce the network load.
Startup delays are also in effect when the module is to output substitute values. The startup delay starts after the module was started and when the load voltage returns.
This means that depending on your process, the initial switch on of lamps is always delayed by the configured time.

Channel output filter down/up

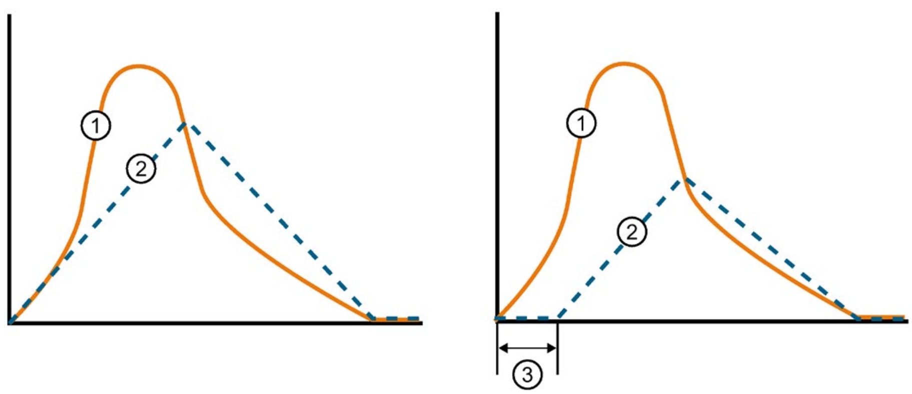
Specifies the down or up output filter of a channel.

To increase the interference immunity of your application, use down or up output filters with values from 500 ms to 60 s.
Quick changes of the filter input values are converted into smoother signal changes at the filter output. This means, for example, that extreme currents in the heating phase of infrared sources are limited.

In addition, you can also use output filters to reduce shifts in the zero crossings of the power supply that can occur in isolating transformers.
This increases the accuracy of the module.

When you have configured a startup delay, the output filter is held at the reset state during this delay.
Once the startup delay has expired, the output filter starts its linear ramp directly at the value that was held during the startup delay.

Note that the configured filter times always refer to the process value jumps from 0% to 100% or from 100% to 0%.
This means the settling time of the filter is shorter for smaller jumps.



① Power without output filter
② Power with output filter (max. slope according to Output filters parameter)
③ Startup delay

Figure 4-2 Power trend or average switch-on duration in case of phase control phase-angle proportional with and without output filter

Each channel has its own output filters. These output filters always work with maximum resolution.

Output filters are also in effect when the module is to output substitute values, for example, after CPU STOP or in case of a communication failure.
This means all transitions are still smooth and infrared sources for hot gluing spots do not fail immediately, for example, but are shut down slowly to ensure that the surface of the gluing spots does not tear due to sudden cooling.

If you do not want to use output filters, use the parameter setting "No filter".

Channel substitute value [0.1%]

Defines the substitute value that is output when a CPU STOP occurs and the setting "Output substitute value" is selected in the "Reaction to CPU STOP" parameter.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.2.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of the DQ 4×24..230VAC/2A HF in PC mode

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. When you configure the module by means of the GSD file, the configuration is available under different short designations/module names. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, V14 or higher	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	DQ 4×24..230VAC/2A HF PC V1.0	X	X	X
1 x 4-channel with value status	DQ 4×24..230VAC/2A HF PC V1.0, QI	X	X	---

Note

The following functions are only fully available when the submodule X.1 is configured and the IO controller to which submodule X.1 is assigned has established a connection to the IO device.

- Firmware update
- I&M identification data
- PROFIenergy

Value status (quality information, QI)

The value status is always activated for the following module names:

- DQ 4×24..230VAC/2A HF PC V1.0, QI

An additional bit is assigned to each channel for the value status. The bit for the value status indicates if the output value specified by the user program is actually pending at the module terminal (0 = value is incorrect).

Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF PC V1.0

The figure below shows the address space allocation for the configuration **without** value status in PC mode (DQ 4×24..230VAC/2A HF PC V1.0).

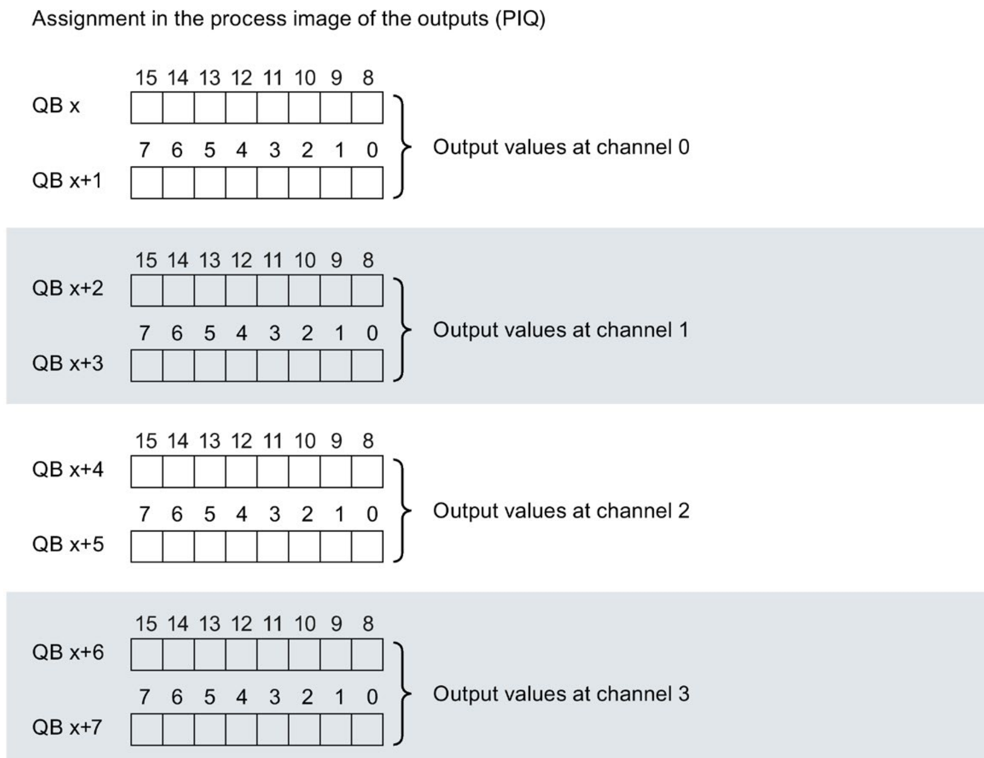


Figure 4-3 Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF PC V1.0 without value status

Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF PC V1.0, QI

The figure below shows the address space allocation for the configuration **with** value status in PC mode (DQ 4×24..230VAC/2A HF PC V1.0, QI).

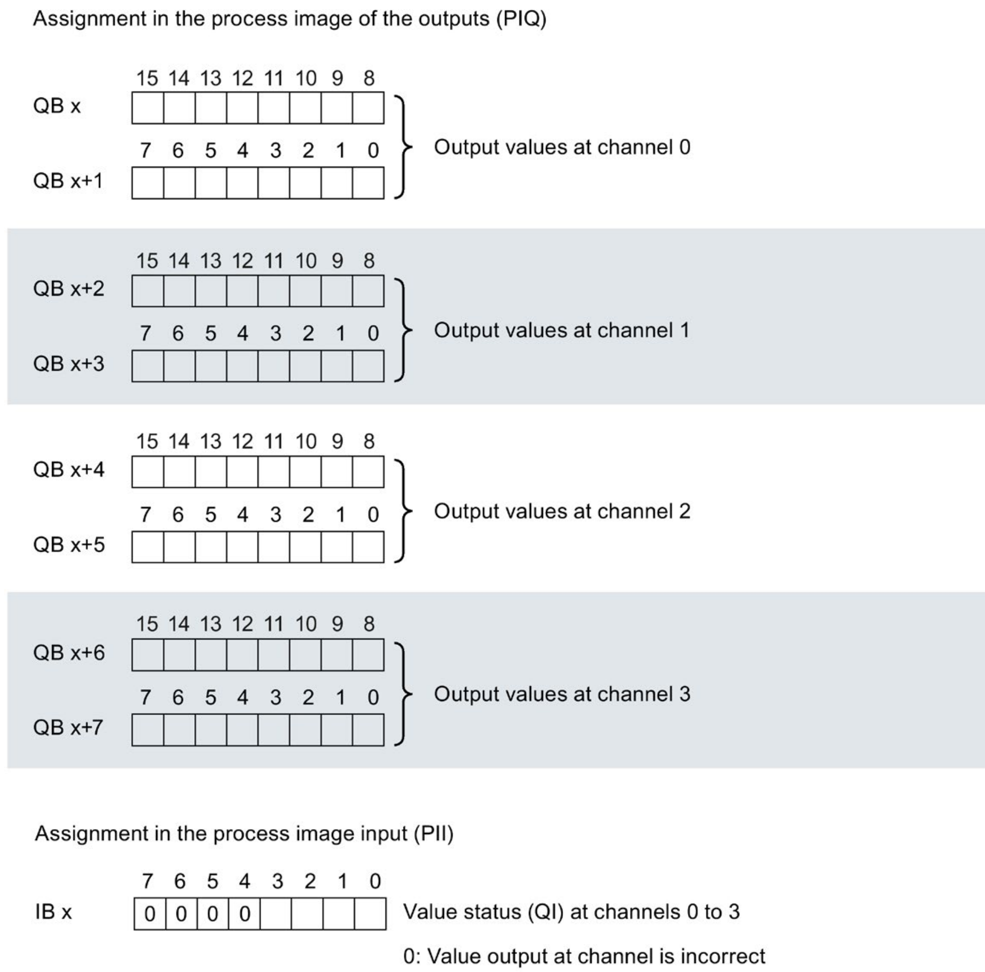

Figure 4-4 Address space for configuration as 1 x 4-channel DQ 4×24..230VAC/2A HF PC V1.0 with value status

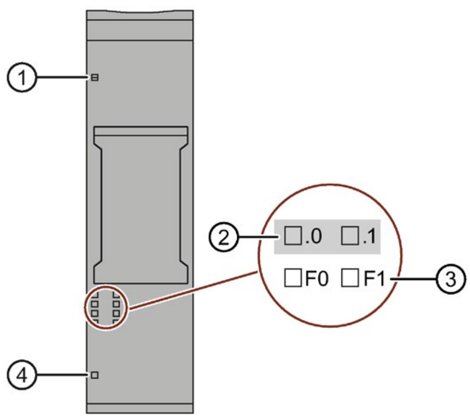
4.3 Interrupts/diagnostics alarms

4.3.1 Status and fault displays

LED display

The following figure shows you the LED display of the DQ 4×24..230VAC/2A HF.



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 4-5 LED displays

Meaning of the LEDs

The following tables explain the meaning of the status and error displays.

DIAG LED

Table 4- 3 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module/channel diagnostics
Flashes	Module parameters assigned and module/channel diagnostics

LED channel status/channel error

Table 4- 4 Status / error display of the LED channel status / channel error

Channel status LED	LED channel error	Meaning
□ Off	□ Off	Channel deactivated or process signal = 0 and no channel diagnostics
■ On	□ Off	Channel activated and process signal = 1 and no channel diagnostics
□ Off	■ On	Channel activated and channel diagnostics

PWR LED

Table 4- 5 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L
■ On	Supply voltage L present

4.3.2 Interrupts

The digital output module DQ 4x24...230VAC/2A HF supports diagnostic interrupts.

Diagnostics interrupts

In PC mode, the module generates a diagnostic interrupt for the following events:

- Overtemperature
- Wire break
- High limit violated
- Parameter assignment error
- Supply voltage missing
- Channel/component temporarily unavailable

Detailed information on the event is available in the STEP 7 online help.

4.3.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.
In PC mode, the module outputs the following diagnostic alarms:

Table 4- 6 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Overtemperature	5_H	• Short-circuit or overload at the digital outputs • Ambient temperature outside the specification	• Correct the process wiring • Improve cooling • Check controlled loads
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, for example, use cables with larger cross-section
		Wirebreak between the module and actuator	Connect the cable
		Channel not connected (open)	Disable diagnostics
High limit violated	7_H	The permitted value range of the process value is exceeded.	Correct the output value (0 to 1000)
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	No or insufficient supply voltage L	• Check supply voltage L at the BaseUnit • Check BaseUnit type
Channel/component temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

Technical specifications 5

Technical specifications of the DQ 4×24...230VAC/2A HF

Article number	6ES7132-6FD00-0CU0
General information	
Product type designation	DQ 4x24 ... 230 V AC/2 A HF, PU 1
Firmware version	V1.0
• FW update possible	Yes
usable BaseUnits	BU type U0
Color code for module-specific color identification plate	CC20
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	STEP 7 V5.5 or higher
• PROFIBUS as of GSD version/GSD revision	GSD as of Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	Yes
• PWM	No
• Oversampling	No
• MSO	No
• Phase control	Yes; Control area: 8.5 ... 100% of the phase angle
• Trailing-edge phase	No
• Half-wave	Yes
• Full-wave	Yes
Supply voltage	
Rated value (AC)	230 V; 47 ... 63 Hz, max. rate of change of frequency 1 mHz/s

Article number	6ES7132-6FD00-0CU0
Input current	
Current consumption (rated value)	8 mA; without load
Output voltage	
Rated value (AC)	230 V; 24V AC to 230V AC
Power loss	
Power loss, typ.	9 W; Active power, load voltage 230 V, all outputs loaded with 2 A, 50 Hz
Address area	
Address space per module	
• Inputs	+ 1 byte for QI information
• Outputs	8 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type U0
• 2-wire connection	BU type U0
• 3-wire connection	BU type U0 + Potential isolation module
Digital outputs	
Number of digital outputs	4
Current-sinking	No
Current-sourcing	Yes
Short-circuit protection	No; external fusing necessary
Open-circuit detection	Yes; channel by channel
• Response threshold, typ.	1 mA; 40 V AC or more
Overload protection	No; A miniature fuse with 10 tripping current and tripping characteristic "quick response" must be provided in the module supply
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	2 A; Max. 4 A, see additional description in manual
• with inductive load, max.	2 A
• on lamp load, max.	100 W; Tungsten rating in accordance with UL; for thermistors with higher power ratings, see the notes in the manual
Output voltage	
• for signal "1", min.	20.4 V
Output current	
• for signal "1" rated value	2 A
• for signal "1" permissible range, min.	10 mA

Article number	6ES7132-6FD00-0CU0
• for signal "1" permissible range, max.	4 A; Note derating data in the manual
• for signal "0" residual current, max.	3 mA
Output delay with resistive load	
• "0" to "1", max.	40 ms; 2 AC cycles
• "1" to "0", max.	20 ms; 1 AC cycle
Parallel switching of two outputs	
• for logic links	No
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	10 Hz; Applies to DQ mode; limited by line frequency in PC mode
• with inductive load (acc. to IEC 60947-5-1, AC15), max.	10 Hz; Applies to DQ mode; limited by line frequency in PC mode
• on lamp load, max.	1 Hz; Applies to DQ mode; limited by line frequency in PC mode
Total current of the outputs	
• Current per channel, max.	2 A; Max. 4 A, see additional description in manual
• Current per module, max.	8 A
Total current of the outputs (per module)	
horizontal installation	
– up to 40 °C, max.	8 A; Applicable for current channels up to 2 A. For current channels between 2 A and 4 A, note derating data in the manual
– up to 50 °C, max.	8 A; Applicable for current channels up to 2 A. For current channels between 2 A and 4 A, note derating data in the manual
– up to 60 °C, max.	8 A; Applicable for current channels up to 2 A. For current channels between 2 A and 4 A, note derating data in the manual
vertical installation	
– up to 30 °C, max.	8 A; Applicable for current channels up to 2 A. For current channels between 2 A and 4 A, note derating data in the manual
– up to 40 °C, max.	8 A; Applicable for current channels up to 2 A. For current channels between 2 A and 4 A, note derating data in the manual
– up to 50 °C, max.	8 A; Applicable for current channels up to 2 A. For current channels between 2 A and 4 A, note derating data in the manual
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m

Article number	6ES7132-6FD00-0CU0
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
• Wire-break	Yes; channel by channel
• Short-circuit	No
• Group error	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; red Fn LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	2 545 V DC/2 s (routine test)
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	50 g

Derating

The figures below show the maximum permissible total current for the derating, depending on the ambient temperature for horizontal and vertical mounting position, with channel currents of 2 A or 4 A.
The following values apply to channel currents up to 2 A for the utilization category AC-15 (IEC 60947-5-1).

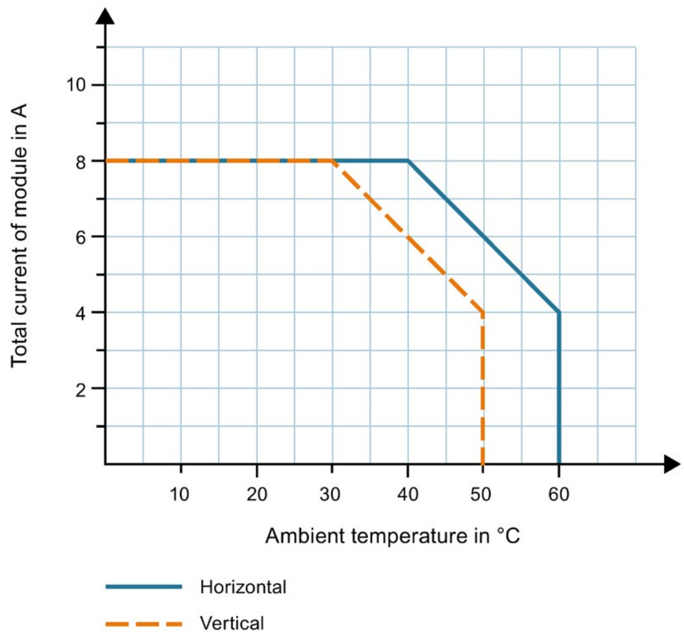


Figure 5-1 Derating depending on ambient temperature - channel current 2 A

The following values apply to channel currents of 2 A to 4 A for the utilization category AC-12 (IEC 60947-5-1):

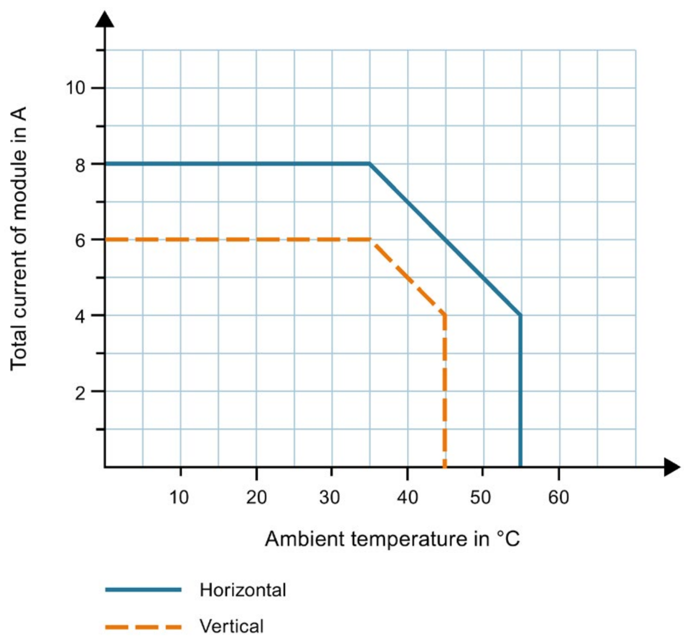

Figure 5-2 Derating depending on ambient temperature - channel current 4 A

Note that the rms values are in effect for the channel and total currents.

Note

Loads with PTC thermistor properties

For PTC thermistors up to 4 A continuous current and power ratings above 100 W (e.g. infrared sources), you must observe the significantly higher inrush current.

Ensure that the switch-on peak current does not exceed 15 A.

To reduce the inrush current, preheat the load or use the function "Output filter with phase control".
This slowly increases the switch-on duration of the load and the inrush current of the load being heated is limited.
Use an output filter time of 5 s or a preheating with 25 ° phase control, for example, for a PTC thermistor with a power rating of 900 W and an estimated factor 10 of the inrush current overshoot.

If you want to connect multiple PTC thermistors per module at the same time, use the "Startup delay" function.
By doing so, you connect the channels at different times so that the inrush current overshoots do not overlap and the fuse is not overloaded.

Electromagnetic compatibility

The control of loads in the control types phase control power-proportional or phase-angle proportional results in strong electromagnetic effects on the power supply network.
To observe the limits in accordance with EMC Directives, you must filter the load supply of the module with phase control in PC mode or when using the function "Output filter with phase control" in DQ mode.
Conformity was measured with filters of the type "EPCOS SIFI-C B84113C". Use this type of filter or a filter with the same characteristic curve or with a characteristic curve with greater damping.
You must ensure conformity with the values in the tables below.

Interference emission in accordance with EN 61000-6-4:2007 + A1:2011 and IEC 61131-2:

Table 5- 1 Interference emission of electromagnetic fields

Frequency	Interference emission
Test environment OATS or SAC (measured at a distance of 10 m) • 30 MHz to 230 MHz • 230 MHz to 1000 MHz	 • <40 dB (μV/m) Q • <47 dB (μV/m) Q
Test environment FAR (measured at a distance of 3 m) • 30 MHz to 230 MHz • 230 MHz to 1000 MHz	 • 45 to 52 dB (μV/m) Q • <52 dB (μV/m) Q
Test environment OATS, SAC or FAR (measured at a distance of 3 m) • 1 GHz to 3 GHz • 3 GHz to 6 GHz	 • <76 dB (μV/m) P / <56 dB (μV/m) M • <80 dB (μV/m) P / <60 dB (μV/m) M

Table 5- 2 Interference emission via the AC power supply

Frequency	Interference emission
0.15 MHz to 0.5 MHz	<79 dB (μV/m) Q <66 dB (μV/m) M
0.5 MHz to 30 MHz	<73 dB (μV/m) Q <60 dB (μV/m) M

Dimension drawing

See the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record

A

A.1 Parameter assignment and structure of parameter data record

The data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to re-configure the module in RUN (e.g. the response of selected channels to the CPU STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

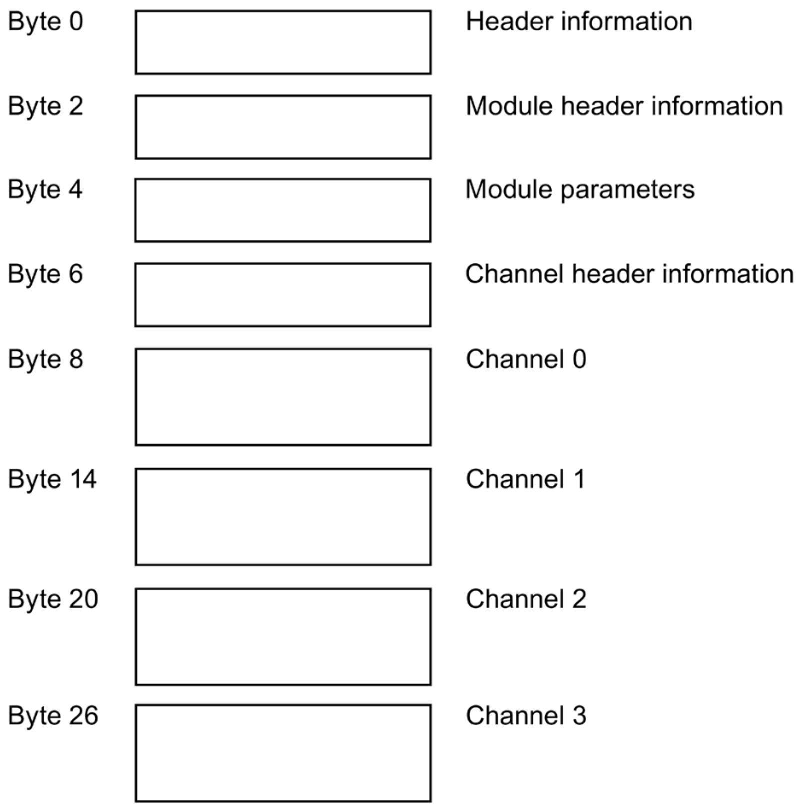

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

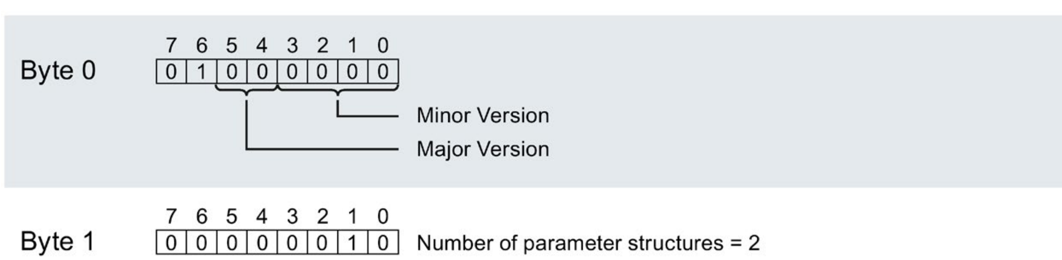

Figure A-2 Header information

Module header information

The figure below shows the structure of the module header information.

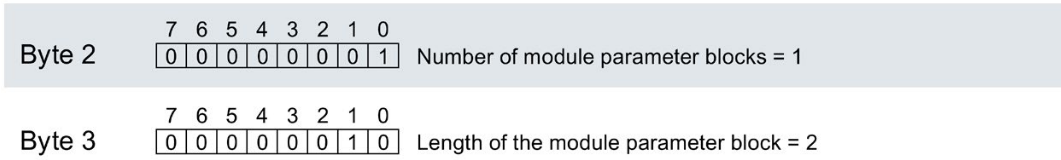

Figure A-3 Module header information

Module parameter block

The figure below shows the structure of the module parameter block for channels 0 to 7. You enable a parameter by setting the corresponding bit to "1".

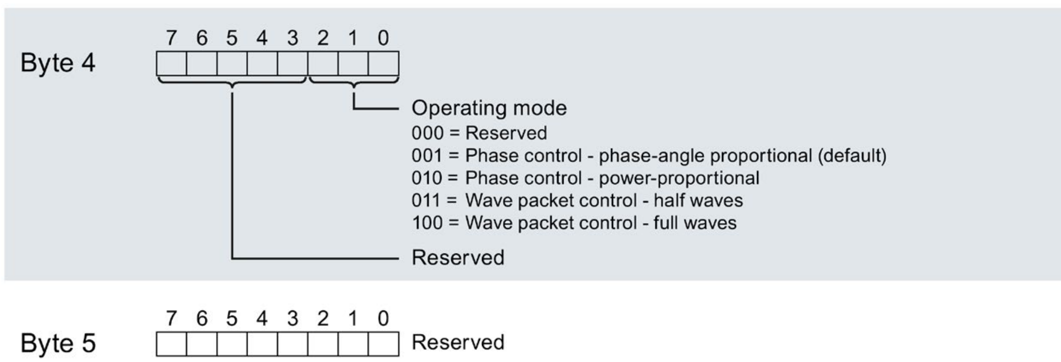

Figure A-4 Module parameter block

Channel header information

The figure below shows the structure of the channel header information.

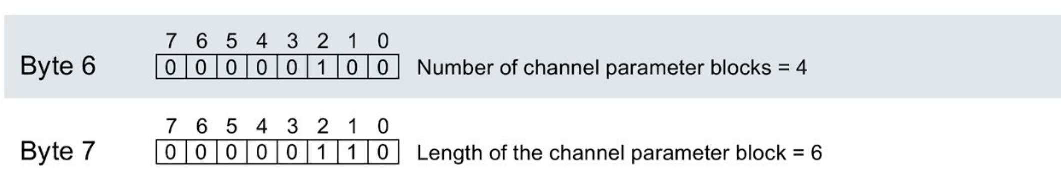

Figure A-5 Channel header information

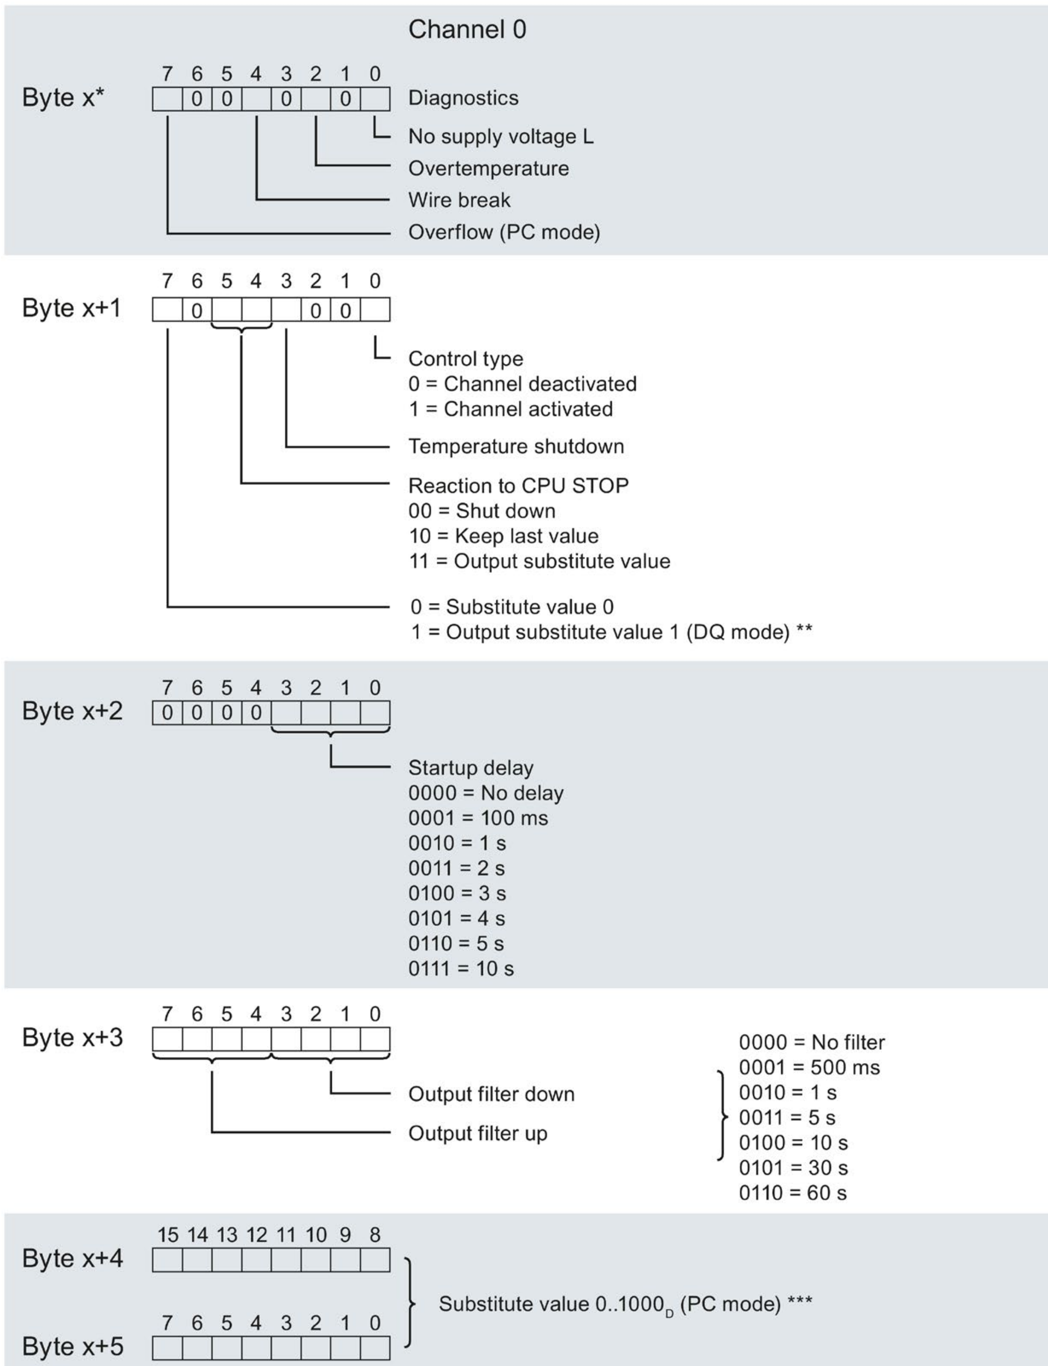
Parameters

The figure below shows the structure of the parameters for channels 0 to 3.
You enable a parameter by setting the corresponding bit to "1".



*   x = 8 + (channel number × 6); channel number = 0 to 3
** is ignored in PC mode
*** is ignored in DQ mode

Figure A-6   Structure byte x up to x+5 for the channel 0 to 3

A.2 Error transferring the data record DQ

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	01	At least one reserved bit is set to "1".	Set all reserved bits to "0".
DF	80	E1	02	Overflow diagnostics is enabled even though DQ mode is active.	Block all Overflow diagnostics or switch to PC mode.
DF	80	E1	05	Invalid coding for operating mode.	Check module parameters.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check all channel parameters.
DF	80	E1	20	Invalid coding for startup delay.	Check all channel parameters.
DF	80	E1	21	Invalid coding for output filter up or down.	Check all channel parameters.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

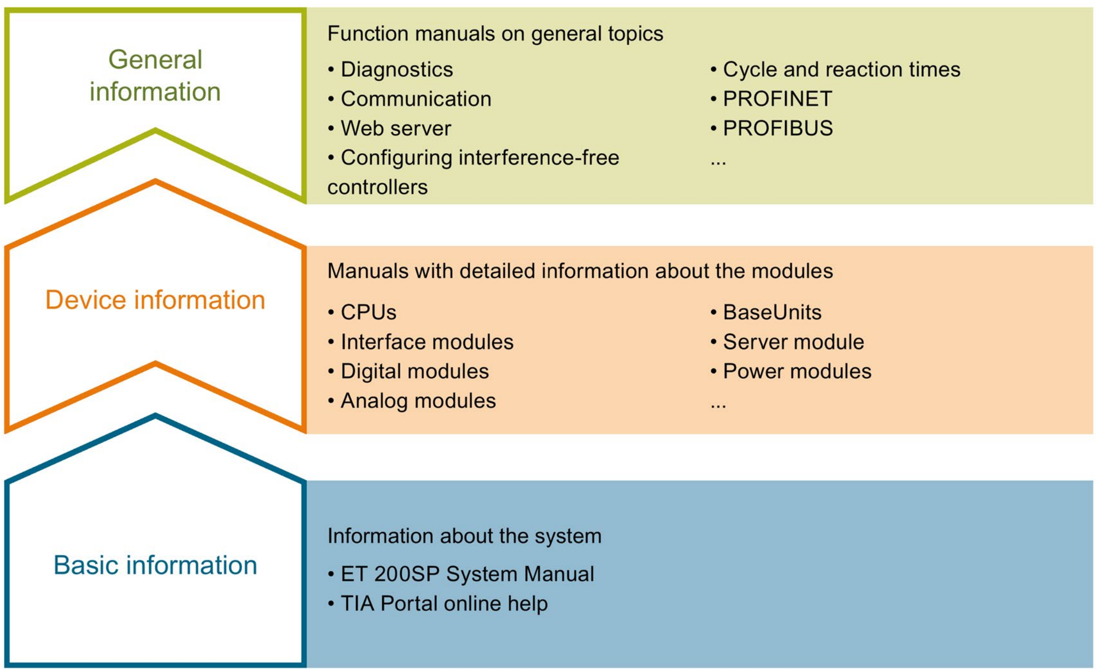
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Application examples

Applications examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find application examples on the Internet (http://support.industry.siemens.com/cs/ww/en/ps/ae).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

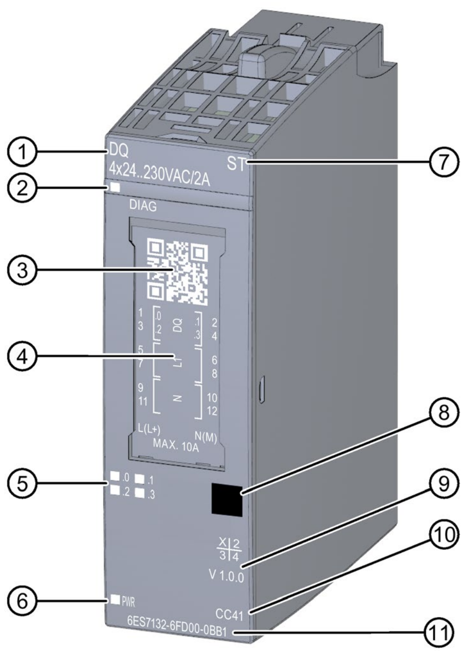
2.1 Properties

Article number

6ES7132-6FD00-0BB1

View of the module



① Module type and name	⑦ Function class
② LED for diagnostics	⑧ Color coding module type
③ 2D matrix code	⑨ Function and firmware version
④ Wiring diagram	⑩ Color code for selecting the color identification labels
⑤ LEDs for channel status	⑪ Article number
⑥ LED for supply voltage	

Figure 2-1 View of the DQ 4×24..230VAC/2A ST module

Properties

The module has the following technical properties:

- 4 digital outputs each with a value status (quality information)
- Supply voltage L+
- Switches in zero point
- Output current 2 A per channel
- Total current 8 A (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, AC contactors, and indicator lights

The module supports the following functions:

- Firmware update
- Identification data I&M0 to I&M3
- Reconfiguration in RUN
- PROFIenergy

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 4x24..230VAC/2A ST module with the terminal assignments for 2-wire and 3-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system system manual.

NOTICE
Dangerous voltage. Risk of death or serious injury.
Always disconnect the system and module from the power supply before commencing work.

Note

Limiting overvoltage

You must ensure overvoltage is limited to 1 kV for the encoder supply.

Note

Power limitation

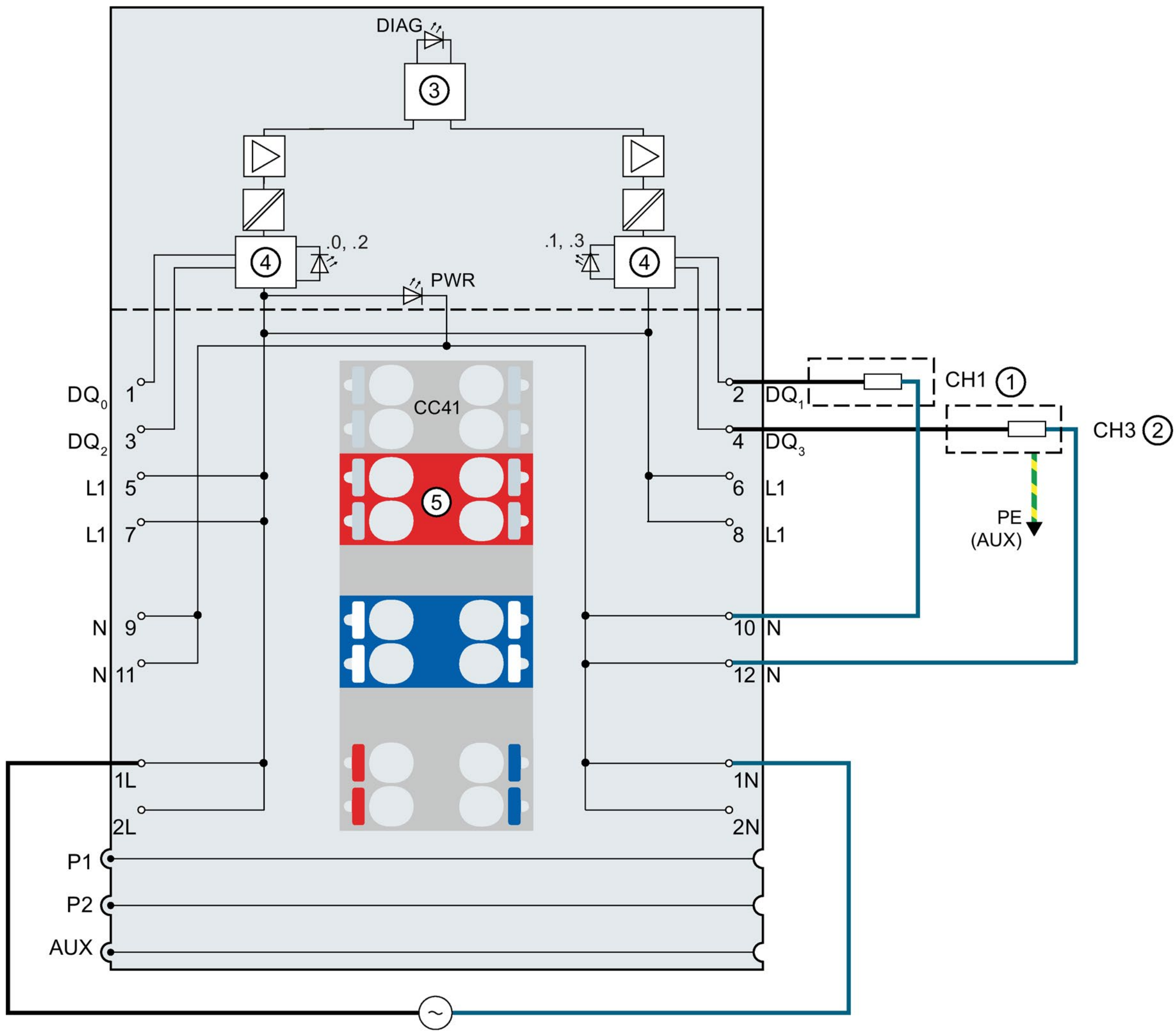
To limit power, each input voltage must have a fuse with a maximum rating of 10 A tripping current. The fuse must be a quick-acting microfuse.

Note

You may use and combine the different wiring options for all channels.

Connection: 2-wire and 3-wire connection of actuators

The following figure shows the block diagram and an example for the terminal assignment of the digital input module DQ 4x24..230VAC/2A ST on the BaseUnit BU type B1.



①	2-wire connection	N	Neutral
②	3-wire connection	1L, 2L	Supply voltage 120 V AC to 230 V AC
③	Backplane bus interface	1N, 2N	Neutral conductor supply voltage
④	Output electronics	PE (AUX)	Protective conductor connection
⑤	Color identification label CCxx (optional)	DIAG	Diagnostics LED (red/green)
DQ_n	Output signal, channel n	.0, .1, .2, .3	Channel status LED (green)
L1	Encoder supply	PWR	Power LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)		

Figure 3-1 Wiring and block diagram for 2-wire and 3-wire connection of actuators

No connection for three-phase loads

The digital output is not suitable for three-phase loads.

Parameter assignment/addressing 4

4.1 Parameters

DQ 4×24..230VAC/2A ST parameters

The table below lists the parameters that can be set. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When performing the configuration in the user program, use the "WRREC" instruction to transfer the parameters to the module using data records (refer to the section Parameter assignment and structure of parameter data record (Page 21)).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Recon-figuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP[1]
Operating mode	• Channel activated • Channel deactivated	Channel activated	Yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module

[1] Only for configuration using the PROFIBUS GSD file; does not affect configuration with STEP 7 using HSP: As the number of parameters with PROFIBUS GSD configuration is limited to a maximum of 244 bytes per ET 200SP station, the configuration options are limited. If required, however, you can still set this parameter using data record 128 as described in the column "GSD file PROFINET IO" (see the table above). The parameter length of the I/O module is 3 bytes.

4.2 Explanation of parameters

Operating mode

Determines whether a channel is enabled or disabled.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

ET 200SP distributed I/O system
(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

Configuration options of DQ 4×24..230VAC/2A ST

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the digital value.

Bit =1: No fault is present on the channel.

Bit =0: Channel is deactivated or there is an error on the module.

If an error on a channel occurs with this module, the value status for all channels is 0.

Address space of the digital output module DQ 4×24..230VAC/2A ST

The following figure shows the assignment of the address space for the DQ 4×24..230VAC/2A ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

Assignment in the process image of the outputs (PIQ)

	7	6	5	4	3	2	1	0	
QB x	0	0	0	0					Output values at channels 0 to 3

Assignment in the process image of the inputs (PII)

	7	6	5	4	3	2	1	0	
IB x	0	0	0	0					Value status (QI) at channels 0 to 3 0: value output at channel is faulty

Figure 4-1 Address space of the DQ 4×24..230VAC/2A ST digital output module with value status

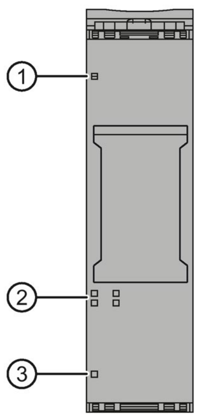
Interrupts/diagnostics alarms

5

5.1 Status and fault displays

LED display

The figure below shows the LED displays of the DQ 4×24..230VAC/2A ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following tables explain the meaning of the status and error displays.

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated or activated and process signal = 0
On	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Load voltage status

Load voltage status

The firmware of the module cannot detect the status of the load voltage.

If the "Load voltage status" function tied to the server module is used, a "1" is always displayed in the status bit for a slot with the DQ 4×24..230VAC/2A ST. Even when the load voltage is not applied.

The state of the load voltage at the terminal does not impact the PROFIenegy behavior.

5.3 Interrupts

The DQ 4x24...230VAC/2A ST digital output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Channel temporarily unavailable
- Parameter assignment error

5.4 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the DIAG LED flashes on the module. The diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Channel/component temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not read in process values in this state.	• Wait for firmware update • Restart the firmware update

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DQ 4×24...230VAC/2A ST

	6ES7132-6FD00-0BB1
Product type designation	DQ 4x24 ... 230VAC/2A
General information	
Firmware version	V1.0
• FW update possible	Yes
Usable BaseUnits	BU type B1
Color code for module-specific color identification label	CC41
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 / V13
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD as of revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
DQ	Yes
DQ with energy-saving function	No
PWM	No
Oversampling	No
MSO	No
Supply voltage	
Rated value (AC)	230 V
Input current	
Current consumption (rated value)	11.5 mA
Power loss	
Power loss, typ.	9 W; active power, load voltage 230 V, all outputs loaded with 2 A, 50 Hz
Address area	
Address space per module	
Address space per module, max.	1 byte; + 1 byte for QI information
Input	1 byte; with QI
Output	1 bytes

Digital outputs	
Number of outputs	4
Sinking output	No
Sourcing output	Yes
Short-circuit protection	No; install a fuse with 10A trigger current when using a type B1 BU
Switching capacity of outputs	
With resistive load, max.	2 A
With lamp load, max.	100 W
Output voltage	
For signal "1", min.	20.4 V
Output current	
For signal "1" rated value	2 A
For signal "1" permitted range, min.	10 mA
For signal "1" permitted range, max.	2 A
For signal "0" residual current, max.	460 µA
Output delay with resistive load	
"0" to "1", max.	10 ms
"1" to "0", max.	10 ms
Parallel switching of 2 outputs	
For logic operations	No
For increased performance	No
For redundant control of a load	Yes
Switching frequency	
With resistive load, max.	10 Hz
With inductive load, max.	0.5 Hz
With lamp load, max.	1 Hz
Total current of outputs	
Current per channel, max.	2 A
Current per module, max.	8 A
Total current of outputs (per module)	
Horizontal installation	
• up to 40 °C, max.	8 A
• up to 50 °C, max.	6 A
• up to 60 °C, max.	4 A
Vertical installation	
• up to 30 °C, max.	8 A
• up to 40 °C, max.	6 A
• up to 50 °C, max.	4 A
Output current per channel	
Horizontal installation	
• up to 60 °C, max.	2 A
Vertical installation	
• up to 50 °C, max.	2 A

	6ES7132-6FD00-0BB1
Triac outputs	
Size of motor starter according to NEMA, max.	5
Cable length	
Shielded, max.	1000 m
Unshielded, max.	600 m
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostics interrupt	No
Diagnostics alarms	
Diagnostics	No
Monitoring of supply voltage	No
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Insulation	
Insulation tested with	DC 2545 V 2 s (routine test)
Dimensions	
Width	20 mm
Weights	
Weight, approx.	50 g

Parameter data record

A

A.1 Parameter assignment and structure of parameter data record

The data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

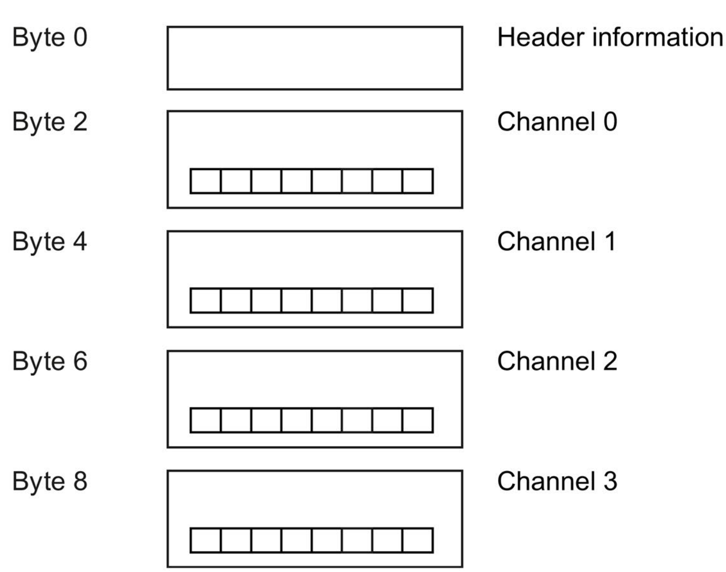

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

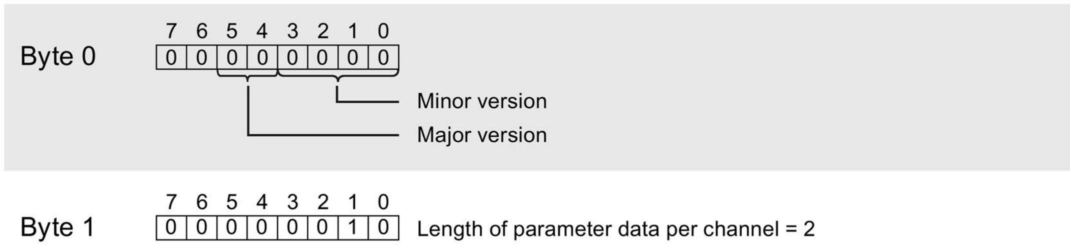

Figure A-2 Header information

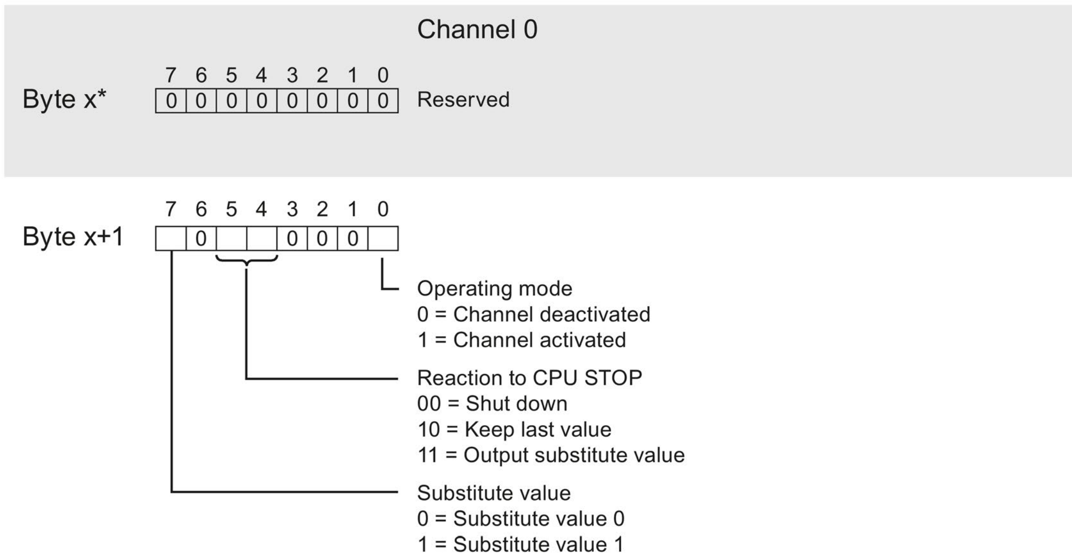
Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number x 2); channel number = 0 to 3

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/91696622) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

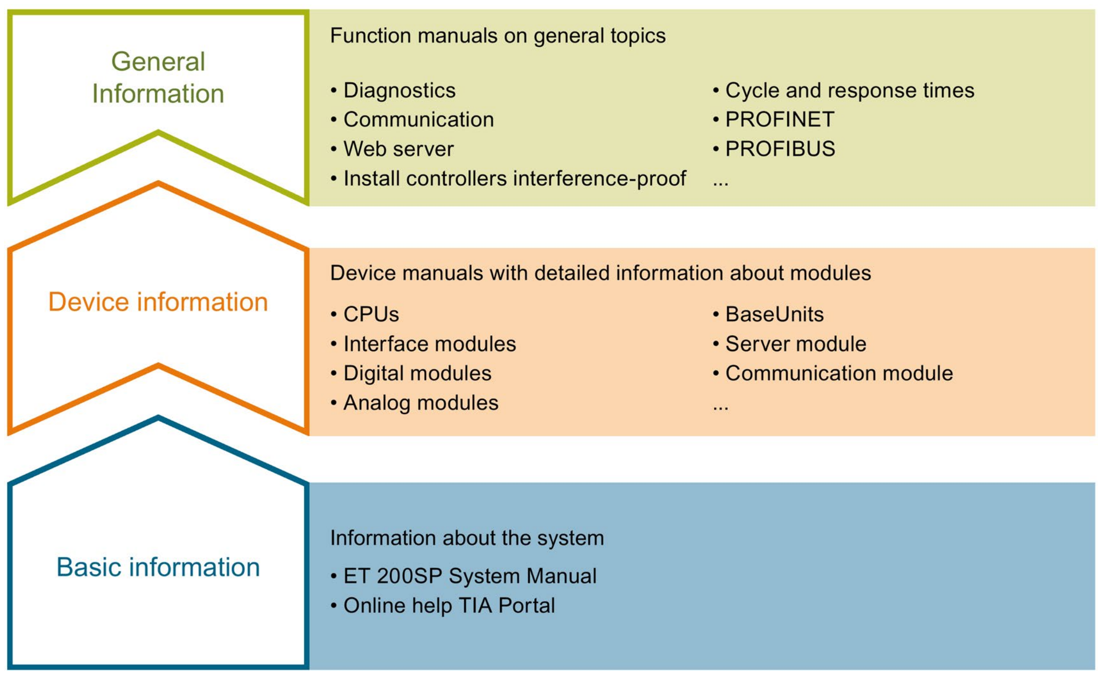
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

⑪ Article number

Image 2-1 View of the module DQ 4×24VDC/2A HF

Properties

The module has the following technical properties:

- Digital output module with 4 outputs
- Source output (PNP, P-switching)
- Supply voltage L+
- Output current 2 A (per channel)
- Configurable diagnostics (per channel)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Safety-related shutdown

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy
- Value status
- Isochronous mode
- Module-internal Shared Output (MSO)

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of
Configurable submodules/ submodules for shared device	1	V2.0.0

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories are supplied with the module and can also be ordered separately as spare parts:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manualET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/91696622).

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 4x24VDC/2A HF module with the terminal assignments for a 1-wire, 2-wire and 3-wire connection. You can use and combine the different wiring options for all channels.

You can find information on wiring the BaseUnits in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Note

- The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

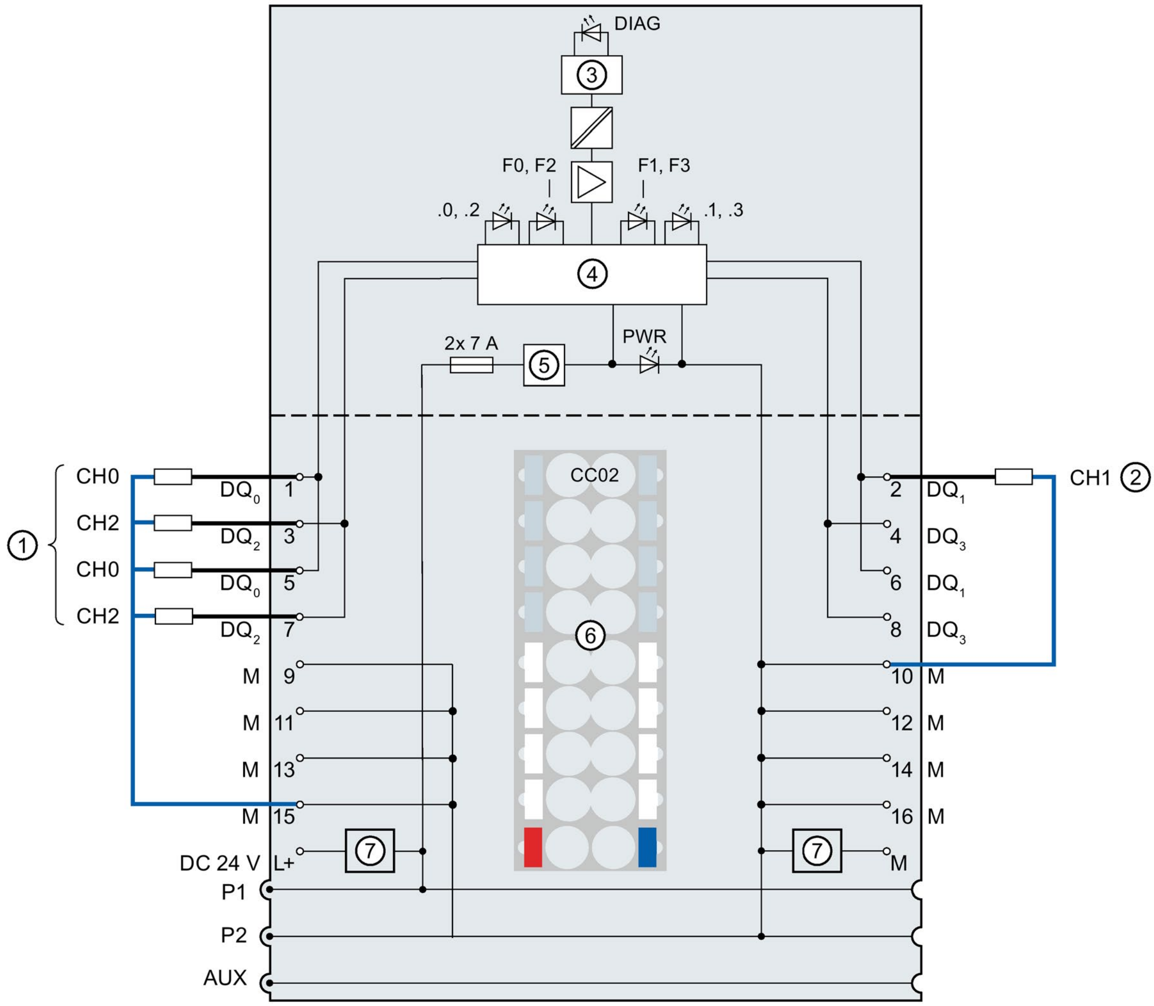
Note

Cross circuit at output

Be aware that voltage from a cross-circuit at the output can feed L+ to modules.

Wiring: 1 and 2-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 4×24VDC/2A HF on the BaseUnit BU type A0 without AUX terminals (1- and 2-wire connection).

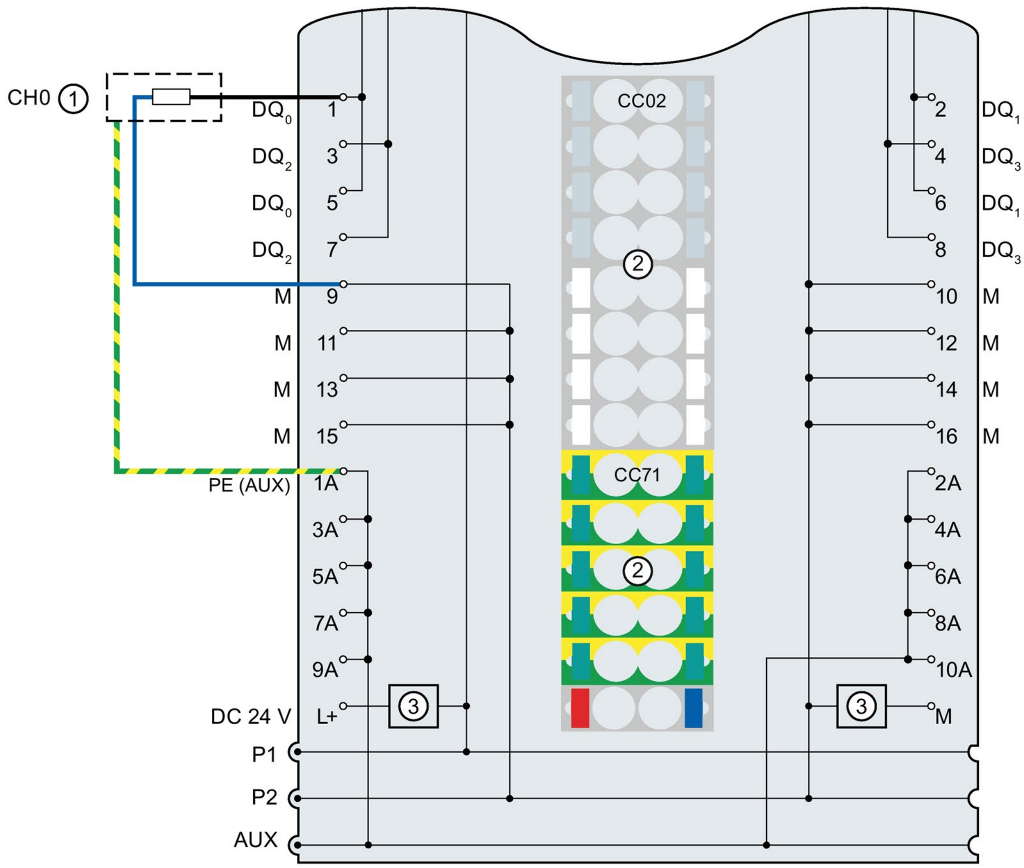


①	1-wire connection	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
②	2-wire connection	M	Ground
③	Backplane bus interface	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored Ba-seUnit)
④	Output electronics	DIAG	Error or diagnostics LED (green, red)
⑤	Polarity reversal protection	.0 to .3	Channel status LED (green)
⑥	Color-coded label with color code CC02 (optional)	F0 to F3	Channel fault LED (red)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	PWR	Power LED (green)
DQ_n	Output signal, channel n		

Image 3-1 Block diagram and terminal assignment for 1- and 2-wire connection of actuators

Wiring: 3-wire connection of actuators

The following figure shows an example of the terminal assignment of the digital output module DQ 4×24VDC/2A HF on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A to 10 A	AUX terminals
②	Color-coded labels with color codes CC02 and CC71 (optional)	PE (AUX)	Protective conductor connection
③	Filter connection supply voltage (only when light-colored BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
DQ_n	Output signal, channel n	M	Ground
		P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Image 3-2 Terminal assignment for 3-wire connection of actuators

4 Parameters/address space

4.1 Parameters

Parameters of the DQ 4x24VDC/2A HF

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records (see chapter Parameter assignment and structure of the parameter data record (Page 31)).

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Parameter reassignment in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to L+	• Disable • Enable	Disable	Yes	Channel	
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Channel	Channel
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Range of values	Default	Parameter reassignment in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP. The parameter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes for each ET 200SP station. If required, you can still assign the parameters using data records 64 to 67 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 7 bytes.

Note

If one of the two parameters "Diagnostics: Short-circuit to L+" or "Diagnostics: Wire break" is enabled and one of these diagnostics occurs, the affected channel is switched off to avoid triggering an undefined load. Note that a diagnostic interrupt can only be generated when diagnostics are enabled. [1]

[1] as of module revision 04

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Diagnostics: Short-circuit to L+

Enabling of the diagnostics if a short-circuit of the actuator supply to L+ occurs.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of DQ 4×24VDC/2A HF

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. When you configure the module by means of the GSD file, the configuration is available under different abbreviations/module names. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Abbreviation/module name in the GSD file	Configuration software, e.g. STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, as of V13, SP1	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	DQ 4×24VDC/2A HF V1.0	X	X	X
1 x 4-channel with value status	DQ 4×24VDC/2A HF V1.0, QI	X	X	---
1 x 4-channel with value status for module-internal Shared Output with up to 4 submodules	DQ 4×24VDC/2A HF V1.0, MSO	X	X	---
1 x 4-channel without value status	DQ 4×24VDC/2A HF V2.0	---	X	---
1 x 4-channel with value status	DQ 4×24VDC/2A HF V2.0, QI	---	X	X
1 x 4-channel with value status for module-internal Shared Output with up to 4 submodules	DQ 4×24VDC/2A HF V2. 0, MSO	---	X	---
2 x 2-channel without value status	DQ 4×24VDC/2A HF V2.0, S.2	---	X	---
2 x 2-channel with value status	DQ 4×24VDC/2A HF V2.0, S.2 QI	---	X	---

Note

The following functions are only fully available when the submodule X.1 is configured and the IO controller to which submodule X.1 is assigned has established a connection to the IO device.

- Firmware update
- I&M identification data
- PROFIenergy

2 x 2-channel configuration

For the configuration, the channels of the module are divided into multiple submodules. The submodules can be assigned to different IO controllers when the module is used in a Shared Device.

The number of usable submodules is dependent on the interface module used. Read the information in the manual for the particular interface module.

Value status (quality information, QI)

The value status is always activated for the following module names:

- DQ 4×24VDC/2A HF QI
- DQ 4×24VDC/2A HF MSO

An additional bit is assigned to each channel for the value status. The bit for the value status indicates if the output value specified by the user program is actually pending at the module terminal (0 = value is incorrect).

Address space for configuration as 1 x 4-channel DQ 4×24VDC/2A HF V1.0

The figure below shows the address space assignment for configuration as a 4-channel module without value status.

Assignment in the process image output (PIQ)

	7	6	5	4	3	2	1	0	Output value:
QB a	0	0	0	0					Channel 0 to 3 (input CH0 to CH3)

Image 4-1 Address space for configuration as 1 x 4-channel DQ 4×24VDC/2A HF, QI without value status

Address space for configuration as 1 x 4-channel DQ 4×24VDC/2A HF V1.0, QI

The following figure shows the assignment of the address space for the configuration as a 4-channel module with value status. You can freely assign the start address for the module. The addresses of the channels are derived from the start address.

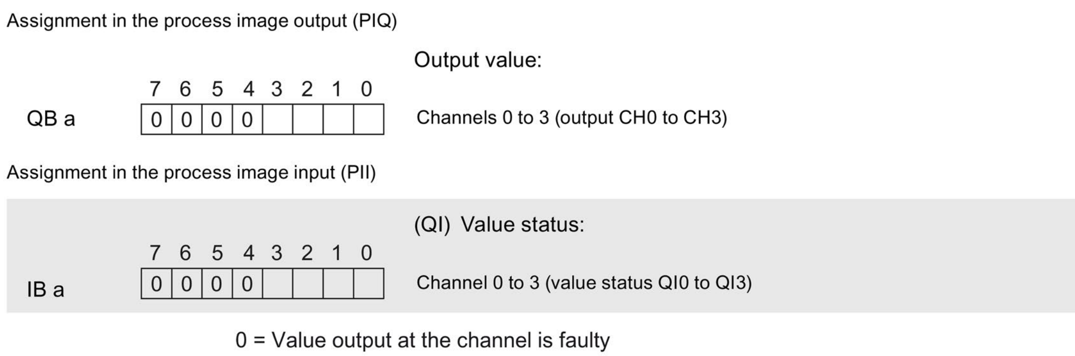


Image 4-2 Address space for configuration as 1 x 4-channel DQ 4×24VDC/2A HF, QI with value status

Address space for configuration as 1 x 4-channel DQ 4×24VDC/2A HF V1.0, MSO

For the configuration as a 1 x 4-channel module (module-internal shared output, MSO), channels 0 to 3 of the module are copied to up to four submodules. Channels 0 to 3 are then available with identical values in various submodules. These submodules can be assigned to up to four IO controllers when the module is used in a shared device:

- The IO controller to which submodule 1 is assigned has write access to outputs 0 to 3.
- The IO controller to which submodule 2, 3, or 4 is assigned has read access to outputs 0 to 3.

Value status (Quality Information,QI)

The meaning of the value status depends on the submodule on which it occurs.

For the 1st submodule (= basic submodule), the value status 0 indicates that the value is incorrect or that the IO controller of the basic submodule is in STOP state.

For the 2nd to 4th submodule (= MSO submodule), the value status 0 indicates that the value is incorrect or one of the following errors has occurred:

- The basic submodule is not yet configured (not ready).
- The connection between the IO controller and the basic submodule has been interrupted.
- The IO controller of the basic submodule is in STOP or POWER OFF state.

The following figure shows the assignment of the address space for submodules 1, 2, 3, and 4 and the value status.

Assignment in the process image output (PIO) for 1st submodule

	7	6	5	4	3	2	1	0	
									1st submodule (basic submodule):
QB a	0	0	0	0					Channels 0 to 3 (output CH0 to CH3)
									(QI) Value status
IB b	0	0	0	0					Channel 0 to 3 (value status QI0 to QI3)

Assignment in the process image input (PII) for 2nd submodule

	7	6	5	4	3	2	1	0	
									2nd submodule (MSO submodule): Read back output values
IB c	0	0	0	0					Channels 0 to 3 (output CH0 to CH3)
									(QI) Value status
IB c+1	0	0	0	0					Channel 0 to 3 (value status QI0 to QI3)

Assignment in the process image input (PII) for 3rd submodule

	7	6	5	4	3	2	1	0	
									3rd submodule (MSO submodule): Read back output values
IB d	0	0	0	0					Channels 0 to 3 (output CH0 to CH3)
									(QI) Value status
IB d+1	0	0	0	0					Channel 0 to 3 (value status QI0 to QI3)

Assignment in the process image input (PII) for 4th submodule

	7	6	5	4	3	2	1	0	
									4th submodule (MSO submodule): Read back output values
IB e	0	0	0	0					Channels 0 to 3 (output CH0 to CH3)
									(QI) Value status
IB e+1	0	0	0	0					Channel 0 to 3 (value status QI0 to QI3)

0 = Value output at the channel is faulty

Image 4-3 Address space for configuration as 1 x 4-channel DQ 4×24VDC/2A HF, MSO with value status

Address space for configuration as 2 x 2-channel DQ 4×24VDC/2A HF, S.2

The figure below shows the address space assignment for configuration as a 2 x 2-channel module without value status.

Each of the two submodules has a freely assignable start address.

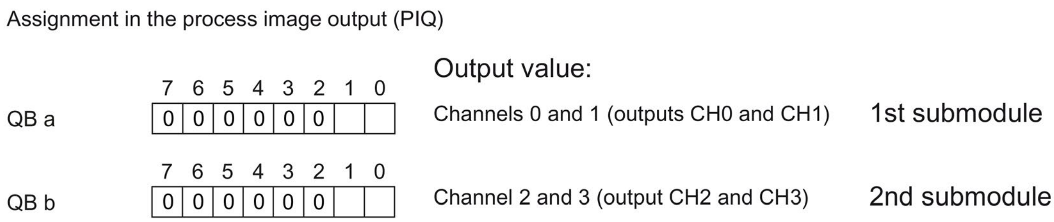

Image 4-4 Address space for configuration as 2 x 2-channel DQ 4×24VDC/2A HF, S.2 without value status

Address space for configuration as 2 x 2-channel DQ 4×24VDC/2A HF, S.2 QI

The figure below shows the address space assignment for configuration as a 2 x 2-channel module with value status.

Each of the two submodules has a freely assignable start address.

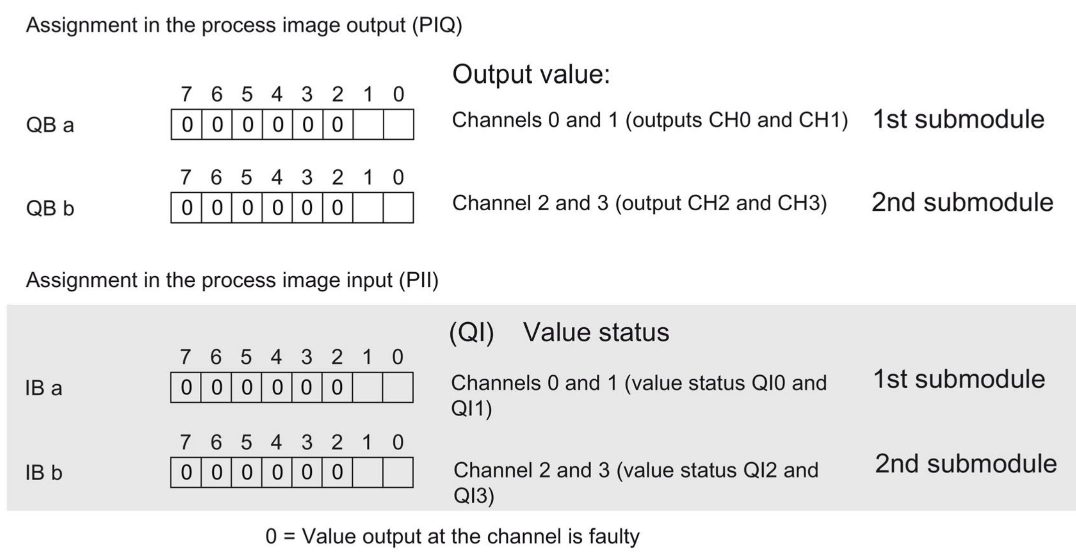

Image 4-5 Address space for configuration as 2 x 2-channel DQ 4×24VDC/2A HF V2.0, S.2 QI with value status

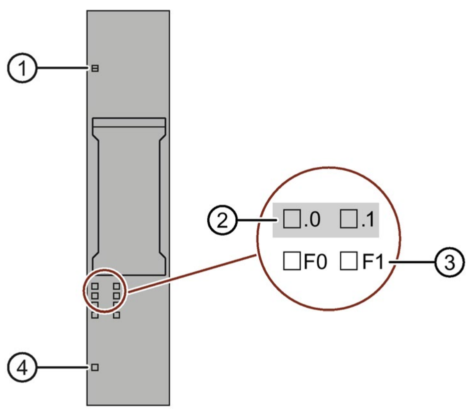
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the DQ 4x24VDC/2A HF.



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Image 5-1 LED display

Meaning of the LEDs

The tables below explain the meaning of the Status and error displays. Remedial measures for diagnostics alarms can be found in section Diagnostics alarms (Page 24).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
☼ Flashes	Module parameters not assigned
■ On	Module parameters assigned and no module/channel diagnostics
☼ Flashes	Module parameters assigned and module/channel diagnostics

LED channel status/channel error

Table 5- 2 Status / error display of the LED channel status / channel error

Channel status LED	LED channel error	Meaning
□ Off	□ Off	Channel deactivated or process signal = 0
■ On	□ Off	Channel activated and no channel diagnostics
□ Off	■ On	Channel activated and channel diagnostics

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
□ Off	Missing supply voltage L+
■ On	Supply voltage L+ present

5.2 Interrupts

The DQ 4×24VDC/2A HF digital output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

Detailed information on the event is available in the STEP 7 online help.

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

You can connect 2 actuators per output.

The diagnostics of the two actuators influenced each other in the case of duplicate wiring.

This means:

- a wire break is only signaled if both actuators are affected
- a single short-circuit affects both actuators

Note

Parallel connection of two outputs

For parallel connection of two outputs for redundant control of a load, the channel diagnostics "Short-circuit to L+" and "Wire break" must be deactivated.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Short-circuit	1_H	• Short-circuit of actuator supply to ground [1] • Short-circuit of actuator supply to L+ [2]	Correct the process wiring
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, for example, use cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor to the actuator contacts in the load resistance range
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel/component temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

[1] only in switched state (output value 1)

[2] only in non-switched state (output value 0)

Note

In case of a short-circuit of the actuator supply to L+ at the activated channel, load distributions can occur which result in wire break diagnostics.

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DQ 4×24VDC/2A HF

	6ES7132-6BD20-0CA0
General information	
Product type designation	ET 200SP, DQ 4x24VDC/2A HF, PU 1
Firmware version	V2.0
• FW update possible	Yes
Usable BaseUnits	BU type A0
Color code for module-specific color identification label	CC02
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1 / -
STEP 7 can be configured/integrated as of version	V5.5 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
DQ	Yes
DQ with energy-saving function	No
PWM	No
Oversampling	No
MSO	Yes
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	19.2 V
Valid range, high limit (DC)	28.8 V
Polarity reversal protection	Yes
Output voltage	
Rated value (DC)	24 V
Power loss	
Power loss, typ.	1 W

	6ES7132-6BD20-0CA0
Address area	
Address space per module	
Address space per module, max.	4 bytes; 2 channels per submodule + QI information
Digital outputs	
Number of outputs	4
Sinking output	No
Sourcing output	Yes
Short-circuit protection	Yes
• Response threshold, typ.	2.8 ... 5.2 A
Limitation of inductive shutdown voltage to	L+ -(37 to 41V)
Control of a digital input	Yes; minimum current consumption 7 mA
Switching capacity of outputs	
With resistive load, max.	2 A
With lamp load, max.	10 W
Load resistance range	
Low limit	12 Ω
High limit	3400 Ω
Output current	
For signal "1" rated value	2 A
For signal "0" residual current, max.	0.1 mA
Output delay with resistive load	
"0" to "1", typ.	50 µs
"1" to "0", typ.	100 µs
Parallel connection of two outputs	
For increased performance	No
Switching frequency	
With resistive load, max.	100 Hz
With inductive load, max.	2 Hz
With lamp load, max.	10 Hz
Total current of the outputs	
Current per channel, max.	2 A
Current per module, max.	8 A
Total current of the outputs (per module)	
Horizontal installation	
• Up to 40 °C, max.	8 A
• Up to 50 °C, max.	6 A
• Up to 60 °C, max.	4 A
Vertical installation	
• Up to 30 °C, max.	8 A
• Up to 40 °C, max.	6 A
• Up to 50 °C, max.	4 A

	6ES7132-6BD20-0CA0
Cable length	
Shielded, max.	1000 m
Unshielded, max.	600 m
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes
Bus cycle time (TDP), min.	500 µs
Jitter, max.	8 µs
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostics interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of the supply voltage	Yes
Wire break	Yes; channel-based
Short-circuit	Yes; channel-based
Group error	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and backplane bus	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic insulation)
Insulation	
Insulation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	30 g

Safety-related shutdown

Note

The digital output module DQ 4x24VDC/2A HF supports safety-related shutdown in connection with a fail-safe power module F-PM-E 24VDC/8A PPM ST:

- SIL according to IEC 61508: 2
- Highest attainable safety class in safety mode, performance level according to EN ISO 13849-1: d

Residual current for signal state "0"

Note

Residual current for signal state "0"

Due to the Diagnostics: Wire break function, there is a low level of residual current in the "0" signal state at the output, which may cause the display diodes to flicker.

This residual current does not depend on the setting for the Diagnostics: Wire break parameter.

Derating trend

The following figure show the load current derating with horizontal and vertical mounting positions.

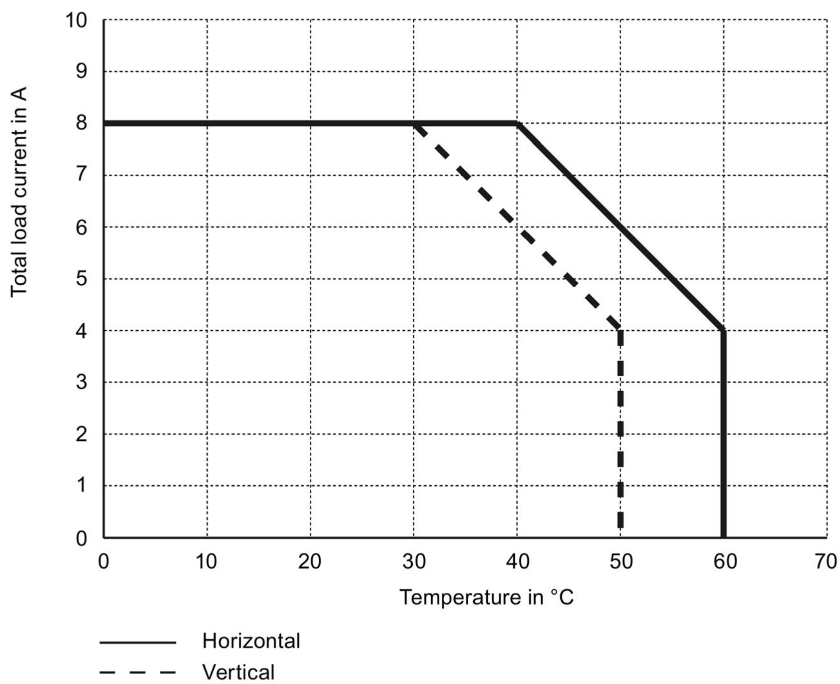


Image 6-1 Load current for mounting position

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

You can configure the individual channels with data records 64 to 67.

Parameter assignment in the user program

You can reassign the module parameters in RUN (e.g. "Switch on diagnostics" can be changed in RUN).

Changing parameters in RUN

The WRREC instruction is used to transfer the parameters to the module using data record 128 or data records 64 to 67. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

If you reconfigure a module and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing".

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, the STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Data record structure

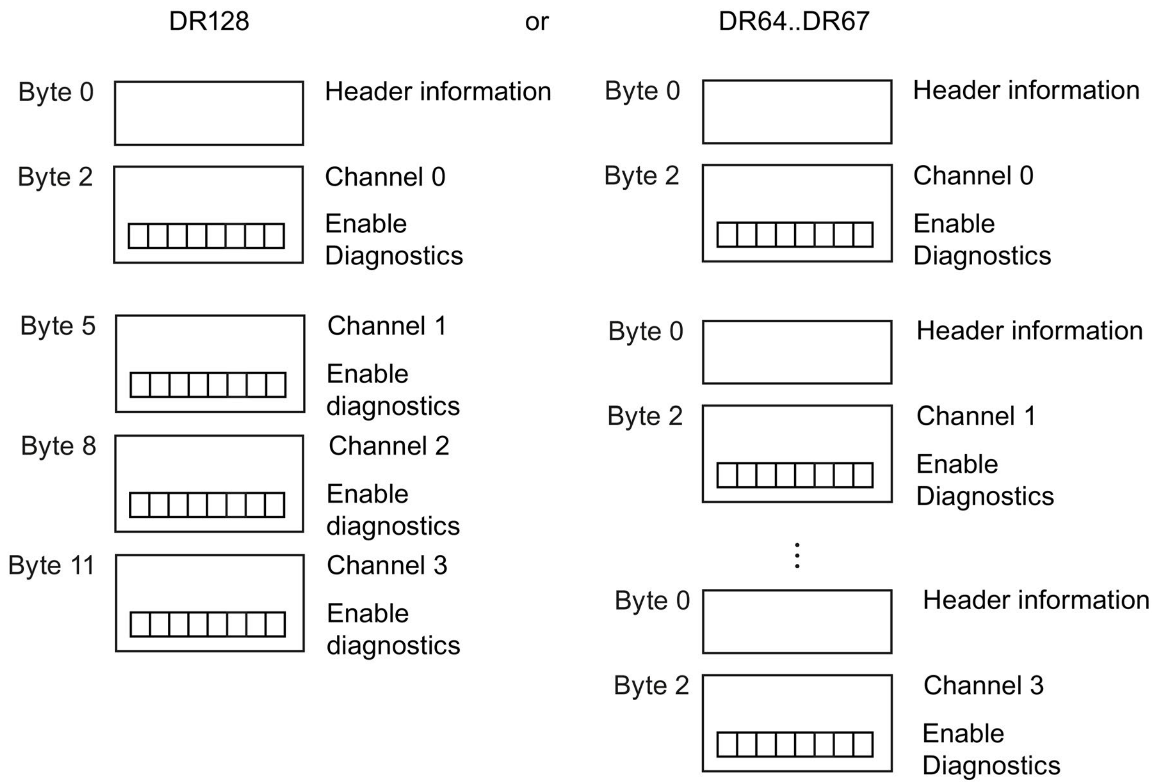

Image A-1 Structure of data record 128 or data records 64 to 67

Header information

The figure below shows the structure of the header information.

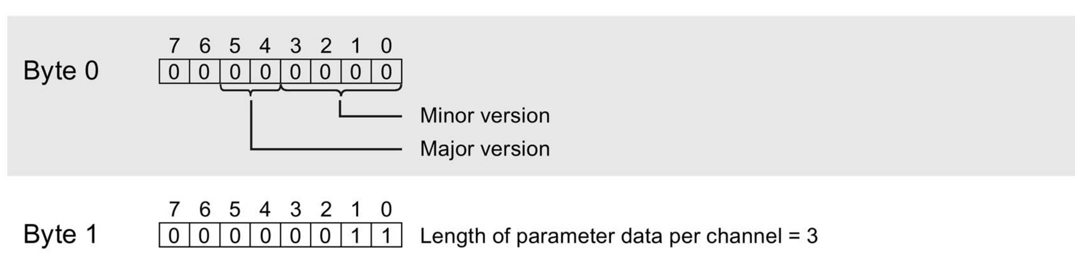

Image A-2 Header information

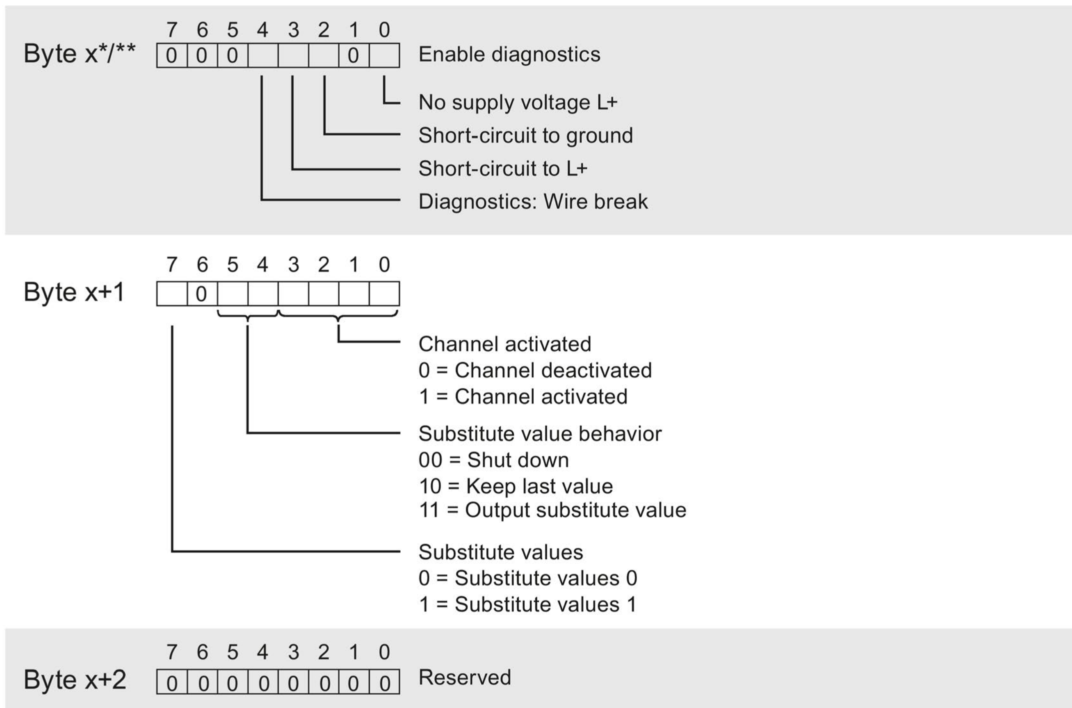
Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 3); channel number = 0 to 3 for DR 128
** x =2 for DR 64 to DR 67

Image A-3 Structure of byte x to x+2 for channels 0 to 3

Error transmitting the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine whether the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	E0	xx	Wrong version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	E1	xx	Parameter error	Check the parameters of the module

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in the system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in the following, it applies to the central processing units of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: To designate the configuring and programming software, we use "STEP 7" in this documentation as a synonym for all versions of "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For ecologically sustainable recycling and disposal of your old device, contact a certified disposal service for electronic scrap and dispose of the device in accordance with the regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

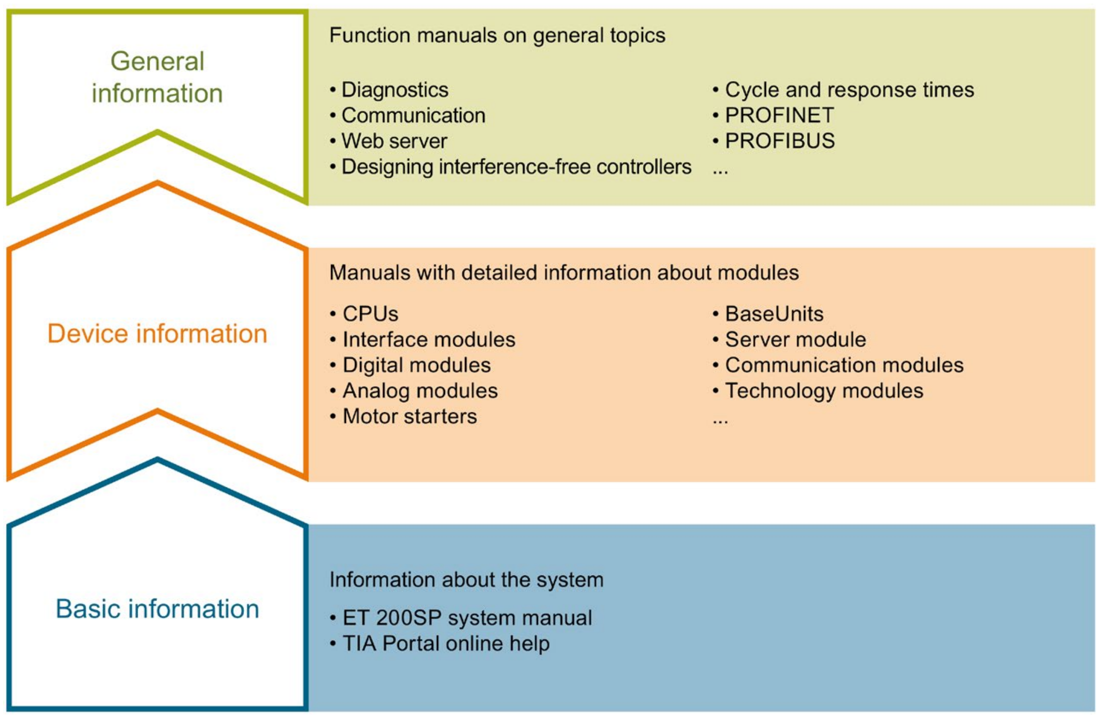
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the DQ 4×24VDC/2A HS module

Properties

The module has the following technical properties:

- Digital output module with 4 outputs (push-pull)
- Source output (PNP, sourcing output)
- Supply voltage L+
- Output current 2 A (per channel)
- Configurable substitute values (per channel)
- Configurable diagnostics (per module)
- Suitable for solenoid valves, DC contactors, and indicator lights

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01 or higher	V1.0.0 or higher	V13 SP1 or higher with HSP 0127	V5.5 SP3 or higher with HSP 0230 V5.0	X	X
Identification data I&M	FS01 or higher	V1.0.0 or higher	V13 SP1 or higher with HSP 0127	V5.5 SP3 or higher with HSP 0230 V5.0	X	X
Configuration in RUN	FS01 or higher	V1.0.0 or higher	V13 SP1 or higher with HSP 0127	V5.5 SP3 or higher with HSP 0230 V5.0	X	X
PROFIenergy	FS01 or higher	V1.0.0 or higher	V13 SP1 or higher with HSP 0127	V5.5 SP3 or higher with HSP 0230 V5.0	X	-
Value status	FS01 or higher	V1.0.0 or higher	V13 SP1 or higher with HSP 0127	V5.5 SP3 or higher with HSP 0230 V5.0	X	-

Overview of operating modes, functions and parameters

The table below provides an overview of:

- The dependencies between the operating modes of the module and associated technical functions
- The required parameter assignment for the respective operating mode

Table 2- 2 Operating modes, functions and parameters of the DQ 4×24VDC/2A HS

Function/Parameter assignment	Operating mode				
	Normal operation	Valve control in normal operation	Pulse width modulation	Oversampling	Cam control
Function					
Isochronous mode [1]	Yes, optional	Yes, optional	No	Yes, required	Yes
• Shortest send clock	125 μs	125 μs	-	250 μs	-
Oversampling	No	No	No	Yes	No
• Number of oversampling levels (output rate)	-	-	-	2 to 32	-
• Shortest sub-cycle (= shortest sample time)	-	-	-	100 μs	-
Cam control	-	-	-	-	Yes
• Maximum number of cam tracks	-	-	-	-	4
• Maximum number of cams per track	-	-	-	-	16
Value status (QI)	x	x	-	-	x
Data length	1 byte	1 byte	8 bytes	16 bytes	14 bytes input data 7 bytes output data

Function/Parameter assignment	Operating mode				
	Normal operation	Valve control in normal operation	Pulse width modulation	Oversampling	Cam control
Parameter assignment					
Holding time valve control	-	x	-	-	-
Pulse width modulation duty cycle	-	x	-	-	-
Pulse width modulation time period	-	x	x	-	-
Substitute value duty cycle	-	-	x	-	-
Pulsed cam output duty cycle	-	-	-	-	x
Pulsed cam output period	-	-	-	-	x
Modulo activated	-	-	-	-	x
Hysteresis	-	-	-	-	x
Axis reference position	-	-	-	-	x
Encoder value minimum/maximum	-	-	-	-	x
Cam start position/end position	-	-	-	-	x
Cam effective direction	-	-	-	-	x
Cam channel assignment	-	-	-	-	x

[1] Isochronous mode is not configurable using a GSD file.

Configuration options

You can configure the module with STEP 7 or with a GSD file. When you configure the module using a GSD file, you can find the configuration under various short designations/module names. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

The following configurations are possible:

Table 2- 3 Configuration options with GSD file of the DQ 4×24VDC/2A HS

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. STEP 7		
		Can be integrated in the hardware catalog of STEP 7 (TIA Portal) V13 SP1 or higher	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel normal operation without value status	DQ 4×24VDC/2A HS	x	x	x
1 x 4-channel normal operation with value status	DQ 4×24VDC/2A HS QI	x	x	-
1 x 4-channel with pulse width modulation	DQ 4×24VDC/2A HS PWM	x	x	x
1 x 4-channel with oversampling	-	x	-	-
1 x 4-channel with cam control and MtM	DQ 4×24VDC/2A HS MCC MtM	-	x	-
	DQ 4×24VDC/2A HS MCC (16 Byte) MtM	-	x	-
	DQ 4×24VDC/2A HS MCC (6 Byte) MtM	-	x	-

Value status (quality information, QI)

The value status is always activated for the following module names in the GSD file:

- DQ 4×24VDC/2A HS **QI** (...)
- DQ 4×24VDC/2A HS MCC MtM (...)

Evaluating the value status

If you enable the value status function for the digital module, a byte in the input address space is additionally assigned. Bits 0 to 3 of this byte are each assigned to one channel. They provide information about the validity of the digital value.

- Bit = 1: No error is present on the channel.
- Bit = 0: Channel is disabled or there is an error in the module.

If an error occurs on a channel of this module, the value status for all channels is 0.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

3.1 Wiring

3.1.1 Wiring and block diagram

In this section, you can find the block diagram of the DQ 4x24VDC/2A HS module showing the terminal assignments for a 2-wire and 3-wire connection in DQ operating mode.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Note

You can connect 2 actuators per output.

Note

Cross circuit at output

Be aware that voltage from a cross circuit at the output can feed L+ to modules.

Note

- The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.
- The connection of actuators with 1-wire connection is not permitted.

Note

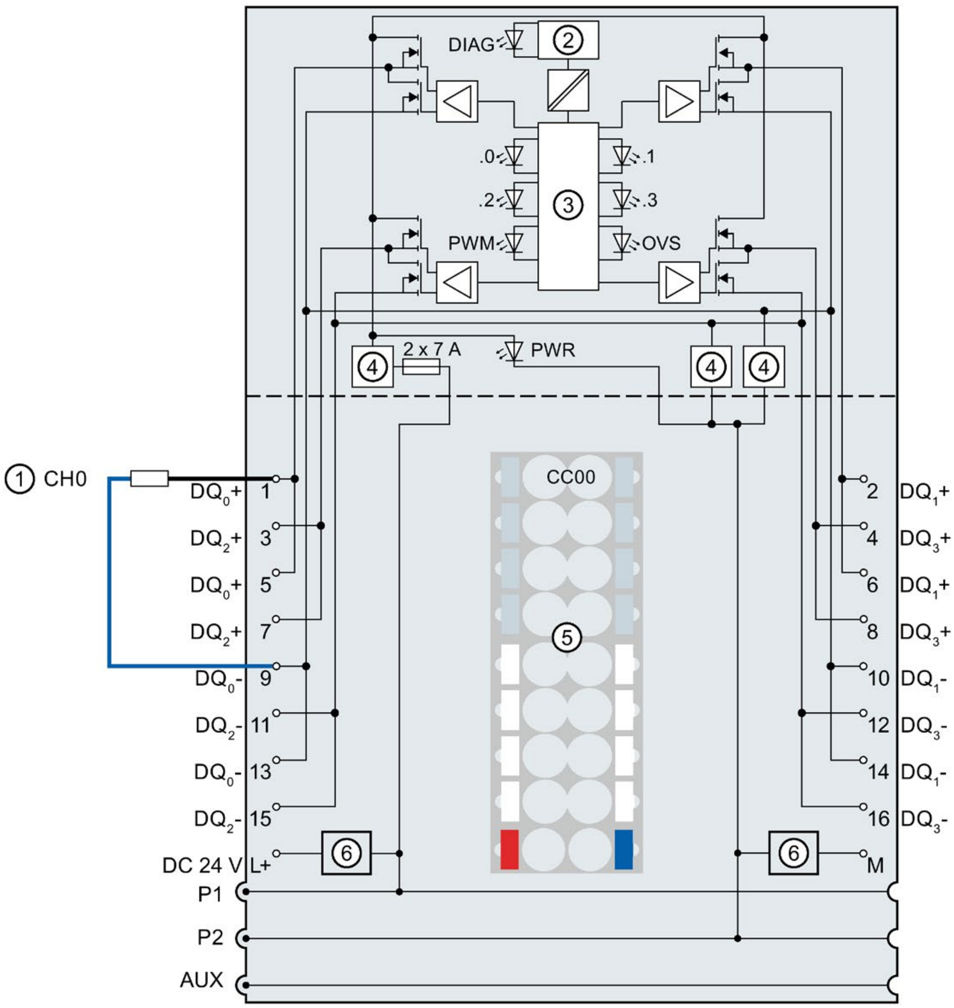
You may use and combine the different wiring options for all channels.

Note

Outputs DQ_n- must not be connected with ground.

Connection: 2-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 without AUX terminals (2-wire connection).

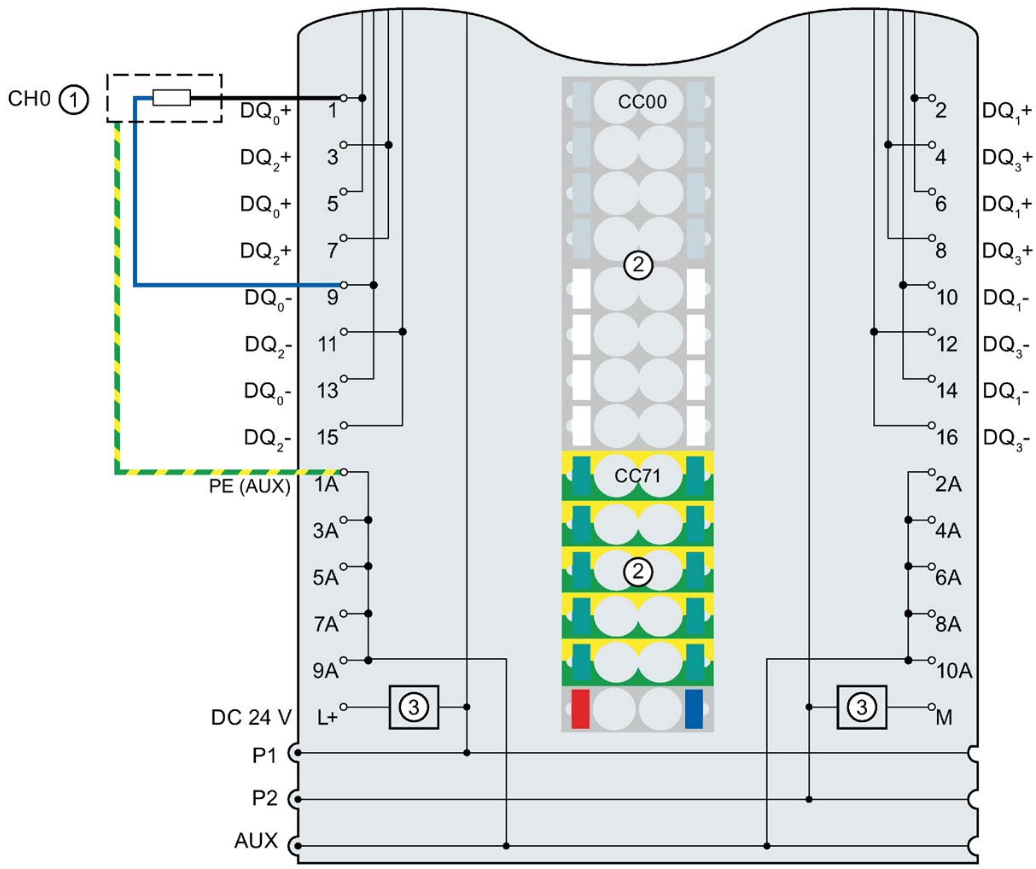


①	2-wire connection	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
②	Backplane bus interface	M	Ground
③	Control unit	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
④	Polarity reversal protection	DIAG	Error or Diagnostics LED (green, red)
⑤	Color-coded label CCxx (optional)	.0, .1, .2, .3	Channel status LED (green)
⑥	Supply voltage filter circuit (only when light BaseUnit is present)	PWM	Pulse width modulation LED (green)
DQ_n+	Output signal, channel n	OVS	Oversampling LED (green)
DQ_n-	Reference output signal, channel n	PWR	Power LED (green)

Figure 3-1 Block diagram and terminal assignment for 2-wire connection of actuators

Connection: 3-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A ... 10 A	AUX terminals
②	Color-coded labels CCxx (optional)	PE (AUX)	Protective conductor connection
③	Supply voltage filter circuit (only when light BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
DQ_n+	Output signal, channel n	M	Ground
DQ_n-	Reference output signal, channel n	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)

Figure 3-2 Terminal assignment for 3-wire connection of actuators

3.2 Parameters/address space

3.2.1 Normal operation/Valve control

Normal operation

"Normal operation" refers to the function of the DQ 4×24VDC/2A HS as digital output module.

Valve control is a special function of normal operation.

Valve control function

You can use the valve control function to switch to a lower "holding current" after operating the valve (inrush current). You do this by activating a pulse width modulation (see section Pulse width modulation (Page 46)).

At a 0 → 1 change of the digital channel, the configured hold time is started. After the hold time elapses, the pulse duty cycle becomes "modulated upon" in the form of a pulse width modulation. The actuating signal is output digitally as a pulse train of on and off pulses.

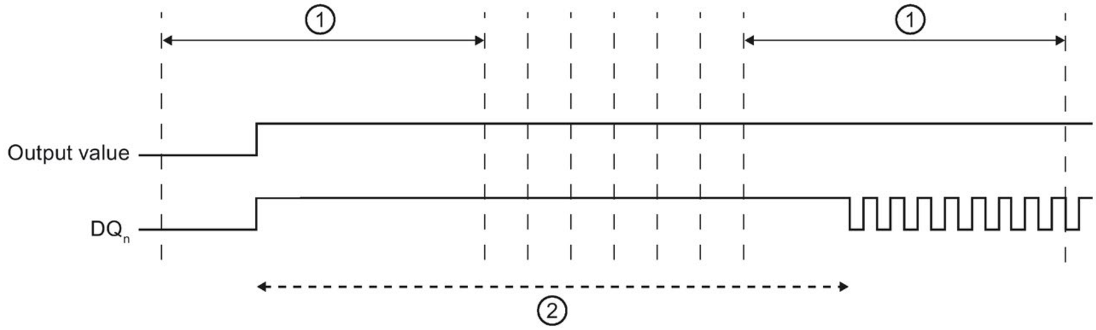
Configuration

You configure valve control with the following parameters:

- "Normal operation" operating mode
- Holding time valve control
- Pulse width modulation duty cycle
- Pulse width modulation time period

Chronological sequence

The figure below shows the chronological sequence for valve control. The pulse width modulation is activated in the next possible data cycle.



① Data cycle

② Holding time valve control

Figure 3-3 Valve control

"Pulse width modulation time period" parameter

You use the "Pulse width modulation time period" parameter to specify the frequency of the pulse width modulation "modulated upon" for the valve control (see section Pulse width modulation (Page 46)).

Note: When this is parameter is set to "Off", the DQ 4×24VDC/2A HS is in normal operation without valve control.

"Pulse width modulation duty cycle" parameter

You use the "Pulse width modulation duty cycle" parameter (0 ... 1000) to specify the pulse duty cycle of the "modulated upon" pulse width modulation within the configured period.

Note: Unlike in the "Pulse width modulation" operating mode, the duty factor cannot be updated cyclically as a function of an output value from the user program in normal operation with valve control.

Derating

Read the information on derating of the module in section Derating of the DQ 4x24VDC/2A HS (Page 95).

3.2.2 Parameters

DQ 4×24VDC/2A HS parameters

The effective range of the assignable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation on an ET 200SP CPU or on an ET 200SP Open Controller
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

In addition to assigning parameters with the configuration software, you can also set the parameters in RUN mode (dynamically) using the user program. When assigning the parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records; see section Parameter assignment and structure of the parameter data record for DQ operating mode (Page 98).

The following parameter settings are possible:

Table 3- 1 Assignable parameters in DQ operating mode (valve control) (GSD file) [3]

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0230 for STEP 7; GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Operating mode [4]	• Normal operation DQ (valve control) [2] • Oversampling • Pulse width modulation • Cam control		No	Module	Module [1]
Output rate	• 1 value/cycle	1 value/cycle	No	Module	Module[1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module [1]
Diagnostics Short circuit to L+/G	• Disable • Enable	Disable	Yes	Module	Module [1]
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel [1]
Reaction to CPU STOP	• Shutdown • Keep last value • Output substitute value 1	Shutdown	Yes	Channel	Module [1]

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0230 for STEP 7; GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Holding time valve control	• 10 ms • 20 ms • ... • 10 s	500 ms	Yes	Channel	Channel [1]
Pulse width modulation duty cycle	• 0% • 0.1% • 0.2% • ... • 100%	50%	Yes	Channel	Channel [1]
Pulse width modulation time period	• Off • 0.20 ms • 0.40 ms • 0.93 ms • 1.33 ms • 4.27 ms • 10.67 ms • 21.33 ms • 34.13 ms • 59.73 ms	Off	Yes	Channel	Channel [1]
Potential group	• Use potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use potential group of the left module	No	Module	Module [1]

1 Because the number of parameters is limited to a maximum of 244 bytes per ET 200SP station when configuring with a PROFIBUS GSD, the possible parameter assignments are restricted. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 15 bytes.

2 Valve control is a special function of normal operation.

3 Oversampling is not supported with GSD files.

4 When configuring with HSP0230 for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

3.2.3 Explanation of parameters

Operating mode

At the module level, specifies the operating mode in which the module's channels are operated. When configuring with HSP0230 for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

- Normal operation as digital output module
  - Valve control is a special function of normal operation, see section Normal operation/Valve control (Page 21).
- Pulse width modulation, see section Pulse width modulation (Page 46)
- Oversampling, see section Oversampling (Page 34)
- Cam control, see section Cam control (Page 62)

Output rate

Specifies the number of subcycles per isochronous data cycle.
See section Oversampling (Page 34).

Diagnostics No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics Short circuit to L+/G

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Channel activated

Specifies whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Holding time valve control

Specifies the time which must expire before the pulse width modulated output signal is output in the next possible data cycle.
See section Normal operation/Valve control (Page 21).

Pulse width modulation duty cycle

Specifies the pulse duty cycle for the "modulated upon" pulse width modulation for the valve control.
See section Normal operation/Valve control (Page 21).

Pulse width modulation time period

Specifies the frequency of the pulse width modulation.
See section Normal operation/Valve control (Page 21) and section Pulse width modulation (Page 46).

Potential group

With the "Potential group" parameter, you specify whether the module is plugged into a light or dark BaseUnit.

A potential group always begins with an I/O module that is plugged into a light BaseUnit. All modules inserted to the right of this that are plugged into dark BaseUnits belong to the same potential group, because the dark BaseUnits are supplied via the light BaseUnits.

The potential group ends at a new light BaseUnit or the end of the station.

3.2.4 Address space

Address space for configuration as a 4-channel DQ 4×24VDC/2A HS

The figure below shows the assignment of the address space for the configuration as a 4-channel module with value status (normal operation without/with valve control). The addresses for the value status are only available if the value status was enabled.

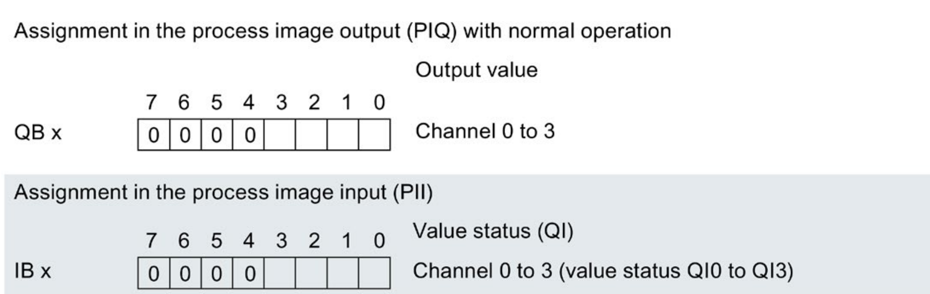

Figure 3-4 Address space for configuration as a 4-channel DQ 4×24VDC/2A HS with value status

Evaluating the value status

If you enable the value status for the digital module, a byte in the input address space is additionally assigned. Bits 0 to 3 of this byte are each assigned to one channel. They provide information about the validity of the digital value.

Bit = 1: No error is present on the channel.

Bit = 0: Channel is disabled or there is an error in the module.

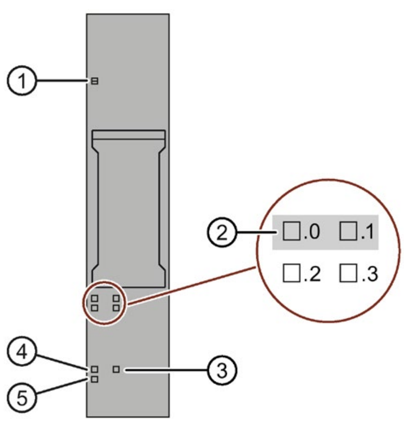
If an error occurs on a channel of this module, the value status for all channels is 0.

3.3 Interrupts/diagnostics alarms

3.3.1 Status and error displays

LED displays

The figure below shows the location of the LED displays of the DQ 4×24VDC/2A HS.



① DIAG (green/red)
② Channel status (green)
③ OVS (green)
④ PWM (green)
⑤ PWR (green)

Figure 3-5 LED displays

Meaning of the LEDs

The following tables contain the meaning of the Status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms.

DIAG LED

Table 3- 2 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 3- 3 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated or process signal = 0
On	Channel activated and process signal = 1

OVS LED and PWM LED

Table 3- 4 Status display of the oversampling LED

OVS LED	PWM LED	Meaning
Off	Off	DQ operating mode (valve control) active
On	Off	Oversampling operating mode active
Off	On	Pulse width modulation operating mode active
On	On	Cam control (MCC) operating mode active

PWR LED

Table 3- 5 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

3.3.2 Interrupts

The DQ 4×24VDC/2A HS digital output module supports diagnostic interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Short circuit
- Excess temperature
- Parameter assignment error
- No supply voltage
- Communication error
- Channel temporarily not available

Detailed information on the event is available in the STEP 7 online help.

3.3.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output and the DIAG LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

You can connect 2 actuators per output.

The diagnostics of the two actuators influence each other in the case of duplicate wiring. This means that a single short-circuit affects both actuators.

Table 3- 6 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Short circuit [1 2]	1_H	Short-circuit of the actuator supply	Correct the process wiring
Excess temperature	5_H	The module has detected that the maximum permitted module temperature has been exceeded. All channels of the module are switched to high resistance. The module is then restarted.	Correct the process wiring
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Communication error	13_H	Module is defective.	Replace the module.
Channel temporarily not available	$1F_H$	Firmware update is currently in progress or was canceled. The module does not output any process values or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

[1] The channels 0 and 1 or 2 and 3 each form a load group. Within a load group, a short-circuit can have an effect on the adjacent channel. The load groups do not have an effect on each other in the case of a short-circuit.

[2] If the short-circuit persists, the module heats up. This may trigger temperature monitoring with excess temperature diagnostic interrupt.

4 Oversampling operating mode

4.1 Connecting

4.1.1 Wiring and block diagram

In this section, you can find the block diagram of the DQ 4x24VDC/2A HS module showing the terminal assignments for a 2-wire and 3-wire connection in oversampling operating mode.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Note

You can connect 2 actuators per output.

Note

Cross circuit at output

Be aware that voltage from a cross circuit at the output can feed L+ to modules.

Note

- The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.
- The connection of actuators with 1-wire connection is not permitted.

Note

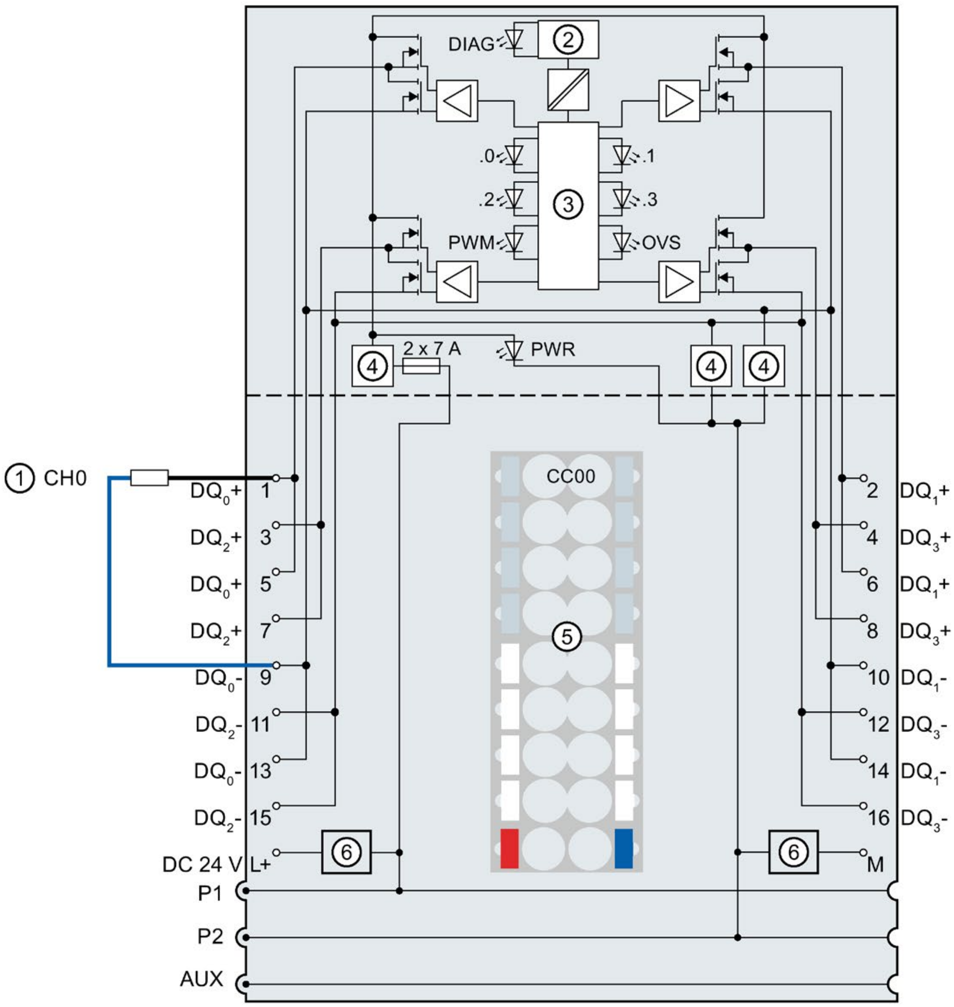
You may use and combine the different wiring options for all channels.

Note

Outputs DQ_n- must not be connected with ground.

Connection: 2-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 without AUX terminals (2-wire connection).

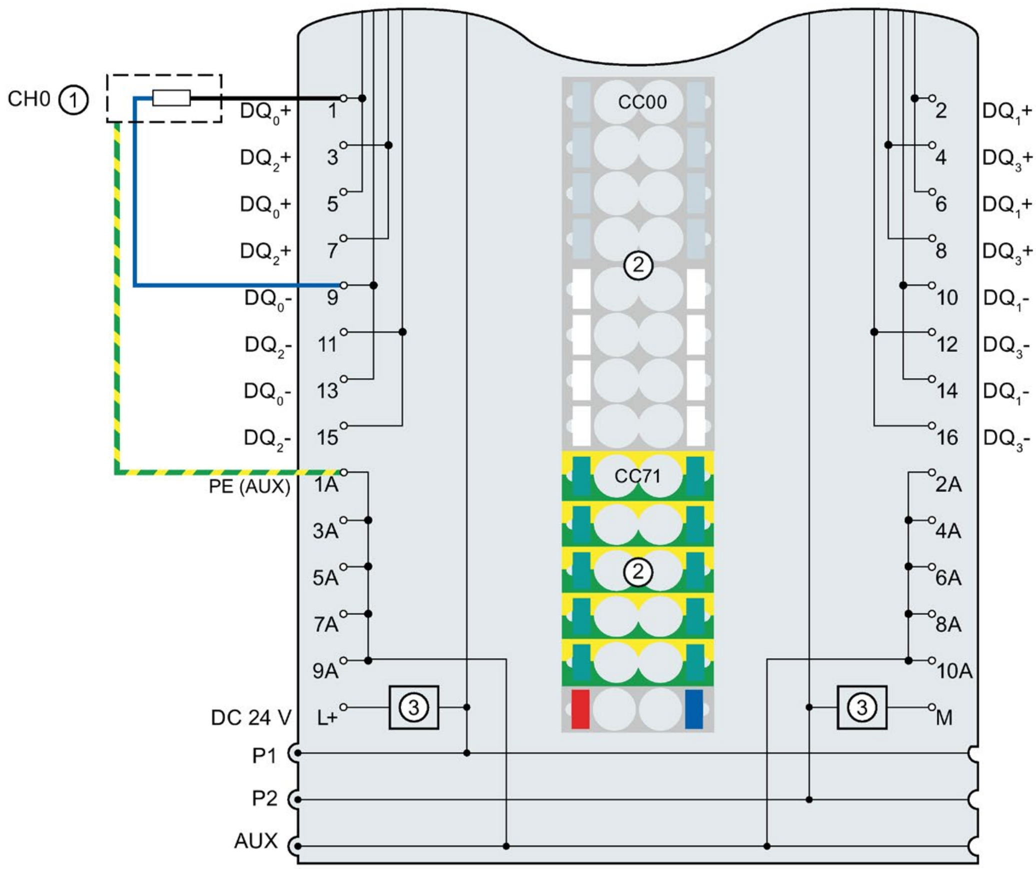


①	2-wire connection	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
②	Backplane bus interface	M	Ground
③	Control unit	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
④	Polarity reversal protection	DIAG	Error or Diagnostics LED (green, red)
⑤	Color-coded label CCxx (optional)	.0, .1, .2, .3	Channel status LED (green)
⑥	Supply voltage filter circuit (only when light BaseUnit is present)	PWM	Pulse width modulation LED (green)
DQ_n+	Output signal oversampling, channel n	OVS	Oversampling LED (green)
DQ_n-	Reference output signal, channel n	PWR	Power LED (green)

Figure 4-1 Block diagram and terminal assignment for 2-wire connection of actuators

Connection: 3-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A ... 10 A	AUX terminals
②	Color-coded labels CCxx (optional)	PE (AUX)	Protective conductor connection
③	Supply voltage filter circuit (only when light BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
DQ_n+	Output signal oversampling, channel n	M	Ground
DQ_n-	Reference output signal, channel n	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)

Figure 4-2 Terminal assignment for 3-wire connection of actuators

4.2 Parameters/address space

4.2.1 Oversampling

Function

Oversampling is the output of data in constant bus cycle segments (sub-cycles), whereby n sub-cycles correspond to one PROFINET bus cycle. A data packet is transmitted from the controller to the module, which outputs the packet in n constant bus sub-cycles.

Oversampling is useful whenever you require output of data with high time resolution but without using an extremely short PROFINET bus cycle and thus fast CPU cycles.

With oversampling, a PROFINET bus cycle is divided into constant bus sub-cycles:

- Each sub-cycle returns a 4-bit output value.
- A sub-cycle is at least 100 μs long.
- Sub-cycles are possible in increments of 2 to 32 (only even numbers). The following applies here: Isochronous data cycle / number of sub-cycles ≥ permitted sub-cycle duration (100 μs).

Requirement

Oversampling is only possible when isochronous mode is set.

Configuration

You configure oversampling with the following parameters:

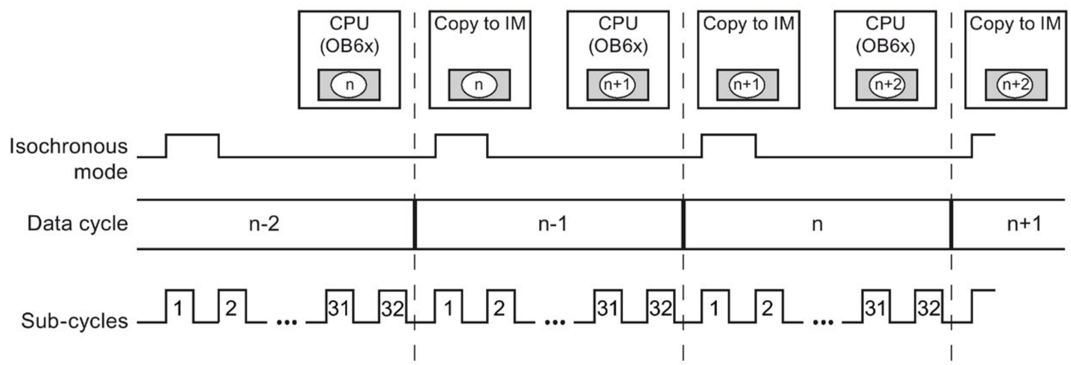
- "Oversampling" operating mode
- Output rate

Note

When oversampling is configured, do not use any reduction ratio of blocks in the runtime groups of your user program. Make sure that the output of data in the module is synchronized with the user program of the CPU.

Chronological sequence

The figure below shows the chronological sequence for oversampling. The output data present in the CPU is output in the data cycle after the next one, distributed across the sub-cycles which are generated on the actual module.



n Output values from bus cycle n

Sub-cycle 4 bit x 32 (max) each = max. 16 bytes output data per data cycle

Figure 4-3 Oversampling

Derating

Read the information on derating of the module in section Derating of the DQ 4x24VDC/2A HS (Page 95).

4.2.2 Parameters

DQ 4×24VDC/2A HS parameters

The effective range of the assignable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation on an ET 200SP CPU or on an ET 200SP Open Controller
- Distributed operation on PROFINET IO in an ET 200SP system

In addition to assigning parameters with the configuration software, you can also set the parameters in RUN mode (dynamically) using the user program. When assigning the parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records; see section Parameter assignment and structure of the parameter data record for oversampling operating mode (Page 104).

The following parameter settings are possible:

Table 4- 1 Assignable parameters in oversampling operating mode

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software HSP0127 for STEP 7 (TIA Portal); HSP0230 for STEP 7
Operating mode [1]	• Normal operation DQ (valve control) [2] • Oversampling • Pulse width modulation • Cam control		No	Module
Output rate	• 2 values/cycle • 4 values/cycle • ... • 32 values/cycle		No	Module
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module
Diagnostics Short circuit to L+/G	• Disable • Enable	Disable	Yes	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel
Reaction to CPU STOP	• Shutdown • Keep last value • Output substitute value 1	Shutdown	Yes	Channel
Potential group	• Use potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use potential group of the left module	No	Module

1 When configuring with HSP0230 for STEP 7, you determine the operating mode when you select the module name.

2 Valve control is a special function of normal operation.

4.2.3 Explanation of parameters

Operating mode

At the module level, specifies the operating mode in which the module's channels are operated. When configuring with HSP0230 for STEP 7, you determine the operating mode when you select the module name.

- Normal operation as digital output module
  - Valve control is a special function of normal operation, see section Normal operation/Valve control (Page 21).
- Pulse width modulation, see section Pulse width modulation (Page 46)
- Oversampling, see section Oversampling (Page 34)
- Cam control, see section Cam control (Page 62)

Output rate

Specifies the number of subcycles per isochronous data cycle.
See section Oversampling (Page 34).

Diagnostics No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics Short circuit to L+/G

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Channel activated

Specifies whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

With the "Potential group" parameter, you specify whether the module is plugged into a light or dark BaseUnit.

A potential group always begins with an I/O module that is plugged into a light BaseUnit. All modules inserted to the right of this that are plugged into dark BaseUnits belong to the same potential group, because the dark BaseUnits are supplied via the light BaseUnits.

The potential group ends at a new light BaseUnit or the end of the station.

On	On	Cam control (MCC) operating mode active

PWR LED

Table 4- 5 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

4.3.2 Interrupts

The DQ 4×24VDC/2A HS digital output module supports diagnostic interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Short circuit
- Excess temperature
- Parameter assignment error
- No supply voltage
- Communication error
- Channel temporarily not available

Detailed information on the event is available in the STEP 7 online help.

4.3.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output and the DIAG LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

You can connect 2 actuators per output.

The diagnostics of the two actuators influence each other in the case of duplicate wiring. This means that a single short-circuit affects both actuators.

Table 4- 6 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Short circuit [1 2]	1_H	Short-circuit of the actuator supply	Correct the process wiring
Excess temperature	5_H	The module has detected that the maximum permitted module temperature has been exceeded. All channels of the module are switched to high resistance. The module is then restarted.	Correct the process wiring
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Communication error	13_H	Module is defective.	Replace the module.
Channel temporarily not available	$1F_H$	Firmware update is currently in progress or was canceled. The module does not output any process values or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

1 The channels 0 and 1 or 2 and 3 each form a load group. Within a load group, a short-circuit can have an effect on the adjacent channel. The load groups do not have an effect on each other in the case of a short-circuit.

2 If the short-circuit persists, the module heats up. This may trigger temperature monitoring with excess temperature diagnostic interrupt.

Pulse width modulation operating mode 5

5.1 Connecting

5.1.1 Wiring and block diagram

In this section, you can find the block diagram of the DQ 4x24VDC/2A HS module showing the terminal assignments for a 2-wire and 3-wire connection in pulse width modulation operating mode.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Note

You can connect 2 actuators per output.

Note

Cross circuit at output

Be aware that voltage from a cross circuit at the output can feed L+ to modules.

Note

- The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.
- The connection of actuators with 1-wire connection is not permitted.

Note

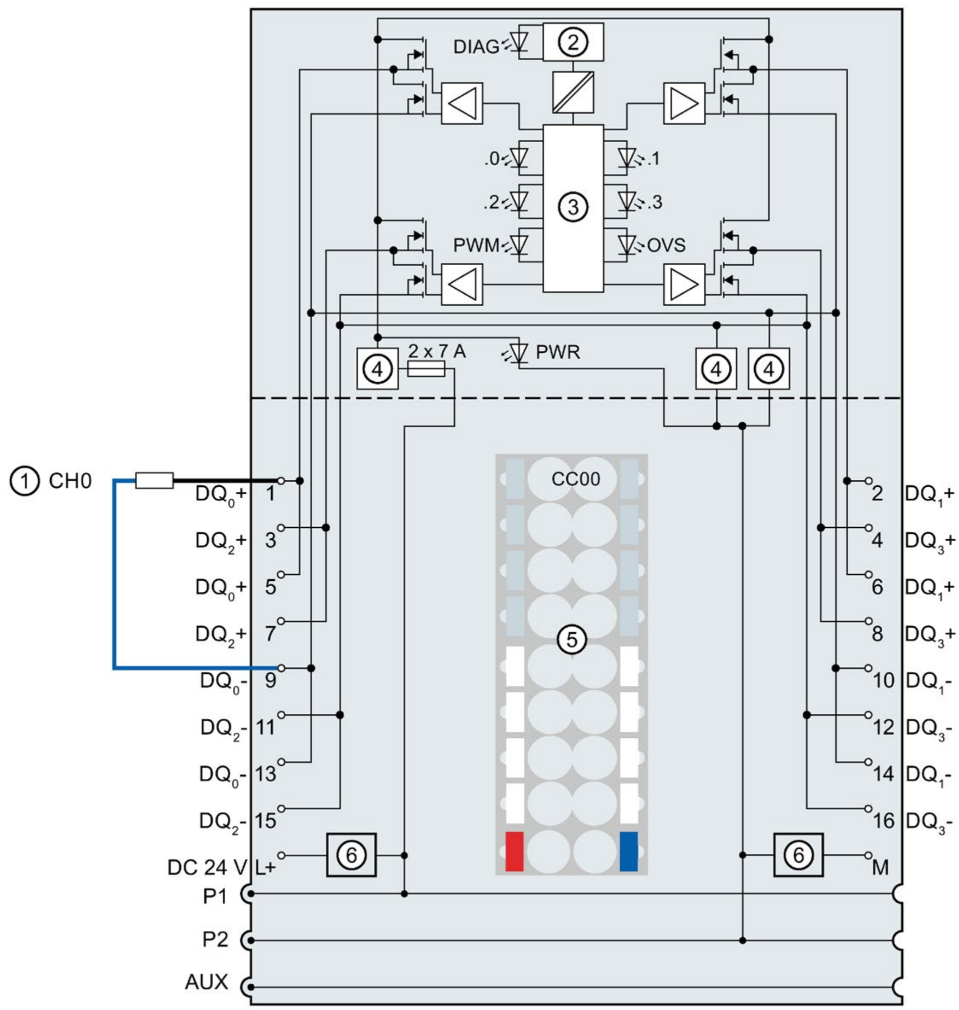
You may use and combine the different wiring options for all channels.

Note

Outputs DQ_n- must not be connected with ground.

Connection: 2-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 without AUX terminals (2-wire connection).

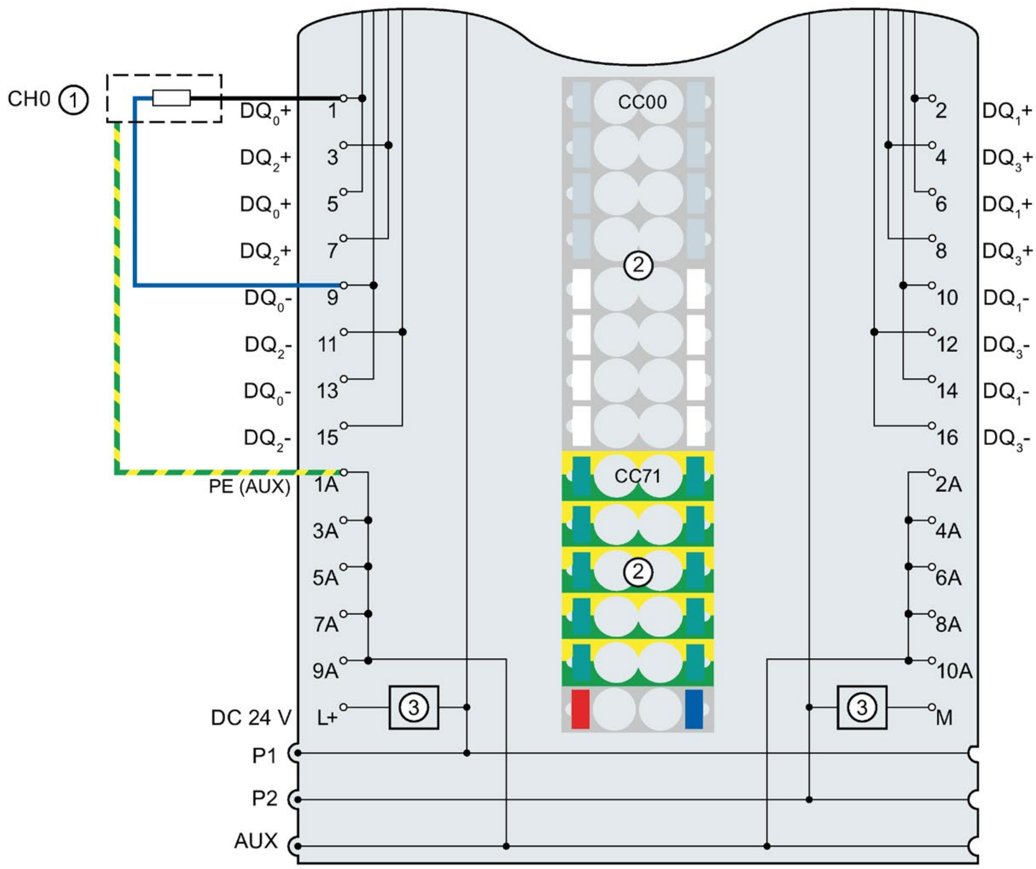


①	2-wire connection	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
②	Backplane bus interface	M	Ground
③	Control unit	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
④	Polarity reversal protection	DIAG	Error or Diagnostics LED (green, red)
⑤	Color-coded label CCxx (optional)	.0, .1, .2, .3	Channel status LED (green)
⑥	Supply voltage filter circuit (only when light BaseUnit is present)	PWM	Pulse width modulation LED (green)
DQ_n+	Output signal pulse width modulation, channel n	OVS	Oversampling LED (green)
DQ_n-	Reference output signal, channel n	PWR	Power LED (green)

Figure 5-1 Block diagram and terminal assignment for 2-wire connection of actuators

Connection: 3-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A ... 10 A	AUX terminals
②	Color-coded labels CCxx (optional)	PE (AUX)	Protective conductor connection
③	Supply voltage filter circuit (only when light BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
DQ_n+	Output signal pulse width modulation, channel n	M	Ground
DQ_n-	Reference output signal, channel n	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light Ba-seUnit)

Figure 5-2 Terminal assignment for 3-wire connection of actuators

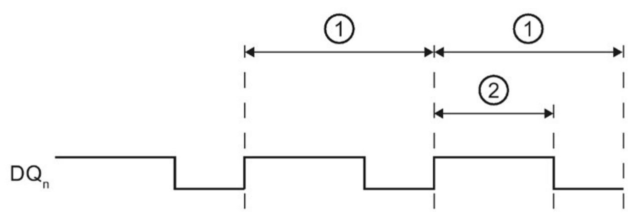
5.2 Parameters/address space

5.2.1 Pulse width modulation

Function

In the "pulse width modulation" operating mode, the four outputs only provide a pulse width modulated output signal.

The digital channel is activated with a pulse duty cycle that is updated cyclically as a function of the output value from the user program. The actuating signal is output digitally as a pulse train of on and off pulses.



① Time period T; frequency of the pulse width modulation: f = 1/T

② Pulse duration (duty factor)

Figure 5-3 Pulse width modulation

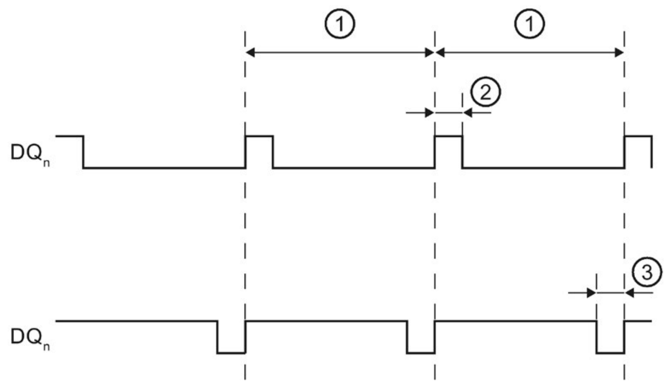
Configuration

You configure the pulse width modulation with the following parameters:

- "Pulse width modulation" operating mode
- Pulse width modulation time period
- Substitute value duty cycle

Chronological sequence

The output value (0 ... 1000) is written from the user program to the output word of the channel. The module maps this value by means of the output characteristic and the values for minimum pulse duration and minimum pulse pause to the configured time period and thus determines the pulse duty cycle (the pulse duration) of the pulse width modulation.

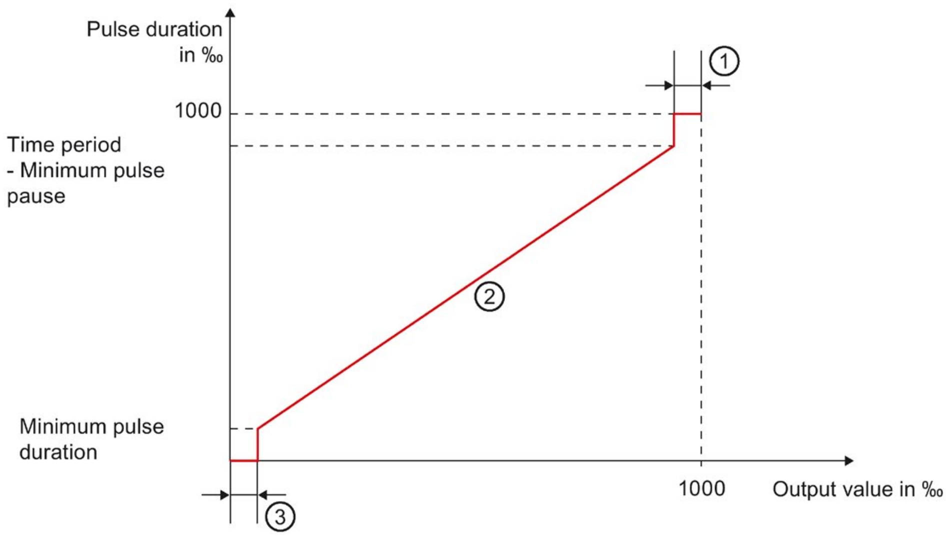


① Time period T
② Minimum pulse duration
③ Minimum pulse pause

Figure 5-4 Minimum pulse duration and minimum pulse pause

The minimum pulse duration and the minimum pulse pause are at least 2 µs each, which means:

- Any pulse duration that is shorter than the minimum pulse duration will be suppressed
- Any pulse duration that is longer than the time period minus minimum pulse duration is reduced to 100% (≙ output value 1000)



① Minimum pulse pause
② Output characteristic
③ Minimum pulse duration

Figure 5-5 Output characteristic of the pulse duration

The following values apply when determining the pulse duty cycle of the pulse width modulation:

Table 5- 1 Determining the pulse duty cycle of the pulse width modulation

Time period parameter	Frequency	Output value in the user program (‰)	Pulse duty cycle at output terminal DQ_n (‰)
0.20 ms	5000 Hz	0...9	0
		10...990	10...990
		991...1000	1000
0.40 ms	2500 Hz	0...4	0
		5...995	5...995
		996...1000	1000
0.93 ms	1071 Hz	0...2	0
		3...997	3...997
		998...1000	1000
1.33 ms	750 Hz	0, 1	0
		2...998	2...998
		999, 1000	1000
4.27 ms	234 Hz	0...1000	0...1000

Time period parameter	Frequency	Output value in the user program (‰)	Pulse duty cycle at output terminal DQ_n (‰)
10.67 ms	94 Hz	0...1000	0...1000
21.33 ms	47 Hz	0...1000	0...1000
34.13 ms	29 Hz	0...1000	0...1000
59.73 ms	17 Hz	0...1000	0...1000

Example

When you configure a channel with 5000 Hz (≙ 200 μs) and the user program writes the value 3 to the output word of the channel, this value is converted to 0 by the module: The channel is permanently 0.

"Diagnostics Overflow" parameter

You use the "Diagnostics Overflow" parameter to enable the diagnostics for the case that the permitted value range of the duty factor is exceeded, i.e. an output value > 1000 from the user program is written to the output word of the channel.

"Substitute value duty cycle" parameter

You use the "Substitute value duty cycle" parameter (0 ... 1000) to specify the pulse duty cycle of the pulse width modulation in the case of a CPU STOP.

Derating

Read the information on derating of the module in section Derating of the DQ 4x24VDC/2A HS (Page 95).

5.2.2 Parameters

Parameters

The effective range of the assignable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation on an ET 200SP CPU or on an ET 200SP Open Controller
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

In addition to assigning parameters with the configuration software, you can also set the parameters in RUN mode (dynamically) using the user program. When assigning the parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records; see section Parameter assignment and structure of the parameter data record for pulse width modulation operating mode (Page 110).

The following parameter settings are possible for the respective operating mode:

Table 5- 2 Assignable parameters in pulse width modulation operating mode (GSD file) [3]

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0230 for STEP 7; GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Operating mode [4]	• Normal operation DQ (valve control) [2] • Oversampling • Pulse width modulation • Cam control		No	Module	Module [1]
Output rate	• 1 value/cycle	1 value/cycle	No	Module	Module[1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module [1]
Diagnostics Short circuit to L+/G	• Disable • Enable	Disable	Yes	Module	Module [1]
Diagnostics Overflow	• Disable • Enable	Disable	Yes	Module	Module [1]
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel [1]
Reaction to CPU STOP	• Shutdown • Keep last value • Output substitute value	Shutdown	Yes	Channel	Module [1]
Substitute value duty cycle	• 0% • 0.1% • 0.2% • ... • 100%	0%	Yes	Channel	Channel [1]

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software	
				HSP0127 for STEP 7 (TIA Portal); HSP0230 for STEP 7; GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Pulse width modulation time period	• Off • 0.20 ms • 0.40 ms • 0.93 ms • 1.33 ms • 4.27 ms • 10.67 ms • 21.33 ms • 34.13 ms • 59.73 ms	0.93 ms	Yes	Channel	Channel [1]
Potential group	• Use potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use potential group of the left module	No	Module	Module [1]

[1] Because the number of parameters is limited to a maximum of 244 bytes per ET 200SP station when configuring with a PROFIBUS GSD, the possible parameter assignments are restricted. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 15 bytes.

[2] Valve control is a special function of normal operation.

[3] Oversampling is not supported with GSD files.

[4] When configuring with HSP0230 for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

5.2.3 Explanation of parameters

Operating mode

At the module level, specifies the operating mode in which the module's channels are operated. When configuring with HSP0230 for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

- Normal operation as digital output module
  - Valve control is a special function of normal operation, see section Normal operation/Valve control (Page 21).
- Pulse width modulation, see section Pulse width modulation (Page 46)
- Oversampling, see section Oversampling (Page 34)
- Cam control, see section Cam control (Page 62)

Output rate

Specifies the number of subcycles per isochronous data cycle.
See section Oversampling (Page 34).

Diagnostics No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics Short circuit to L+/G

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Diagnostics Overflow

You use the "Diagnostics Overflow" parameter to enable the diagnostics for the case that the permitted value range of the duty factor is exceeded, i.e. an output value > 1000 from the user program is written to the output word of the channel. See section Pulse width modulation (Page 46).

Channel activated

Specifies whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Substitute value duty cycle

You use the "Substitute value duty cycle" parameter (0 ... 1000) to specify the pulse duty cycle of the pulse width modulation in the case of a CPU STOP. See section Pulse width modulation (Page 46).

Pulse width modulation time period

Specifies the frequency of the pulse width modulation.
See section Normal operation/Valve control (Page 21) and section Pulse width modulation (Page 46).

Potential group

With the "Potential group" parameter, you specify whether the module is plugged into a light or dark BaseUnit.

A potential group always begins with an I/O module that is plugged into a light BaseUnit. All modules inserted to the right of this that are plugged into dark BaseUnits belong to the same potential group, because the dark BaseUnits are supplied via the light BaseUnits.

The potential group ends at a new light BaseUnit or the end of the station.

Derating

Read the information on derating of the module in section Derating of the DQ 4x24VDC/2A HS (Page 95).

5.2.4 Address space

Address space for configuration with pulse width modulation

The figure below shows the address space allocation for the configuration with pulse width modulation.

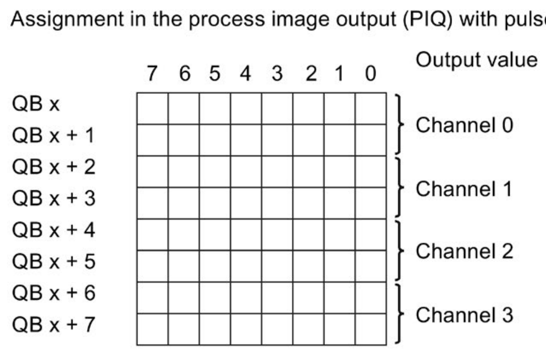

Figure 5-6 Address space of the DQ 4×24VDC/2A HS with pulse width modulation

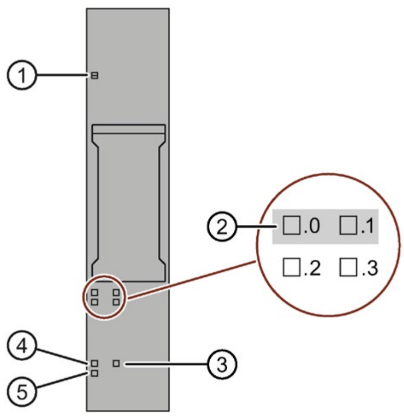
5.3 Interrupts/diagnostics alarms

5.3.1 Status and error displays

LED displays

The figure below shows the location of the LED displays of the DQ 4×24VDC/2A HS.



①	DIAG (green/red)
②	Channel status (green)
③	OVS (green)
④	PWM (green)
⑤	PWR (green)

Figure 5-7 LED displays

Meaning of the LEDs

The following tables contain the meaning of the Status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms.

DIAG LED

Table 5- 3 Error display of the DIAG LED

DIAG LED	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
■ On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 4 Status display of the channel status LED

Channel status LED	Meaning
□ Off	Channel deactivated or process signal = 0
■ On	Channel activated and process signal = 1

OVS LED and PWM LED

Table 5- 5 Status display of the oversampling LED

OVS LED	PWM LED	Meaning
□ Off	□ Off	DQ operating mode (valve control) active
■ On	□ Off	Oversampling operating mode active
□ Off	■ On	Pulse width modulation operating mode active
■ On	■ On	Cam control (MCC) operating mode active

PWR LED

Table 5- 6 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

5.3.2 Interrupts

The DQ 4×24VDC/2A HS digital output module supports diagnostic interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Short circuit
- Excess temperature
- High limit violated
- Parameter assignment error
- No supply voltage
- Communication error
- Channel temporarily not available

Detailed information on the event is available in the STEP 7 online help.

5.3.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output and the DIAG LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

You can connect 2 actuators per output.

The diagnostics of the two actuators influence each other in the case of duplicate wiring. This means that a single short-circuit affects both actuators.

Table 5- 7 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Short circuit [1] [2]	1_H	Short-circuit of the actuator supply	Correct the process wiring
Excess temperature	5_H	The module has detected that the maximum permitted module temperature has been exceeded. All channels of the module are switched to high resistance. The module is then restarted.	Correct the process wiring
High limit violated	7_H	The permitted value range of the duty factor has been exceeded.	Correct the output value (0 to 1000)
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Communication error	13_H	Module is defective.	Replace the module.
Channel temporarily not available	$1F_H$	Firmware update is currently in progress or was canceled. The module does not output any process values or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

1 The channels 0 and 1 or 2 and 3 each form a load group. Within a load group, a short-circuit can have an effect on the adjacent channel. The load groups do not have an effect on each other in the case of a short-circuit.

2 If the short-circuit persists, the module heats up. This may trigger temperature monitoring with excess temperature diagnostic interrupt.

6 Cam control operating mode

6.1 Connecting

6.1.1 Wiring and block diagram

In this section, you can find the block diagram of the DQ 4x24VDC/2A HS module showing the terminal assignments for a 2-wire and 3-wire connection in cam control operating mode.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Note

You can connect 2 actuators per output.

Note

Cross circuit at output

Be aware that voltage from a cross circuit at the output can feed L+ to modules.

Note

- The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.
- The connection of actuators with 1-wire connection is not permitted.

Note

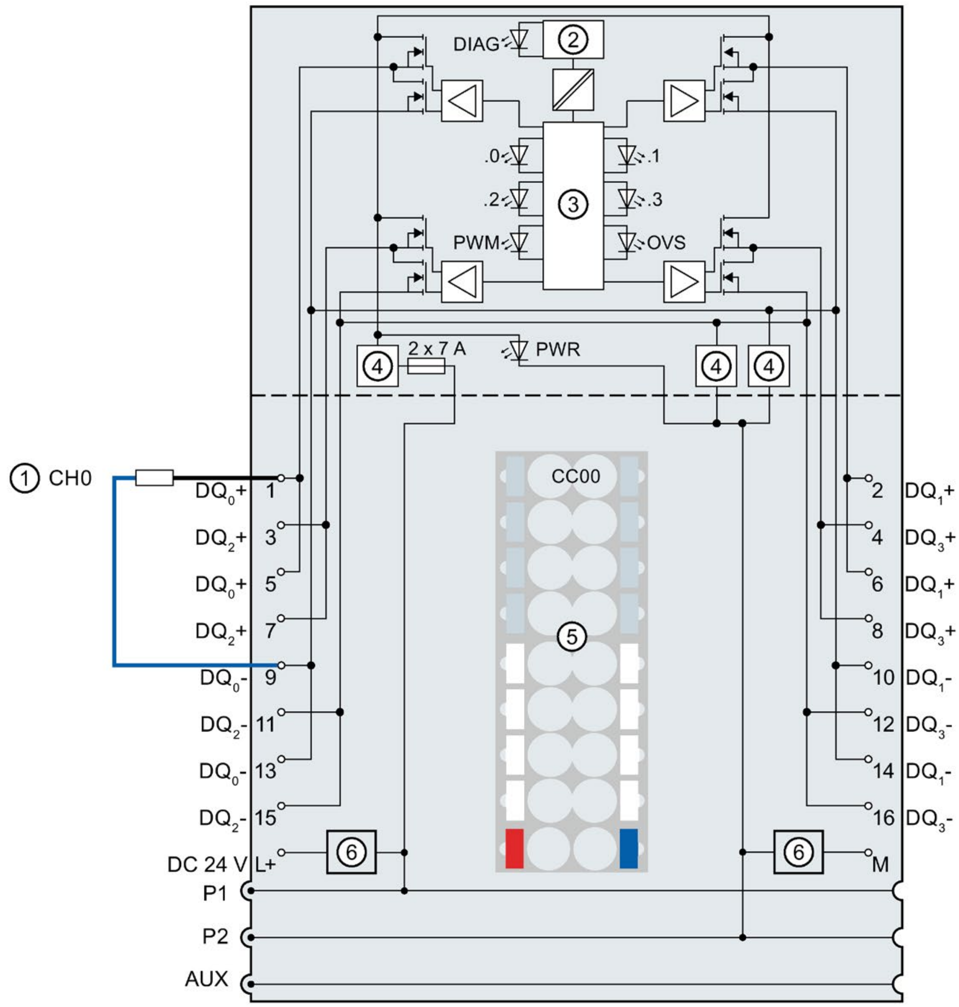
You may use and combine the different wiring options for all channels.

Note

Outputs DQ_n- must not be connected with ground.

Connection: 2-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 without AUX terminals (2-wire connection).

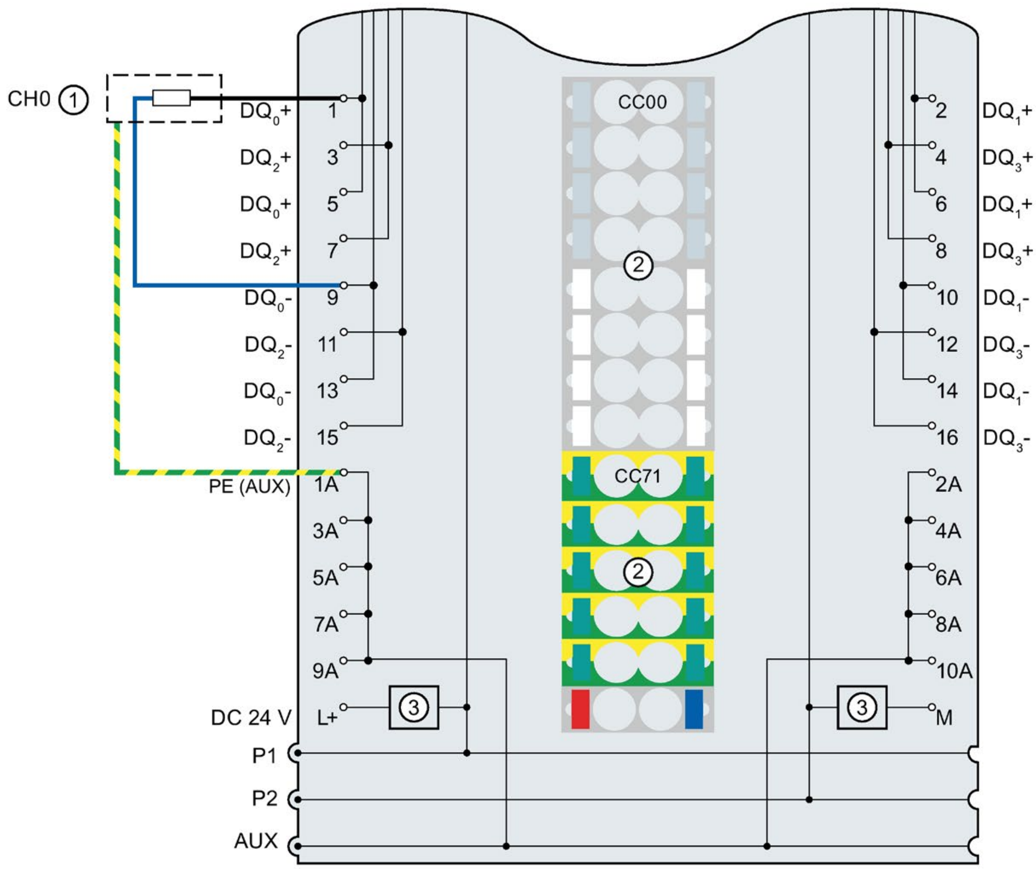


①	2-wire connection	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
②	Backplane bus interface	M	Ground
③	Control unit	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
④	Polarity reversal protection	DIAG	Error or Diagnostics LED (green, red)
⑤	Color-coded label CCxx (optional)	.0, .1, .2, .3	Channel status LED (green)
⑥	Supply voltage filter circuit (only when light BaseUnit is present)	PWM	Pulse width modulation LED (green)
DQ_n+	Output signal cam control, channel n	OVS	Oversampling LED (green)
DQ_n-	Reference output signal, channel n	PWR	Power LED (green)
		MCC	Oversampling LED (green) and Power LED (green)

Figure 6-1 Block diagram and terminal assignment for 2-wire connection of actuators

Connection: 3-wire connection of actuators

The figure below shows an example for the terminal assignment of the digital output module DQ 4×24VDC/2A HS on the BaseUnit BU type A0 with AUX terminals (3-wire connection).



①	3-wire connection	1 A ... 10 A	AUX terminals
②	Color-coded labels CCxx (optional)	PE (AUX)	Protective conductor connection
③	Supply voltage filter circuit (only when light BaseUnit is present)	24 V DC	Supply voltage L+ (infeed for light BaseUnit only)
DQ_n+	Output signal cam control, channel n	M	Ground
DQ_n-	Reference output signal, channel n	P1, P2, AUX	Internal self-configuring voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)

Figure 6-2 Terminal assignment for 3-wire connection of actuators

6.2 Parameters/address space

6.2.1 Cam control

Function

In "Cam control" operating mode, switching signals are generated dependent on an encoder value.

The axis can be executed as:

- Linear axis
- Rotary axis with modulo function

The ET 200SP distributed I/O system determines the current actual position value of the axis using an encoder that is connected to an encoder module, e.g. I/O module or TM Count 1x24V/TM PosInput 1 technology module. In doing so, the encoder signals are evaluated, e.g. the pulses, which are proportional to the distance covered, are counted. The digital outputs (cams) switch on or off depending on the actual position value. However, the output value can be overruled by the control interface, PROFIenergy or CPU STOP.

A maximum of 16 cams can be configured for each DQ4HS module. These 16 cams can be distributed among the 4 outputs of the module as desired.

You realize a cam control with more than 4 cam tracks with the help of several DQ4HS modules, whereby each DQ4HS module can represent up to 4 cam tracks. All the DQ4HS modules of this cam control unit are supplied from a single encoder source but have their own input/output area. Each DQ4HS module has its own control/feedback interface and can operate independent of the other DQ4HS module in the multi-track cam control unit.

The DQ4HS module can also be used in mixed operation. In mixed operation, a portion of the outputs can be used as cam track and the rest of the outputs can be controlled directly by the CPU.

Requirement

The cam control function can only be used in combination with an interface module that supports module to module communication (MtM). For example, interface module IM 155-6 PN/2 HF V4.1 or higher.

Configuration

You configure the cam control with the following parameters:

- "Cam control" operating mode
- Modulo activated
- Encoder module
- Hysteresis
- Axis reference position
- Minimum encoder value/Maximum encoder value
- Cam start position and end position
- Cam effective direction
- Cam channel assignment
- Pulsed cam output duty cycle
- Pulsed cam output period

Note

Pulsed cam output

You can activate/deactivate the pulsed cam output via the control interface.

Encoder data

"Cam control" operating mode requires an external encoder that is connected to a separate encoder module. The encoder module must be in the same station. The interface module uses module to module communication (MtM) to transfer the encoder data from the encoder module to the DQ4HS module where the encoder data is processed. The module to module communication (MtM) must be appropriately configured in the configuration.

The encoder value contains the axis position within the encoder data. Multiple electronic cams (switching points as a function of the encoder value) can be configured in the DQ4HS module. Through these cams, the digital outputs exhibit a defined switching behavior in relation to the encoder value. In "Cam control" operating mode, the digital output is the cam track. Mechanical vibrations of the encoder can be compensated using a configurable hysteresis.

The configured range of the cam (cam start and end positions and effective direction) is compared with the encoder value, and the switching state (0/1) of the digital output (cam track) is generated based on the result of the comparison.

Note

Incorrect switching operation due to increment jumps

Increment jumps can occur if, due to the system, an encoder value is not transferred to the digital output module at each increment of the sensor, e.g. a value is transferred at only every fourth increment. As a result, the output can be switched on and off incorrectly.

If increment jumps are possible in your system, ensure that the maximum increment jump is less than 1/2 x (maximum encoder value - minimum encoder value).

Note

Direction detection

If no direction information is included with the supplied encoder data, two valid different encoder values are needed for the direction detection (SYNC = 1). The two values allow a subtraction to be performed and the direction to be derived from the result.

Cam start position and end position

The switch-on range of cams is basically defined by a start position and end position.

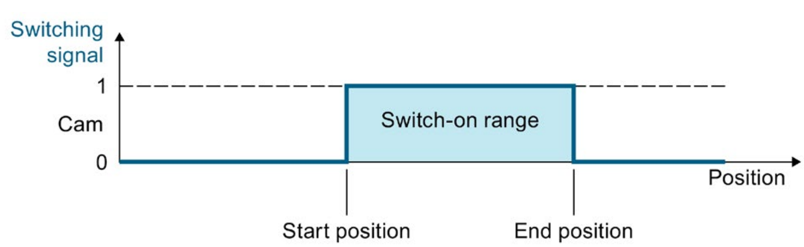


Figure 6-3 Cam start position and end position

Effective direction

A cam can be switched as a function of the motion direction.

The following effective directions are possible for the cams:

None:

The cam is not evaluated.

Positive:

Switching behavior for effective direction "Positive"

- The cam switches on when the start position is reached in the positive motion direction ①.
- The cam switches off when the end position is crossed in the positive motion direction ②.
- At a direction reversal within the switch-on range from the positive to negative effective direction, the cam is switched off ③.
- At a direction reversal within the switch-on range from the negative to positive effective direction, the cam is switched on ④.

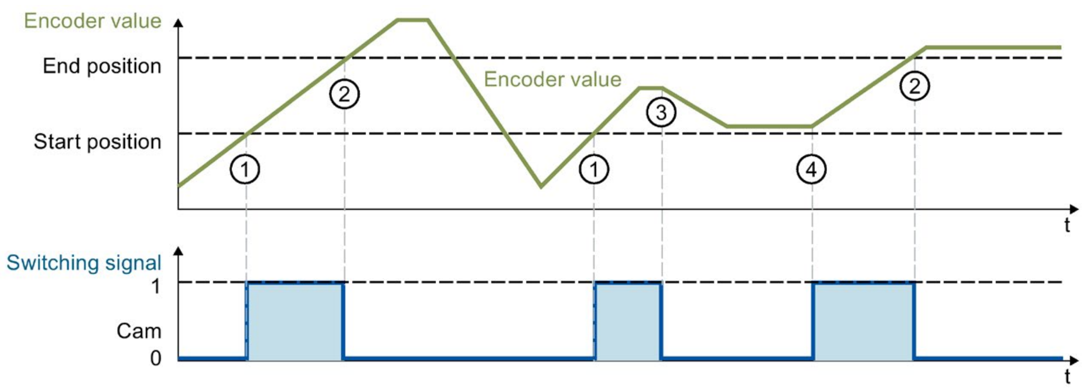

Figure 6-4 Cam with effective direction "Positive"

Negative:

Switching behavior for effective direction "Negative":

- The cam switches on when the end position is reached in the negative motion direction ①.
- The cam switches off when the start position is crossed in the negative motion direction ②.
- At a direction reversal within the switch-on range from the negative to positive effective direction, the cam is switched off ③.
- At a direction reversal within the switch-on range from the positive to negative effective direction, the cam is switched on ④.

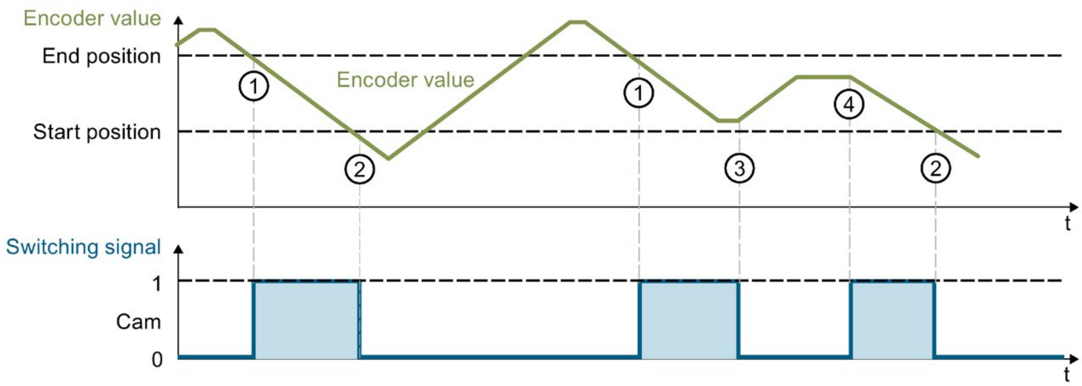

Figure 6-5 Cam with effective direction "Negative"

Both:

Switching behavior for effective direction "Both":

- The cam switches on when the encoder value is within the switch-on range ①.

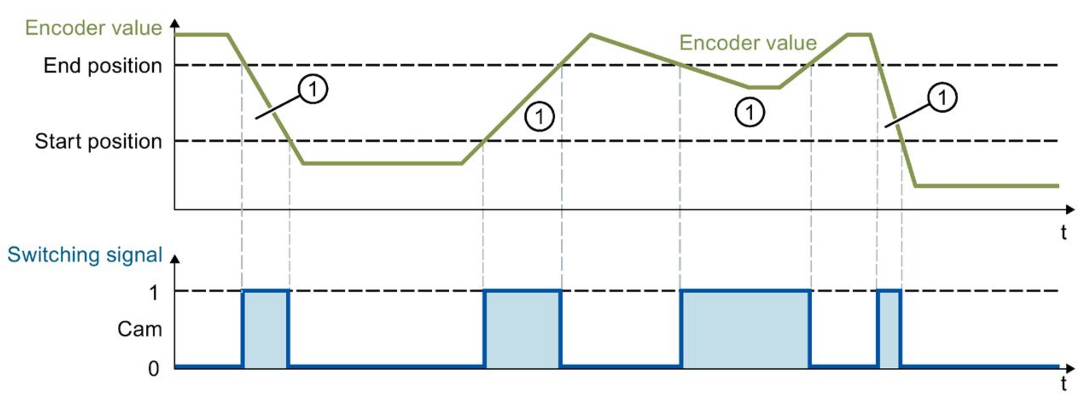

Figure 6-6 Cam with effective direction "Both"

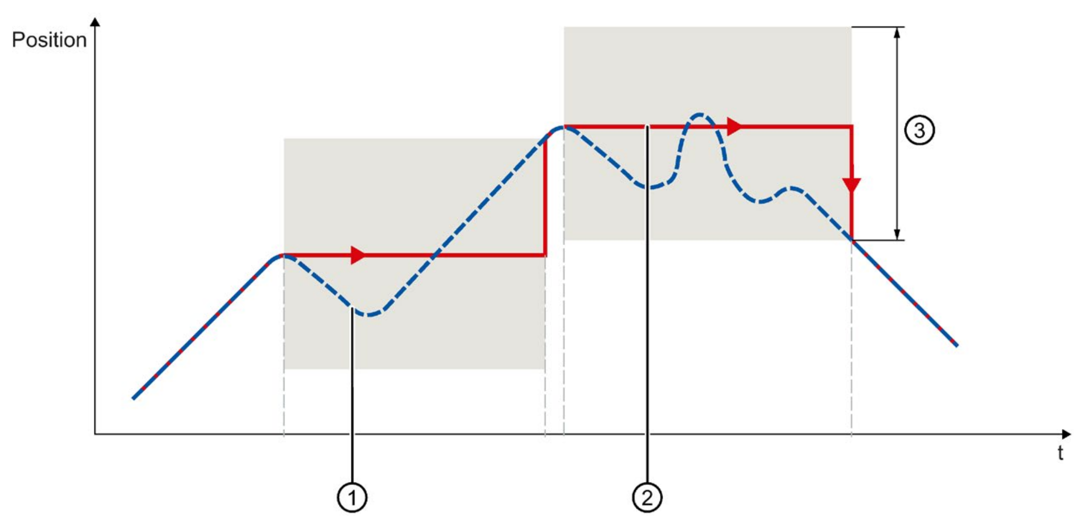
Hysteresis

Fluctuations of the position value of an axis can cause unwanted switching on and off in the cam control. Such unwanted switching states can be suppressed by configuring a hysteresis (> 0).

The hysteresis is a position tolerance within which the position values may vary without changing the switching state of the cam. Changes of direction detected within the hysteresis are ignored.

Behavior when hysteresis is activated:

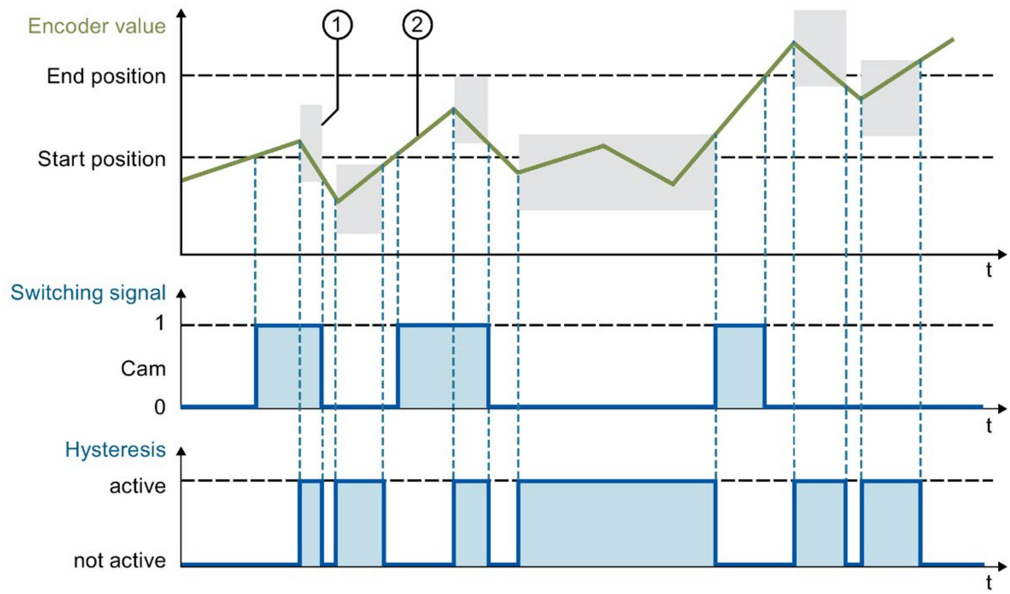
- The status of the hysteresis is indicated in the feedback interface (HYS).
- The configured hysteresis width is in effect for all cams.
- The hysteresis boundary points can be read out on the HYS-START and HYS-END registers. They represent the hysteresis range spanned by the firmware.
- The hysteresis is always reevaluated by the firmware if no hysteresis range is currently activated on the cam (HYS=0) at the time of a direction reversal.
- The hysteresis range extends in the positive and negative directions around the detected direction reversal point. The hysteresis range thus extends over double the configured hysteresis.
- The following applies within the hysteresis:
  - The switching state of the cam is not changed.
- After the hysteresis range is exited, the output is set according to the cam settings.



① Actual position
② Effective position
③ Effective hysteresis

Figure 6-7 Hysteresis range - Detail

The following example shows the effects of the hysteresis on the switching behavior of the cam with positive effective direction. The hysteresis keeps the output stable when the encoder value signals a small direction reversal. For better orientation, lines are shown for the signal changes.



① Hysteresis range
② Encoder value

Figure 6-8 Cam with hysteresis

Channel assignment

You use the channel assignment to specify the assignment of output channel to cam. You can assign an output channel to each cam. All cams that are assigned to the same output channel must not overlap.

Note

Effective direction

Cams with configured effective direction "None" are disabled.

Pulsed cam output

It is possible to pulse the cams. This function can be activated via a control interface and is active while a cam has state 1. You configure the pulsed cam output with the "Pulsed cam output duty cycle" and "Pulsed cam output period" parameters.

You use the "Pulsed cam output duty cycle" parameter (0 ... 1000) to specify the pulse duty cycle of the "modulated upon" pulse within the configured period.

Note

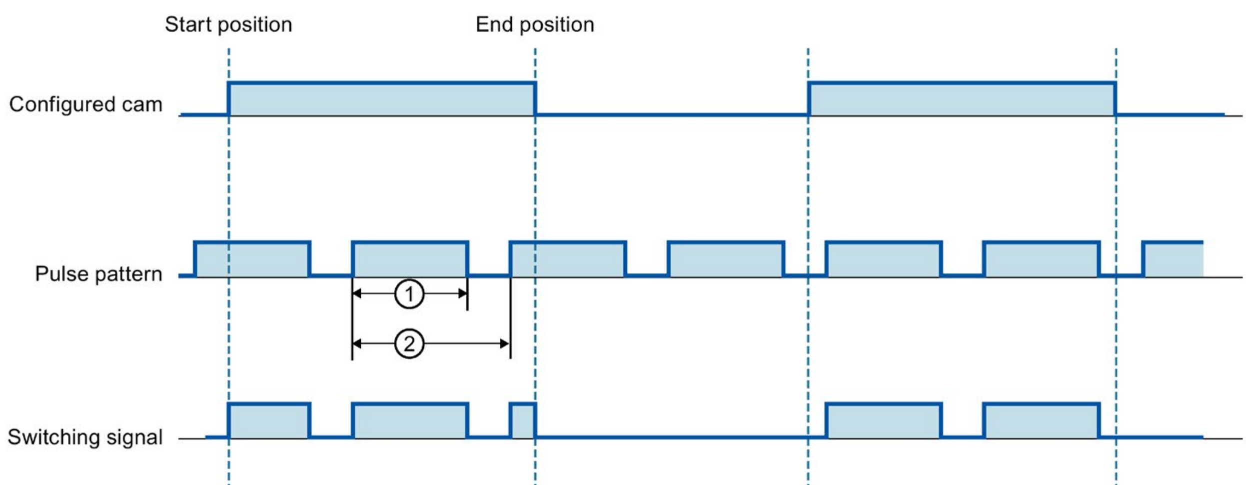
In contrast to the "Pulse width modulation" operating mode, the duty cycle cannot be updated cyclically as a function of an output value from the user program.

You use the "Pulsed cam output period" parameter to specify the frequency of the pulse "modulated upon" for the cam control.

Note

The edges of the pulsed output cam are not synchronized with the cam start or end.

If the interpulse period is currently active, the first rising edge can come later at the cam start and the last falling edge can come earlier at the cam end.



① T_{ON}
② Period
Duty cycle = T_{ON} / Period * 100%

Figure 6-9 Pulsed cam output

Example of the application of the pulsed cam output:
A glue trace is to be applied to a box for adhesion. To save glue, glue dots will be placed instead of a continuous trace in the switch-on range (cam).

Pulse width modulation (Page 46)

6.2.2 Parameters

Parameters

The effective range of the assignable parameters depends on the type of configuration.

The following configurations are possible:

- Distributed operation on PROFINET IO in an ET 200SP system

In addition to assigning parameters with the configuration software, you can also set the parameters in RUN mode (dynamically) using the user program. When assigning the parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records; see section Parameter assignment and structure of the parameter data record for cam control operating mode (Page 116).

The module to module communication (MtM) must also be configured for the cam control operating mode. You can find additional information regarding module to module communication (MtM), e.g. in manual Interface Module IM 155-6 PN/2 HF.

The following parameter settings are possible:

Table 6- 1 Assignable parameters in cam control operating mode (GSD file) [2]

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software
				GSD file PROFINET IO
Operating mode [3]	• Normal operation DQ (valve control) [1] • Oversampling • Pulse width modulation • Cam control		No	Module
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module
Diagnostics Short circuit to L+/G	• Disable • Enable	Disable	Yes	Module

Cam 0 channel assignment to Cam 15 channel assignment	• Channel 0 • Channel 1 • Channel 2 • Channel 3	Channel 0	Yes	Module

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software
				GSD file PROFINET IO
Channel activated	• Disable • Enable	Enable	Yes	Channel
Reaction to CPU STOP	• Shutdown • Keep last value • Output substitute value 1	Shutdown	Yes	Channel
Pulsed cam output duty cycle	• 0% • 0.1% • 0.2% • ... • 100%	50%	Yes	Channel
Pulsed cam output period	• Off • 0.20 ms • 0.40 ms • 0.93 ms • 1.33 ms • 4.27 ms • 10.67 ms • 21.33 ms • 34.13 ms • 59.73 ms	0.93 ms	Yes	Channel
Potential group	• Use potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use potential group of the left module	No	Module

1 Valve control is a special function of normal operation.

2 Oversampling is not supported with GSD files.

3 When configuring with a GSD file, you determine the operating mode when you select the module name.

4 Only available in the configuration variant "DQ 4x24VDC/2A HS V2.0, MCC (16 Byte) MtM".

The following parameters are possible for the module to module communication (MtM)

Table 6- 2 Assignable parameters for module to module communication (MtM)

Parameters	Value range	Default	Configuration in RUN	Effective range with configuration software
				GSD file PROFINET IO
Slot of encoder module	1 to 64	1	No	Module
Subslot of encoder module	1	1	No	Module
Encoder module [1]	• DI 8x24VDC HS, Count, Ch.0 • DI 8x24VDC HS, Count, Ch.1 • DI 8x24VDC HS, Count, Ch.2 • DI 8x24VDC HS, Count, Ch.3 • AI 2xU/I 2-/4-wire HS, Ch.0 • AI 2xU/I 2-/4-wire HS, Ch.1 • AI 2xU/I 2-/4-wire HS, QI, Ch.0 • AI 2xU/I 2-/4-wire HS, QI, Ch.1 • TM Count 1x24VDC, Ch.0 [2] • TM Count 1x24VDC Fastmode, Ch.0 • TM PosInput 1, Ch.0 [2] • TM PosInput 1 Fastmode, Ch.0 • AI 2xSG 4-/6-wire HS, Ch.0 [2] • AI 2xSG 4-/6-wire HS, Ch.1 [2]	DI 8x24VDC HS, Count, Ch.0	No	Module

[1] The parameter must be assigned identical with the "Encoder module" parameter under "Parameters in cam control operating mode".

[2] Only available in the configuration variant "DQ 4x24VDC/2A HS V2.0, MCC (16 Byte) MtM".

6.2.3 Explanation of parameters

6.2.3.1 Parameters in cam control operating mode

Operating mode

At the module level, specifies the operating mode in which the module's channels are operated. When configuring using a GSD file, you determine the operating mode when you select the module name.

- Normal operation as digital output module
  - Valve control is a special function of normal operation, see section Normal operation/Valve control (Page 21).
- Pulse width modulation, see section Pulse width modulation (Page 46)
- Oversampling, see section Oversampling (Page 34)
- Cam control, see section Cam control (Page 62)

Diagnostics No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics Short circuit to L+/G

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Encoder source diagnostics

Enabling of the diagnostics for the following events:

- Invalid encoder value when modulo is deactivated (outside minimum encoder value/maximum encoder value)
- Value status of the encoder module = 0
- Encoder module removed

Modulo activated

When "Modulo" is activated (value = 1), the encoder value is mapped onto a recurring modulo range. The modulo range is defined by the start value and the length. The start value corresponds to the "Minimum encoder value" parameter.

The length is calculated using the following formula:

Length = ABS (maximum encoder value - minimum encoder value) +1

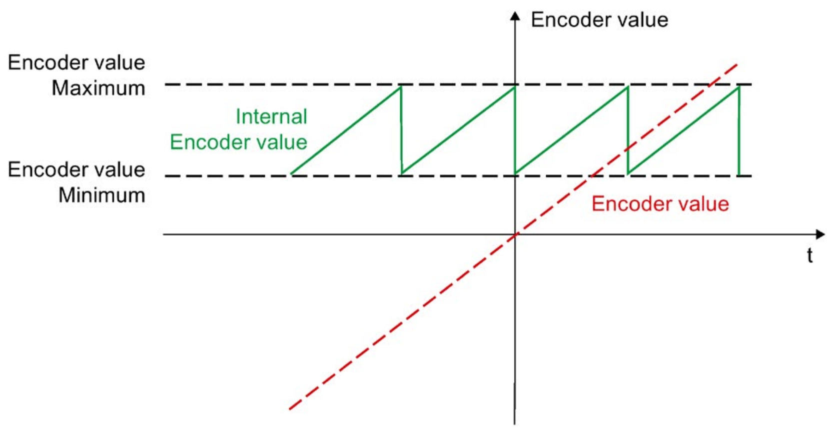

Figure 6-10 Modulo calculation

Encoder module

With the help of the "Encoder module" parameter, you specify how the encoder data that is transferred to the DQ4HS module via module to module communication (MtM) is interpreted. The selected encoder module/encoder channel must be identical with the configured encoder module that supplies the encoder data.

Depending on which encoder module is being used, not only the encoder value but also the value status of the encoder module and/or the direction of the encoder is included in the supplied encoder data and processed in the cam control.

The following table shows the availability of value status and direction of the encoder module:

Table 6- 3 Availability of value status and direction of the encoder module:

Encoder module	Value status	Direction
DI 8x24VDC HS	-	-
AI 2xU/I 2-/4-wire HS	x [1]	-
TM Count 1x24VDC	x	x
TM PosInput 1	x	x
AI 2xSG 4-/6-wire HS	x	-

[1] In the configuration variant with QI.

The value status of the encoder module affects the value status of the DQ4HS module. If the value status of the encoder module is invalid, the value status of the DQ4HS module is set to 0.

For encoder modules that do not provide a direction in the encoder data, it must be kept in mind that only 2 valid different encoder values have to be available in the cam control before the internal direction detection can evaluate the encoder value and the associated configured cam. With the first valid encoder value, INP_OK = 1 is set, and with the second valid value, SYNC = 1 is additionally set.

Hysteresis

With the help of a hysteresis, fluctuations (minimal direction reversal in the encoder value) that affect the encoder value can be compensated.

The hysteresis setting must satisfy the following conditions:

- Hysteresis < ABS ((maximum encoder value - minimum encoder value) / 4)
- Hysteresis < Cam_i end position - Cam_i start position [i = 0 to 15]

Axis reference position

With the help of the axis reference position, the encoder value can be adapted or corrected, e.g. for taking the zero position of the sensor into account. The axis reference position is subtracted from the encoder value before further processing of the encoder value.

Encoder value minimum/maximum

- "Minimum encoder value" is the low value of the valid encoder range. When "Modulo" is activated, this value is the start value for the modulo operation.
- "Maximum encoder value" is the high value of the valid encoder range. When "Modulo" is activated, this value is used for calculating the length for the modulo operation.

The difference of "Maximum encoder value" and "Minimum encoder value" must be at least 2.

When "Modulo" is deactivated, a check is made to determine whether the encoder value is less than "Minimum encoder value" and greater than "Maximum encoder value".

When "Modulo" is activated, the result of "Maximum encoder value" - "Maximum encoder value" must not exceed the value 2,147,483,646.

Cam 0 start position/end position to Cam 15 start position/end position

The position values are used to specify the switching range of the cam that, in combination with the effective direction and channel assignment, leads to the switching action at the output.

When modulo is deactivated, the following applies:

- Minimum encoder value <= Cam start position < Cam end position <= Maximum encoder value

When modulo is activated, the following applies:

- Minimum encoder value < Maximum encoder value
- Minimum encoder value <= Cam start position <= Maximum encoder value
- Minimum encoder value <= Cam end position <= Maximum encoder value
- Cam start position <> Cam end position

See section Cam control (Page 62).

Cam 0 effective direction to Cam 15 effective direction

With this parameter, you specify the effective direction of the cam.

See section Cam control (Page 62).

Cam 0 channel assignment to Cam 15 channel assignment

With this parameter, you specify the assignment of the output channel for a cam. You can assign an output channel to each cam.

Channel activated

Specifies whether a channel is activated or deactivated.

Reaction to CPU STOP

Specifies the behavior of the module in the event of a CPU STOP and for all channels in the cam control in the event of invalid encoder values.

Note

With "Output substitute value 1" or "Keep last value", a pulsed cam output continues to act.

Pulsed cam output duty cycle

This parameter indicates the percentage of switching state "1" for the time specified in the "Pulsed cam output period" parameter.

Pulsed cam output period

This parameter specifies the period of the pulsed cam output.

Potential group

With the "Potential group" parameter, you specify whether the module is plugged into a light or dark BaseUnit.

A potential group always begins with an I/O module that is plugged into a light BaseUnit. All modules inserted to the right of this that are plugged into dark BaseUnits belong to the same potential group, because the dark BaseUnits are supplied via the light BaseUnits.

The potential group ends at a new light BaseUnit or the end of the station.

6.2.3.2 Parameters for module to module communication (MtM)

Slot of encoder module

Specifies the slot of the encoder module for the module to module communication (MtM)

Subslot of encoder module

This value is permanently preset to 1.

Encoder module

Specifies the module that is used as an encoder module for the module to module communication (MtM)

Note

Parameter assignment of the encoder module

The parameter must be assigned identical with the "Encoder module" parameter under Parameters in cam control operating mode (Page 74).

6.2.4 Address space

6.2.4.1 Assignment of the control interface

Control interface

The user program uses the control interface to influence the behavior of the cam control. The figure below shows the address space allocation for the control interface in the process image output.

"QB x" represents the start address of output byte x.

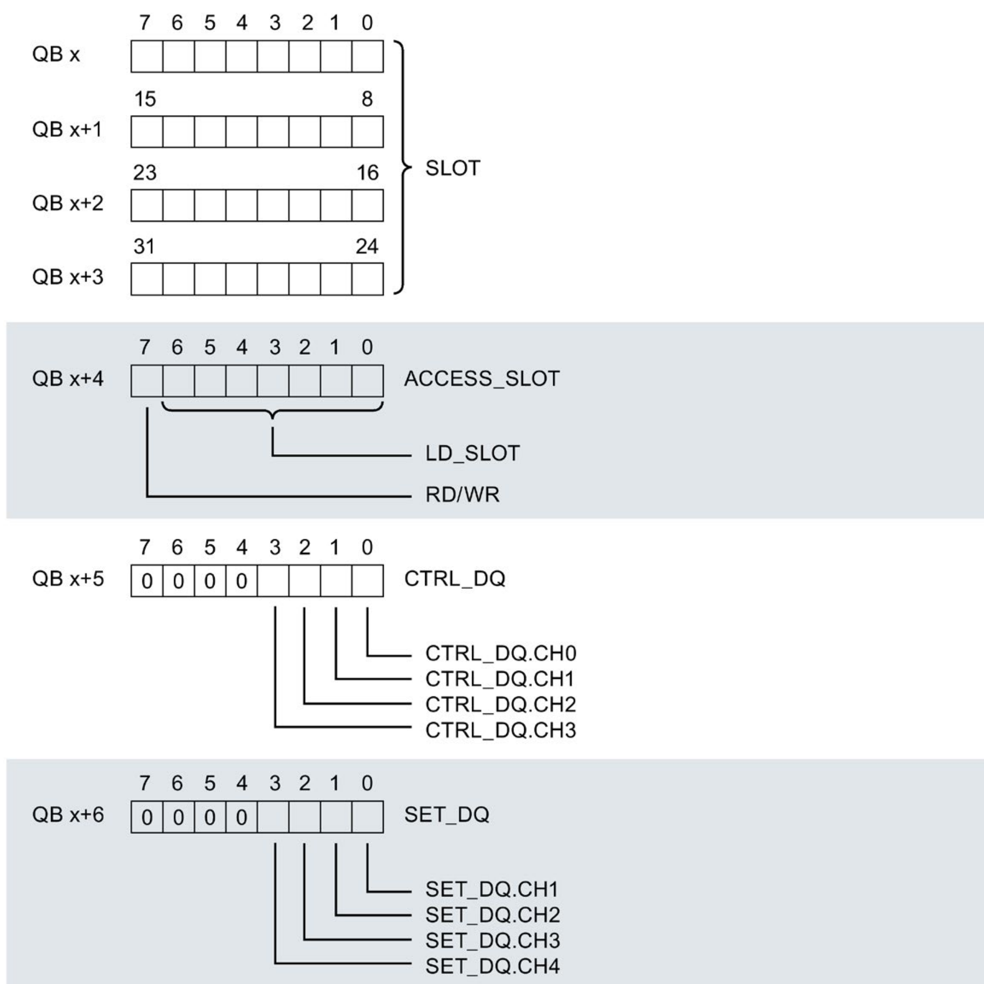

Figure 6-11 Assignment of the control interface

6.2.4.2 Notes on the control interface

Notes on the control bits

Table 6- 4 Details for the control interface

Control bit	Notes
SLOT	You use this value to specify the write accesses for the registers addressable with LD_SLOT.
ACCESS_SLOT	• RD/WR = 0: Read access to the addressed register. • RD/WR = 0 --> 1: Writing is enabled at a transition from "0" to "1". Note: After a successful write operation, the addressed register is read. • LD_SLOT You use this value to select the register, see Notes on the control interface (Page 80).
CTRL_DQ.CHx	You use this bit to specify how channel X is controlled. • 0 = Direct channel writing by the CPU. • 1 = Take channel value from the cam track.
SET_DQ.CHx	Values for the direct channel writing by the CPU. The bit is processed in combination with bit CTRL_DQ.x = 0. • 0 = Channel X outputs the value 0. • 1 = Channel X outputs the value 1.

Table 6- 5 Addressable register in LD_SLOT

Value of LD_SLOT	Register	Notes
0x00	CAM_Ctrl-Version	Version of the software module and the user ID • Bits 0 to 7: Version-Low of SW module CAM_Ctrl • Bits 8 to 15: Version-High of SW module CAM_Ctrl • Bits 16 to 31: User ID
0x01	CAM_Ctrl-Config	Static module configuration • Bits 0 to 7: Number of channels • Bits 8 to 15: Number of cams • Bits 16 to 23: Number of internal registers • Bits 24 to 31: Reserved
0x02	ENC_RAW	Raw copied encoder value
0x03	HYS_START	When hysteresis is active (STS_REG.HYS = 1), the HYS_START and HYS_END registers contain the boundary points of the hysteresis.
0x04	HYS_END	
0x05	ENC_ERRORS	Read: Number of detected errors in the encoder data (change from 1 to 0 of bit INP_OK in byte STS_REG of the feedback interface). Write: Resetting the counter

Value of LD_SLOT	Register	Notes
0x06	DIFF_MEDIAN [1]	Read: Averaged difference value of the incoming encoder values (indicator for update rate) The evaluation is directly coupled to the raw value (encoder data). • Only the differences between the encoder values as a moving average are evaluated. Write: Resetting the counter
0x07	PWM_WRITE	Read: Status of the currently activated pulsed cam output Write: Activation/deactivation of the pulsed cam output • Deactivate pulsed cam output for channel X: SLOT.Bitx = 0 • Activate pulsed cam output for channel X: SLOT.Bitx = 1
0x08	CAM_ON-INFO	Bit string with the switching state of the 16 cams of the cam pool

[1] You can use the DIFF_MEDIAN value, for example, to evaluate the increment jumps occurring in the application during the commissioning phase.

6.2.4.3 Assignment of the feedback interface

Feedback interface

The user program receives current values and status information from the module via the feedback interface. The figure below shows the address space allocation for the feedback interface in the process image input.

"IB x" represents the start address of input byte x.

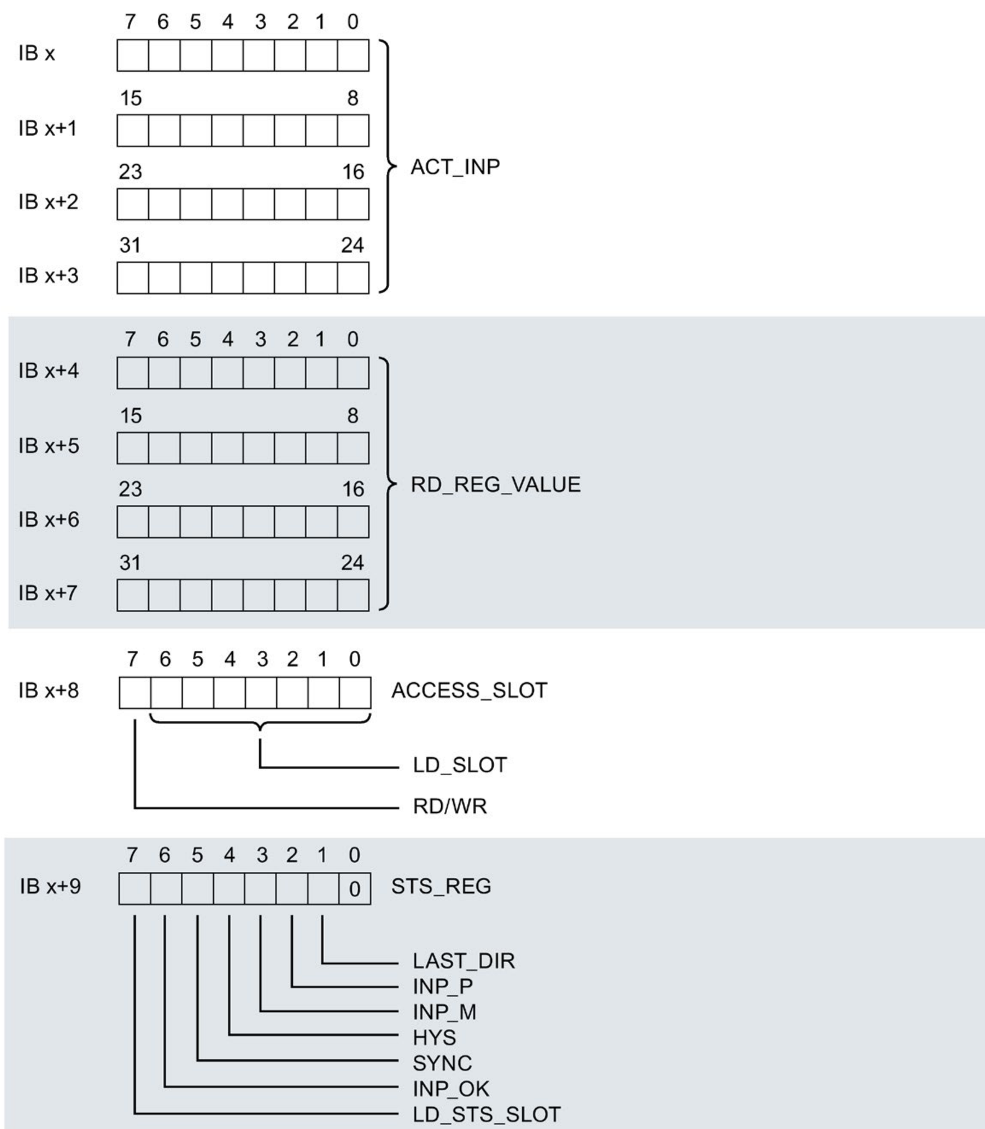

Figure 6-12 Assignment of the feedback interface, part 1

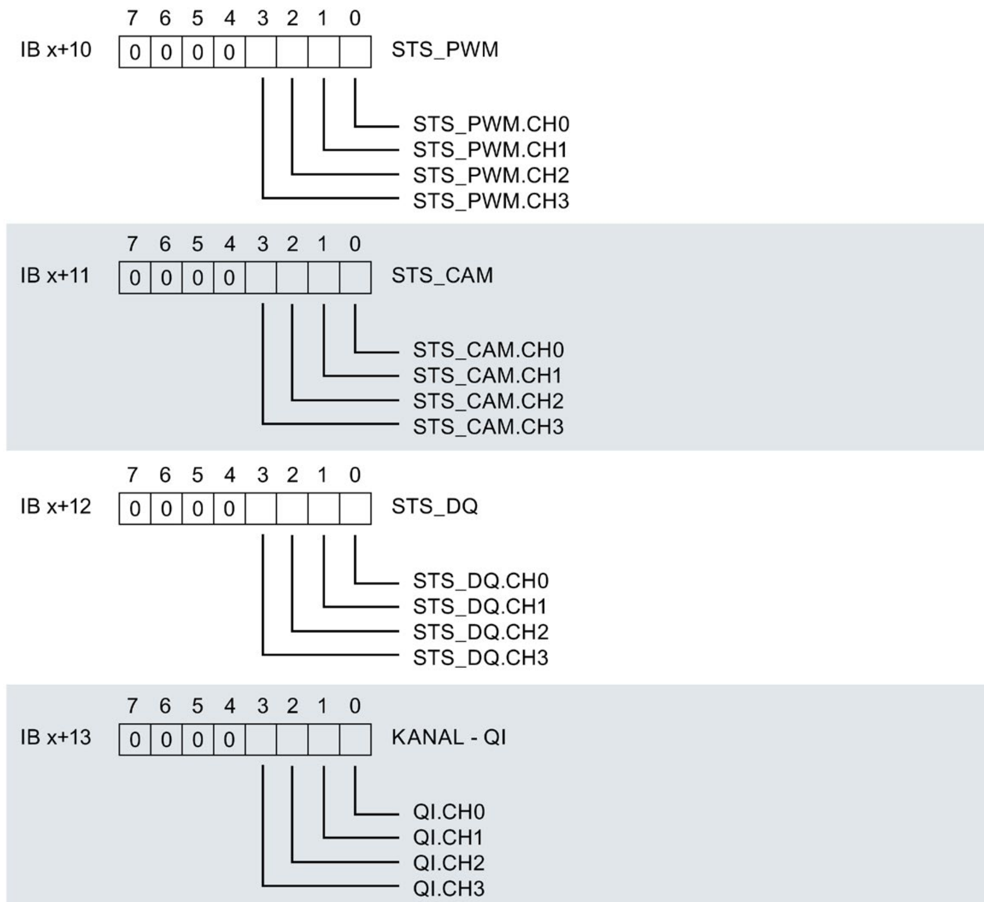

Figure 6-13 Assignment of the feedback interface, part 2

6.2.4.4 Notes on the feedback interface

Notes on the feedback bits

Table 6- 6 Details for the feedback interface

Feedback bit	Notes
ACT_INP	Internal encoder value This value is used by the cam control unit of the digital output module for evaluating the configured cams.
RD_REG_VALUE	Register value that was requested via the control interface, see table "Addressable registers in LD_SLOT".
ACCESS_SLOT	Feedback in response to the SLOT request via the control interface.
LAST_DIR	• 0 = Backward motion of last motion • 1 = Forward motion of last motion
INP_P	• 0 = No forward motion • 1 = Forward motion (current encoder value)
INP_M	• 0 = No backward motion • 1 = Backward motion (current encoder value)
HYS	• 0 = Hysteresis is not active • 1 = Hysteresis is active
SYNC	• 0 = No encoder direction available Note: If no encoder direction is available, the configured substitute values are output for all channels that operate as a cam track (CTRL_DQ.CHx = 1). • 1 = Encoder data can be used for cam output
INP_OK	• 0 = Encoder data is invalid Note: When the encoder data is invalid, the value status is set to 0. • 1 = Encoder data detected as invalid
LD_STS_SLOT	This bit changes its value following a successful write operation.
STS_PWM	Status for pulsed cam output of channels 0 to 3 • Bit 0 for channel 0: 0 = No pulsed cam output, 1 = Pulsed cam output activated • Bit 1 for channel 1: 0 = No pulsed cam output, 1 = Pulsed cam output activated • Bit 2 for channel 2: 0 = No pulsed cam output, 1 = Pulsed cam output activated • Bit 3 for channel 3: 0 = No pulsed cam output, 1 = Pulsed cam output activated • Bits 4 to 7: Reserved

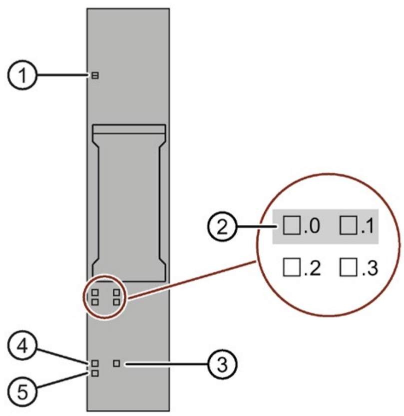
Feedback bit	Notes
STS_CAM	Signal status of the cam tracks • Bit 0 for channel 0: 0 = Cam track off, 1 = Cam track on • Bit 1 for channel 1: 0 = Cam track off, 1 = Cam track on • Bit 2 for channel 2: 0 = Cam track off, 1 = Cam track on • Bit 3 for channel 3: 0 = Cam track off, 1 = Cam track on • Bits 4 to 7: Reserved
STS_DQ	Signal status of the digital outputs • Bit 0 for channel 0: 0 = DQ channel off, 1 = DQ channel on (pulse output is possible) • Bit 1 for channel 1: 0 = DQ channel off, 1 = DQ channel on (pulse output is possible) • Bit 2 for channel 2: 0 = DQ channel off, 1 = DQ channel on (pulse output is possible) • Bit 3 for channel 3: 0 = DQ channel off, 1 = DQ channel on (pulse output is possible) • Bits 4 to 7: Reserved

6.3 Interrupts/diagnostics alarms

6.3.1 Status and error displays

LED displays

The figure below shows the location of the LED displays of the DQ 4×24VDC/2A HS.



① DIAG (green/red)
② Channel status (green)
③ OVS (green)
④ PWM (green)
⑤ PWR (green)

Figure 6-14 LED displays

Meaning of the LEDs

The following tables contain the meaning of the Status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms.

DIAG LED

Table 6- 7 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 6- 8 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated or process signal = 0
On	Channel activated and process signal = 1

OVS LED and PWM LED

Table 6- 9 Status display of the oversampling LED

OVS LED	PWM LED	Meaning
Off	Off	DQ operating mode (valve control) active
On	Off	Oversampling operating mode active
Off	On	Pulse width modulation operating mode active
On	On	Cam control (MCC) operating mode active

PWR LED

Table 6- 10 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

6.3.2 Interrupts

The DQ 4×24VDC/2A HS digital output module supports diagnostic interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Short circuit
- Excess temperature
- Parameter assignment error
- No supply voltage
- Communication error
- Invalid encoder data
- Encoder module removed or not ready to operate
- Channel temporarily not available

Detailed information on the event is available in the STEP 7 online help.

6.3.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output and the DIAG LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

You can connect 2 actuators per output.

The diagnostics of the two actuators influence each other in the case of duplicate wiring. This means that a single short-circuit affects both actuators.

Table 6- 11 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarms	Error code	Meaning	Solution
Short circuit [1 2]	1_H	Short-circuit of the actuator supply	Correct the process wiring
Excess temperature	5_H	The module has detected that the maximum permitted module temperature has been exceeded. All channels of the module are switched to high resistance. The module is then restarted.	Correct the process wiring
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Communication error	13_H	Module is defective.	Replace the module.
Error 1 in actuator/sensor	$1D_H$	The encoder data is invalid.	• Check encoder module and connected sensor. • Check messages about encoder modules and eliminate any errors.
Error 2 in actuator/sensor	$1E_H$	The encoder module is removed or not ready to operate	• Insert encoder module • Insert server module • Check connection to the controller
Channel temporarily not available	$1F_H$	Firmware update is currently in progress or was canceled. The module does not output any process values or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

[1] The channels 0 and 1 or 2 and 3 each form a load group. Within a load group, a short-circuit can have an effect on the adjacent channel. The load groups do not have an effect on each other in the case of a short-circuit.

[2] If the short-circuit persists, the module heats up. This may trigger temperature monitoring with excess temperature diagnostic interrupt.

Technical specifications 7

7.1 Technical specifications

Technical specifications of the DQ 4×24VDC/2A HS

Article number	6ES7132-6BD20-0DA0
General information	
Product type designation	DQ 4x24 V DC/2 A HS
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	STEP 7 V15.1 or higher
• STEP 7 configurable/integrated as of version	Via GSD as of V5.6 HF4
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.33
Operating mode	
• DQ	Yes
• DQ with energy-saving function	Yes; Valve control
• PWM	Yes
• Cam control (switching at comparison values)	Yes; Via MtM (module-to-module communication)
• Oversampling	Yes
• MSO	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7132-6BD20-0DA0
Input current	
Current consumption, max.	50 mA; without load
Output voltage	
Rated value (DC)	24 V
Power loss	
Power loss, typ.	2.5 W; at 24 V, 25 °C, DQ mode, 2 A per channel
Address area	
Address space per module	
• Inputs	1 byte; Max. 14 bytes in the cam control operating mode
• Outputs	1 byte; Max. 16 bytes in the oversampling operating mode
Hardware configuration	
Automatic encoding	
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0
• 3-wire connection	BU type A0 with AUX terminals or potential distributor module
• 4-wire connection	BU type A0 + Potential isolation module
Digital outputs	
Type of digital output	Source output (PNP, current-sourcing)
Number of digital outputs	4
Current-sinking	No
Current-sourcing	Yes; Push-pull output
Short-circuit protection	Yes
• Response threshold, typ.	6 A
Limitation of inductive shutdown voltage to	M (-1 V)
Controlling a digital input	No

Article number	6ES7132-6BD20-0DA0
Digital output functions, parameterizable	
• Switching tripped by comparison values	Yes
– Number of cam tracks, max.	4
– Number of cams per module, max.	16
– Number of cams per track, max.	16
– Supported axis types	Linear axes and rotary axes with modulo function
– Hysteresis	Yes
– Pulsed cam output	Yes
– Range of values for comparison values, max.	-2,147,483,648 to 2,147,483,647 (user-specific within this range)
• Freely usable digital output	Yes
• PWM output	Yes
– Number, max.	4
– Cycle duration, parameterizable	Yes; 0 ms, 0.2 ms, 0.4 ms, 0.93 ms, 1.33 ms, 4.27 ms, 10.67 ms, 21.33 ms, 34.13 ms, 59.73 ms
– Resolution of the duty cycle	0.1 %
• Digital output with oversampling	Yes
– Number, max.	4
– Values per cycle, max.	32
– Resolution, min.	100 µs
Switching capacity of the outputs	
• with resistive load, max.	2 A
• on lamp load, max.	10 W
Load resistance range	
• lower limit	12 Ω
• upper limit	3 400 Ω
Output current	
• for signal "1" rated value	2 A
• for signal "0" residual current, max.	0.1 mA
Output delay with resistive load	
• "0" to "1", max.	1 µs
• "1" to "0", max.	1 µs
Parallel switching of two outputs	
• for uprating	No

Article number	6ES7132-6BD20-0DA0
Switching frequency	
• with resistive load, max.	5 kHz
• with inductive load, max.	5 kHz
• on lamp load, max.	5 kHz
Total current of the outputs	
• Current per channel, max.	2 A
• Current per module, max.	8 A
Total current of the outputs (per module)	
horizontal installation	
– up to 30 °C, max.	8 A; DQ mode
– up to 40 °C, max.	6.9 A; DQ mode
– up to 50 °C, max.	4.7 A; DQ mode
– up to 60 °C, max.	2.5 A; DQ mode
vertical installation	
– up to 30 °C, max.	7.2 A; DQ mode
– up to 40 °C, max.	5.6 A; DQ mode
– up to 50 °C, max.	4 A; DQ mode
Cable length	
• shielded, max.	50 m
• unshielded, max.	50 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes; Operating modes DQ and OVS only
Execution and activation time (TCO), min.	40 µs
Bus cycle time (TDP), min.	125 µs
Jitter, max.	1 µs
Interrupts/diagnostics/status information	
Diagnostic functions	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
• Wire-break	No
• Short-circuit	Yes; Module-wise
• Group error	Yes

Article number	6ES7132-6BD20-0DA0
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety-related tripping of standard modules	No
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C; On request: Ambient temperatures lower than 0 °C (without condensation)
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; On request: Ambient temperatures lower than 0 °C (without condensation)
• vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	31 g

Dimension drawing

7.2 Derating of the DQ 4x24VDC/2A HS

Maximum permitted output current depending on the frequency

The figure below shows the maximum permitted output current per channel depending on the frequency.

You must take this characteristic into consideration for all operating modes of the module.

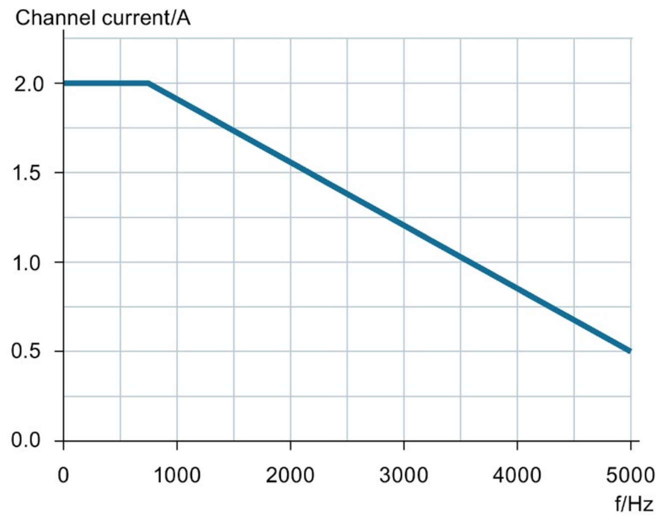

Figure 7-1 Derating of the DQ 4×24VDC/2A HS depending on the frequency

Maximum permitted output current depending on the ambient temperature

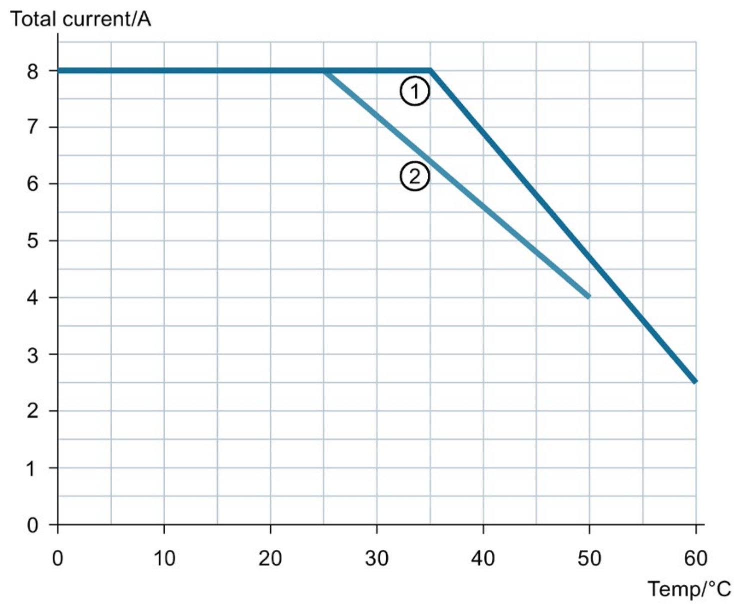
In addition to the dependency of the maximum permitted output current on the frequency, you also have to take into consideration the dependency on the ambient temperature. Depending on the configured operating mode, there is an additional "DQ" or "PWM" derating. The table below shows the dependencies of derating version and module operating mode:

Table 7- 1 Additional derating versions of the DQ 4×24VDC/2A HS

Derating version	Operating mode				
	Normal operation	Valve control in normal operation	Pulse width modulation	Oversampling	Cam control
DQ derating	x	-	-	x	-
PWM derating	-	x	x	-	x

DQ derating

The figure below shows the maximum permitted total current depending on the ambient temperature for the DQ derating.

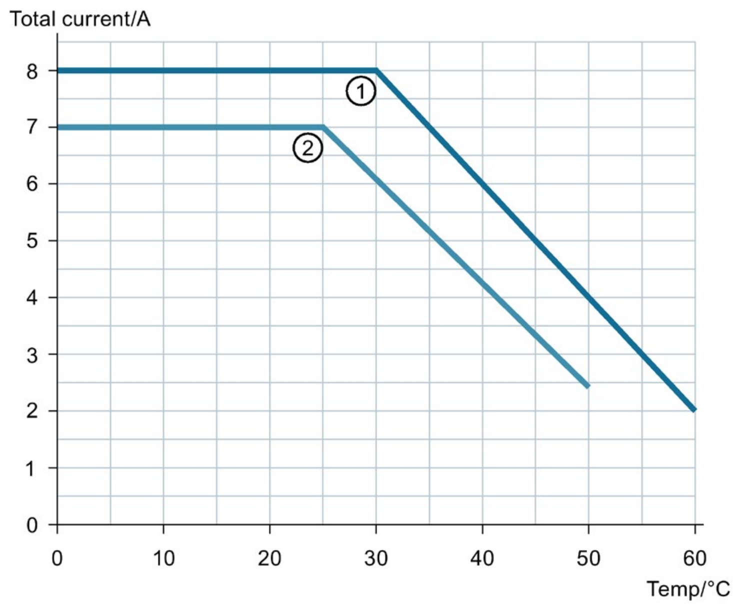


① Horizontal installation position
② Vertical installation position

Figure 7-2 Additional DQ derating depending on the ambient temperature

PWM derating

The figure below shows the maximum permitted total current depending on the ambient temperature for the PWM derating.



① Horizontal installation position
② Vertical installation position

Figure 7-3 Additional PWM derating depending on the ambient temperature

Parameter data records A

A.1 Parameter assignment and structure of the parameter data record for DQ operating mode

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, the reaction to CPU STOP of individual channels can be changed in RUN without this having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment can result in a brief exit from clocked mode and renewed synchronization with the fieldbus cycle.

Note

Changing parameters in RUN

When parameters are reassigned in RUN, a brief signal failure can occur at the output. For this reason, reassignment of parameters in RUN should be done when a 0 is being output at the output.

STATUS output parameter

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128 for entire module

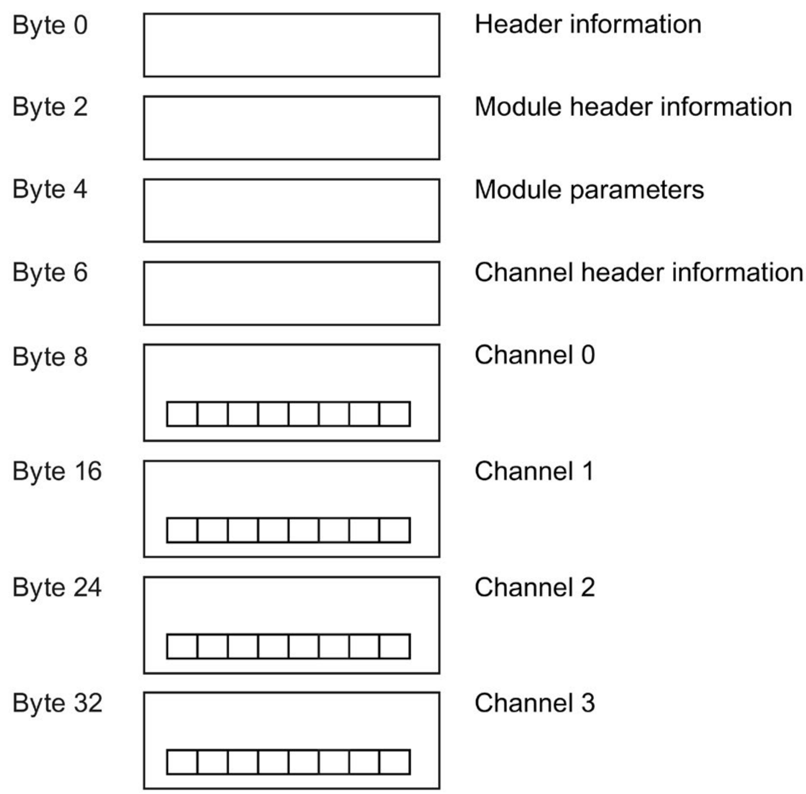


Figure A-1 Structure of data record 128 for entire module

Header information

The figure below shows the structure of the header information.

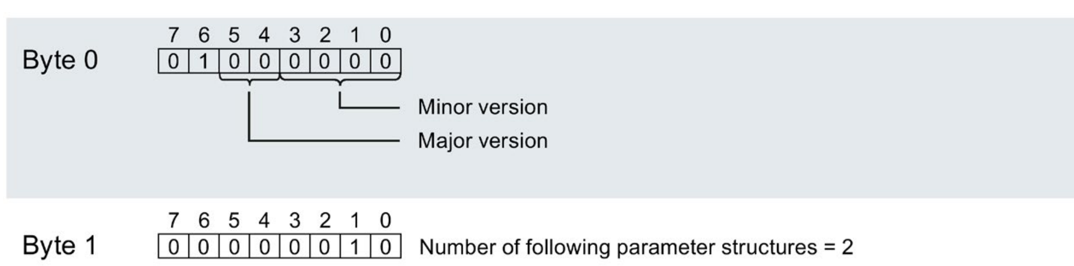

Figure A-2 Header information

Module header information

The figure below shows the structure of the module header information.

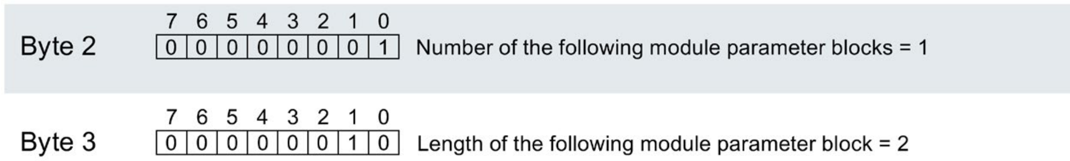

Figure A-3 Module header information

Module parameter block

The figure below shows the structure of the module parameter block for channels 0 to 3.

Enable a parameter by setting the corresponding bit to "1".

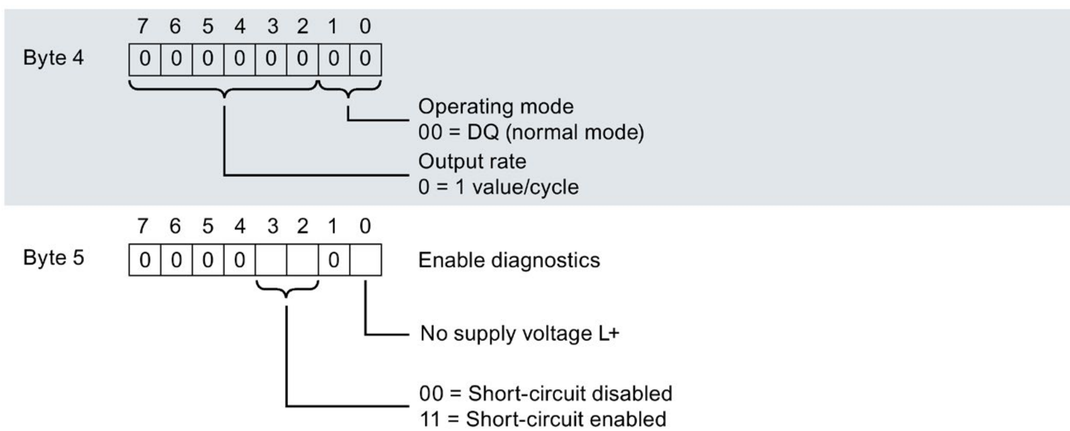

Figure A-4 Module parameter block

Channel header information

The figure below shows the structure of the channel header information.

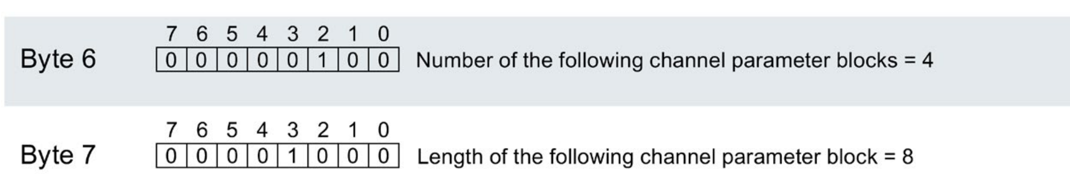

Figure A-5 Channel header information

Channel parameter block

The figure below shows the structure of the channel parameter block.

Enable a parameter by setting the corresponding bit to "1".

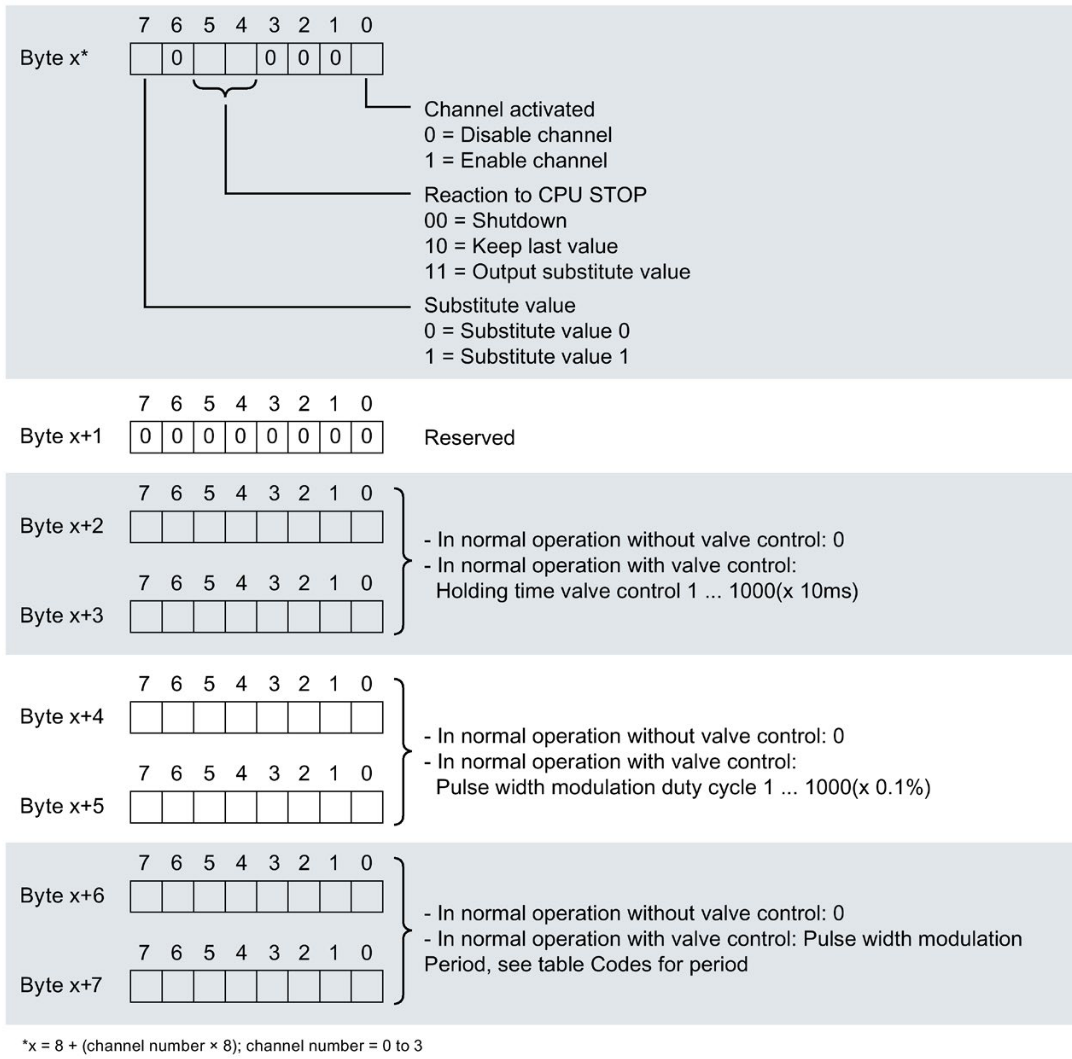

Figure A-6 Structure of byte x to x+7 for channels 0 to 3

Codes for time period of the pulse width modulation

The following table contains the codes for the time period of the pulse width modulation of the digital output module. You must enter these codes in bytes x+6 and x+7 of the channel parameter block of data record 128 (see previous figure).

Table A- 1 Codes for the period

Value	Time period	Code
0	Off	0000 0000
4	0.20 ms	0000 0100
7	0.40 ms	0000 0111
12	0.93 ms	0000 1100

Errors when transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module take over the values from the data record.

In case of errors, the WRREC instruction for writing data records returns corresponding error codes in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help.

The following table shows the module-specific error codes and their meaning for data record 128. The error codes are supported starting from firmware version V2.0.0.

Table A- 2 Error messages, their meaning and corrective measures

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$B0_H$	00_H	Number of the data record unknown	Enter a valid number for the data record.
DF_H	80_H	$B1_H$	01_H	Length of the data record incorrect	Enter a valid value for the data record length.
DF_H	80_H	$B2_H$	00_H	Module not accessible	• Check station. • Plug the module in correctly. • Check parameters of the WRREC block.
DF_H	80_H	$E0_H$	01_H	Incorrect version in header	Correct the version number of the parameter block, see Figure A-2 Header information (Page 99).

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$E0_H$	02_H	Error in the header, length or number of parameter blocks	Correct the length and number of parameter blocks, see Figure A-2 Header information (Page 99) and Figure A-3 Module header information (Page 100).
DF_H	80_H	$E1_H$	01_H	Reserved bit set	Write 0 to all reserved bits.
DF_H	80_H	$E1_H$	02_H	Invalid diagnostics enable bit set for operating mode	Correct the diagnostics enables according to the operating mode, see Figure A-4 Module parameter block (Page 100).
DF_H	80_H	$E1_H$	06_H	Code for behavior with substitute value invalid	Use valid code for reaction to CPU STOP, see Figure A-6 Structure of byte x to x+7 for channels 0 to 3 (Page 101).
DF_H	80_H	$E1_H$	$0D_H$	Code for output rate invalid	Use valid code for output rate, see Figure A-4 Module parameter block (Page 100).
DF_H	80_H	$E1_H$	21_H	Set operating mode invalid	Adapt operating mode according to the configuration, see Figure A-4 Module parameter block (Page 100).
DF_H	80_H	$E1_H$	22_H	Value for holding time valve control invalid	Adapt holding time valve control to valid value, see Figure A-6 Structure of byte x to x+7 for channels 0 to 3 (Page 101).
DF_H	80_H	$E1_H$	23_H	Value for pulse width modulation duty cycle invalid	Adapt pulse width modulation duty cycle to valid value, see Figure A-6 Structure of byte x to x+7 for channels 0 to 3 (Page 101).
DF_H	80_H	$E1_H$	24_H	Code for pulse width modulation time period invalid	Use valid code for pulse width modulation time period, see Figure A-6 Structure of byte x to x+7 for channels 0 to 3 (Page 101).

A.2 Parameter assignment and structure of the parameter data record for oversampling operating mode

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, the reaction to CPU STOP of individual channels can be changed in RUN without this having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment can result in a brief exit from clocked mode and renewed synchronization with the fieldbus cycle.

STATUS output parameter

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128 for entire module

Codes for the output rate

The table below contains the codes for the output rate of the digital output module. You must enter these codes in byte 4 of the module parameter block of data record 128 (see figure).

Table A- 3 Codes for the output rate

Value	Output rate	Code
1	2 values/cycle	000001
3	4 values/cycle	000011
5	6 values/cycle	000101
7	8 values/cycle	000111
9	10 values/cycle	001001
11	12 values/cycle	001011
13	14 values/cycle	001101
15	16 values/cycle	001111
17	18 values/cycle	010001
19	20 values/cycle	010011
21	22 values/cycle	010101
23	24 values/cycle	010111
25	26 values/cycle	011001
27	28 values/cycle	011011
29	30 values/cycle	011101
31	32 values/cycle	011111

Errors when transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module take over the values from the data record.

In case of errors, the WRREC instruction for writing data records returns corresponding error codes in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help.

The following table shows the module-specific error codes and their meaning for data record 128. The error codes are supported starting from firmware version V2.0.0.

Table A- 4 Error messages, their meaning and corrective measures

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$B0_H$	00_H	Number of the data record unknown	Enter a valid number for the data record.
DF_H	80_H	$B1_H$	01_H	Length of the data record incorrect	Enter a valid value for the data record length.
DF_H	80_H	$B2_H$	00_H	Module not accessible	• Check station. • Plug the module in correctly. • Check parameters of the WRREC block.
DF_H	80_H	$E0_H$	01_H	Incorrect version in header	Correct the version number of the parameter block, see Figure A-8 Header information (Page 105).
DF_H	80_H	$E0_H$	02_H	Error in the header, length or number of parameter blocks	Correct the length and number of parameter blocks, see Figure A-8 Header information (Page 105), figure Figure A-9 Module header information (Page 106) and Figure A-11 Channel header information (Page 106).
DF_H	80_H	$E1_H$	01_H	Reserved bit set	Write 0 to all reserved bits.
DF_H	80_H	$E1_H$	02_H	Invalid diagnostics enable bit set for operating mode	Correct the diagnostics enables according to the operating mode, see Figure A-10 Module parameter block (Page 106).
DF_H	80_H	$E1_H$	06_H	Code for behavior with substitute value invalid	Use valid code for reaction to CPU STOP, see Figure A-12 Structure of byte x to x+7 for channels 0 to 3 (Page 107).
DF_H	80_H	$E1_H$	$0D_H$	Code for output rate invalid	Use valid code for output rate, see Figure A-10 Module parameter block (Page 106).
DF_H	80_H	$E1_H$	21_H	Set operating mode invalid	Adapt operating mode according to the configuration, see Figure A-10 Module parameter block (Page 106).

Codes for time period of the pulse width modulation

The following table contains the codes for the time period of the pulse width modulation of the digital output module. You must enter these codes in bytes x+6 and x+7 of the channel parameter block of data record 128 (see previous figure).

Table A- 5 Codes for the period

Value	Time period	Code
0	Off	0000 0000
4	0.20 ms	0000 0100
7	0.40 ms	0000 0111
12	0.93 ms	0000 1100
14	1.33 ms	0000 1110
21	4.27 ms	0001 0101
26	10.67 ms	0001 1010
30	21.33 ms	0001 1110
33	34.13 ms	0010 0001
36	59.73 ms	0010 0100

Errors when transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module take over the values from the data record.

In case of errors, the WRREC instruction for writing data records returns corresponding error codes in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help.

The following table shows the module-specific error codes and their meaning for data record 128. The error codes are supported starting from firmware version V2.0.0.

Table A- 6 Error messages, their meaning and corrective measures

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$B0_H$	00_H	Number of the data record unknown	Enter a valid number for the data record.
DF_H	80_H	$B1_H$	01_H	Length of the data record incorrect	Enter a valid value for the data record length.
DF_H	80_H	$B2_H$	00_H	Module not accessible	• Check station. • Plug the module in correctly. • Check parameters of the WRREC block.
DF_H	80_H	$E0_H$	01_H	Incorrect version in header	Correct the version number of the parameter block, see Figure A-14 Header information (Page 111).

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$E0_H$	02_H	Error in the header, length or number of parameter blocks	Correct the length and number of parameter blocks, see Figure A-14 Header information (Page 111) and Figure A-17 Channel header information (Page 112).
DF_H	80_H	$E1_H$	01_H	Reserved bit set	Write 0 to all reserved bits.
DF_H	80_H	$E1_H$	02_H	Invalid diagnostics enable bit set for operating mode	Correct the diagnostics enables according to the operating mode, see Figure A-16 Module parameter block (Page 112).
DF_H	80_H	$E1_H$	06_H	Code for behavior with substitute value invalid	Use valid code for reaction to CPU STOP, see Figure A-18 Structure of byte x to x+7 for channels 0 to 3 (Page 113).
DF_H	80_H	$E1_H$	$0A_H$	Value for substitute value invalid	Adapt substitute value to valid value, see Figure A-18 Structure of byte x to x+7 for channels 0 to 3 (Page 113).
DF_H	80_H	$E1_H$	$0D_H$	Code for output rate invalid	Use valid code for output rate, see Figure A-16 Module parameter block (Page 112).
DF_H	80_H	$E1_H$	21_H	Set operating mode invalid	Adapt operating mode according to the configuration, see Figure A-16 Module parameter block (Page 112).
DF_H	80_H	$E1_H$	24_H	Code for pulse width modulation time period invalid	Use valid code for pulse width modulation time period, see Figure A-18 Structure of byte x to x+7 for channels 0 to 3 (Page 113).

Parameter assignment and structure of the parameter data record for pulse width modulation operating mode (Page 110)

A.4 Parameter assignment and structure of the parameter data record for cam control operating mode

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, you can change the period of individual channels in RUN without this having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

If a parameter is changed in the module parameter block or in the internal cam control block, the direction information is nullified (SYNC = 0) until it can be detected again. As long as no direction information is available, the configured substitute values are output for the cam control channels.

Note

Direction detection

If no direction information is included with the supplied encoder data, two valid different encoder values are needed for the direction detection (SYNC = 1). The two values allow a subtraction to be performed and the direction to be derived from the result.

STATUS output parameter

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Errors when transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module take over the values from the data record.

In case of errors, the WRREC instruction for writing data records returns corresponding error codes in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help.

The following table shows the module-specific error codes and their meaning for data record 128. The error codes are supported starting from firmware version V2.0.0.

Table A- 8 Error messages, their meaning and corrective measures

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$B0_H$	00_H	Number of the data record unknown	Enter a valid number for the data record.
DF_H	80_H	$B1_H$	01_H	Length of the data record incorrect	Enter a valid value for the data record length.
DF_H	80_H	$B2_H$	00_H	Module not accessible	• Check station. • Plug the module in correctly. • Check parameters of the WRREC block.
DF_H	80_H	$E0_H$	01_H	Incorrect version in header	Correct the version number of the parameter block, see Figure A-20 Header information (Page 117).

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$E0_H$	02_H	Error in the header, length or number of parameter blocks	Correct the length and number of parameter blocks, see Figure A-20 Header information (Page 117) and Figure A-21 Module header information in cam control operating mode (Page 118).
DF_H	80_H	$E1_H$	01_H	Reserved bit set	Write 0 to all reserved bits.
DF_H	80_H	$E1_H$	02_H	Invalid diagnostics enable bit set for operating mode	Correct the diagnostics enables according to the operating mode, see Figure A-22 Module parameter block in cam control operating mode (Page 118).
DF_H	80_H	$E1_H$	06_H	Code for behavior with substitute value invalid	Use valid code for reaction to CPU STOP, see Figure A-27 Structure of byte x to x+7 for channels 0 to 3 in cam control operating mode (Page 121).
DF_H	80_H	$E1_H$	21_H	Set operating mode invalid	Adapt operating mode according to the configuration, see Figure A-22 Module parameter block in cam control operating mode (Page 118).
DF_H	80_H	$E1_H$	23_H	Value for pulsed cam output duty cycle invalid	Adapt pulsed cam output duty cycle to valid value, see Figure A-27 Structure of byte x to x+7 for channels 0 to 3 in cam control operating mode (Page 121).
DF_H	80_H	$E1_H$	24_H	Code for pulsed cam output period invalid	Use valid code for pulsed cam output period, see Figure A-27 Structure of byte x to x+7 for channels 0 to 3 in cam control operating mode (Page 121).
DF_H	80_H	$E1_H$	42_H	Difference of maximum encoder value and minimum encoder value invalid	Difference of maximum encoder value and minimum encoder value invalid must not exceed 2,147,483,646.
DF_H	80_H	$E1_H$	43_H	Format of encoder value invalid	Read back data record 128 and apply the values/codes of the internal layout block unchanged.
DF_H	80_H	$E1_H$	44_H	Difference of maximum encoder value and minimum encoder value invalid	The difference of maximum encoder value and minimum encoder value must be at least 2.
DF_H	80_H	$E1_H$	45_H	Specifications in the layout of encoder data invalid	Read back data record 128 and apply the values/codes of the internal layout block unchanged.
DF_H	80_H	$E1_H$	46_H	Value of hysteresis invalid	The hysteresis setting must satisfy the following conditions: • Hysteresis < ABS ((maximum encoder value - minimum encoder value) / 4)
DF_H	80_H	$E1_H$	47_H	Value for channel assignment of a cam invalid	For the channel assignment of a cam, only values 0 to 3 may be used, see Figure A-24 Internal block cam control (Modular CAM Controller), part 1 (Page 119).

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF$_H$	80$_H$	E1$_H$	48$_H$	Difference of cam end position and cam start position invalid	The hysteresis setting must satisfy the following conditions: • Hysteresis < Cam$_i$ end position - Cam$_i$ start position [i = 0 to 15] or Cam end position and cam start position must satisfy the following conditions: When modulo is deactivated: • Cam end position > Cam start position When modulo is activated: • Cam end position <> Cam start position
DF$_H$	80$_H$	E1$_H$	49$_H$	Overlapping of cams	The switch-on range of all cams that are assigned to a cam track must not overlap.
DF$_H$	80$_H$	E1$_H$	4A$_H$	Cam start position or cam end position invalid or outside of encoder range	Cam end position and cam start position must satisfy the following conditions: When modulo is deactivated: • Minimum encoder value <= Cam start position < Cam end position <= Maximum encoder value When modulo is activated: • Minimum encoder value <= Cam start position <= Maximum encoder value • Minimum encoder value <= Cam end position <= Maximum encoder value
DF$_H$	80$_H$	E1$_H$	4B$_H$	Structure version invalid	Write 0 to structure version, see Figure A-24 Internal block cam control (Modular CAM Controller), part 1 (Page 119).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For ecologically sustainable recycling and disposal of your old device, contact a certified disposal service for electronic scrap and dispose of the device in accordance with the regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

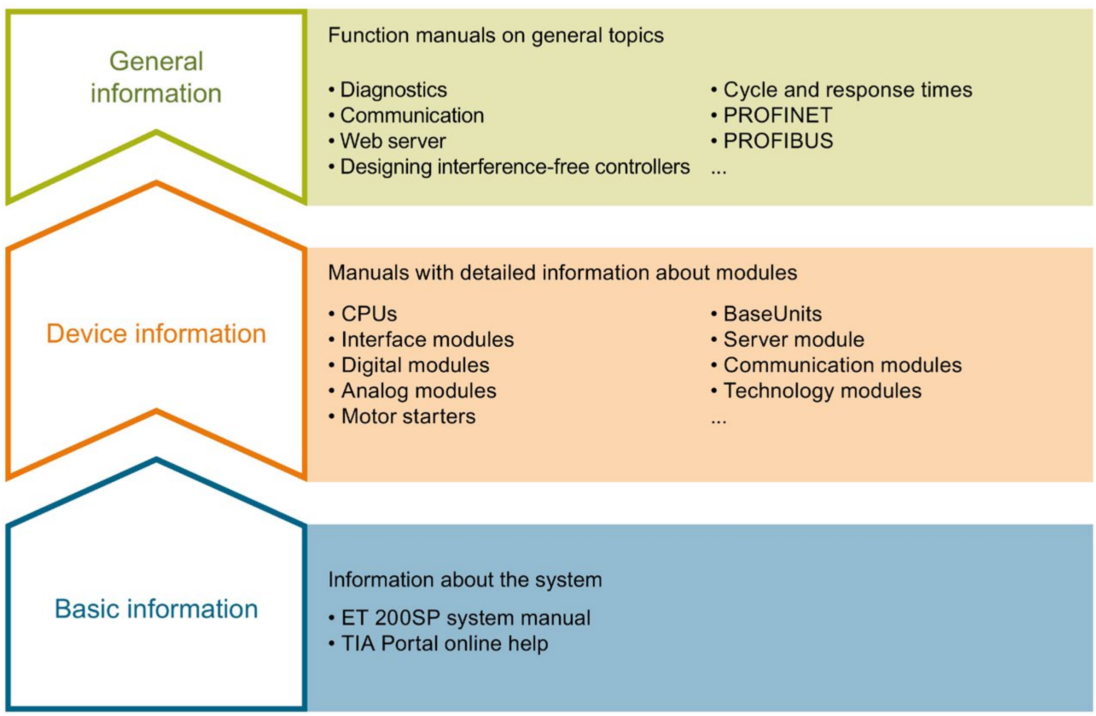
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

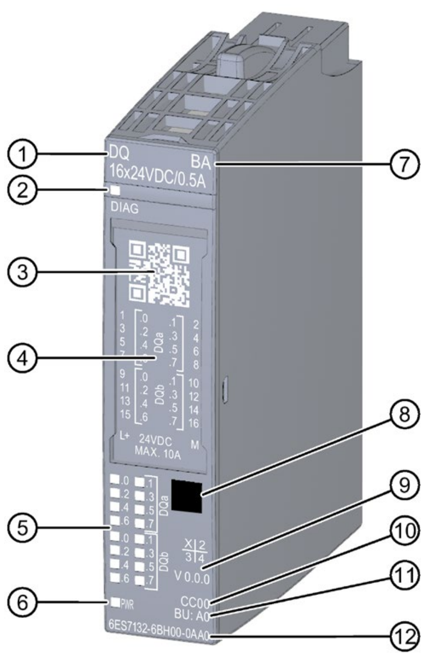
Product overview 2

2.1 Properties

Article number

6ES7132-6BH00-0AA0

View of the module



①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color coding module type
③	2D matrix code	⑨	Function and firmware version
④	Wiring diagram	⑩	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the module DQ 16×24VDC/0.5A BA

Properties

The module has the following technical properties:

- Digital output module with 16 outputs
- Supply voltage L+
- Output current 0.5 A (per channel), total current max. 8 A
- Source output (PNP, P-switching)
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0240	V5.5 SP3 or higher with HSP 0230 V8.0 or higher	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manualET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Connecting 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 16×24VDC/0.5A BA module with the terminal assignments for a 1-wire and 2-wire connection.

You can find information on wiring the BaseUnit as well as information on wiring your system with potential distribution modules in the system manual Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Note

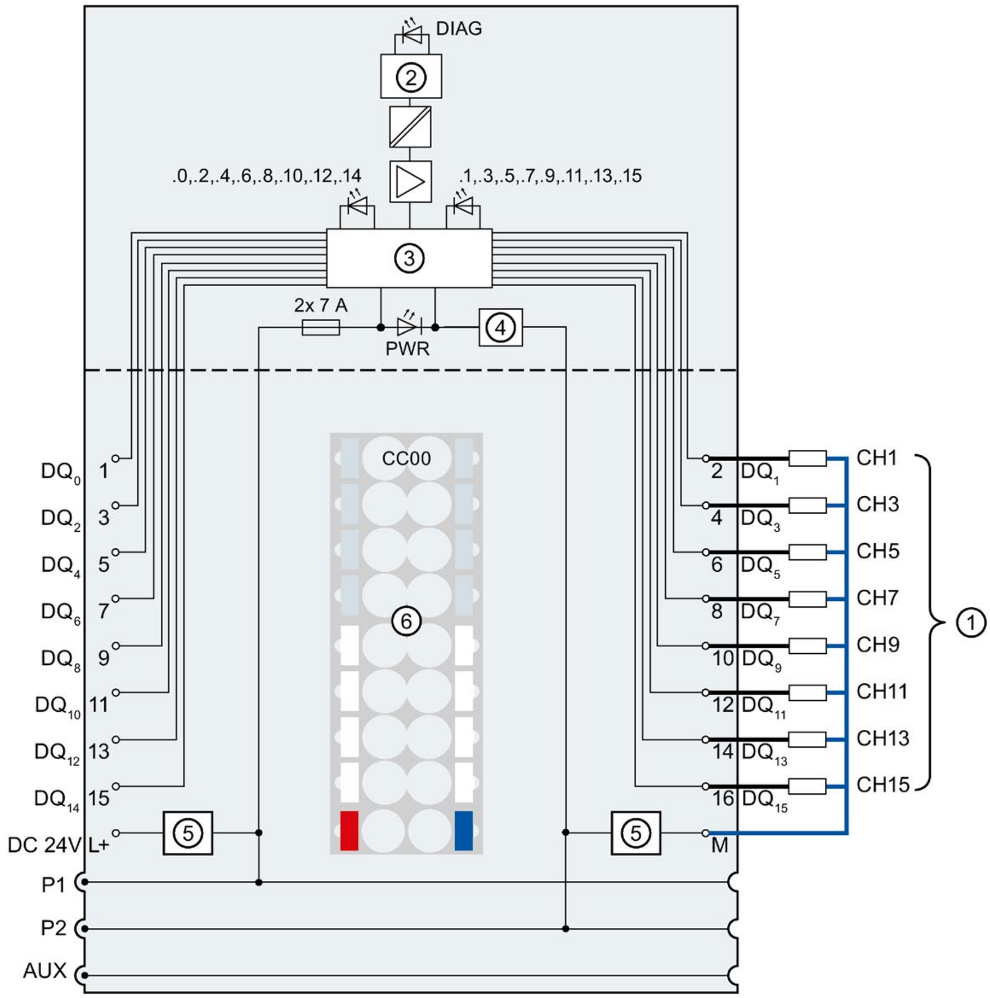
The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Note

The fuse integrated in BaseUnit type A1 may be triggered in the digital output module, rendering the terminals unusable.
Make sure that you only use digital output modules with BaseUnit type A0 during commissioning.

Wiring: 1-wire connection of actuators

The following figure shows the block diagram and an example for the terminal assignment of the digital output module DQ 16×24VDC/0.5A BA on the BaseUnit BU type A0 (1-wire connection).



①	1-wire connection	DQ_n	Output signal, channel n
②	Backplane bus interface	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
③	Output electronics	M	Ground
④	Polarity reversal protection	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑤	Supply voltage filter circuit (only available with light BaseUnit)	DIAG	Diagnostics LED (green, red)
⑥	Color-coded label with color code CC00 (optional)	.0 to .15	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire connection of actuators

Example: 2-wire connection of actuators with potential distribution module

The following figure shows an example for the terminal assignment of the digital output module DQ 16×24VDC/0.5A BA on the BaseUnit BU type A0 (2-wire connection) in combination with a potential distribution module.

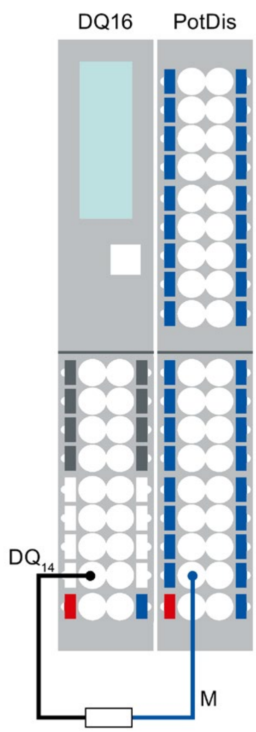


Figure 3-2 Example: 2-wire connection of actuators with potential distribution module

Parameters/address space 4

4.1 Parameters

Parameters for DQ 16x24VDC/0.5A BA

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of parameter data record (Page 26).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassignment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 6 bytes.

4.2 Declaration of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of DQ 16x24VDC/0.5A BA

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g., with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 16-channel without value status	DQ 16x24VDC/0.5A BA V0.0	V14 or higher with HSP 0230	X	X

Address space

The figure below shows the assignment of the address space for DQ 16x24VDC/0.5A BA.

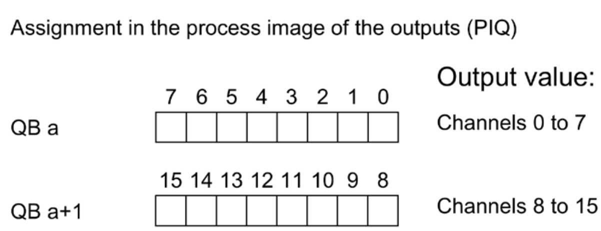

Figure 4-1 Address space DQ 16×24VDC/0.5A BA

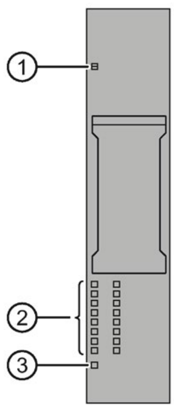
Interrupts/diagnostic alarms 5

5.1 Status and error display

LED display

DQ 16x24VDC/0.5A BA



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The following tables contain the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in chapter Diagnostic messages (Page 21).

DIAG LED

Table 5- 1 DIAG LED fault display

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module not configured
On	Module parameters assigned
Flashing	Module diagnostics is available

LED channel status

Table 5- 2 LED channel status display

LED channel status	Meaning
Off	Channel deactivated or activated and process signal = 0
On	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ present

5.2 Interrupts

The DQ 16×24VDC/0.5A BA digital output module supports diagnostic interrupts.

Diagnostic interrupts

The module generates a diagnostic interrupt at the following events:

- Parameter assignment error
- Supply voltage missing

5.3 Diagnostic messages

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	• Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

6 Technical specifications

Technical specifications of the DQ 16×24VDC/0.5A BA

Article number	6ES7132-6BH00-0AA0
General information	
Product type designation	DQ 16x 24 V DC/0.5 A BA, PU 1
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	STEP 7 V5.5 or higher
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	55 mA; without load
Output voltage	
Rated value (DC)	24 V

Article number	6ES7132-6BH00-0AA0
Power loss	
Power loss, typ.	1 W
Address area	
Address space per module	
• Outputs	2 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0 + Potential isolation module
• 3-wire connection	BU type A0 + Potential isolation module
• 4-wire connection	BU type A0 + Potential isolation module
Digital outputs	
Type of digital output	Source output (PNP, current-sourcing)
Number of digital outputs	16
Current-sinking	No
Current-sourcing	Yes
Short-circuit protection	Yes
• Response threshold, typ.	1.4 A; 0.7 to 1.9 A
Open-circuit detection	No
Limitation of inductive shutdown voltage to	Typ. L+ (-53 V)
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	100 kΩ
Output current	
• for signal "1" rated value	0.5 A
• for signal "0" residual current, max.	30 μA
Output delay with resistive load	
• "0" to "1", typ.	80 μs; at rated load
• "0" to "1", max.	150 μs; at rated load
• "1" to "0", typ.	100 μs; at rated load
• "1" to "0", max.	200 μs; at rated load

Article number	6ES7132-6BH00-0AA0
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	100 Hz
• with inductive load, max.	2 Hz
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per channel, max.	0.5 A
• Current per module, max.	8 A
Total current of the outputs (per module)	
horizontal installation	
– up to 60 °C, max.	8 A
vertical installation	
– up to 50 °C, max.	8 A
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	No
• Short-circuit	No
• Group error	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	

Article number	6ES7132-6BH00-0AA0
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Dimension drawing

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to reconfigure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

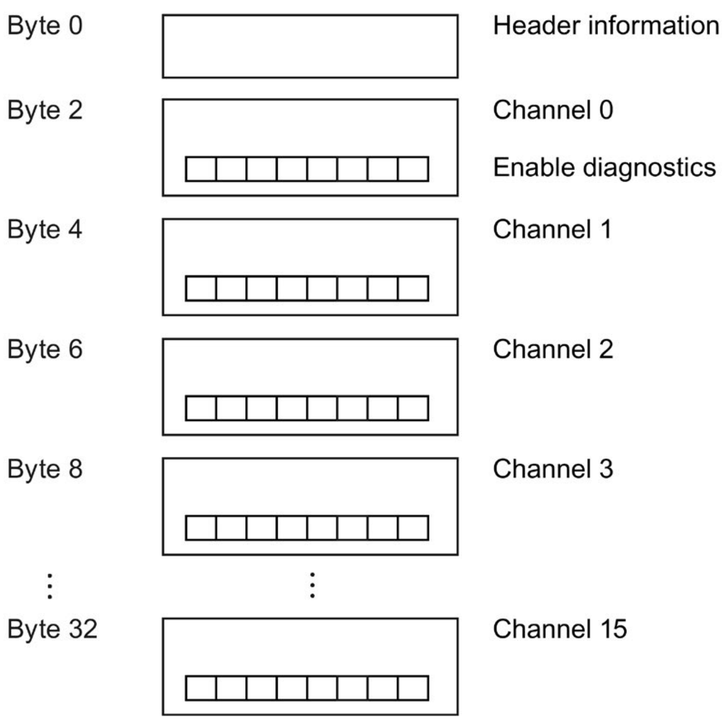

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

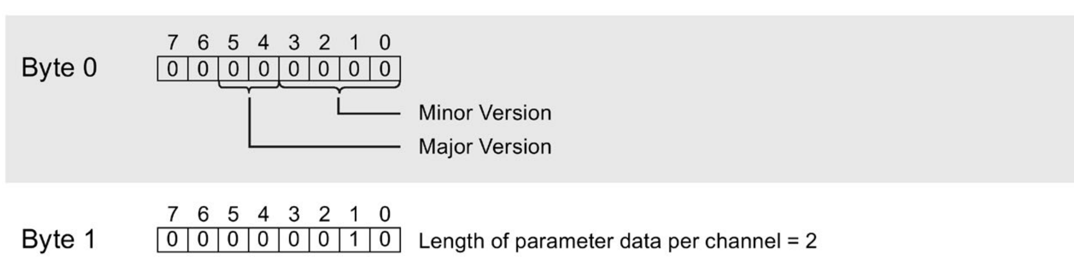

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 15.

You enable a parameter by setting the corresponding bit to "1".

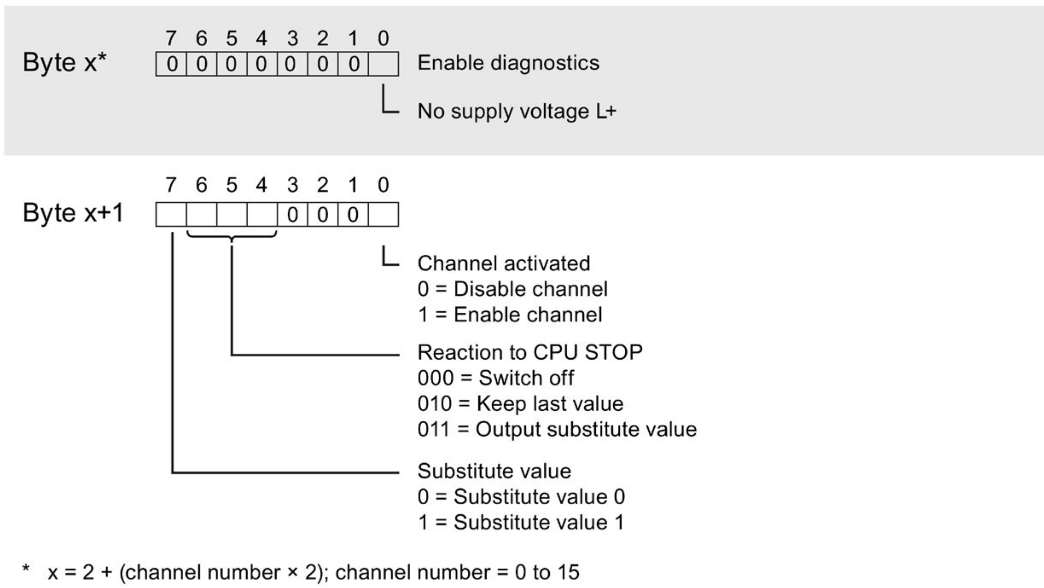

Figure A-3 Structure byte x to x+1 for the channels 0 to 15

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E0	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7132-6BH00-0BA0 to 6ES7132-6BH0**1**-0BA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

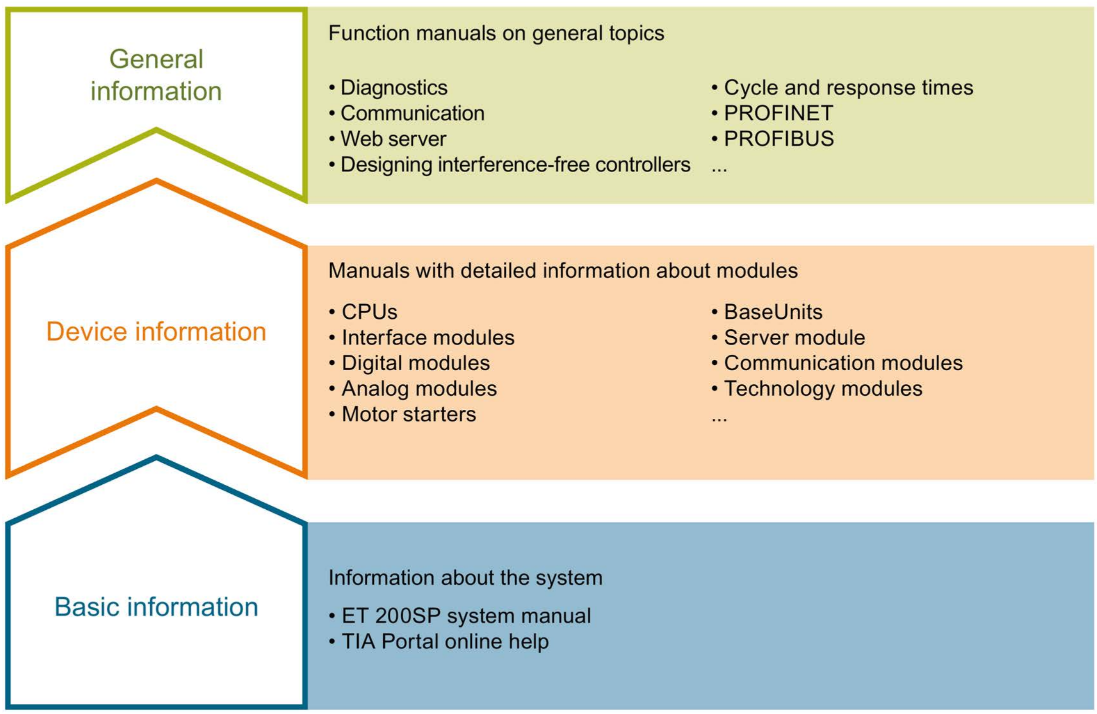
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the module DQ 16×24VDC/0.5A ST

Properties

The module has the following technical properties:

- Digital output module with 16 outputs
- Source output (PNP, P-switching)
- Supply voltage L+
- Output current 0.5 A (per channel), total current max. 8 A
  (see derating: Technical specifications (Page 25))
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Safety-related shutdown

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
PROFIenergy	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0230 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manualET 200SP distributed I/O system. (http://support.automation.siemens.com/WW/view/en/58649293)

Connecting 3

3.1 Wiring and block diagram

This section includes the block diagram of the DQ 16×24VDC/0.5A ST module with the terminal assignments for a 1-wire connection.

You can find information on wiring the BaseUnit in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Note

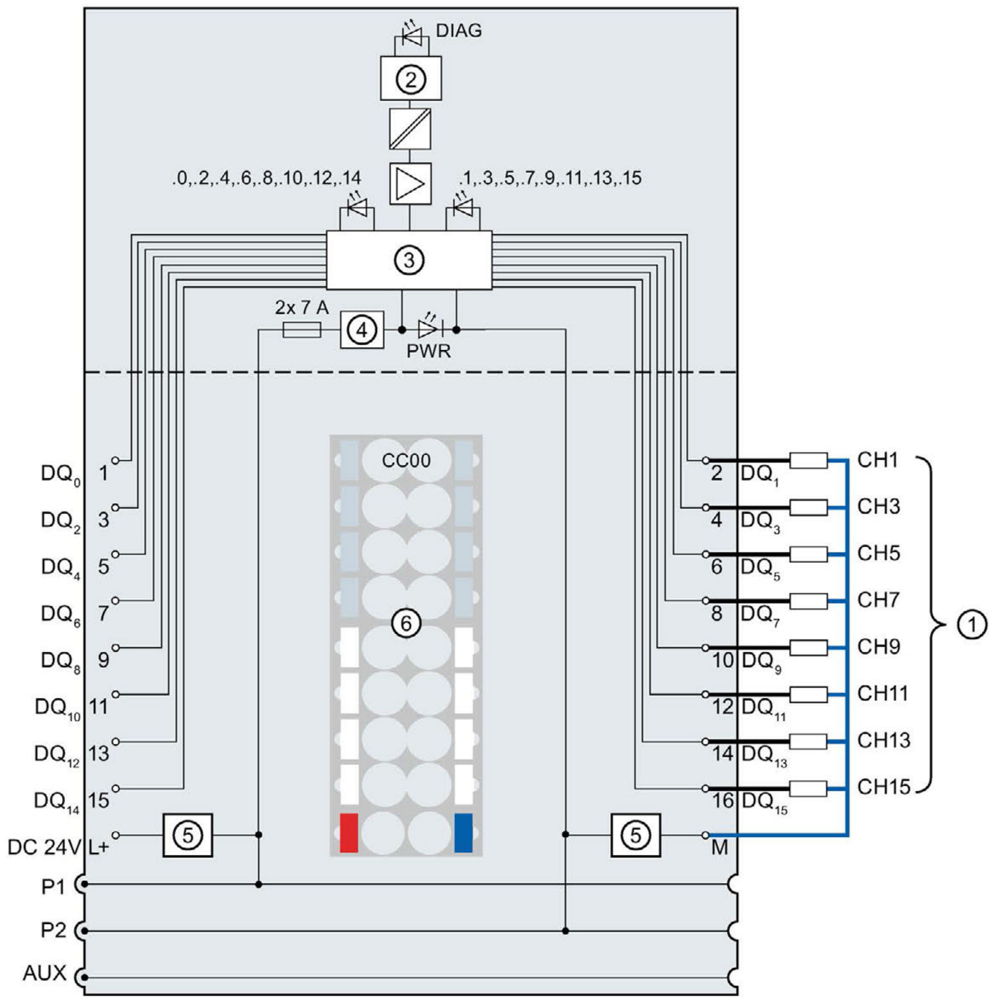
The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Note

The fuse integrated in BaseUnit type A1 may be triggered in the digital output module, rendering the terminals unusable.
Make sure that you only use digital output modules with BaseUnit type A0 during commissioning.

Wiring: 1-wire connection of actuators

The following figure shows the block diagram and an example for the terminal assignment of the digital output module DQ 16×24VDC/0.5A ST on the BaseUnit BU type A0 (1-wire connection).



①	1-wire connection	DQn	Output signal, channel n
②	Backplane bus interface	24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)
③	Output electronics	M	Ground
④	Polarity reversal protection	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑤	Supply voltage filter circuit (only available with light BaseUnit)	DIAG	Diagnostics LED (green, red)
⑥	Color-coded label with color code CC00 (optional)	.0 to .15	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for 1-wire connection of actuators

Parameters/address space 4

4.1 Parameters

Parameters for DQ 16x24VDC/0.5A ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of parameter data record (Page 31).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassign-ment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameters	Range of values	Default	Parameter reassign-ment in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (mod-ule plugged into a dark-colored Ba-seUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 32 bytes.

Note

- If both parameters "Diagnostics: short-circuit to L+" and "Diagnostics: wire break" are enabled and one of these diagnostic events occurs, the affected channel is switched off. This prevents undefined load switching and the corresponding diagnostic alarm is triggered.
- If both parameters "Diagnostics: short-circuit to L+" and "Diagnostics: wire break" are enabled and one of these diagnostic events occurs, the affected channel is switched off. This prevents undefined load switching and the corresponding diagnostic alarm is triggered.
- If the parameter "Diagnostics: short-circuit to L+" is enabled and "Diagnostics: wire break" is disabled, the signal status is retained at the affected channel when "Diagnostics: short-circuit to L+" occurs. A diagnostic alarm is triggered only for 0 signal.

4.2 Declaration of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

Diagnostics: Short-circuit to L+

Enabling of the diagnostics if a short-circuit of the actuator supply to L+ occurs.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

ET 200SP distributed I/O system
(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of DQ 16x24VDC/0.5A ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hard-ware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 16-channel without value status	DQ 16x24VDC/0.5A ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 16-channel with value status	DQ 16x24VDC/0.5A ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional two bytes are allocated in the input address space if you enable the value status for the digital module. Bits 0 to 15 in these bytes are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the DQ 16x24VDC/0.5A ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

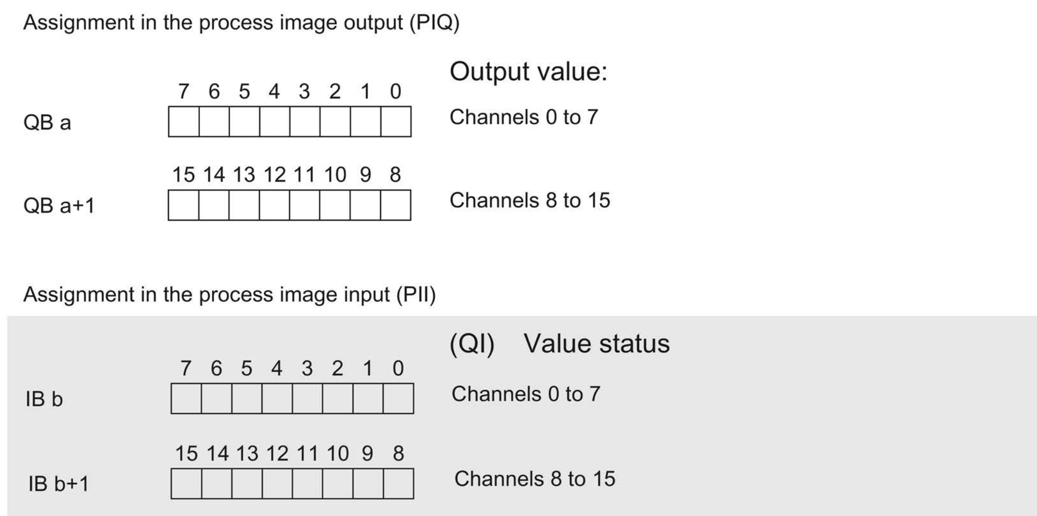

Figure 4-1 Address space of DQ 16×24VDC/0.5A ST with value status

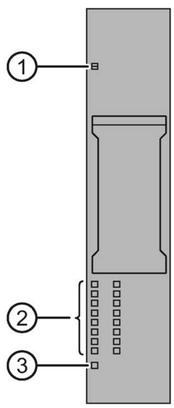
Interrupts/diagnostic alarms 5

5.1 Status and error display

LED display

DQ 16x24VDC/0.5A ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LEDs

The following tables contain the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in chapter Diagnostic messages (Page 24).

DIAG LED

Table 5- 1 DIAG LED fault display

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module not configured
On	Module parameters assigned
Flashing	Module diagnostics is available

LED channel status

Table 5- 2 LED channel status display

LED channel status	Meaning
Off	Channel deactivated or activated and process signal = 0
On	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ present

5.2 Interrupts

The digital output module DQ 16×24VDC/0.5A ST supports diagnostic interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit
- Wire break
- Parameter assignment error
- Supply voltage missing

5.3 Diagnostic messages

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Note

Parallel connection of two outputs

For parallel connection of two outputs for redundant control of a load, the channel diagnostics "Short-circuit to L+" and "Wire break" must be deactivated.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit	1_H	• Short-circuit of actuator supply to ground • Short-circuit of actuator supply to L+	Correct the process wiring
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, e.g. use cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect a resistor to the actuator contacts in the load resistance range
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	• Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

6 Technical specifications

6.1 Technical specifications

Technical specifications of the DQ 16×24VDC/0.5A ST

Article number	6ES7132-6BH01-0BA0
General information	
Product type designation	DQ 16x24 VDC/0.5 A ST
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	No
Redundancy	
• Redundancy capability	Yes

Article number	6ES7132-6BH01-0BA0
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	60 mA; without load
Output voltage	
Rated value (DC)	24 V
Power loss	
Power loss, typ.	1 W
Address area	
Address space per module	
• Inputs	+ 2 bytes for QI information
• Outputs	2 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 1-wire connection	BU type A0
• 2-wire connection	BU type A0 + Potential isolation module
• 3-wire connection	BU type A0 + Potential isolation module
• 4-wire connection	BU type A0 + Potential isolation module
Digital outputs	
Type of digital output	Source output (PNP, current-sourcing)
Number of digital outputs	16
Current-sinking	No
Current-sourcing	Yes
Short-circuit protection	Yes
• Response threshold, typ.	1 A
Open-circuit detection	Yes
Limitation of inductive shutdown voltage to	Typ. L+ (-50 V)
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	12 kΩ

Article number	6ES7132-6BH01-0BA0
Output current	
• for signal "1" rated value	0.5 A
• for signal "0" residual current, max.	0.1 mA
Output delay with resistive load	
• "0" to "1", typ.	50 µs
• "1" to "0", typ.	100 µs
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	100 Hz
• with inductive load, max.	2 Hz
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per channel, max.	0.5 A
• Current per module, max.	8 A
Total current of the outputs (per module)	
horizontal installation	
– up to 30 °C, max.	8 A
– up to 40 °C, max.	8 A
– up to 50 °C, max.	6 A
– up to 60 °C, max.	4 A
vertical installation	
– up to 30 °C, max.	8 A; in all other mounting positions
– up to 40 °C, max.	6 A; in all other mounting positions
– up to 50 °C, max.	4 A; in all other mounting positions
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No

Article number	6ES7132-6BH01-0BA0
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; Module-wise
• Short-circuit to M	Yes; Module-wise
• Short-circuit to L+	Yes; Module-wise
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety-oriented group deactivation	Yes
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; in all other mounting positions
• vertical installation, max.	50 °C; in all other mounting positions
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m

Article number	6ES7132-6BH01-0BA0
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Safety-related shutdown

Note

The digital output module DQ 16x24VDC/0.5A ST supports safety-related shutdown in connection with a fail-safe power module F-PM-E 24VDC/8A PPM ST:

- SIL according to IEC 61508: 2
- Highest attainable safety class in safety mode, performance level according to EN ISO 13849-1: d

Residual current for signal state "0"

Note

Residual current for signal state "0"

Due to the Diagnostics: Wire break function, there is a low level of residual current in the "0" signal state at the output, which may cause the display diodes to flicker.

This residual current does not depend on the setting for the Diagnostics: Wire break parameter.

Derating trend

The following figure show the load current derating with horizontal and vertical mounting positions.

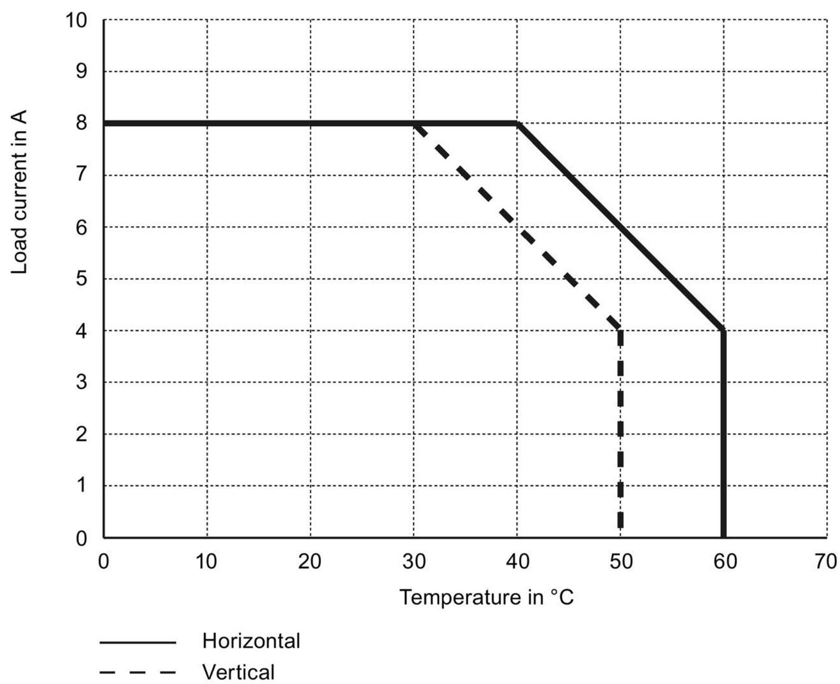


Figure 6-1 Load current for mounting position

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to reconfigure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

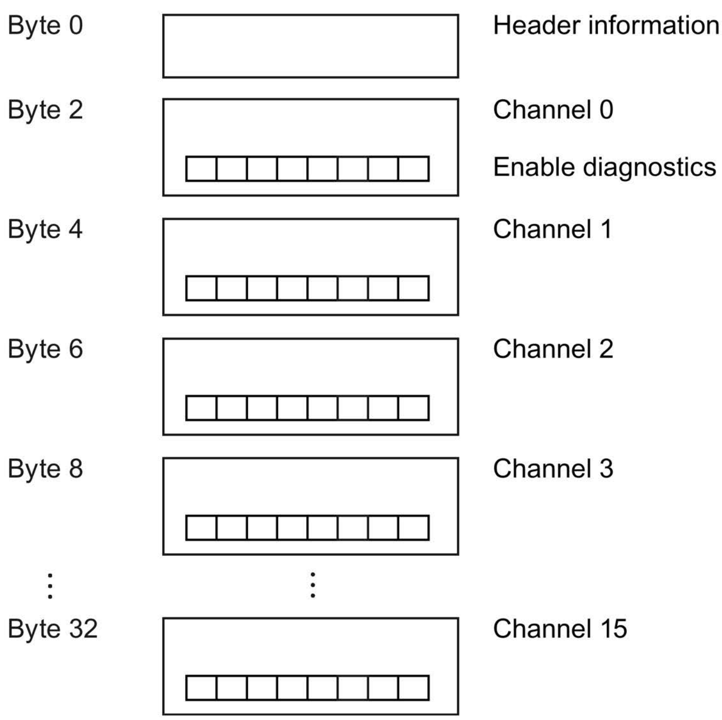

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

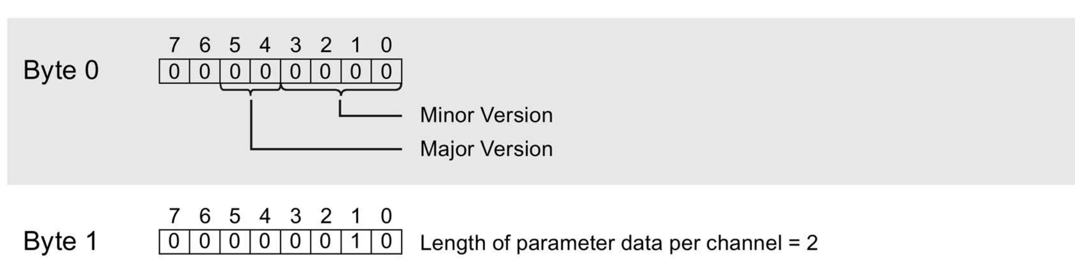

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 15.

You enable a parameter by setting the corresponding bit to "1".

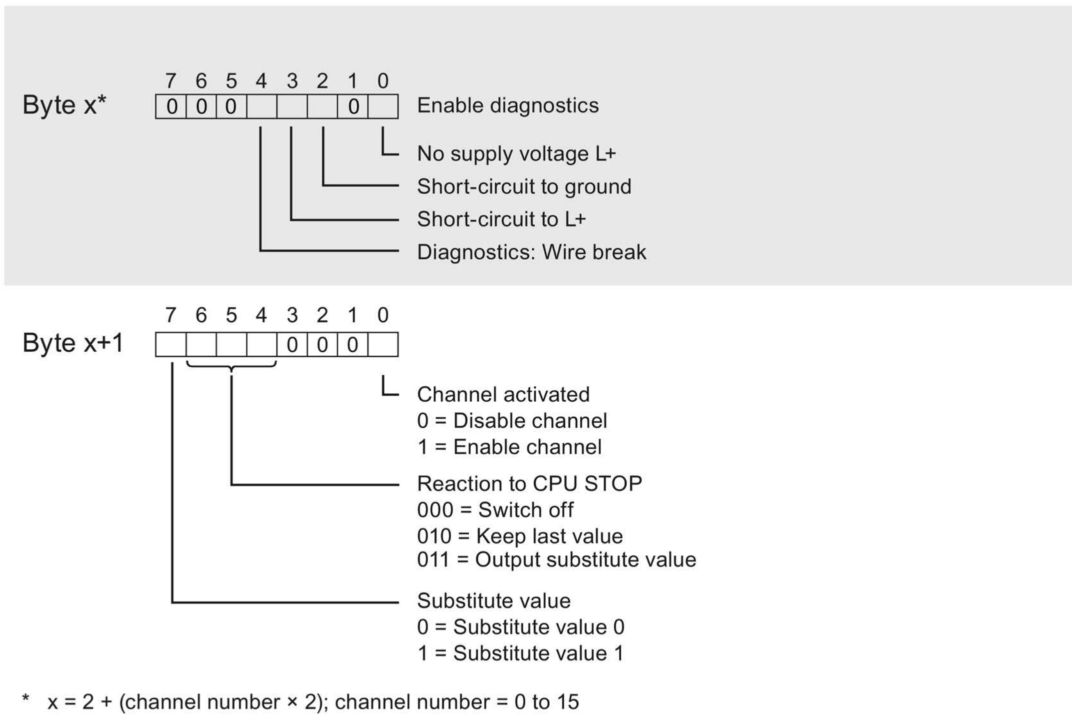

Figure A-3 Structure byte x to x+1 for the channels 0 to 15

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7132-6GD50-0BA0 to 6ES7132-6GD5**1**-0BA0. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

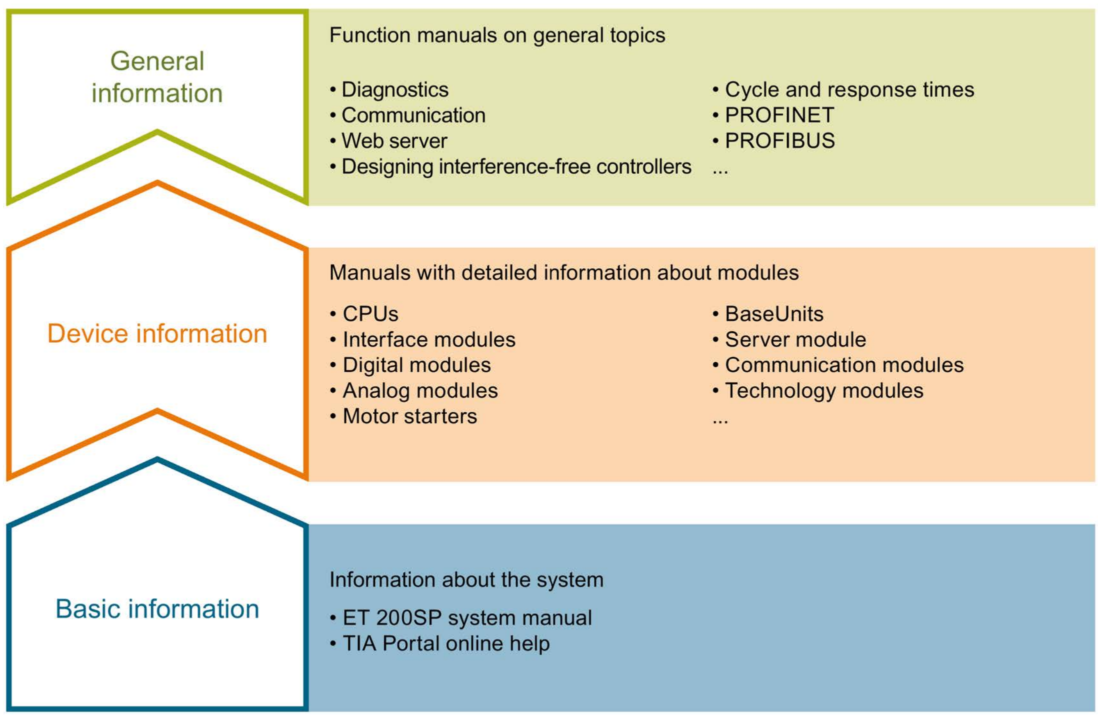
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑫ Article number

Figure 2-1 View of the RQ 4×24VUC/2A CO ST module

Properties

The module has the following technical properties:

- 4 digital outputs with floating relay changeover contacts
- Supply voltage L+
- Output current per output 2 A
- Normally open contact (NO: normally open) and normally closed contact (NC: normally closed)
- Assignable substitute values (per channel)
- Configurable diagnostics (per module)
- Suitable for resistive load

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X
PROFIenergy	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X

Accessories

The following accessories are supplied with the module and can also be ordered separately as spare parts:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the RQ 4x24VUC/2A CO ST module with the terminal assignments for a 3-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

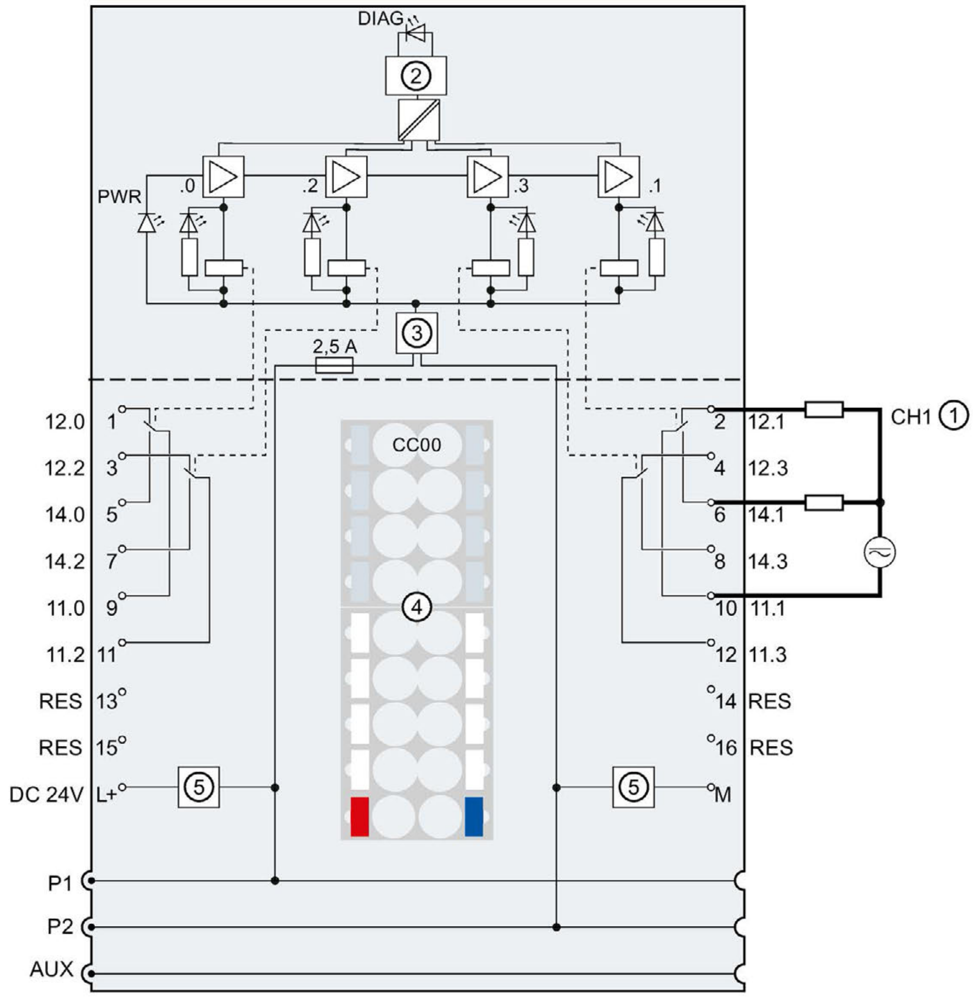
You may use and combine the different wiring options for all channels.

Note

The relay contacts of the module can only switch identical voltage potential. The AUX terminals can only be used with an associated identical voltage or PE.

Connection: 2-wire connection of actuators

The following figure shows the block diagram and an example of the terminal assignment of the digital output module RQ 4x24VUC/2A CO ST on the BaseUnit BU type A0.



①	2-wire connection	11.n	Common contact
②	Backplane bus interface	12.n	Normally closed contact
③	Polarity reversal protection	14.n	Normally open contact
④	Color identification label CCxx (optional)	n	Channel
⑤	Filter connection supply voltage (only when light-colored BaseUnit is present)	DIAG	Diagnostics LED (green, red)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)	L+	24 V DC (infeed only with light-colored BaseUnit)
.0, .1, .2, .3	Channel status LED (green)	PWR	Power LED (green)
		M	Ground

Figure 3-1 Wiring and block diagram for 2-wire connection of actuators

Parameters/address space 4

4.1 Parameters

RQ 4x24VUC/2A CO ST parameters

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records (see chapter Parameter assignment and structure of the parameter data record (Page 27)).

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfig-uration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Channel activated	• Disable • Enable	Enable	Yes	Channel	Channel

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP. The parameter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes for each ET 200SP station. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 8 bytes.

4.2 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of RQ 4x24VUC/2A CO ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	RQ 4x24VUC/2A CO ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 4-channel with value status	RQ 4x24VUC/2A CO ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional two bytes are allocated in the input address space if you enable the value status for the digital module. Bits 0 to 3 in these bytes are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the RQ 4x24VUC/2A CO ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

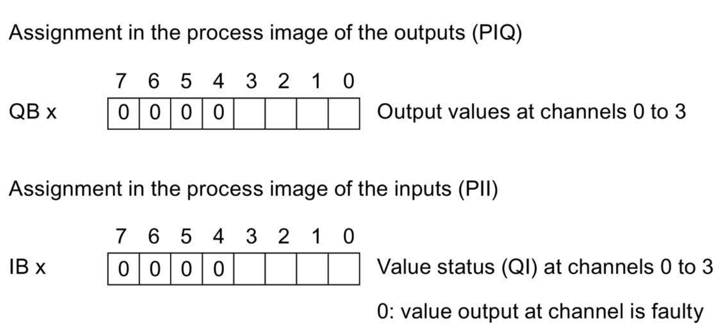


Figure 4-1 Address space of the digital output module RQ 4x24VUC/2A CO ST

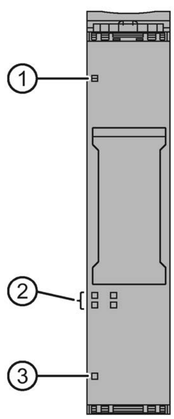
Interrupts/diagnostics alarms

5

5.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the RQ 4x24VUC/2A CO ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The tables below explain the meaning of the status and error displays. Remedial measures for diagnostics alarms can be found in section Diagnostics alarms (Page 22).

LED DIAG

Table 5- 1 Error display of the LED DIAG

LED DIAG	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
■ On	Module parameters assigned
Flashes	Module diagnostics is available

LED channel status

Table 5- 2 Status display of the LED channel status

LED channel status	Meaning
□ Off	Channel deactivated or activated and process signal = 0
■ On	Channel activated

LED PWR

Table 5- 3 Status display of the LED PWR

LED PWR	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

5.2 Interrupts

The RQ 4×24VUC/2A CO ST digital output module supports diagnostics alarms.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following event:

- Parameter assignment error
- No supply voltage

Detailed information on the event is available in the STEP 7 online help.

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Remedy
Parameter assignment error	10_H	The module cannot evaluate parameters for the channel	• Incorrect parameter assignment • Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the potential group • Check BaseUnit

Technical specifications 6

6.1 Technical specifications

Technical specifications of the RQ 4×24VUC/2A CO ST

Article number	6ES7132-6GD51-0BA0
General information	
Product type designation	RQ CO 4x 24 V DC/2 A ST, PU 1
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	No
Redundancy	
• Redundancy capability	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7132-6GD51-0BA0
Input current	
Current consumption (rated value)	50 mA
Power loss	
Power loss, typ.	1.2 W
Address area	
Address space per module	
• Inputs	+ 1 byte for QI information
• Outputs	1 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Digital outputs	
Type of digital output	Relays
Number of digital outputs	4
Current-sinking	Yes
Current-sourcing	Yes
Short-circuit protection	No
Parallel switching of two outputs	
• for logic links	Yes
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	2 Hz
Total current of the outputs	
• Current per channel, max.	2 A
• Current per module, max.	8 A
Total current of the outputs (per module)	
horizontal installation	
– up to 40 °C, max.	8 A
– up to 50 °C, max.	6 A
– up to 60 °C, max.	4 A
vertical installation	
– up to 30 °C, max.	8 A
– up to 40 °C, max.	6 A
– up to 50 °C, max.	4 A; in all other mounting positions

Article number	6ES7132-6GD51-0BA0
Relay outputs	
• Number of relay outputs	4
• Rated supply voltage of relay coil L+ (DC)	24 V
• Current consumption of relays (coil current of all relays), max.	40 mA
Switching capacity of contacts	
– with resistive load, max.	2 A
– Thermal continuous current, max.	2 A
– Switching current, min.	1 mA; 5 V DC
– Rated switching voltage (DC)	24 V
– Rated switching voltage (AC)	24 V
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	200 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	No
• Short-circuit	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	Yes
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes

Article number	6ES7132-6GD51-0BA0
Isolation	
Isolation tested with	707 V DC (type test)
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Derating trend

The following figure show the load current derating with horizontal and vertical mounting positions.

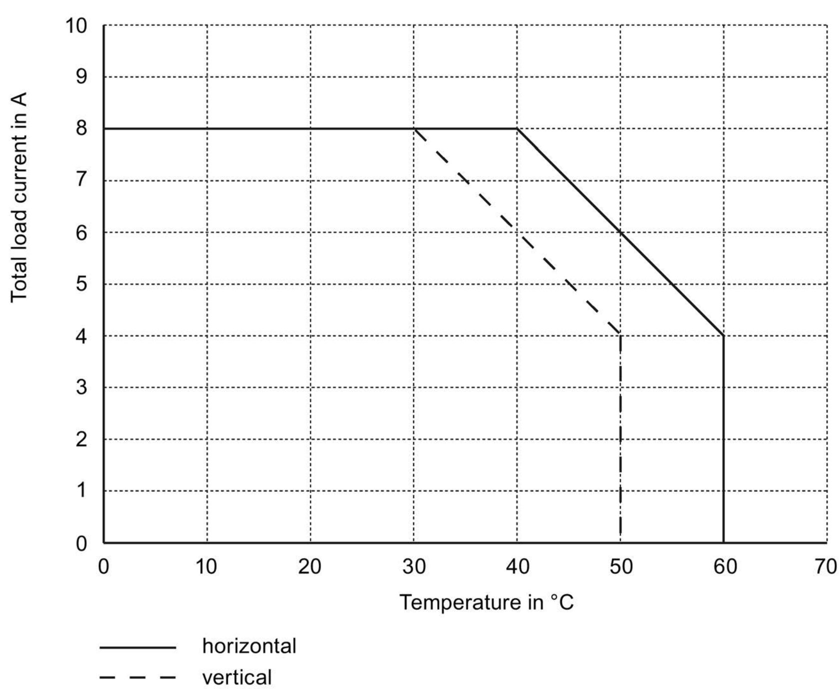


Figure 6-1 Load current for mounting position

Dimensional drawing

See the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to re-configure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

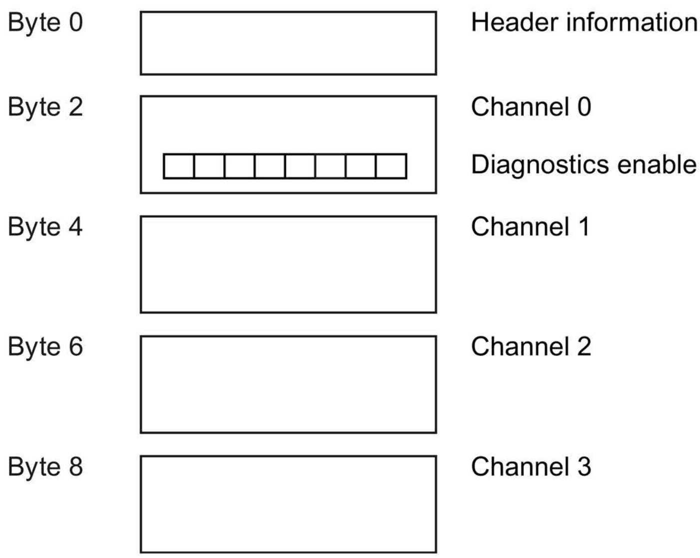

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

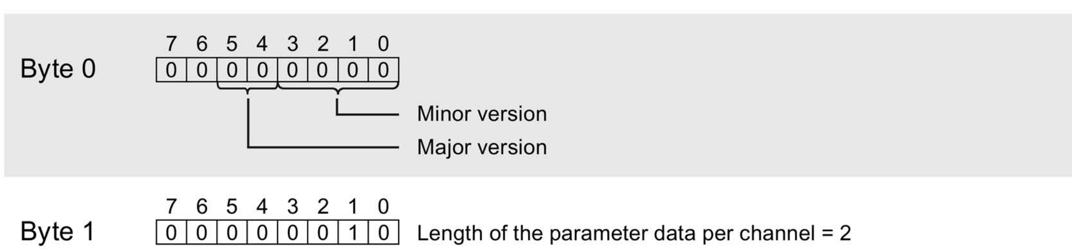

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters in data record 128.

Enable a parameter by setting the corresponding bit to "1".

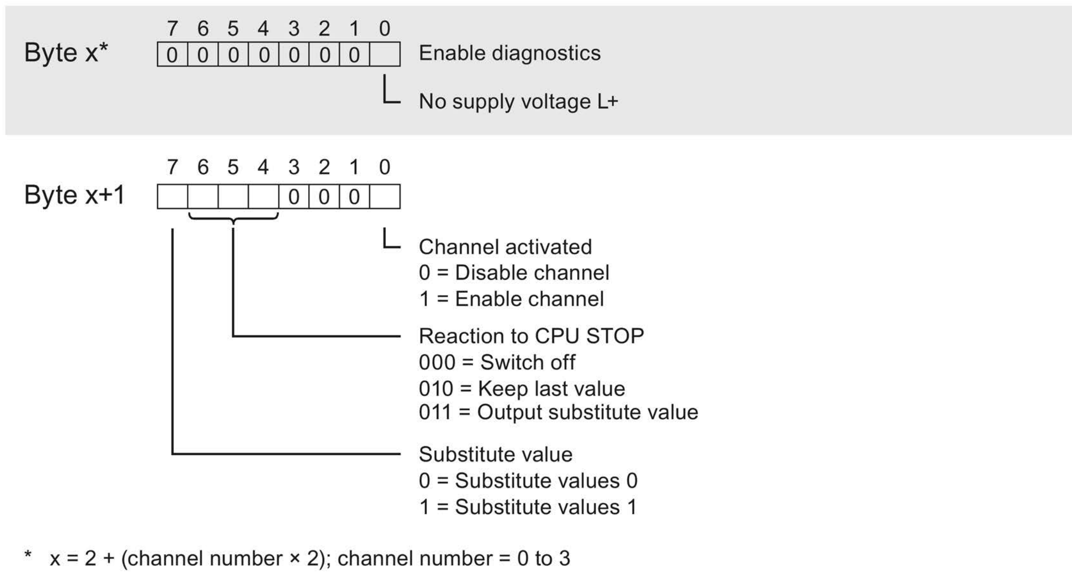

Figure A-3 Structure byte x to x+1 for the channels 0 to 3

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Due to the change in hardware, the article number of the module has been changed from 6ES7132-6HD00-0BB1 to 6ES7132-6HD01-0BB1. Both modules are compatible, except for the firmware-update function.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

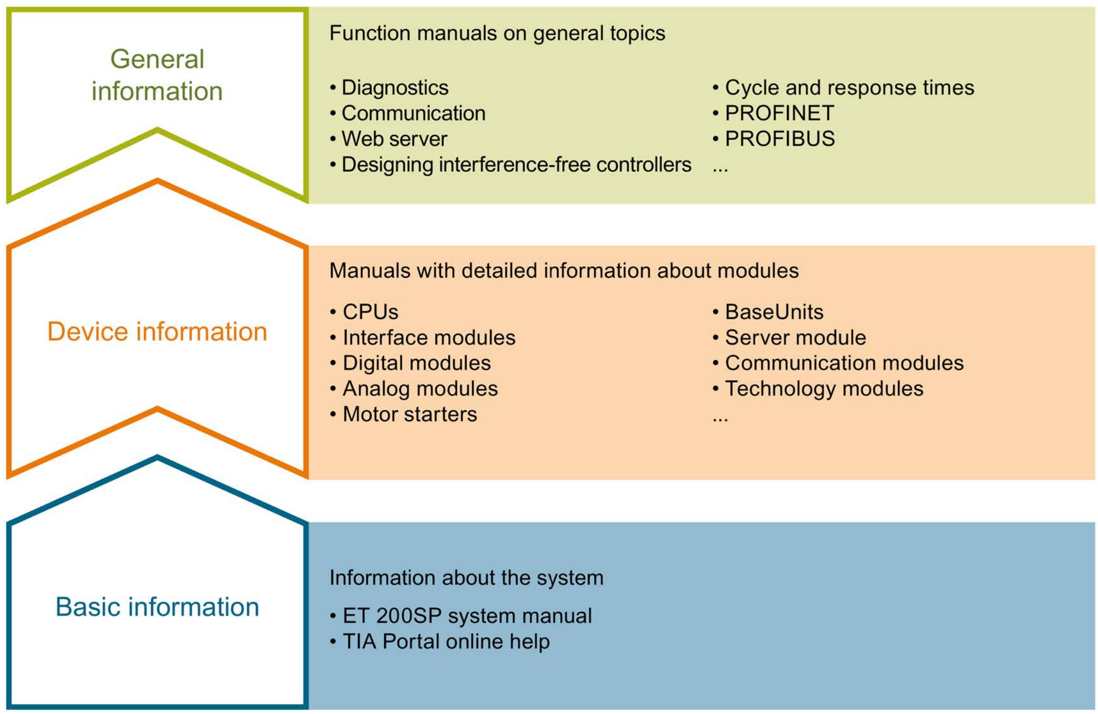
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the RQ 4×120VDC-230VAC/5A NO ST module

Properties

The module has the following technical properties:

- Digital output module with 4 floating relay outputs
- Supply voltage L+
- Output current per output 5 A
- Normally open contact (NO: normally open)
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- Suitable for solenoid valves, DC contactors, and indicator lights

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Identification data I&M0 to I&M3	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X
Configuration in RUN	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X
PROFIenergy	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X
Value status	FS01	V0.0.0 and higher	V14 or higher with HSP 0222	V5.5 SP3 or higher with HSP 0232 V7.0	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring up 3

3.1 Wiring and block diagram

This section includes the block diagram of the RQ 4x120VDC-230VAC/5A NO ST module with the terminal assignments for 2-wire and 3-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

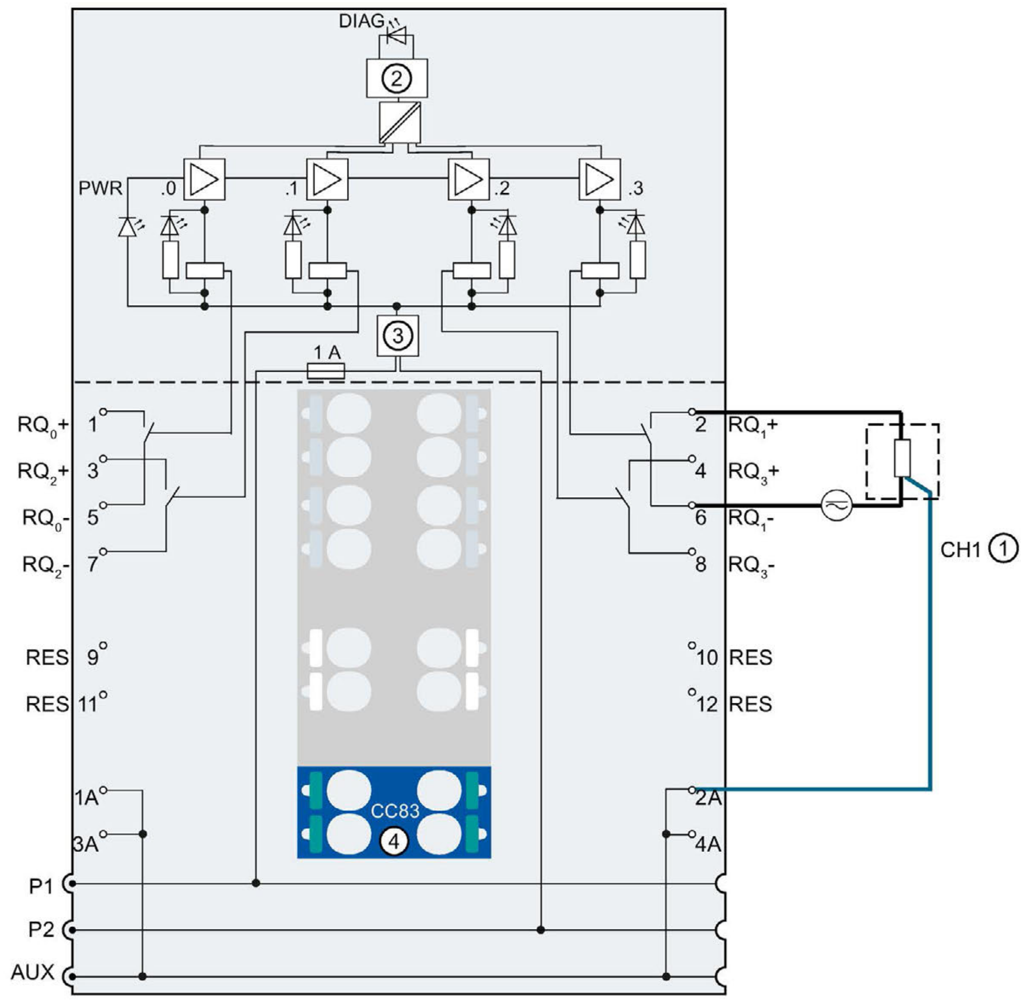
You may use and combine the different wiring options for all channels.

Note

The relay contacts of the module can only switch identical voltage potential. The AUX terminals can only be used with an associated identical voltage or PE.

Connection: 3-wire connection of actuators

The following figure shows the block diagram and an example for the terminal assignment of the digital output module RQ 4x120VDC-230VAC/5A NO ST on the BaseUnit BU type B0.

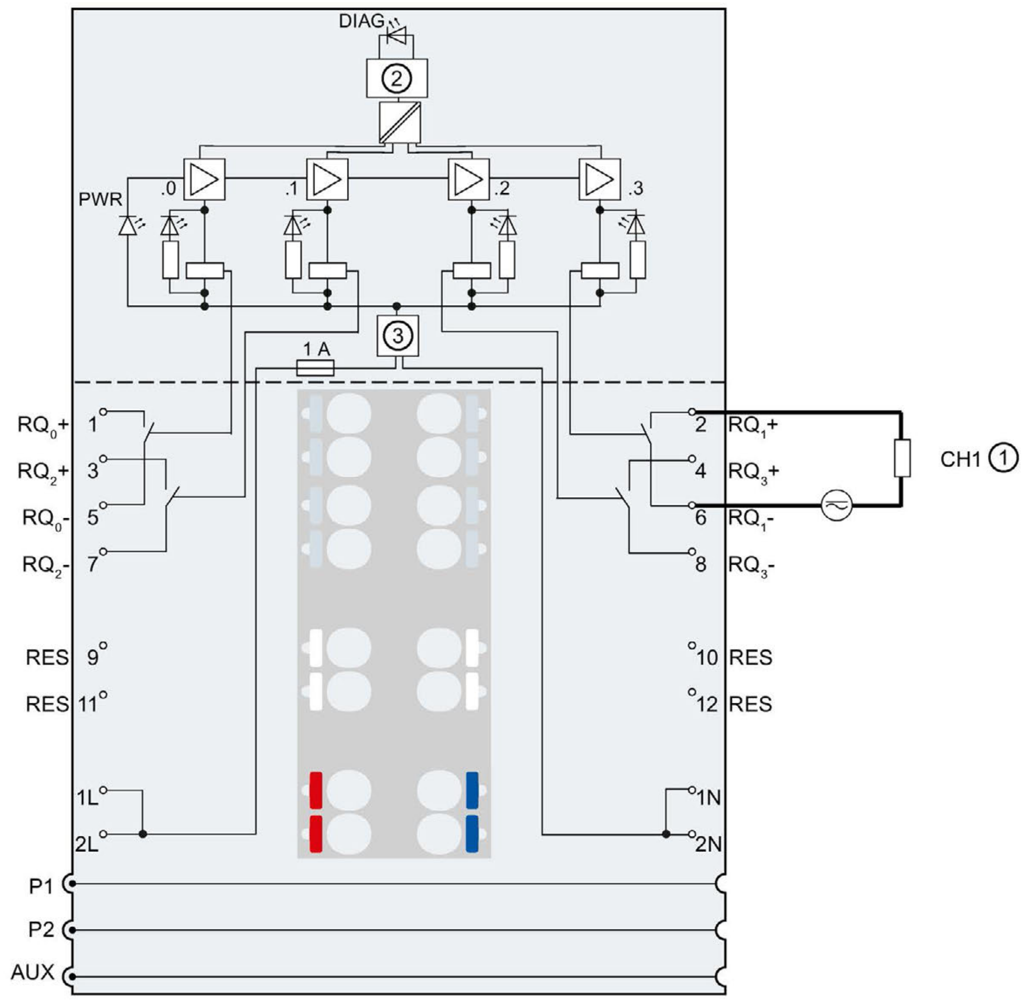


①	3-wire connection	RES	Reserve, must remain unused for future function extensions
②	Backplane bus interface	1A to 4A	AUX terminals (freely usable up to 230 V AC)
③	Polarity reversal protection	DIAG	Diagnostics LED (green, red)
④	Color identification label CCxx (optional)	.0, .1, .2, .3	Channel status LED (green)
RQ_n+, RQ_n-	Channel n	PWR	Power LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)		

Figure 3-1 Wiring and block diagram for 3-wire connection of actuators

Connection: 2-wire connection of actuators

The following figure shows the block diagram and an example for the terminal assignment of the digital output module RQ 4x120VDC-230VAC/5A NO ST on the BaseUnit BU type B1.



①	2-wire connection	1L, 2L	Supply voltage 24 V DC
②	Backplane bus interface	1N, 2N	Neutral conductor supply voltage
③	Polarity reversal protection	DIAG	Diagnostics LED (green, red)
RQ_n+, RQ_n-	Channel n	.0, .1, .2, .3	Channel status LED (green)
RES	Reserve, must remain unused for future function extensions	PWR	Power LED (green)
		P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)

Figure 3-2 Wiring and block diagram for 2-wire connection of actuators

4 Parameters/address space

4.1 Parameters

Parameters for RQ 4x120VDC-230VAC/5A NO ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the parameters depends on the type of configuration.

The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of the parameter data record (Page 29).

The following parameter settings are possible:

Table 4- 1 Settable parameters and their defaults (GSD file)

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics No supply voltage L+	• Disable • Enable	Disable	yes	Module	Module
Channel enabled	• Disable • Enable	Enable	yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	yes	Channel	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 8 bytes.

4.2 Explanation of the parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is enabled or disabled.

Reaction to CPU STOP

Specifies the behavior of the module if the CPU changes to STOP.

(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of RQ 4x120VDC-230VAC/5A NO ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module using a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in hardware catalog STEP 7	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	RQ 4x120VDC-230VAC/5A NO ST V0.0	V14, SP1 or higher with HSP 0222	X	X
1 x 4-channel with value status	RQ 4x120VDC-230VAC/5A NO ST V0.0, QI	V14, SP1 or higher with HSP 0222	X	---

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the RQ 4x120VDC-230VAC/5A NO ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

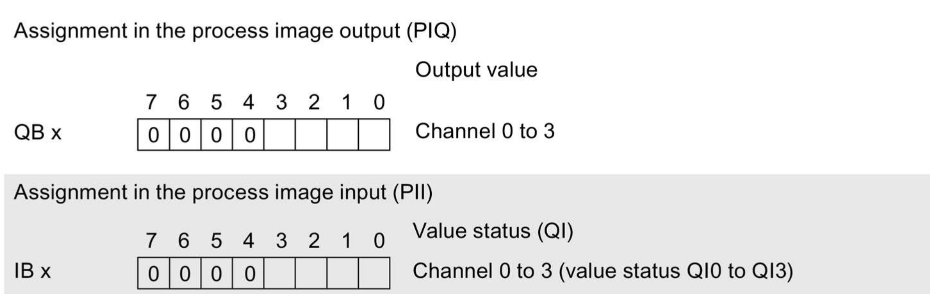

Figure 4-1 Address space of RQ 4×120VDC-230VAC/5A NO ST with value status

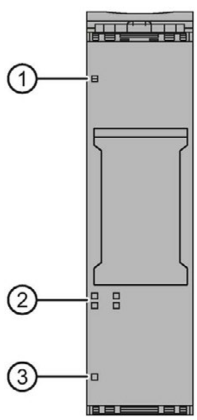
Interrupts/diagnostics alarms

5

5.1 Status and error display

LED display

The figure below shows the LED displays (status and error displays) of the RQ 4x120VDC-230VAC/5A NO ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 22).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
off	Backplane bus supply of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
on	Module parameters assigned
Flashes	Module diagnostics is available

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
off	Channel deactivated or activated and process signal = 0
on	Channel activated and process signal = 1

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
off	No supply voltage L+
on	Supply voltage L+ present

5.2 Interrupts

The RQ 4×120VDC-230VAC/5A NO ST digital output module supports diagnostic interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt for the following events:

- Parameter assignment error
- No supply voltage

5.3 Diagnostics alarms

A diagnostic alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No supply voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

Technical specifications 6

6.1 Technical specifications

Technical specifications of the RQ 4×120VDC-230VAC/5A NO ST

Article number	6ES7132-6HD01-0BB1
General information	
Product type designation	RQ 4x120 VDC … 230 VAC/5 A NO ST
Firmware version	V0.0
• FW update possible	No
usable BaseUnits	BU type B0, B1
Color code for module-specific color identification plate	CC40
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• DQ	Yes
• DQ with energy-saving function	No
• PWM	No
• Oversampling	No
• MSO	No
Redundancy	
• Redundancy capability	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes

Article number	6ES7132-6HD01-0BB1
Input current	
Current consumption (rated value)	55 mA; without load
Output voltage	
Rated value (AC)	230 V
Power loss	
Power loss, typ.	1.5 W
Address area	
Address space per module	
• Inputs	+ 1 byte for QI information
• Outputs	1 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Digital outputs	
Type of digital output	Relays
Number of digital outputs	4
Current-sinking	Yes
Current-sourcing	Yes
Short-circuit protection	No
Parallel switching of two outputs	
• for logic links	Yes
• for uprating	No
• for redundant control of a load	Yes
Switching frequency	
• with resistive load, max.	2 Hz
• with inductive load, max.	0.5 Hz
• on lamp load, max.	2 Hz
Total current of the outputs	
• Current per channel, max.	5 A
• Current per module, max.	20 A
Total current of the outputs (per module)	
horizontal installation	
– up to 50 °C, max.	20 A
– up to 60 °C, max.	16 A
vertical installation	
– up to 40 °C, max.	20 A
– up to 50 °C, max.	16 A; in all other mounting positions

Article number	6ES7132-6HD01-0BB1
Relay outputs	
• Number of relay outputs	4
• Rated supply voltage of relay coil L+ (DC)	24 V
• Current consumption of relays (coil current of all relays), max.	40 mA
• external protection for relay outputs	Yes, with 6A
• Number of operating cycles, max.	7 000 000; see additional description in the manual
Switching capacity of contacts	
– with inductive load, max.	2 A; see additional description in the manual
– with resistive load, max.	5 A; see additional description in the manual
– Thermal continuous current, max.	5 A; Max. 1 385 VA, 150 W
– Switching current, min.	100 mA; 5 V DC
– Rated switching voltage (DC)	24 V DC to 120 V DC
– Rated switching voltage (AC)	24V AC to 230V AC
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	200 m
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	Yes
Alarms	
• Diagnostic alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	No
• Short-circuit	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; green/red DIAG LED

Article number	6ES7132-6HD01-0BB1
Potential separation	
Potential separation channels	
• between the channels	Yes
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between channels and backplane bus/supply voltage	240 V AC
Isolation	
Isolation tested with	2 500 V DC (type test)
tested with	
• between channels and backplane bus/supply voltage	2500 V DC
• between backplane bus and supply voltage	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; in all other mounting positions
• vertical installation, max.	50 °C; in all other mounting positions
Altitude during operation based on sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	40 g

Derating trend

The following figure show the load current derating with horizontal and vertical mounting positions.

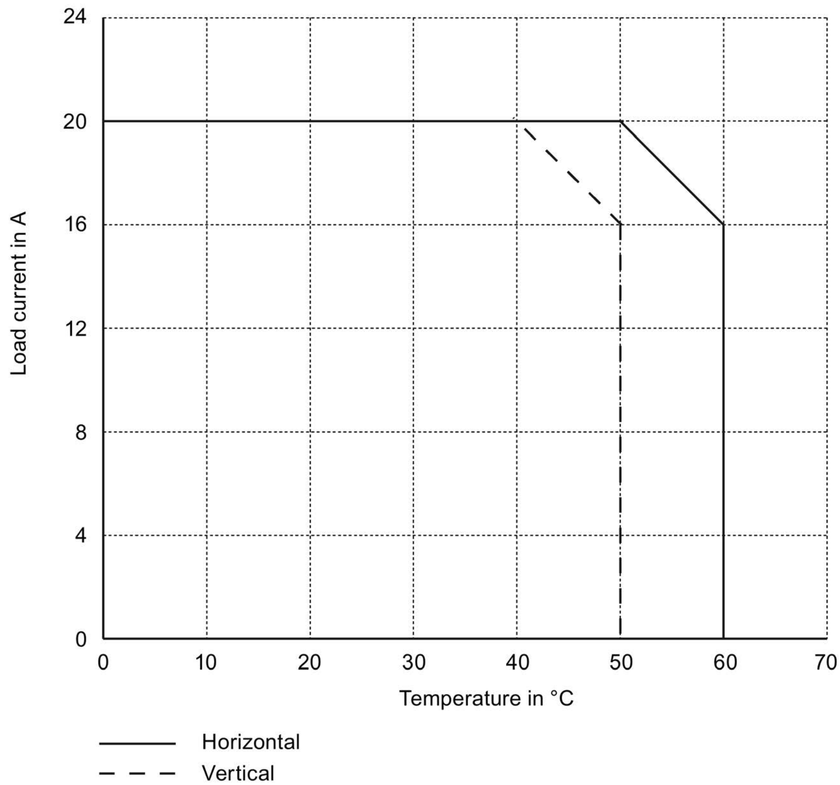


Figure 6-1 Load current and mounting position

Dimension drawing

See the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

6.2 Switching cycles

Switching capacity and lifetime of the contacts

With an external protective circuit, the contacts will last longer than specified in the table. This table shows the switching capacity and lifetime of the relay contacts:

Table 6- 1 Switching capacity and lifetime of the relay contacts

Resistive load	Voltage	Current	Switching cycles (typical)
For resistive load	24 VDC	5.0 A	0.1 million
		4.0 A	0.2 million
		2.0 A	0.5 million
		1.0 A	1.6 million
		0.5 A	4 million
		0.1 A	7 million
	60 VDC	0.5 A	1.6 million
	120 VDC	0.2 A	1.6 million
	48 VAC	2.0 A	1.6 million
	60 VAC	2.0 A	1.2 million
	120 VAC	5.0 A	0.1 million
		3.0 A	0.2 million
		2.0 A	0.4 million
		1.0 A	0.8 million
		0.5 A	1.5 million
	230 VAC	5.0 A	0.1 million
		3.0 A	0.2 million
		2.0 A	0.4 million
		1.0 A	0.8 million
		0.5 A	1.5 million
For inductive load in accordance with IEC 947-5-1 DC 13/ AC15	24 VDC	2.0 A	0.1 million
		1.0 A	0.2 million
		0.5 A	0.5 million
	60 VDC	0.5 A	0.2 million
	120 VDC	0.2 A	0.5 million
	48 VAC	1.0 A	0.7 million
	60 VAC	1.0 A	0.5 million
	120 VAC	2.0 A	0.1 million
		1.0 A	0.3 million
		0.5 A	1 million
		0.1 A	2 million
For inductive load in accordance with IEC 947-5-1 DC 13/ AC15	230 VAC	2.0 A	0.1 million
		1.0 A	0.3 million
		0.5 A	1 million

Parameter data record A

A.1 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You have the option to reconfigure the module in RUN (e.g. the response of selected channels to the CPU-STOP state can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

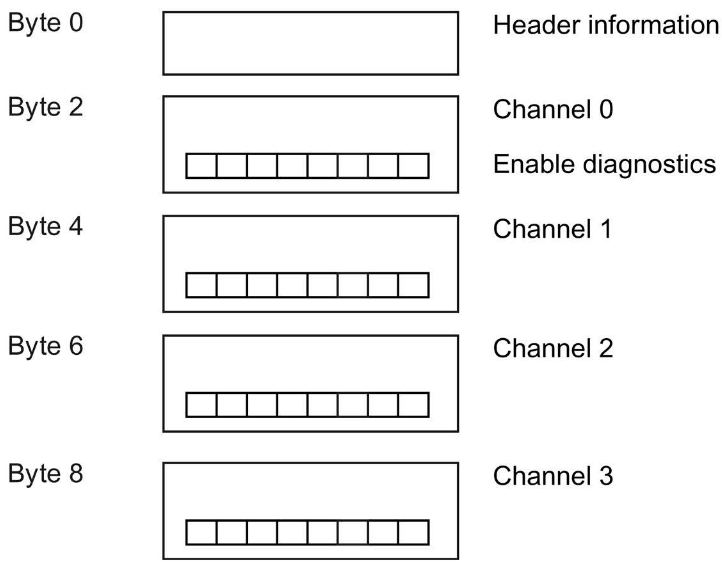

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

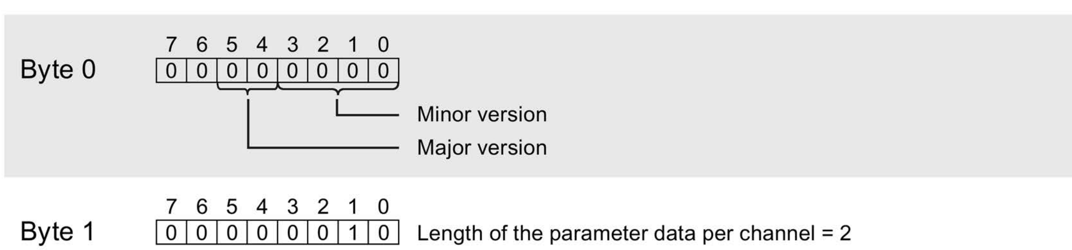

Figure A-2 Header information

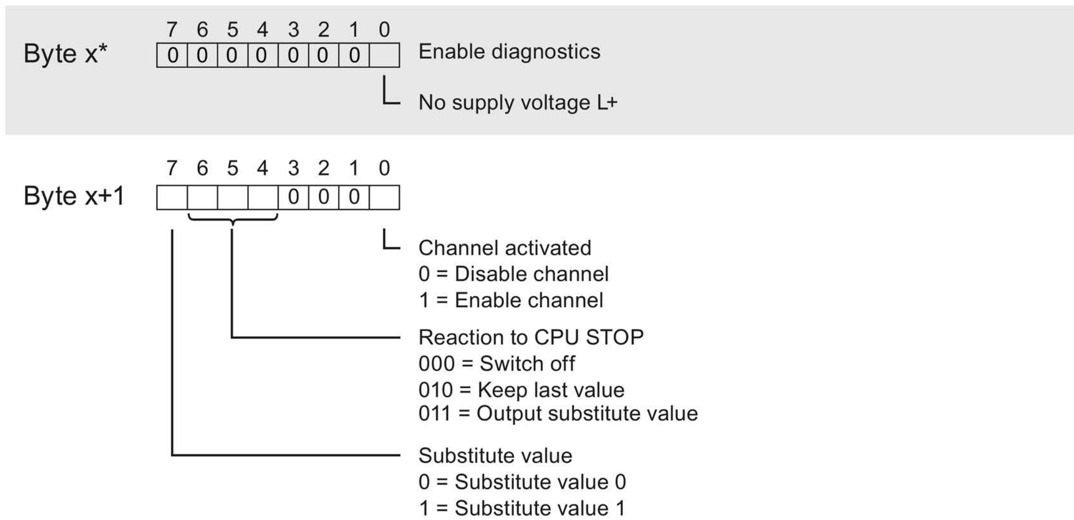
Parameters

The figure below shows the structure of the parameters in data record 128.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 2); channel number = 0 to 3

Figure A-3 Structure byte x to x+1 for the channels 0 to 3

Error transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter. (See also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station whether the module is plugged or drawn. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	06	Invalid coding for substitute value behavior.	Check the parameters of the module.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

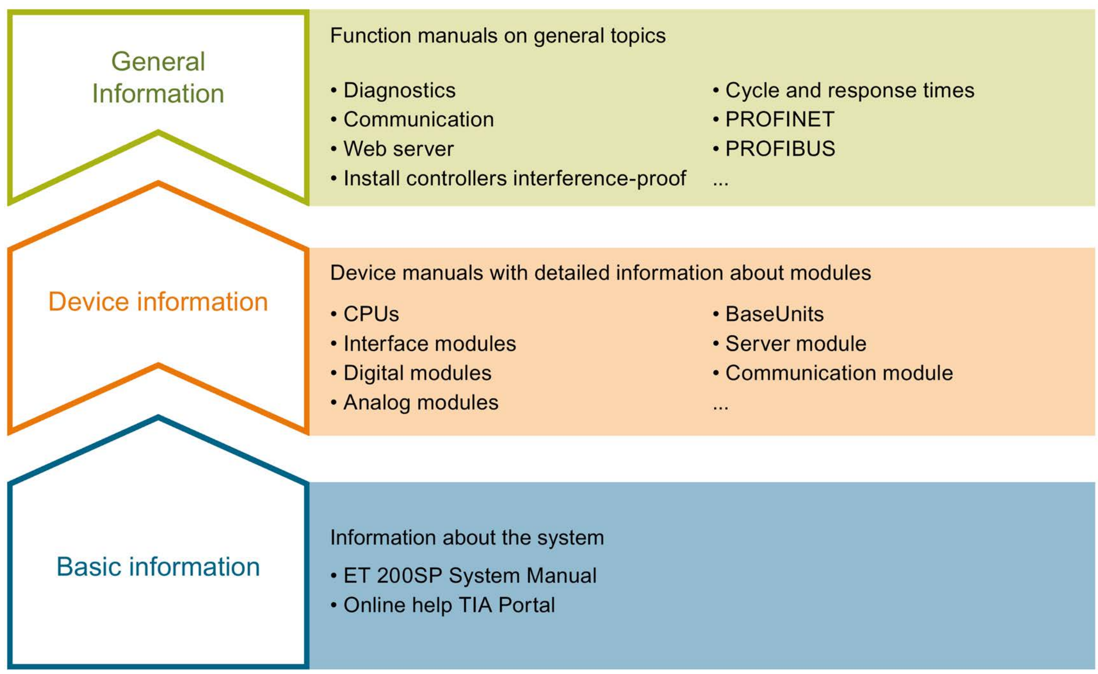
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

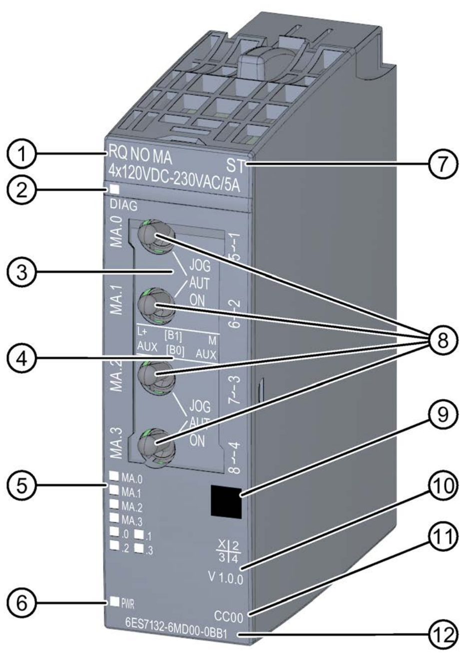
View of the module



① Module type and name

② LED for diagnostics

③ JOG (switch position up: jog)
AUT (switch position "middle": Automatic mode
ON (switch position down: Manual mode (MANUAL ON))

④ Wiring diagram

⑤ LEDs for channel status and manual mode

⑥ LED for supply voltage

⑦ Function class

⑧ Toggle/jog switch for manually controlling the relay

⑨ Color coding module type

⑩ Function and firmware version

⑪ Color code for selecting the color identification labels

⑫ Article number

Image 2-1 View of the module RQ 4×120VDC-230VAC/5A NO MA ST

Properties

The module has the following technical properties:

- Digital output module with 4 floating relay outputs
- Supply voltage L+
- Output current 5 A (per output)
- Normally open contact (NO: normally open)
- Configurable diagnostics (per module)
- Configurable substitute values (per channel)
- 4 toggle/jog switches (jog, automatic or manual mode (MANUAL ON)) for controlling the relay
- Suitable for solenoid valves, DC contactors, and indicator lights

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy
- Value status

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Note

When load voltage is present, the relays of the RQ 4x120VDC-230VAC/5A NO MA ST can also be activated via a manual switch even when they are in a non-configured state.

When an output is set to manual control, the relay remains active during a firmware update.

Accessories

The following accessories must be ordered separately:

- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

3 Wiring

3.1 Wiring and block diagram

This section includes the block diagram of the RQ 4x120VDC-230VAC/5A NO MA ST module with the terminal assignments for a 2-wire and 3-wire connection.

You can find information on wiring the BaseUnit in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Note

You can use and combine the different wiring options for all channels.

Note

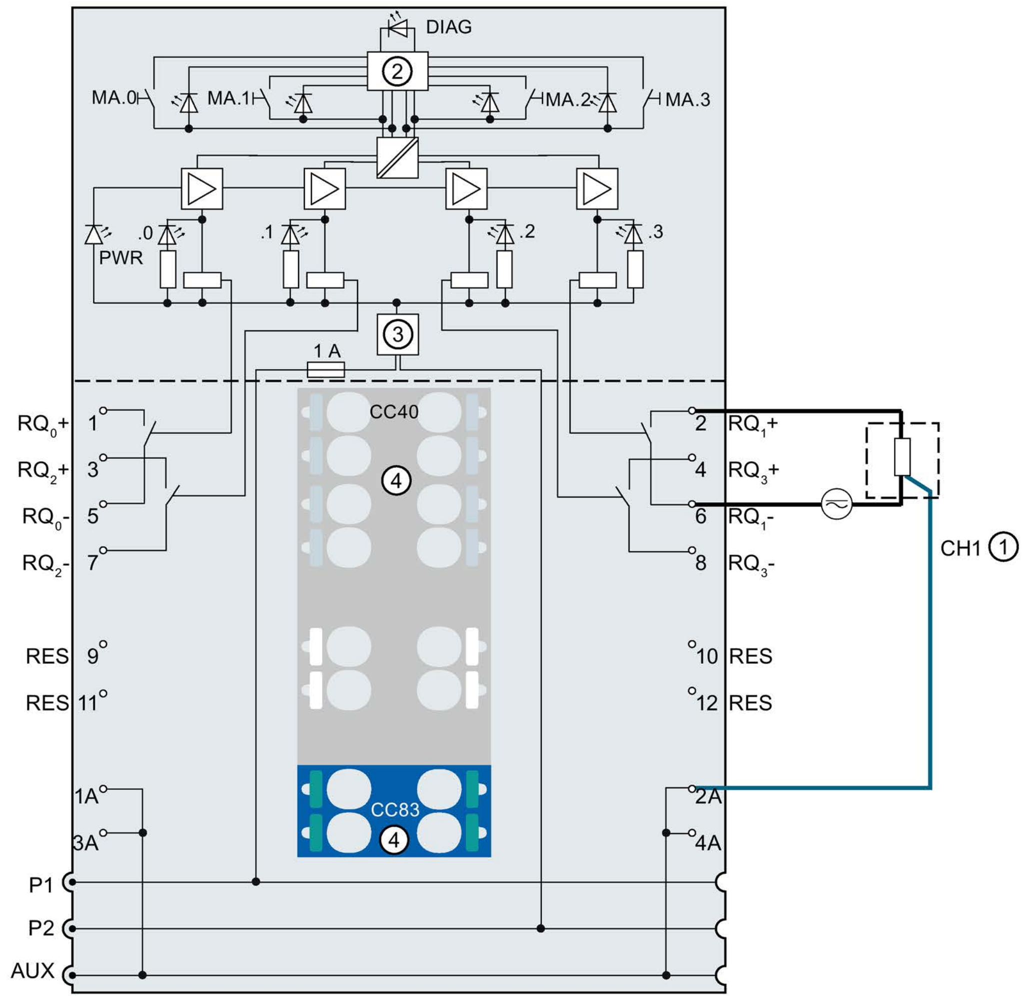
The relay contacts of the module can only switch identical voltage potential. The AUX terminals can only be used with an associated identical voltage or PE.

Note

The switch position of the toggle/jog switch is stored in the process image input (PII) and can be read there.

Wiring: 3-wire connection of actuators

The following figure shows the block diagram and an example of the terminal assignment of the digital output module RQ 4x120VDC-230VAC/5A NO MA ST on the BaseUnit BU type B0.

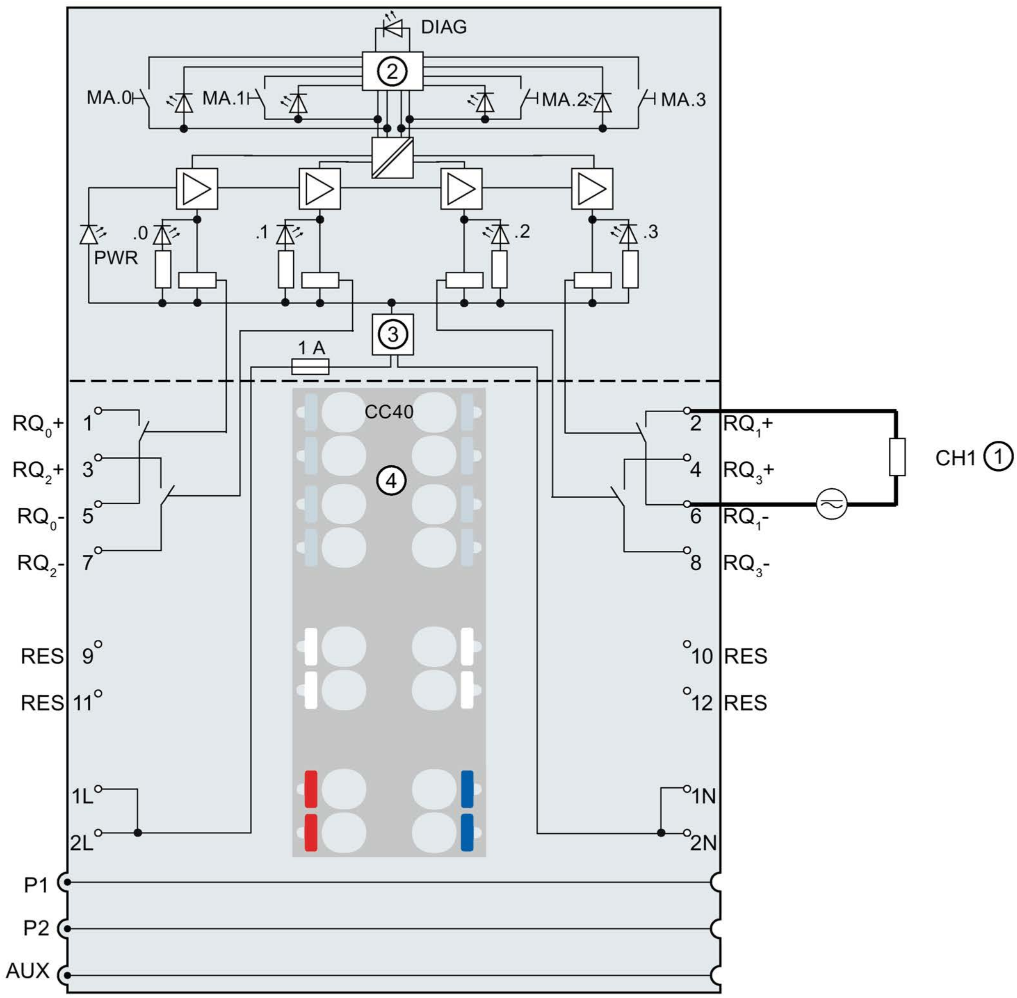


①	3-wire connection	RES	Reserve, must remain unused for future function extensions
②	Backplane bus interface	1A to 4A	AUX terminals (freely usable up to 230 V AC)
③	Polarity reversal protection	DIAG	Diagnostics LED (green, red)
④	Color-coded label with color codes CC40 and CC83 (optional)	MA .0 .. .3	LED MANUAL ON and automatic
RQ_n+, RQ_n-	Channel n	.0, .1, .2, .3	Channel status LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)	PWR	Power LED (green)

Image 3-1 Wiring and block diagram for 3-wire connection of actuators

Wiring: 2-wire connection of actuators

The following figure shows the block diagram and an example of the terminal assignment of the digital output module RQ 4x120VDC-230VAC/5A NO MA ST on the BaseUnit BU type B1.



①	2-wire connection	1N, 2N	Neutral conductor supply voltage
②	Backplane bus interface	DIAG	Diagnostics LED (green, red)
③	Polarity reversal protection	MA .0 .. .3	LED MANUAL ON and automatic
④	Color-coded label with color code CC40 (optional)	.0, .1, .2, .3	Channel status LED (green)
RQ_n+, RQ_n-	Channel n	PWR	Power LED (green)
RES	Reserve, must remain unused for future function extensions	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)
1L, 2L	Supply voltage 24 V DC		

Image 3-2 Wiring and block diagram for 2-wire connection of actuators

Toggle/jog switch for controlling the relay

You can switch the relay using the toggle/jog switch to jog, MANUAL ON (manual mode) or automatic mode for each channel. In manual mode, the state set by the output data is ignored.

The 4 toggle/jog switches are located on the front of the electronic module.

- JOG (switch position "up": job mode): Short-term manual operation (MANUAL ON), while jogged.
- AUT (switch position "middle" or "not activated": Automatic mode): Each channel is activated via the user program (normal operation).
- ON (switch position "down": Manual mode (MANUAL ON) permanently): Each channel is switched on ("1" signal) independent of the activation of the user program (and substitute values).

Parameters/address space 4

4.1 Parameters

Parameters for RQ 4x120VDC-230VAC/5A NO MA ST

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of the parameter data record (Page 28).

The following parameter settings are possible:

Table 4- 1 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Parameter reassign-ment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [1]
Diagnostics: No supply voltage L+	• Enable • Disable	Disable	Yes	Module	Module
Channel activated	• Enable • Disable	Enable	Yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value 1	Turn off	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged in-to light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data rec-ord 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 4 bytes.

4.2 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Channel activated

Determines whether a channel is activated or deactivated.

Reaction to CPU STOP

Determines the behavior of the module in the event of a CPU STOP.

Potential group

The load or supply voltage is fed module by module. The voltage buses P1, P2 and AUX are looped through the module from the left to the right neighboring module without tap.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.3 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image output/input.

Configuration options of RQ 4×120VDC-230VAC/5A NO MA ST

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 2 Configuration options with GSD file

Configuration	**Short designation/module name in the GSD file**	**Configuration software, e.g. with STEP 7 (TIA Portal)**		
		Integrated in the hardware catalog STEP 7, as of V13, SP1	**GSD file PROFINET IO**	**GSD file PROFIBUS DP**
1 x 4-channel without value status	RQ 4×120VDC-230VAC/5A NO MA ST	X	X	X
1 x 4-channel with value status	RQ 4×120VDC-230VAC/5A NO MA ST, QI	X	X	-

Evaluating the value status

An additional byte is allocated in the input address space if you enable the value status for the digital module. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the digital value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the RQ 4×120VDC-230VAC/5A NO MA ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

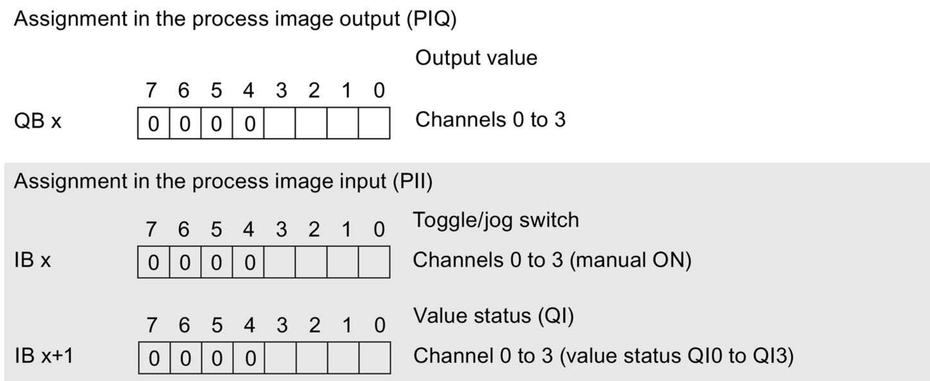


Image 4-1 Address space of RQ 4×120VDC-230VAC/5A NO MA ST with value status

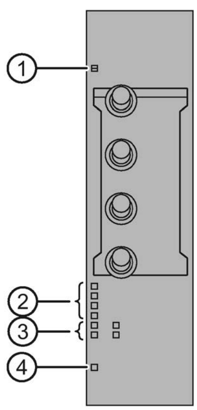
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The following figure shows you the LED display of the RQ 4x120VDC-230VAC/5A NO MA ST.



① DIAG (green/red)
② MA .0 .. .3 (yellow)
③ Channel status (green)
④ PWR (green)

Image 5-1 LED display

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 21).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

LED MA 1..4

Table 5- 2 Status display of the LED MA .0 .. .3 (manual mode)

Channel status LED	Meaning
Off	Automatic
On	Manual ON (toggle/jog switch) = Manual mode Output enabled at specific channel

Channel status LED

Table 5- 3 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated or activated and process signal = 0
On	Channel activated and process signal = 1

PWR LED

Table 5- 4 Status display of the PWR LED

PWR LED	Meaning
□ Off	Missing supply voltage L+
■ On	Supply voltage L+ present

5.2 Interrupts

The digital output module RQ 4×120VDC-230VAC/5A NO MA ST supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update • Restart the firmware update

Technical specifications 6

6.1 Technical specifications

Technical specifications of the RQ 4×120VDC-230VAC/5A NO MA ST

	6ES7132-6MD00-0BB1
General information	
Product type designation	ET 200SP, RQ 4x120VDC-230VAC/5A NO MA ST
Firmware version	V1.0
• FW update possible	Yes
Usable BaseUnits	BU type B0, B1
Color code for module-specific color identification label	CC00
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
DQ	Yes
DQ with energy-saving function	No
PWM	No
Oversampling	No
MSO	No
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	19.2 V
Valid range, high limit (DC)	28.8 V
Polarity reversal protection	Yes
Input current	
Current consumption, max.	100 mA; no load
Power loss	
Power loss, typ.	1.5 W

	6ES7132-6MD00-0BB1
Address area	
Address space per module	
Address space per module, max.	1 byte; + 1 byte for QI information
Inputs	1 byte; with QI
Outputs	1 byte
Digital outputs	
Number of outputs	4
Short-circuit protection	No
Switching frequency	
With resistive load, max.	2 Hz
With inductive load, max.	0.5 Hz
With lamp load, max.	2 Hz
Total current of the outputs	
Current per channel, max.	5 A
Current per module, max.	20 A
Total current of the outputs (per module)	
Horizontal installation	
• Up to 50 °C, max.	20 A
• Up to 60 °C, max.	16 A
Vertical installation	
• Up to 40 °C, max.	20 A
• Up to 50 °C, max.	16 A
Relay outputs	
Number of relay outputs	4
Rated input voltage of relay coil L+ (DC)	24 V
Current consumption of relays (coil current of all relays), max.	40 mA
External fuse for relay outputs	Yes, with 6 A
Number of switching cycles, max.	7000000; see additional description in the manual
Switching capacity of the contacts	
• With inductive load, max.	2 A; see additional description in the manual
• With resistive load, max.	5 A; see additional description in the manual
• Thermal continuous current, max.	5 A
• Switched current, min.	100 mA; 5 V DC
• Rated switching voltage (DC)	24 V DC to 120 V DC
• Rated switching voltage (AC)	24 V AC to 230 V AC
Cable length	
Shielded, max.	1000 m
Unshielded, max.	200 m

	6ES7132-6MD00-0BB1
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostics interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of the supply voltage	Yes
Wire break	No
Short-circuit	No
Group error	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	Yes
Between the channels and backplane bus	Yes
Between the channels and voltage supply of the electronics	Yes
Permitted potential difference	
Between channels and backplane bus/supply voltage	240 V AC
Insulation	
Insulation tested with	2 500 V DC (type test)
Tested with	
Between channels and backplane bus/supply voltage	2500 V DC
Between backplane bus and supply voltage	707 V DC (type test)
Dimensions	
Width	20 mm
Weights	
Weight, approx.	45 g

Note

External fuse for relay outputs

The outputs have to be protected by an external fuse.

When installed in a danger area according to the National Electric Code (NEC), the fuse must only be removed with the correct tool when the module is not in an explosion-proof zone.

Derating trend

The following figure show the load current derating with horizontal and vertical mounting positions.

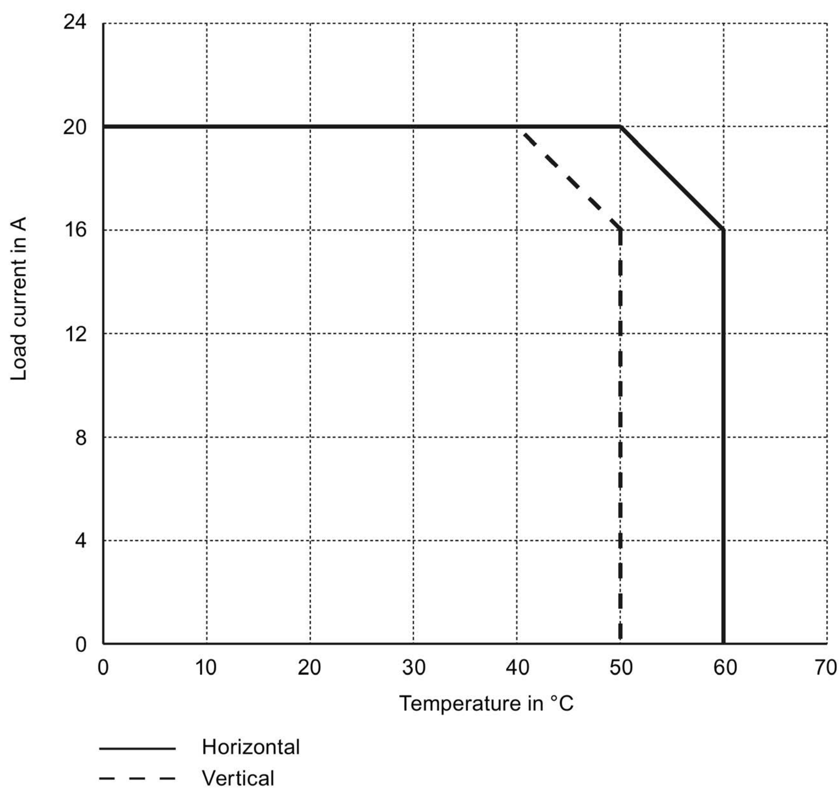


Image 6-1 Load current for mounting position

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

6.2 Switching cycles

Switching capacity and lifetime of the contacts

With an external protective circuit, the contacts will last longer than specified in the table. This table shows the switching capacity and lifetime of the relay contacts:

Table 6- 1 Switching capacity and lifetime of the relay contacts

Resistive load	Voltage	Current	Switching cycles (typical)
For resistive load	24 V DC	5.0 A	0.1 million
		4.0 A	0.2 million
		2.0 A	0.5 million
		1.0 A	1.6 million
		0.5 A	4 million
		0.1 A	7 million
	60 VDC	0.5 A	1.6 million
	120 VDC	0.2 A	1.6 million
	48 VAC	2.0 A	1.6 million
	60 VAC	2.0 A	1.2 million
	120 VAC	5.0 A	0.1 million
		3.0 A	0.2 million
		2.0 A	0.4 million
		1.0 A	0.8 million
		0.5 A	1.5 million
	230 VAC	5.0 A	0.1 million
		3.0 A	0.2 million
		2.0 A	0.4 million
		1.0 A	0.8 million
		0.5 A	1.5 million
For inductive load in accordance with IEC 947-5-1 DC 13/ AC15	24 V DC	2.0 A	0.1 million
		1.0 A	0.2 million
		0.5 A	0.5 million
	60 VDC	0.5 A	0.2 million
	120 VDC	0.2 A	0.5 million
	48 VAC	1.0 A	0.7 million
	60 VAC	1.0 A	0.5 million
	120 VAC	2.0 A	0.1 million
		1.0 A	0.3 million
		0.5 A	1 million
		0.1 A	2 million

Resistive load	Voltage	Current	Switching cycles (typical)
For inductive load in accordance with IEC 947-5-1 DC 13/ AC15	230 VAC	2.0 A	0.1 million
		1.0 A	0.3 million
		0.5 A	1 million

Note

Tests of mechanical environmental conditions

Shock tested according to IEC 60068-2-27. Shock intensity: 100 m/s^2 peak value, 11 ms duration

Parameter data record A

A.1 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can change the parameters of the module in RUN.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

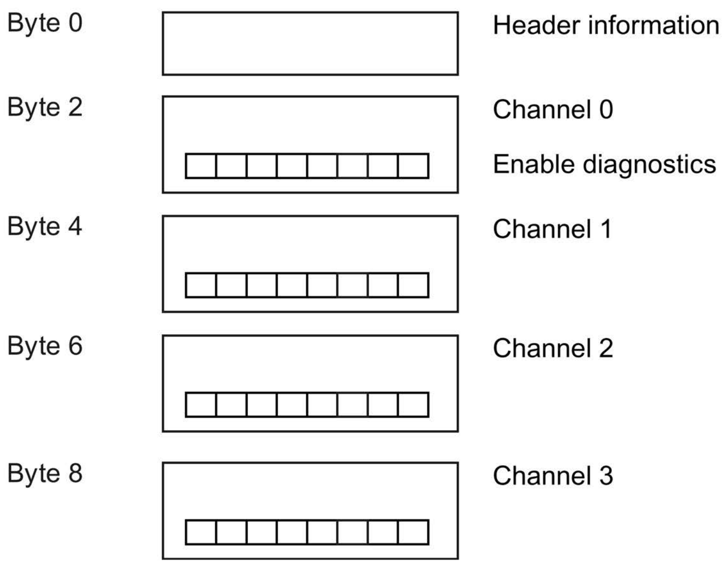

Image A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

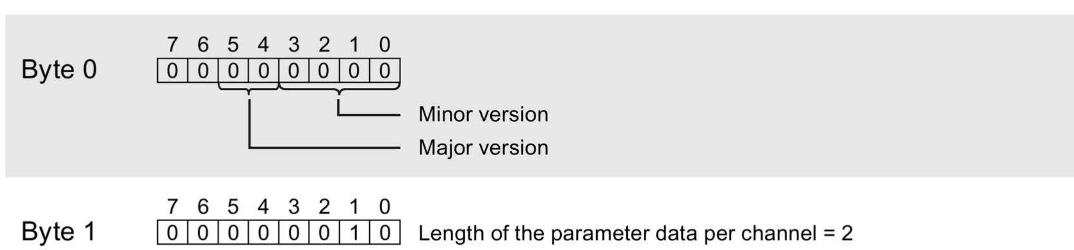

Image A-2 Header information

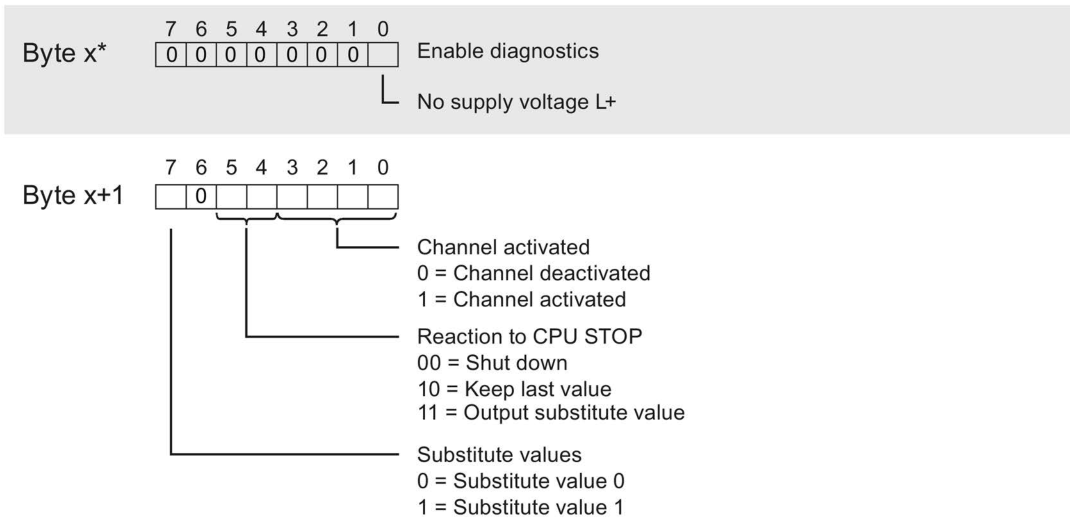
Parameters

The figure below shows the structure of the parameters in data record 128.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 2); channel number = 0 to 3

Image A-3 Structure byte x to x+1 for the channels 0 to 3

Error transmitting the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine whether the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	E0	xx	Wrong version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	E1	xx	Parameter error	Check the parameters of the module

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

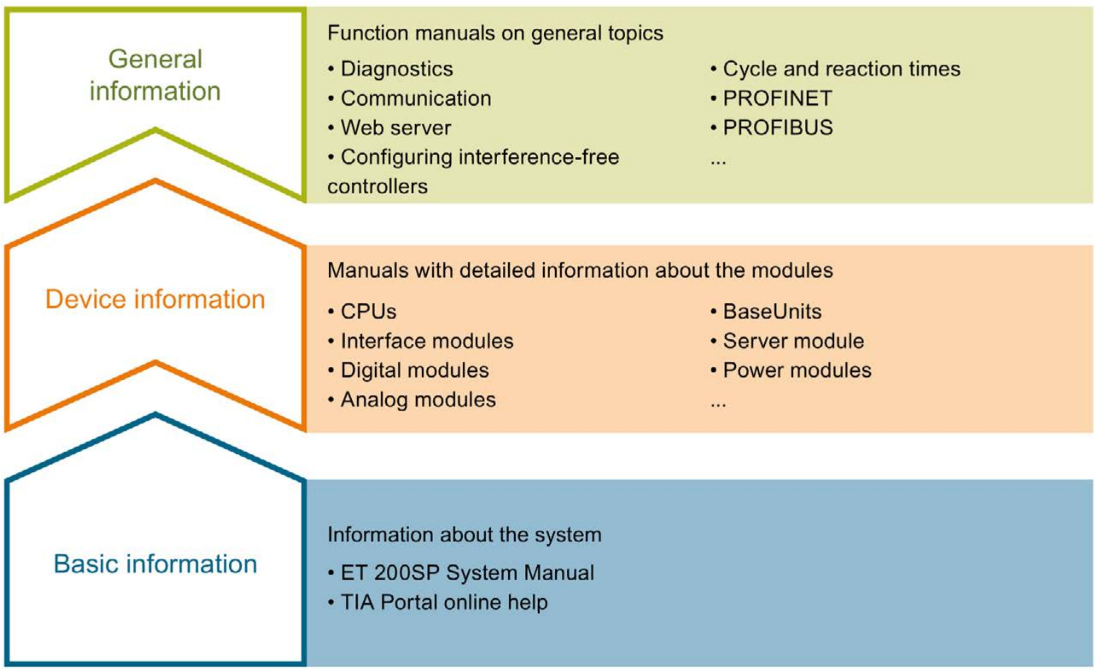
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Application examples

Applications examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find application examples on the Internet (http://support.industry.siemens.com/cs/ww/en/ps/ae).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

④ Wiring diagram	⑩ Color code for selecting the color identification labels
⑤ LEDs for channel status	⑪ Article number
⑥ LED for supply voltage	

Figure 2-1 View of the AI 8×U BA module

Properties

The module has the following technical properties:

- Analog input module with 8 inputs (single-ended)
- Input ranges for voltage measurement:
  - ±10 V, resolution 16 bits including sign
  - 0 to 10 V, resolution 15 bits
- Cycle time of the module (all channels) 10 ms
- Configurable diagnostics (per module)

The module supports the following functions:

- Firmware update
- I&M identification data
- Reconfiguration in RUN

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3 Wiring up

3.1 Wiring and block diagram

This section includes the block diagram of the AI 8xU BA module with the terminal assignments for a 2-wire connection.

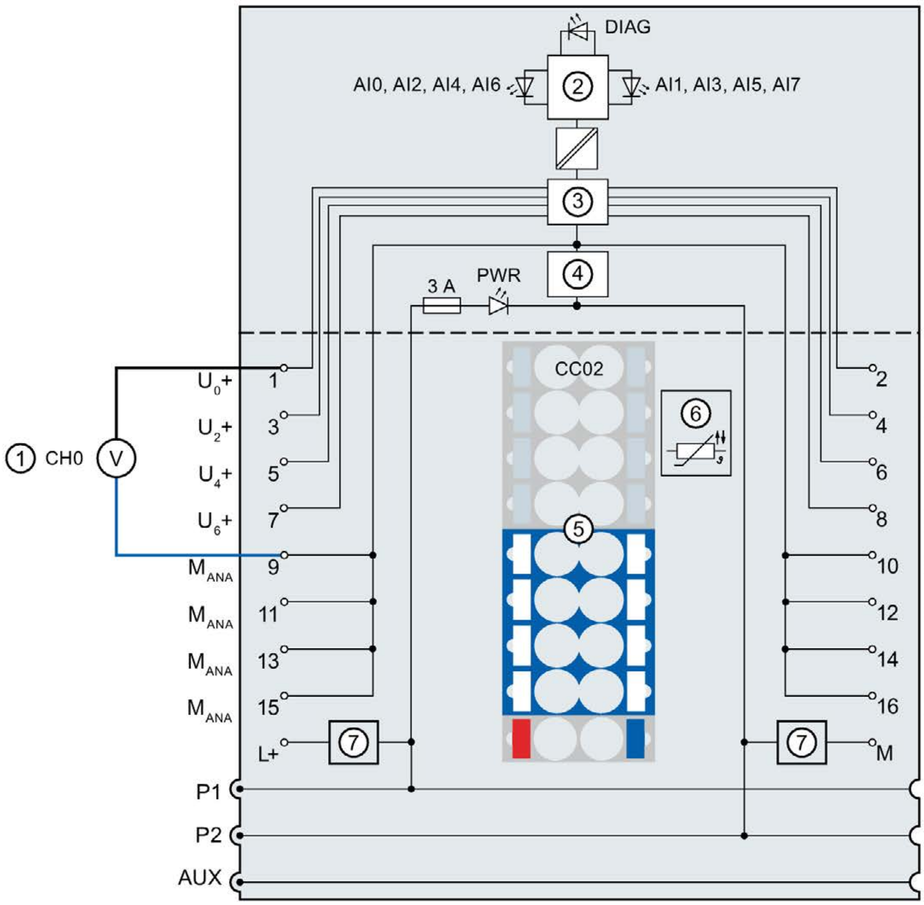
You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Connection: Voltage measurement 2-wire connection

The following figure shows the block diagram and an example for the terminal assignment of the analog input module AI 8xU BA on the BaseUnit BU type A0/A1.



①	2-wire connection for voltage measurement	U_n+	Voltage input positive, channel n
②	Backplane bus interface	M_{ANA}	Ground of the analog inputs
③	Analog-to-digital converter (ADC)	L+	24 V DC (infeed only with light-colored BaseUnit)
④	Current limitation	M	Ground
⑤	Color identification label CCxx (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	AI0 to AI7	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for voltage measurement 2-wire connection

Parameters/address space 4

4.1 Measuring types and ranges

The analog input module AI 8xU BA has the following measuring ranges:

Table 4- 1 Measuring ranges

Measurement type	Measuring range	Resolution
Voltage	0 to 10 V	15 bits
	±10 V	16 bits including sign

You will find the tables of the measuring ranges as well as overflow, overrange, etc., in the section Representation of analog values (Page 29).

4.2 Parameters

AI 8xU BA parameters

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning the parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records, see section Parameter assignment and structure of the parameter data record (Page 25)).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

<table>
<tr><th rowspan="2">Parameter</th><th rowspan="2">Range of values</th><th rowspan="2">Default</th><th rowspan="2">Reconfigura-tion in RUN</th><th colspan="2">Effective range with configura-tion software, e.g. STEP 7 (TIA Portal)</th></tr>

</table>

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Interference frequency suppression	• 60 Hz (50 ms) • 50 Hz (60 ms) [2] • 16.6 Hz (180 ms) • 4800 Hz (0.625 ms) • 60 Hz (18.75 ms) [3] • 50 Hz (22.5 ms) [2, 3] • 16.6 Hz (67.5 ms) [3]	50 Hz (60 ms)	Yes	Channel	Module
Potential group	• Use potential group of the left module (dark-colored BaseUnit) • Enable new potential group (light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP: The parameter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes for each ET 200SP station. If required, you can still assign this parameter using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 8 bytes.

[2] Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

[3] By selecting this interference frequency suppression with shorter integration time, the attenuation of the interference frequency that can be achieved is reduced (see Technical specifications).

Note

Unused channels

Disable unused channels in the parameter assignment to improve the cycle time of the module.

A deactivated channel always returns the value $7FFF_H$.

4.3 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Type/range of measurement

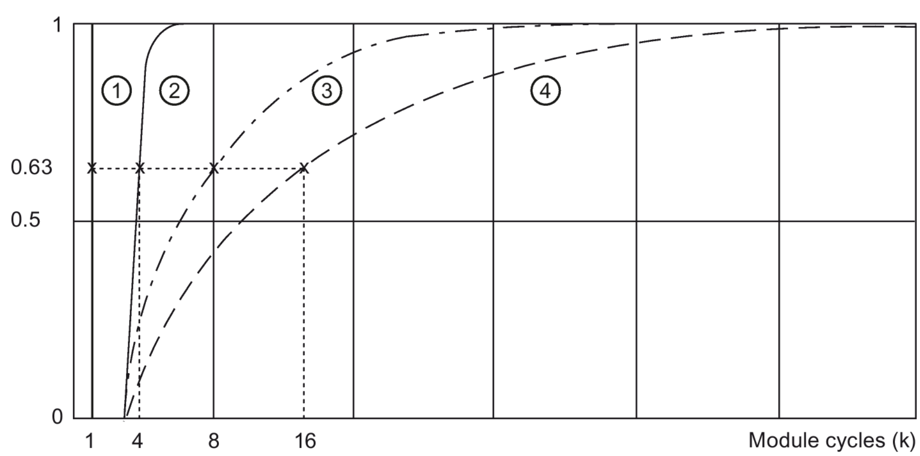
See the section Measurement types and measuring ranges (Page 12).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) × cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This is valid for all signal changes at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-1 Smoothing for AI 8xU BA

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the alternating voltage network may negatively affect the measured value, in particular when measuring in the low voltage range. With this parameter, the user specifies the line frequency that is predominant in the plant.

Potential group

You can use the "Potential group" parameter to specify whether the module is inserted in a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the dark-colored BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

4.4 Address space

Address space

The figure below shows the assignment of the address space for AI 8×U BA.

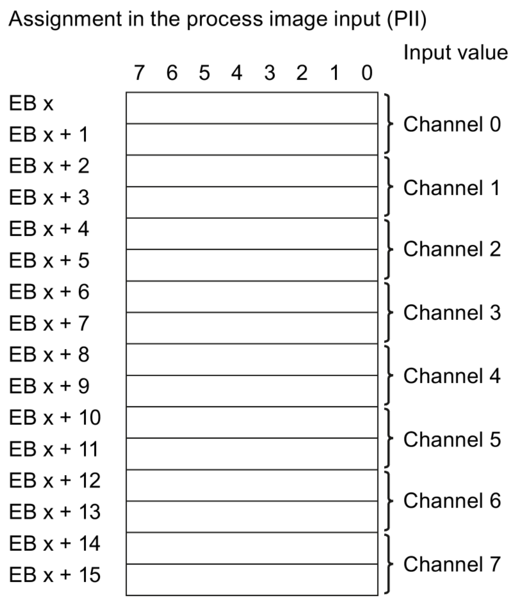

Figure 4-2 Address space of AI 8×U BA

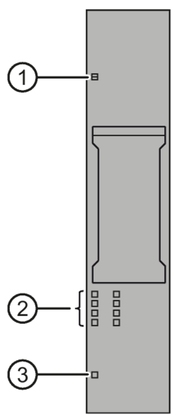
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays of the AI 8xU BA.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following tables contain the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 20).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The analog input module AI 8×U BA supports diagnostics interrupts.

Diagnostic interrupt

The module generates a diagnostic interrupt at the following events:

- Channel temporarily unavailable
- Low limit violated
- High limit violated
- Error
- Parameter assignment error
- No load voltage

5.3 Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the DIAG LED flashes on the module. The diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
High limit violated	7_H	Value is above overrange.	Correct interplay between module and encoder
Low limit violated	8_H	Value is below underrange.	Correct interplay between module and encoder
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module does not read any process values in this state.	• Wait for firmware update • Restart the firmware update

Technical specifications 6

6.1 Technical specifications

Technical specifications of the AI 8×U BA

	6ES7134-6FF00-0AA1
Product type designation	ET 200SP, 8xU Basic
General information	
Firmware version	V1.0
• FW update possible	Yes
Usable BaseUnits	BU type A0, A1
Color code for module-specific color identification label	CC02
Product function	
I&M data	Yes; I&M0 to I&M3
Scalable measuring range	No
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	V2.3 / -
Operating mode	
Oversampling	No
MSI	No
CiR Configuration in RUN	
Reconfiguration in RUN possible	Yes
Calibration in RUN possible	No
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	19.2 V
Valid range, high limit (DC)	28.8 V
Polarity reversal protection	Yes
Input current	
Current consumption, max.	25 mA
Power loss	
Power loss, typ.	0.7 W

	6ES7134-6FF00-0AA1
Address area	
Address space per module	
Address space per module, max.	16 bytes
Analog inputs	
Number of analog inputs	8; single-ended
Maximum permitted input voltage for voltage input (destruction limit)	30 V
Cycle time (all channels), min.	1 ms; per channel
Input ranges (rated values), voltages	
0 to +10 V	Yes; 15 bits
Input resistance (0 to 10 V)	100 kΩ
-10 V to +10 V	Yes; 16 bits including sign
Input resistance (-10 V to +10 V)	100 kΩ
Cable length	
Shielded, max.	200 m
Formation of analog values for the inputs	
Integration and conversion time/resolution per channel	
Resolution with overrange (bit including sign), max.	16 bits
Integration time configurable	Yes
Interference voltage suppression for interference frequency f1 in Hz	16.67 / 50 / 60 / 4 800 (16.67 / 50 / 60)
Conversion time (per channel)	ms; 180 / 60 / 50 / 0.625 (67.5 / 22.5 / 18.75)
Measured value smoothing	
Number of steps	4; none; 4/8/16 times
Configurable	Yes
Encoders	
Connection of the signal transmitters	
For voltage measurement	Yes
For current measurement as 4-wire transducer	No
Errors/accuracies	
Linearity error (in relation to input range), (+/-)	± 0.01%
Temperature error (in relation to input range), (+/-)	± 0.005%
Crosstalk between inputs, min.	50 dB
Repeat accuracy in settled state at 25 °C (in relation to input range), (+/-)	± 0.05%
Operational limit in the entire temperature range	
Voltage in relation to input range, (+/-)	± 0.5%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to input range, (+/-)	± 0.3%
Interference voltage suppression for f = n x (f1 +/- 1%), f1 = interference frequency	
Series-mode interference (peak of the interference < rated value of the input range), min.	70 dB; with conversion time 67.5 / 22.5 / 18.75 ms: 40 dB

	6ES7134-6FF00-0AA1
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Interrupts	
Diagnostic interrupt	Yes
Limit interrupt	No
Diagnostics alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	No
Short-circuit	No
Group error	Yes
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes, green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green / red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	75 V DC/60 V AC (basic insulation)
Insulation	
Insulation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Dimension drawing

See the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Measurement type	Measuring range	Diagnostics		
		No supply voltage L+	Overflow	Underflow
Deactivated		*	*	*
Voltage	±10 V	x	x	x
	0 to 10 V	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Measurement type	Measuring range	Diagnostics	
		No supply voltage L+	Overflow/underflow
Deactivated		*	*
Voltage	±10 V	x	x
	0 to 10 V	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

The module can be re-configured in RUN (for example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

STATUS output parameter

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

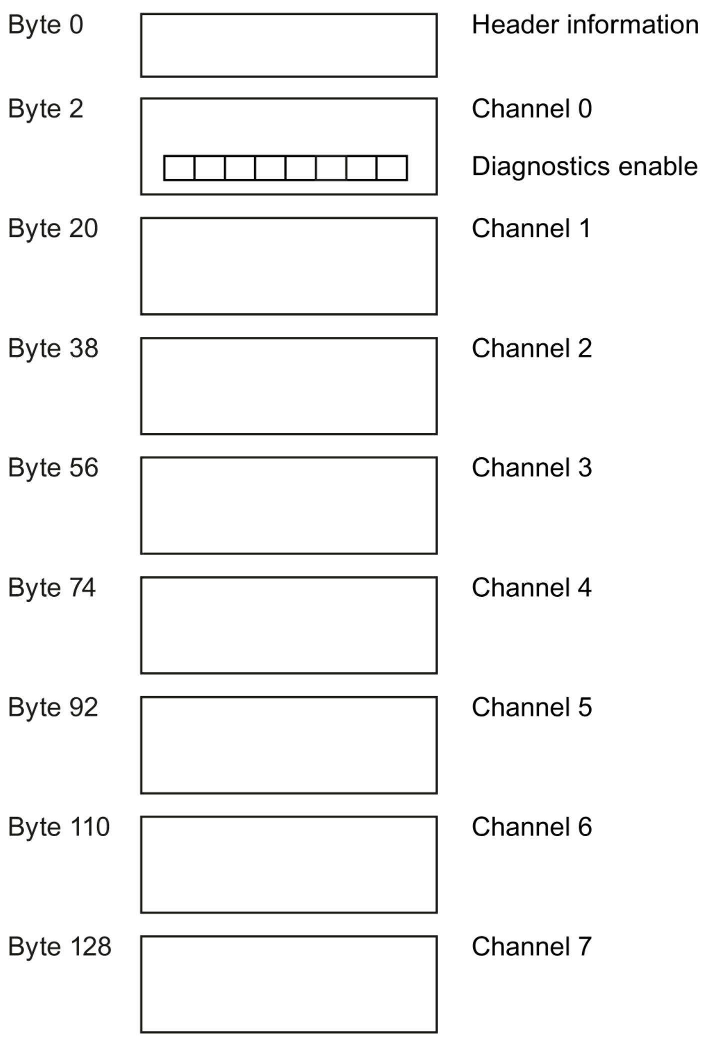


Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

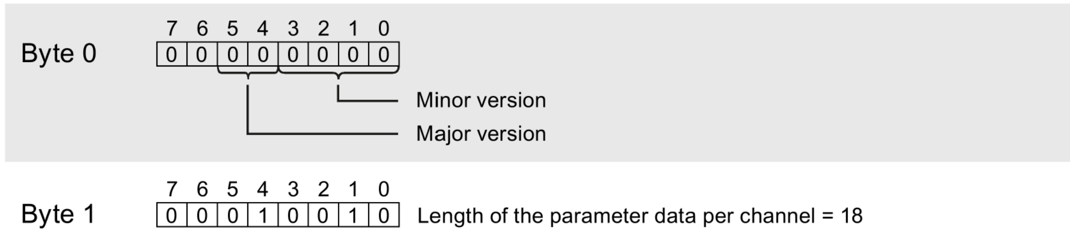

Figure A-2 Header information

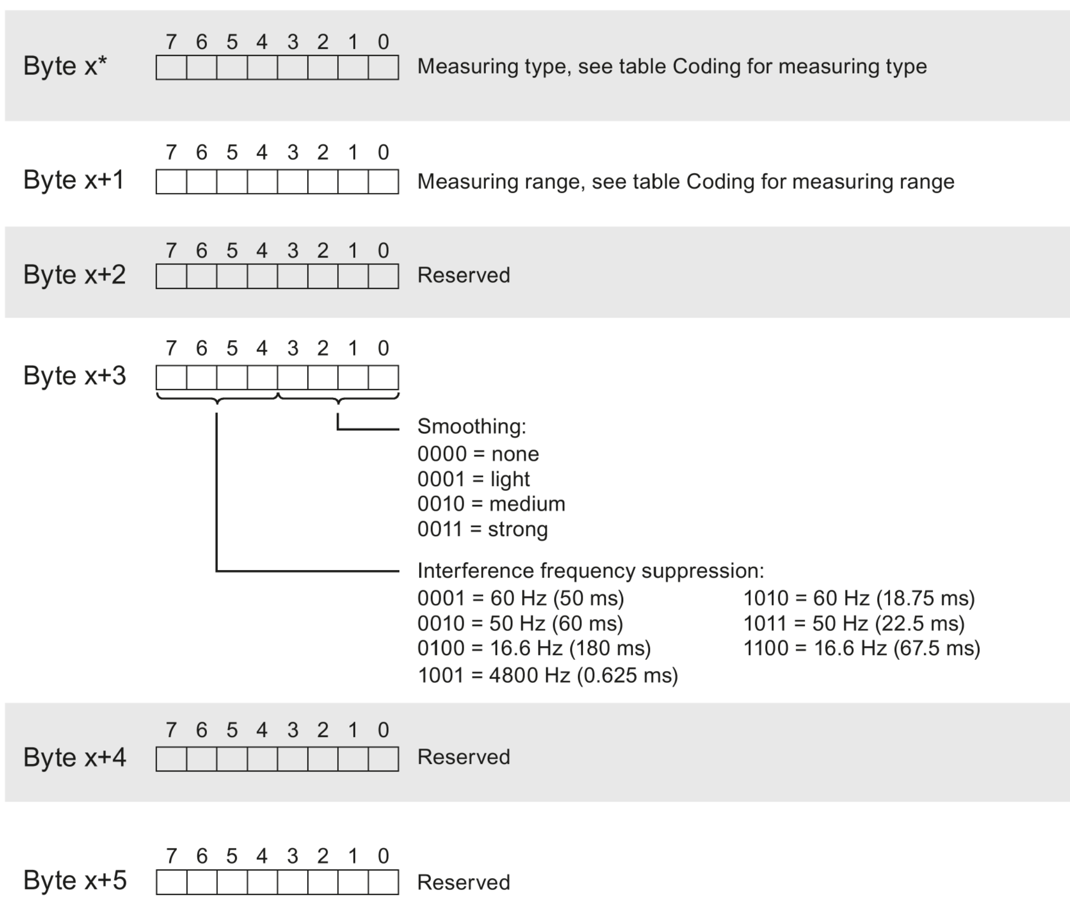
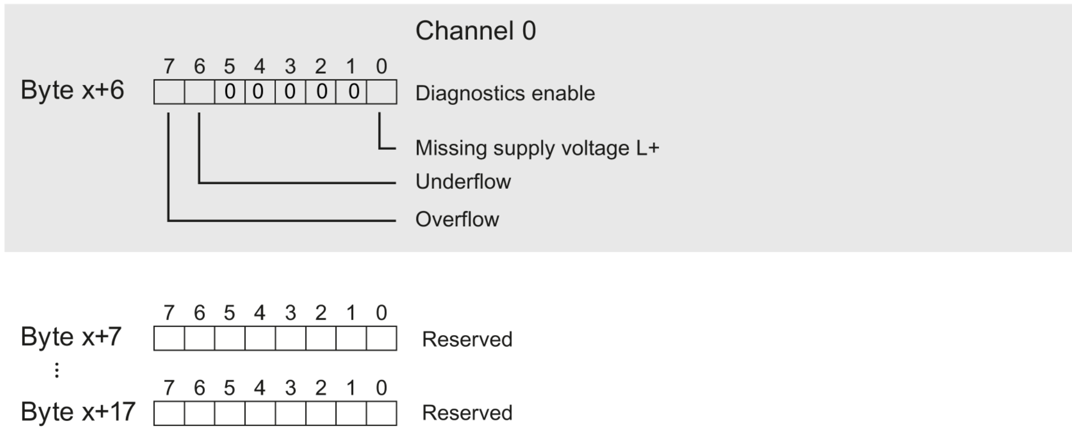
Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

Enable a parameter by setting the corresponding bit to "1".





* x = 2 + (channel number × 18); channel number = 0 to 7

Figure A-3 Structure of byte x to x+17 for channels 0 to 7

Codes for measurement types

The following table contains the codes for the measurement types of the analog input module. You must enter these codes at byte x (see previous figure).

Table A- 1 Codes for measurement types

Measurement type	Code
Deactivated	0000 0000
Voltage	0000 0001

Codes for measuring ranges

The following table contains the codes for the measuring ranges of the analog input module. You enter these codes at byte x+1 (see previous figure).

Table A- 2 Codes for measuring ranges

Measuring range	Code
±10 V	0000 1001
0 to 10 V	0000 1011

Representation of analog values B

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	**Measured value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

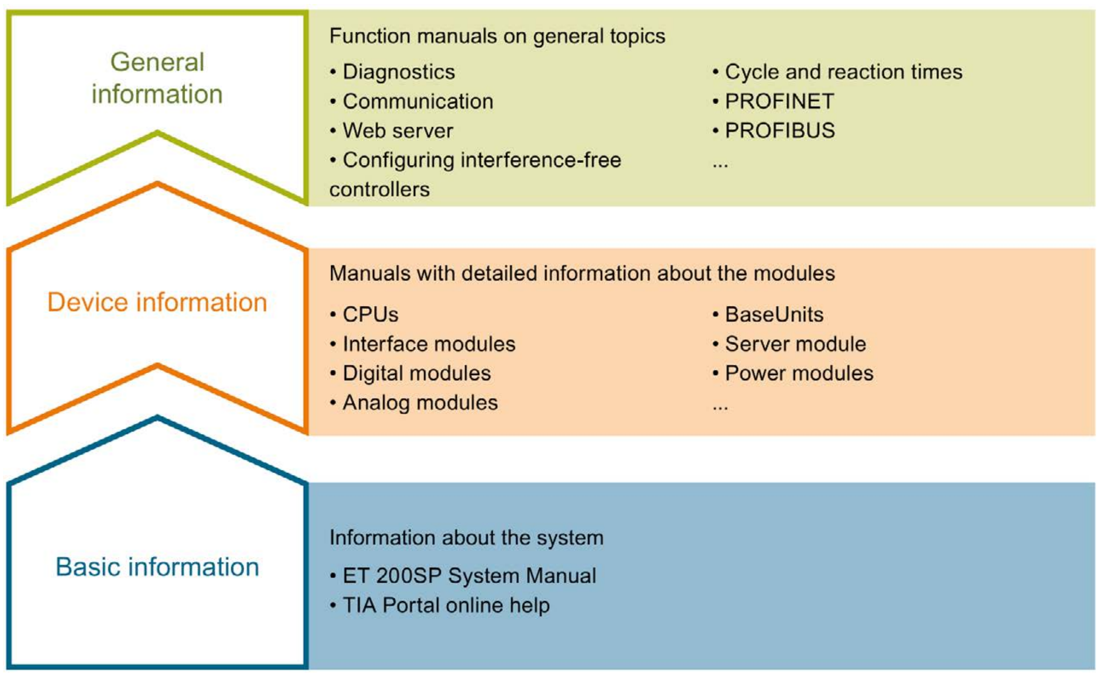
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Application examples

Applications examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

⑧ Color coding module type
⑨ Function and firmware version
⑩ Color code for selecting the color identification labels
⑪ Article number

Figure 2-1 View of the AI 8×I 2-/4-wire BA module

Properties

The module has the following technical properties:

- Analog input module with 8 inputs (single-ended)
- For 2-wire and 4-wire transducers
- Input ranges for current measurement:
  - 4 to 20 mA, resolution 15 bits
  - 0 to 20 mA, resolution 15 bits
  - ±20 mA, resolution 16 bits including sign
- Cycle time of the module (all channels) 10 ms
- Configurable diagnostics (per module)

The module supports the following functions:

- Firmware update
- I&M identification data
- Reconfiguration in RUN

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3 Wiring up

3.1 Wiring and block diagram

This section includes the block diagram of the AI 8xI 2-/4-wire BA module with the terminal assignments for 2-wire and 4-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

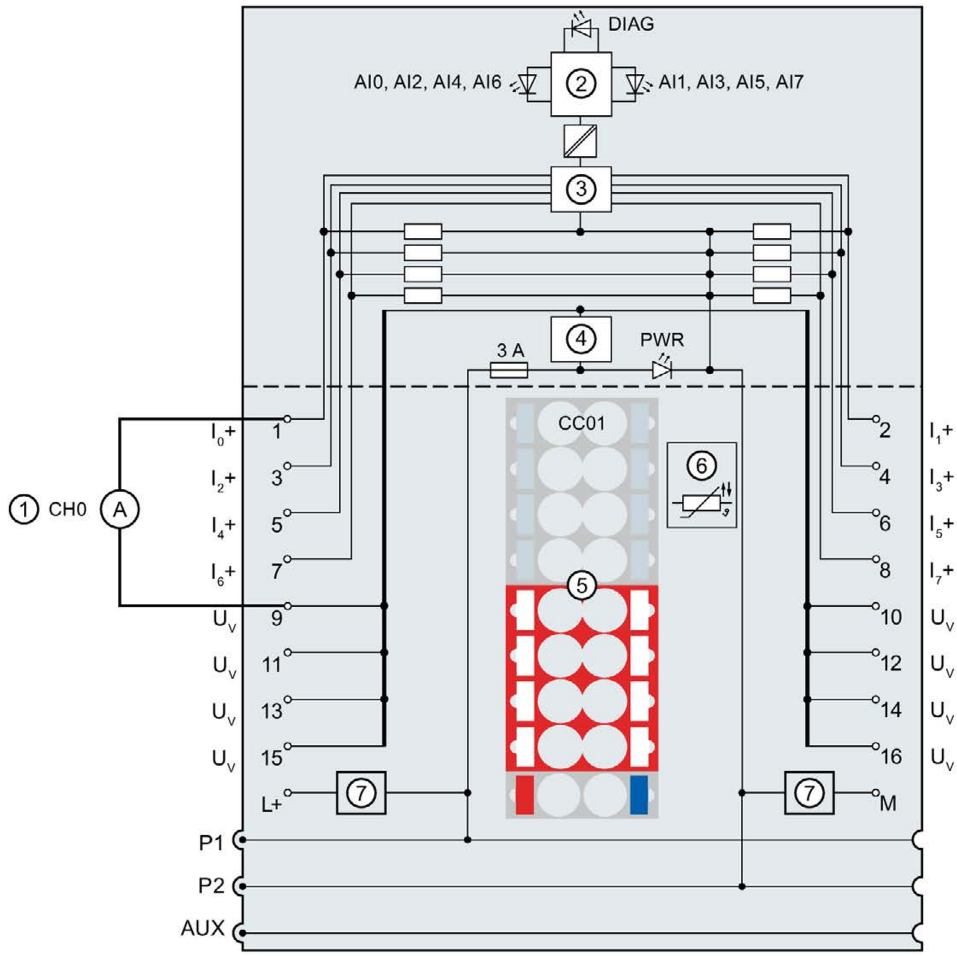
You may use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Connection: Current measurement 2-wire connection

The following figure shows the block diagram and an example for the terminal assignment of the analog input module AI 8xI 2-/4-wire BA on the BaseUnit BU type A0/A1.

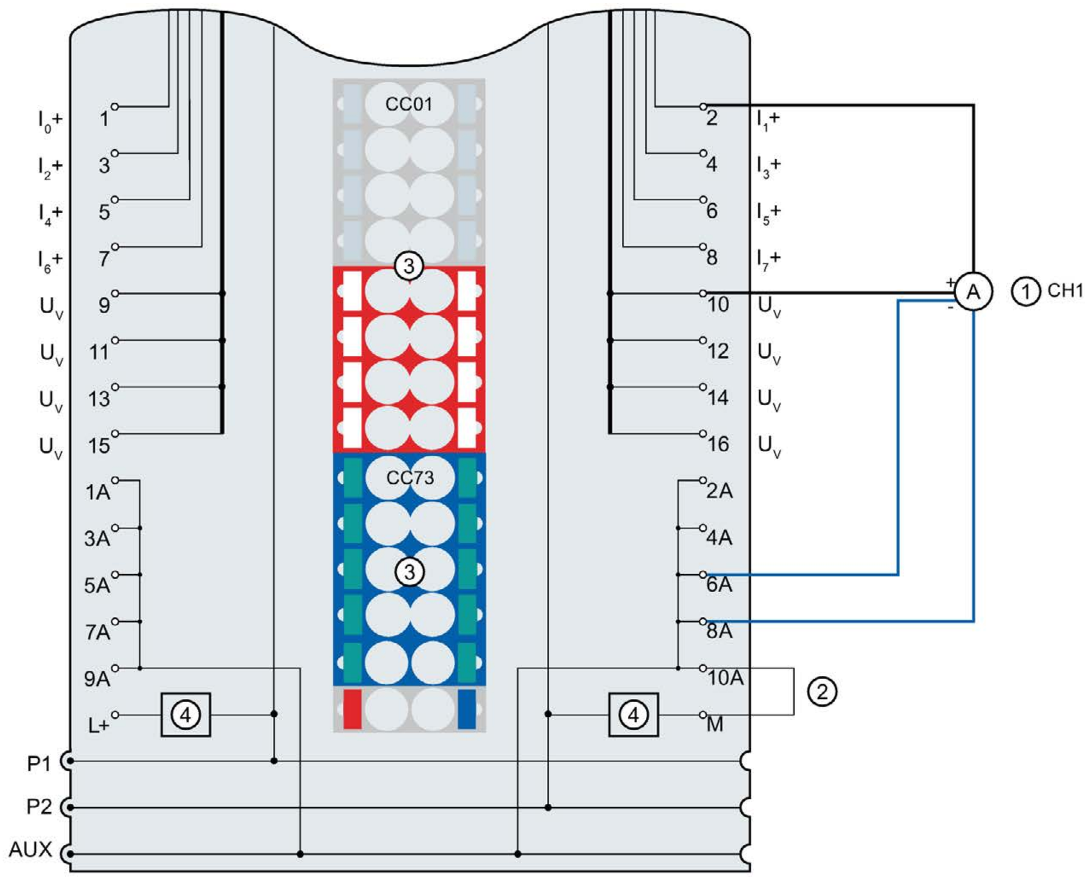


①	2-wire connection for current measurement	I_n+	Input signal, channel n
②	Backplane bus interface	U_V	Infeed voltage
③	Analog-to-digital converter (ADC)	L+	24 V DC (infeed only with light-colored BaseUnit)
④	Current limitation	M	Ground
⑤	Color identification label CCxx (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	AI0 to AI7	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for voltage measurement 2-wire connection

Connection: Current measurement 4-wire connection

The following figure shows the block diagram and an example for the terminal assignment of the analog input module AI 8xI 2-/4-wire BA on the BaseUnit BU type A0 with AUX terminals.



①	4-wire connection for current measurement
②	Connection AUX terminals to ground
③	Color identification labels CCxx (optional)
④	Filter connection supply voltage (only when light-colored BaseUnit is present)
I_n+	Input signal, channel n
U_V	Infeed voltage
L+	24 V DC (infeed only with light-colored BaseUnit)
M	Ground
1 A to 10 A	AUX terminals
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Figure 3-2 Wiring and block diagram for voltage measurement 4-wire connection

Parameters/address space 4

4.1 Measuring types and ranges

The analog input module AI 8xI 2-/4-wire BA has the following measuring ranges:

Table 4- 1 Measuring ranges

Measurement type	Measuring range	Resolution
Current (2-wire or 4-wire connection)	0 to 20 mA 4 to 20 mA	15 bits 15 bits
Current (4-wire connection)	± 20 mA	16 bits including sign

You will find the tables of the measuring ranges as well as overflow, overrange, etc., in the section Representation of analog values (Page 32).

4.2 Parameters

AI 8xI 2-/4-wire BA parameters

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of the parameter data record (Page 28).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Overflow	• Disable • Enable	Disable	Yes	Module	Module [1]
Diagnostics: Underflow	• Disable • Enable	Disable	Yes	Module	
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Module	Module
Type/range of measurement	• Deactivated • Current (4-wire connection) 0 to 20 mA • Current (4-wire connection) 4 to 20 mA • Current (4-wire connection) +/-20 mA • Current (2-wire connection) 0 to 20 mA • Current (2-wire connection) 4 to 20 mA	Current (4-wire connection) 4 to 20 mA	Yes	Channel	Channel
Smoothing	• None • Weak • Medium • Strong	None	Yes	Channel	Channel

Parameter	Range of values	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Interference frequency suppression	• 60 Hz (50 ms) • 50 Hz (60 ms) [2] • 16.6 Hz (180 ms) • 4800 Hz (0.625 ms) • 60 Hz (18.75 ms) [3] • 50 Hz (22.5 ms) [2 3] • 16.6 Hz (67.5 ms) [3]	50 Hz (60 ms)	Yes	Channel	Module
Potential group	• Use potential group of the left module (dark-colored BaseUnit) • Enable new potential group (light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

1 Only when configuring using a PROFIBUS GSD file; does not apply to configuration with STEP 7 via HSP: The parameter assignment options are limited because PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes for each ET 200SP station. If required, you can still assign this parameter using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 8 bytes.

2 Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

3 By selecting this interference frequency suppression with shorter integration time, the attenuation of the interference frequency that can be achieved is reduced (see Technical specifications).

Note

Unused channels

"Deactivate" unused channels in the parameter assignment to improve the cycle time of the module.

A deactivated channel always returns the value $7FFF_H$.

4.3 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics: Wire break

Enabling of the diagnostics if the module has no current flow or the current is too weak to be measured at the relevant input.

The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the Diagnostics: Wire break is output.

Measurement type/measuring ranges

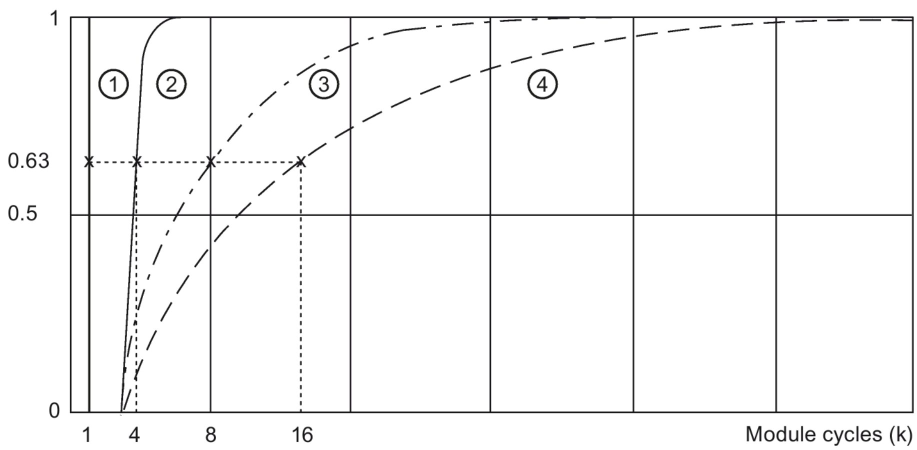
See the section Measurement types and measuring ranges (Page 13).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) × cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This is valid for all signal changes at the analog input.



① No smoothing (k = 1)

② Weak (k = 4)

③ Medium (k = 8)

④ Strong (k = 16)

Figure 4-1 Smoothing with AI 8xI 2-/4-wire BA

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the alternating voltage network may negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Potential group

You can use the "Potential group" parameter to specify whether the module is inserted in a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the dark-colored BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

4.4 Address space

Address space

The figure below shows the assignment of the address space for AI 8×I 2-/4-wire BA.

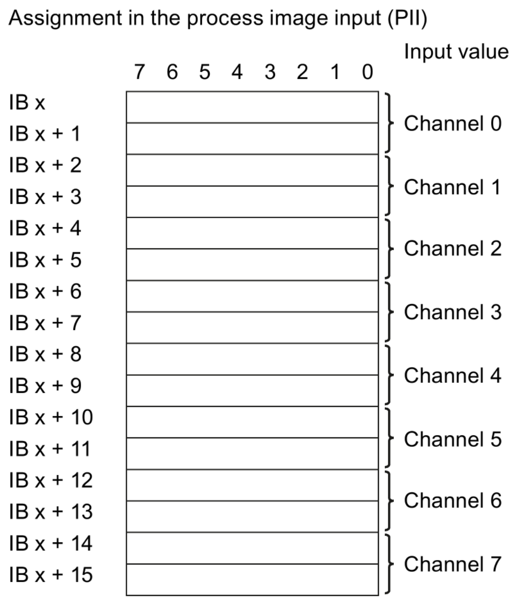

Figure 4-2 Address space of AI 8×I 2-/4-wire BA

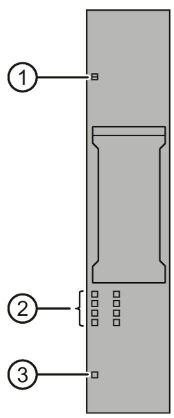
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays of the AI 8xU/I 2-/4-wire BA.



① DIAG (green/red)

② Channel status (green)

③ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following tables contain the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 22).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel deactivated
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The analog input module AI 8×I 2-/4-wire BA supports diagnostics interrupts.

Diagnostic interrupt

The module generates a diagnostic interrupt at the following events:

- Channel temporarily unavailable
- Short-circuit (2-wire and 4-wire connection, current)
- Wire break (current 4 to 20 mA)
- Low limit violated
- High limit violated
- Error
- Parameter assignment error
- No load voltage

5.3 Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the DIAG LED flashes on the module. The diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit *	1_H	Encoder supply to ground	Correct interplay between module and encoder
Wire break	6_H	Impedance of encoder circuit too high	Use a different encoder type or modify the wiring, for example, using cables with a larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Deactivate channel • Connect the encoder contacts
High limit violated	7_H	Value is above overrange.	Correct interplay between module and encoder
Low limit violated	8_H	Value is below underrange.	Correct interplay between module and encoder
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment (diagnostics wire break set only with the permitted measuring ranges).
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module does not read any process values in this state.	• Wait for firmware update • Restart the firmware update

* Short-circuit of the encoder supply to ground has an effect on all channels.

Technical specifications 6

6.1 Technical specifications

Technical specifications of the AI 8×I 2-/4-wire BA

	6ES7134-6GF00-0AA1
Product type designation	ET 200SP, AI 8xI 2-/4-wire Basic
General information	
Firmware version	V1.0
• FW update possible	Yes
Usable BaseUnits	BU type A0, A1
Color code for module-specific color identification label	CC01
Product function	
I&M data	Yes; I&M0 to I&M3
Scalable measuring range	No
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	V2.3 / -
Operating mode	
Oversampling	No
MSI	No
CiR Configuration in RUN	
Reconfiguration in RUN possible	Yes
Calibration in RUN possible	No
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	19.2 V
Valid range, high limit (DC)	28.8 V
Polarity reversal protection	Yes
Input current	
Current consumption, max.	25 mA; without encoder supply

	6ES7134-6GF00-0AA1
Encoder supply	
24 V encoder supply	
24 V	Yes
Short-circuit protection	Yes
Output current, max.	0.7 A; total current of all encoders/channels
Power loss	
Power loss, typ.	0.7 W; without encoder supply voltage
Address area	
Address space per module	
Address space per module, max.	16 bytes
Analog inputs	
Number of analog inputs	8; single-ended
Maximum permitted input current for current input (destruction limit)	50 mA
Cycle time (all channels), min.	1 ms; per channel
Input ranges (rated values), currents	
0 to 20 mA	Yes
Input resistance (0 to 20 mA)	100 Ω; 15 bits
-20 mA to +20 mA	Yes
Input resistance (-20 mA to +20 mA)	100 Ω; 16 bits including sign
4 mA to 20 mA	Yes
Input resistance (4 mA to 20 mA)	100 Ω; 15 bits
Cable length	
Shielded, max.	200 m
Formation of analog values for the inputs	
Integration and conversion time/resolution per channel	
Resolution with overrange (bit including sign), max.	16 bits
Integration time configurable	Yes
Interference voltage suppression for interference frequency f1 in Hz	16.67 / 50 / 60 / 4 800 (16.67 / 50 / 60)
Conversion time (per channel)	ms; 180 / 60 / 50 / 0.625 (67.5 / 22.5 / 18.75)
Measured value smoothing	
Number of steps	4; none; 4/8/16 times
Configurable	Yes
Encoders	
Connection of the signal transmitters	
For voltage measurement	No
For current measurement as 2-wire transducer	Yes
• Load of 2-wire transducer, max.	650 Ω
For current measurement as 4-wire transducer	Yes

	6ES7134-6GF00-0AA1
Errors/accuracies	
Linearity error (in relation to input range), (+/-)	± 0.01%
Temperature error (in relation to input range), (+/-)	0.005%/K
Crosstalk between inputs, min.	50 dB
Repeat accuracy in settled state at 25 °C (in relation to input range), (+/-)	± 0.05%
Operational limit in the entire temperature range	
Current in relation to input range, (+/-)	± 0.5%
Basic error limit (operational limit at 25 °C)	
Current in relation to input range, (+/-)	± 0.3%
Interference voltage suppression for f = n x (f1 +/- 1%), f1 = interference frequency	
Series-mode interference (peak of the interference < rated value of the input range), min.	70 dB; with conversion time 67.5 / 22.5 / 18.75 ms: 40 dB
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Interrupts	
Diagnostic interrupt	Yes
Limit interrupt	No
Diagnostics alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	Yes; for 4 to 20 mA
Short-circuit	Yes; encoder supply to ground; module-based
Group error	Yes
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green / red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No

	6ES7134-6GF00-0AA1
Permitted potential difference	
Between different circuits	75 V DC/60 V AC (basic insulation)
Insulation	
Insulation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range with PROFINET.

Measurement type	Measuring range	Diagnostics				
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow	Wire break
Deactivated		*	*	*	*	*
Current (4-wire connection)	0 to 20 mA	x	x	x	x	-
	4 to 20 mA	x	x	x	x	x
	±20 mA	x	x	x	x	-
Current (2-wire connection)	0 to 20 mA	x	x	x	-	-
	4 to 20 mA	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range with PROFIBUS.

Measurement type	Measuring range	Diagnostics			
		No supply voltage L+	Short-circuit to ground	Overflow/underflow	Wire break
Deactivated		*	*	*	*
Current (4-wire connection)	0 to 20 mA	x	x	x	-
	4 to 20 mA	x	x	x	x
	±20 mA	x	x	x	-
Current (2-wire connection)	0 to 20 mA	x	x	x	-
	4 to 20 mA	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

The module can be re-configured in RUN (for example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

STATUS output parameter

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

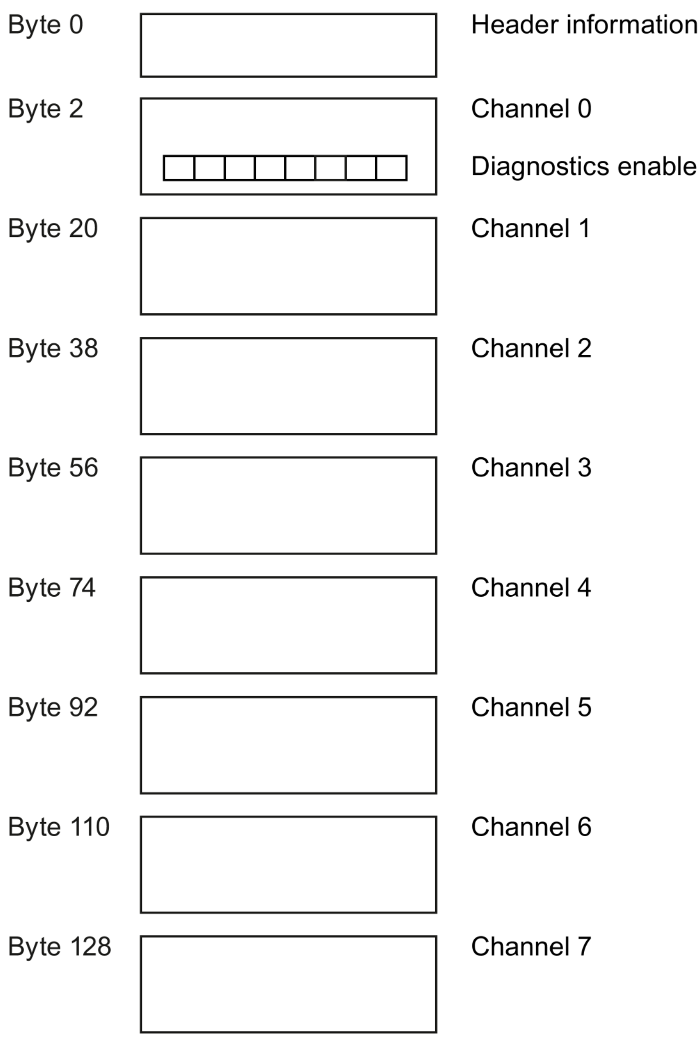

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

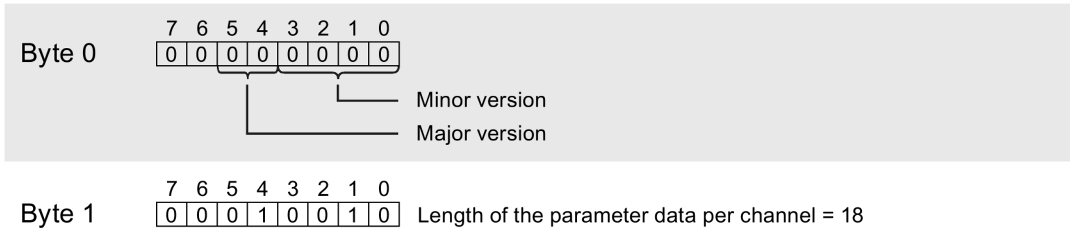

Figure A-2 Header information

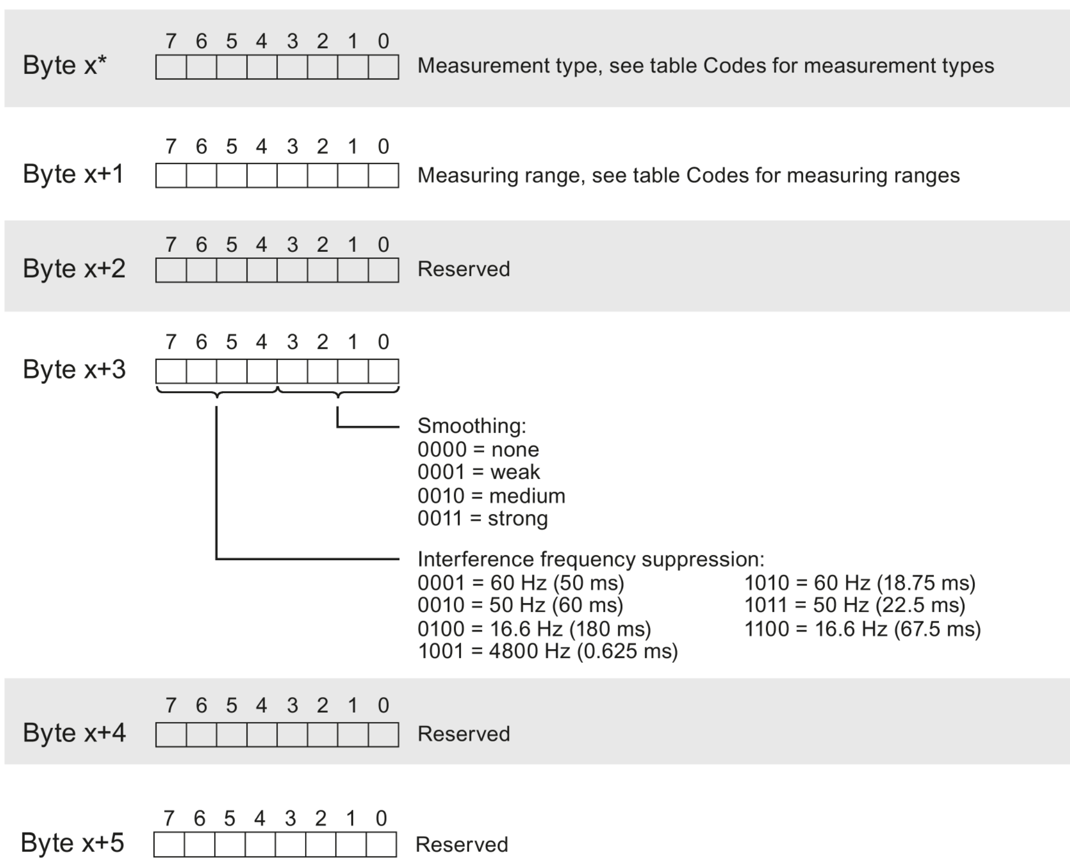
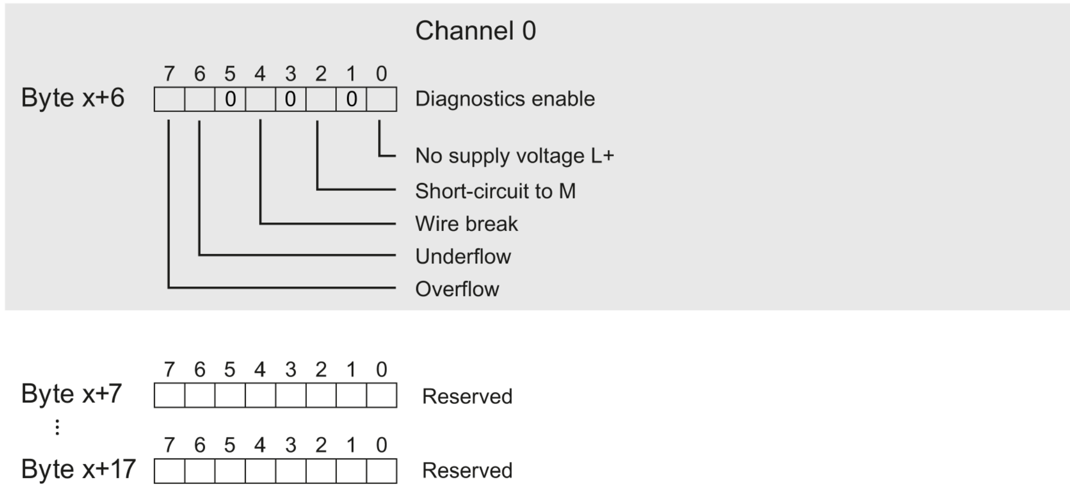
Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

Enable a parameter by setting the corresponding bit to "1".





* x = 2 + (channel number × 18); channel number = 0 to 7

Figure A-3 Structure of byte x to x+17 for channels 0 to 7

Codes for measurement types

The following table contains the codes for the measurement types of the analog input module. You must enter these codes at byte x (see previous figure).

Table A- 1 Codes for measurement types

Measurement type	Code
Deactivated	0000 0000
Current, 4-wire connection	0000 0010
Current, 2-wire connection	0000 0011

Codes for measuring ranges

The following table contains the codes for the measuring ranges of the analog input module. You enter these codes at byte x+1 (see previous figure).

Table A- 2 Codes for measuring ranges

Measuring range	Code
0 to 20 mA	0000 0010
4 to 20 mA	0000 0011
±20 mA	0000 0100

Representation of analog values

B

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	**Hexadecimal**	**High byte**	**Low byte**
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table B- 3 Unipolar input ranges

Dec. val-ue	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	<-17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.2 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 4 Current measuring range ±20 mA

Values		Current measuring range	Range
Dec.	**Hex.**	**±20 mA**	
32767	7FFF	>23.52 mA	Overflow
32511	7EFF	23.52 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	15 mA	
1	1	723.4 nA	
0	0	0 mA	
-1	FFFF		
-20736	AF00	-15 mA	
-27648	9400	-20 mA	
-27649	93FF		Underrange
-32512	8100	-23.52 mA	
-32768	8000	<-23.52 mA	Underflow

Table B- 5 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		Current measuring range		Range
Dec.	**Hex.**	**0 to 20 mA ***	**4 to 20 mA**	
32767	7FFF	>23.52 mA	>22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	<-3.52 mA	<1.185 mA	Underflow

* For measurement type "2-wire connection", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Wiring and block diagram has been modified.

Conventions

CPU: When the term "CPU" is used in the following, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

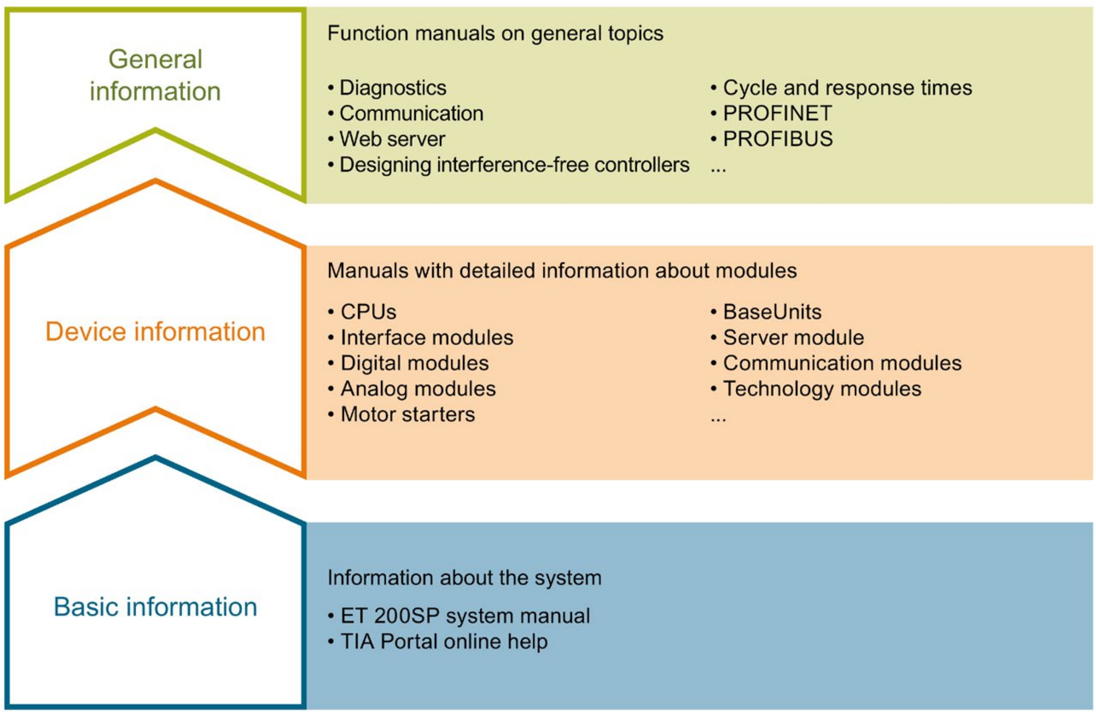
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the module AI 4×U/I 2-wire ST

Properties

The module has the following technical properties:

- Analog input module with 4 inputs
- Measuring type voltage and current for 2-wire transducer (can be set for each channel)
- Input ranges for voltage measurement:
  - ±10 V, resolution 16 bits including sign
  - ±5 V, resolution 16 bits including sign
  - 1 to 5 V, resolution 15 bits
  - 0 to 10 V, resolution 15 bits
- Input ranges for current measurement:
  - 4 to 20 mA, resolution 15 bits
  - 0 to 20 mA, resolution 15 bits
- Electrically isolated from the supply voltage L+ (only for voltage measuring type)
- Permitted common mode voltage: 10 V_{ss}
- Configurable diagnostics per module

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V2.0.0 or higher	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V2.0.0 or higher	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
Reconfiguration in RUN	FS01	V2.0.0 or higher	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
PROFIenergy	FS01	V2.0.0 or higher	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
Value status	FS01	V2.0.0 or higher	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You will find additional information on the accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Wiring up 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 4xU/I 2-wire ST module with the terminal assignments.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

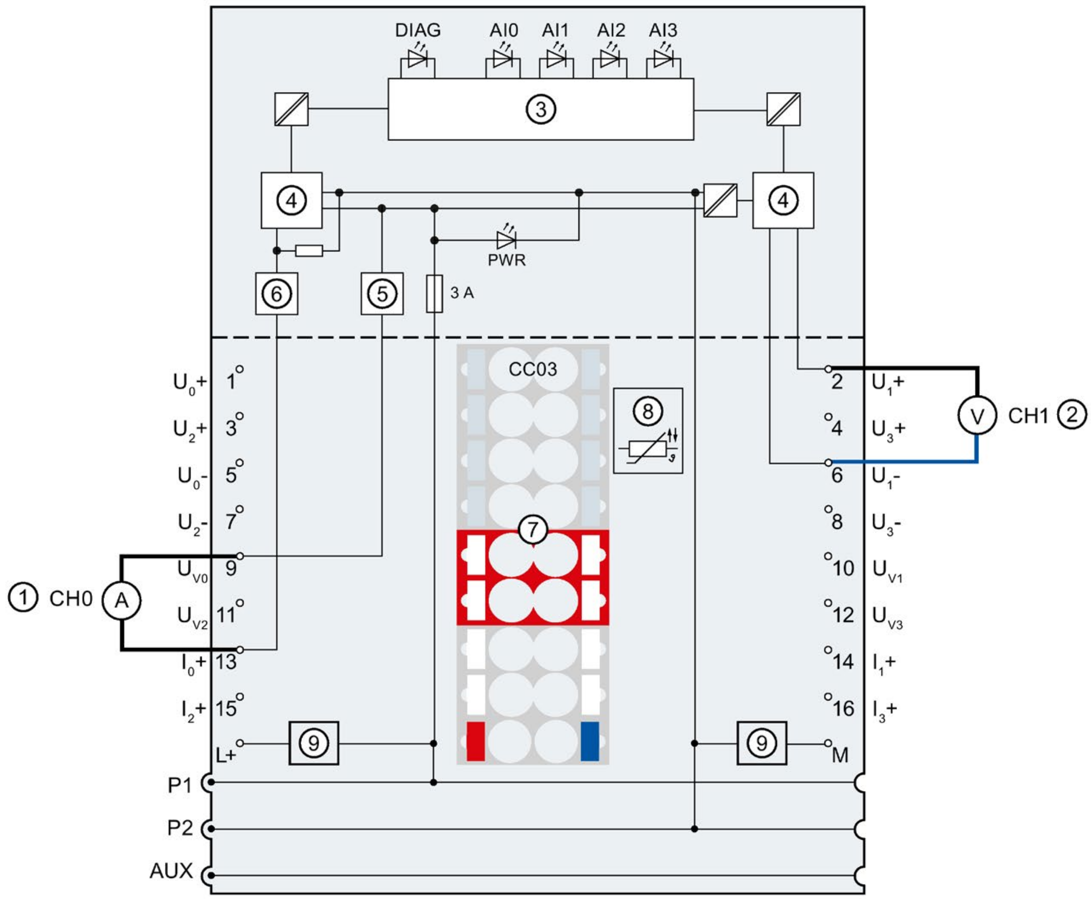
You can use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.

Wiring: Voltage and current measurement 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 4xU/I 2-wire ST on the BaseUnit BU type A0/A1.



①	2-wire connection for current measurement (2-wire transducer)	Un+	Voltage input positive, channel n
②	2-wire connection for voltage measurement	Un-	Voltage input negative, channel n
③	Backplane bus interface	Uvn	Supply voltage, channel n
④	Analog-to-digital converter (ADC)	In+	Current input positive, channel n
⑤	Short-circuit protection	L+	24 V DC (infeed only with light BaseUnit)
⑥	Current limitation	M	Ground
⑦	Color-coded label with color code CC03 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
⑧	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
⑨	Supply voltage filter circuit (only when light BaseUnit is present)	AI0, AI1, AI2, AI3	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for voltage and current measurement

Parameters/address space 4

4.1 Measuring types and ranges

The analog input module AI 4×U/I 2-wire ST has the following measuring ranges:

Table 4- 1 Measuring ranges

Measuring type	Measuring range	Resolution
Voltage	± 5 V	16 bits including sign
	±10 V	16 bits including sign
	1 to 5 V	15 bits
	0 to 10 V	15 bits
Current (2-wire transducer)	0 mA to 20 mA	15 bits
	4 to 20 mA	15 bits

You will find the tables of the measuring ranges as well as overflow, overrange, etc., in the section Representation of analog values (Page 37).

4.2 Parameters

Parameters of the AI 4xU/I 2-wire ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of the parameter data record (Page 32).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Configura-tion in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Overflow	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Underflow	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Wire break	• Disable • Enable	Disable	Yes	Module	Module
Measuring type/range	• deactivated • Voltage +/- 5 V • Voltage +/- 10 V • Voltage 1..5 V • Voltage 0..10 V • Current (2-wire trans-ducer) 0..20 mA • Current (2-wire trans-ducer) 4..20 mA	Current (2-wire transducer) 4..20 mA	Yes	Channel	Channel
Smoothing	• None • weak • medium • strong	None	Yes	Channel	Channel

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Interference frequency suppression [2]	• 60 Hz • 50 Hz[1] • 16.6 Hz	50 Hz	Yes	Channel	Module [3]
Potential group	• Use potential group of the left module (module plugged into a dark BaseUnit) • Enable new potential group (module plugged into light BaseUnit)	Use potential group of the left module	No	Module	Module

1 ...Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

2 The settings in the "Interference frequency suppression" parameter have a direct effect on the conversion time of the channel. The analog value is therefore also affected by additionally set filtering via the "Smoothing" parameter.

2 Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 5 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter by using the data record 128, see the appendix "Parameter data set".

Note

Unused channels

Disable unused channels in the parameter assignment to improve the cycle time of the module.

A disabled channel always returns the value $7FFF_H$.

4.3 Explanation of the parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics Short-circuit to ground

Enabling of the diagnostics in the event of a short-circuit of the encoder supply to ground or of an input to the encoder supply. Short-circuit is also detected in the range 1 to 5 V, when both input signals are short-circuited.

The short-circuit and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, however, the short-circuit diagnostics suppresses the underflow diagnostics. Short-circuit is output as the diagnostics event.

Diagnostics overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics Wire break

Enabling of the diagnostics if the module has no current flow or the current is too weak to be measured at the relevant input.

The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the wire break diagnostics info is output.

Type/range of measurement

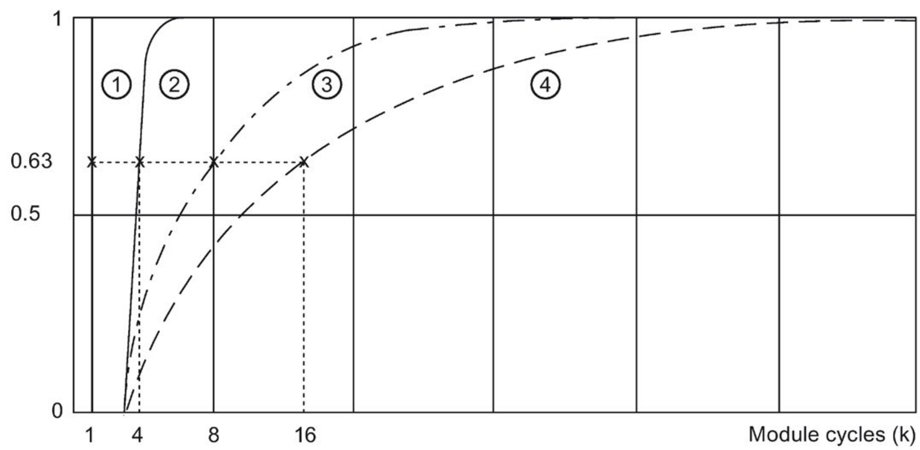
Refer to the section Measuring types and ranges (Page 16).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This applies to every signal change at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-1 Smoothing with AI 4xU/I 2-wire ST

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network can negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the supply frequency that is predominant in the plant.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AI 4×U/I 2-wire ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

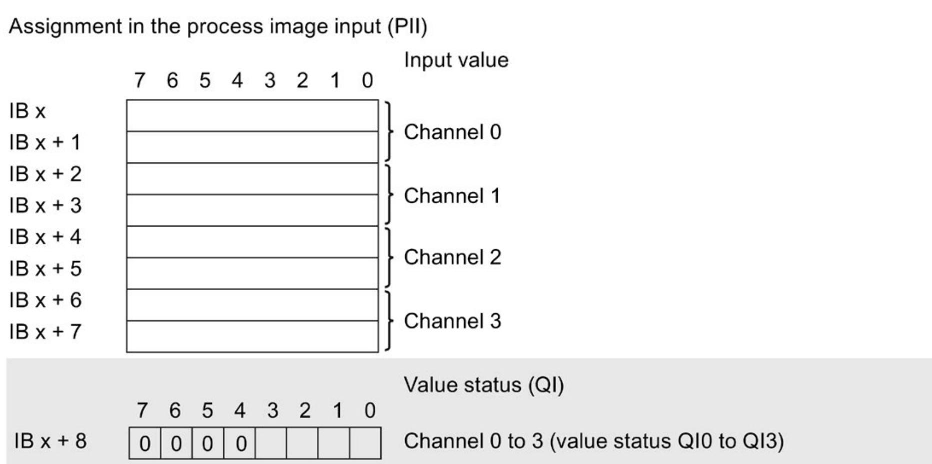


Figure 4-2 Address space of the AI 4×U/I 2-wire ST with value status

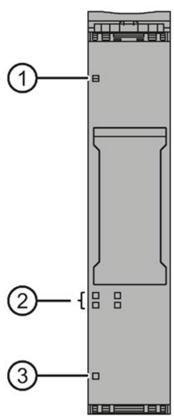
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The figure below shows the LED displays (status and error displays) of the AI 4xU/I 2-wire ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 25).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel disabled
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The analog input module AI 4×U/I 2-wire ST supports diagnostics interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt for the following events:

- Channel temporarily unavailable
- Short-circuit (current, voltage 1..5 V)
- Wire break (current 4 to 20 mA)
- Low limit violated
- High limit violated
- Error
- Parameter assignment error
- Supply voltage missing

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and how to deal with them

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (current)*	1_H	Sensor supply to ground	Correct the module/encoder tuning
		Input to sensor supply	
Short-circuit (1 to 5 V) **	1_H	Short-circuit of input signal	Correct the module/encoder tuning
		Open input	Connect input
Wire break (current) **	6_H	Impedance of encoder circuit too high.	Use a different encoder type or modify the wiring, for example, using cables with a larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect the sensor contacts
High limit violated	7_H	Value is above the overrange.	Correct the module/encoder tuning
Low limit violated	8_H	Value is below the underrange.	Correct the module/encoder tuning
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module does not read any process values in this state.	• Wait for firmware update. • Restart the firmware update.

* Short-circuit of the encoder supply to ground and/or of the input signal to the encoder supply of a channel can have a temporary effect on other channels (duration < 0.5 s). This means the short-circuit diagnostics can also be reported for unaffected channels and/or the measured value can be affected temporarily.

** In case of activated smoothing the module calculates the measured values across several module cycles. The module only generates the short circuit or wire break diagnosis if the smoothed measured value is stable. After the short-circuit or wire break has been eliminated, the module supplies stable measured values again depending on the set smoothing level.

Technical specifications 6

6.1 Technical specifications

Technical specifications of the AI 4×U/I 2-wire ST

The following table shows the technical specifications as of 09/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6HD01-0BA1/td?dl=en).

Article number	6ES7134-6HD01-0BA1
General information	
Product type designation	ET 200SP, AI 4x U/I 2-wire, P. unit 1
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC03
Product function	
• I&M data	Yes; I&M0 to I&M3
• Measuring range scalable	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14 / -
• STEP 7 configurable/integrated as of version	V5.6 and higher
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• Oversampling	No
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	No

Article number	6ES7134-6HD01-0BA1
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	37 mA; without sensor supply
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes
• Output current, max.	20 mA; max. 50 mA per channel for a duration < 10 s
Power loss	
Power loss, typ.	0.85 W; Without encoder supply voltage
Address area	
Address space per module	
• Address space per module, max.	8 byte; + 1 byte for QI information
Hardware configuration	
Automatic encoding	
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 2-wire connection	BU type A0, A1
Analog inputs	
Number of analog inputs	4; Differential inputs
permissible input voltage for voltage input (destruction limit), max.	30 V
permissible input current for current input (destruction limit), max.	50 mA
Cycle time (all channels), min.	Sum of the basic conversion times and additional processing times (depending on the parameterization of the active channels)
Input ranges (rated values), voltages	
• 0 to +10 V	Yes; 15 bit
• Input resistance (0 to 10 V)	120 kΩ
• 1 V to 5 V	Yes; 15 bit
• Input resistance (1 V to 5 V)	120 kΩ
• -10 V to +10 V	Yes; 16 bit incl. sign
• Input resistance (-10 V to +10 V)	120 kΩ
• -5 V to +5 V	Yes; 16 bit incl. sign
• Input resistance (-5 V to +5 V)	120 kΩ

Article number	6ES7134-6HD01-0BA1
Input ranges (rated values), currents	
• 0 to 20 mA	Yes; 15 bit
• Input resistance (0 to 20 mA)	100 Ω; + approx. 0.7 V diode forward voltage
• 4 mA to 20 mA	Yes; 15 bit
• Input resistance (4 mA to 20 mA)	100 Ω; + approx. 0.7 V diode forward voltage
Cable length	
• shielded, max.	1 000 m; 200 m for voltage measurement
Analog value generation for the inputs	
Measurement principle	integrating (Sigma-Delta)
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz
• Conversion time (per channel)	180 / 60 / 50 ms
Smoothing of measured values	
• Number of smoothing levels	4; None; 4/8/16 times
• parameterizable	Yes
Encoder	
Connection of signal encoders	
• for voltage measurement	Yes
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	No
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.01 %
Temperature error (relative to input range), (+/-)	0.005 %/K
Crosstalk between the inputs, min.	50 dB
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.05 %
Operational error limit in overall temperature range	
• Voltage, relative to input range, (+/-)	0.5 %
• Current, relative to input range, (+/-)	0.5 %

Article number	6ES7134-6HD01-0BA1
Basic error limit (operational limit at 25 °C)	
• Voltage, relative to input range, (+/-)	0.3 %
• Current, relative to input range, (+/-)	0.3 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	70 dB
• Common mode voltage, max.	10 V
• Common mode interference, min.	90 dB
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	No
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; at 4 to 20 mA
• Short-circuit	Yes; with 1 to 5 V or 2-wire mode: Short-circuit of the encoder supply to ground or of an input to the encoder supply
• Group error	Yes
• Overflow/underflow	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; Green LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; Green/red LED
Potential separation	
Potential separation channels	
• between the channels	Yes; channel group-specific between 2-wire current input group and voltage input group
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes; only for voltage inputs

Article number	6ES7134-6HD01-0BA1
Permissible potential difference	
between the inputs (UCM)	10 V DC
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation
• horizontal installation, max.	60 °C
• vertical installation, min.	-30 °C; No condensation
• vertical installation, max.	50 °C
• Vertical installation, min.	-30 °C; No condensation
• Vertical installation, max.	50 °C
• Horizontal installation, min.	-30 °C; No condensation
• Horizontal installation, max.	50 °C
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	Up to max. 5 000 m, at installation height > 2 000 m additional restrictions, see manual for details
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	32 g

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measuring type and measuring range for PROFINET.

Measuring type	Measuring range	Diagnostics				
		No supply voltage L+	Short-circuit to M	Overflow	Underflow	Wire break
deactivated		*	*	*	*	*
Voltage	±5 V	x	-	x	x	-
	±10 V	x	-	x	x	-
	1..5 V	x	x	x	x	-
	0..10 V	x	-	x	x	-
Current (2-wire transducer)	0..20 mA	x	x	x	x	-
	4..20 mA	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measuring type and measuring range for PROFIBUS.

Measuring type	Measuring range	Diagnostics			
		No supply voltage L+	Short-circuit to M	Overflow/ Underflow	Wire break
deactivated		*	*	*	*
Voltage	±5 V	x	-	x	-
	±10 V	x	-	x	-
	1..5 V	x	x	x	-
	0..10 V	x	-	x	-
Current (2-wire transducer)	0..20 mA	x	x	x	-
	4..20 mA	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

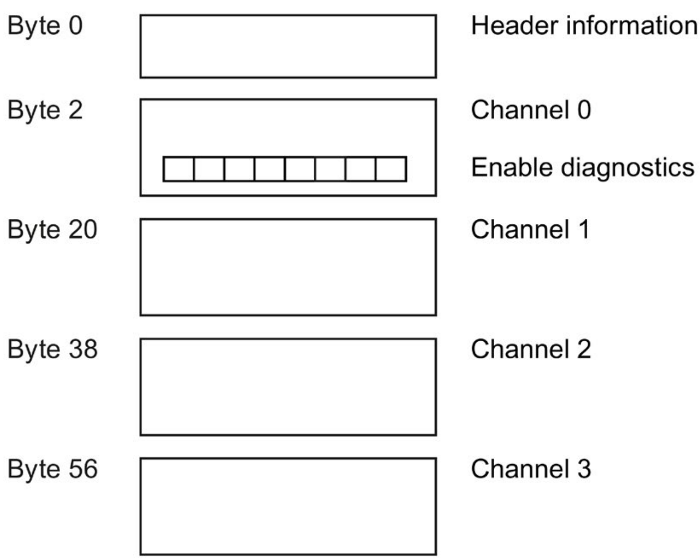


Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

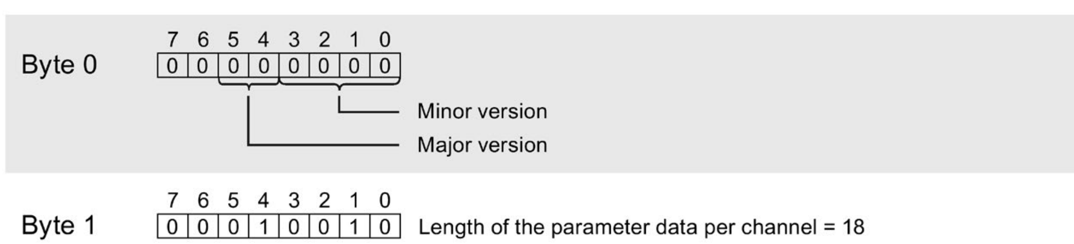

Figure A-2 Header information

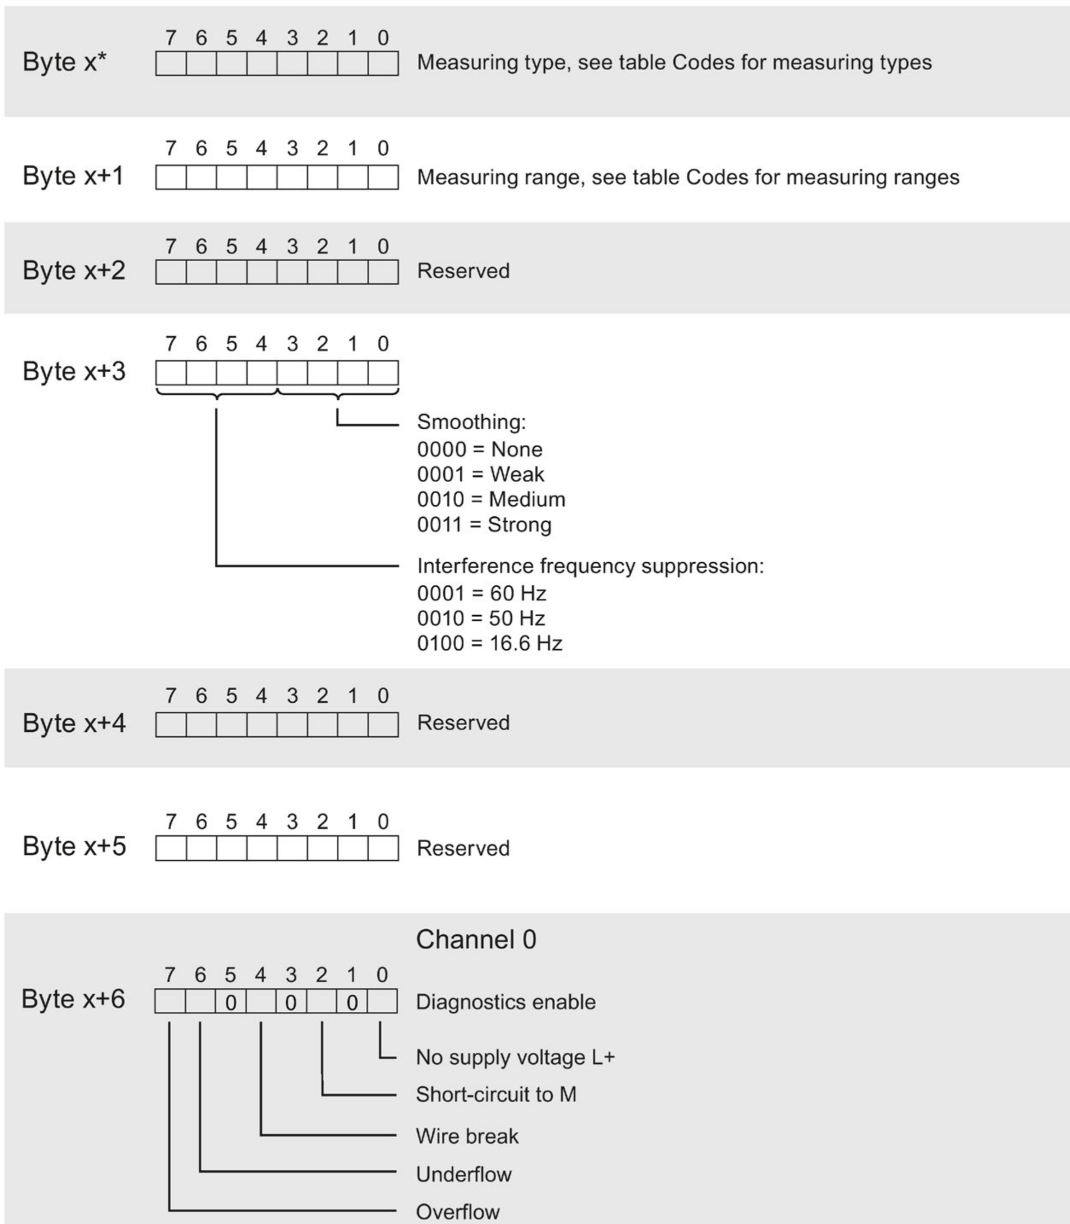
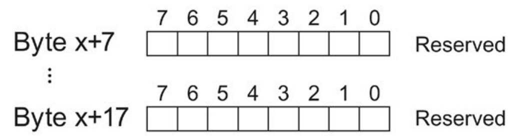
Parameter

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".





* x = 2 + (channel number × 18); channel number= 0 to 3

Figure A-3 Structure of byte x to x+17 for channels 0 to 3

Codes for the measuring type

The following table contains the codes for the measuring types of the analog input module. You must enter these codes at byte x (see previous figure).

Table A- 1 Codes for the measuring type

Measuring type	Coding
Deactivated	0000 0000
Voltage	0000 0001
Current, 2-wire transducer	0000 0011

Codes for the measuring range

The following table contains the codes for the measuring ranges of the analog input module. You enter these codes at byte x+1 (see previous figure).

Table A- 2 Codes for the measuring range

Measuring type	Coding
Voltage	
±5 V	0000 1000
±10 V	0000 1001
1 to 5 V	0000 1010
0 to 10 V	0000 1011
Current	
0 to 20 mA	0000 0010
4 to 20 mA	0000 0011

A.3 Error in transferring the data record analog input

Error transferring the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station to determine whether the module is plugged or pulled. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	01	Reserved bit set	Check the parameters of the module.
DF	80	E1	02	Invalid diagnostics enable bit set for operating mode.	Check the parameters of the module.
DF	80	E1	05	Invalid coding set for measuring range / measurement type.	Check the parameters of the module.
DF	80	E1	08	Invalid coding set for interference frequency suppression / integration time.	Check the parameters of the module.
DF	80	E1	09	Invalid coding for smoothing.	Check the parameters of the module.

Representation of analog values B

This appendix shows the analog values for all measuring ranges that you can use with the analog module.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its assigned parameters.

The table below shows the representation of binary analog values and of the associated decimal and hexadecimal units of the analog values.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Nominal range
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table B- 3 Unipolar input ranges

Dec. val- ue	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	Nominal range
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	<-17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.2 Representation of analog values in voltage measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible voltage measuring ranges.

Table B- 4 Voltage measuring range ±10 V and ±5 V

Values		Voltage measuring range		Range
Dec.	**Hex.**	**±10 V**	**±5 V**	
32767	7FFF	>11.759 V	>5.879 V	Overflow
32511	7EFF	11.759 V	5.879 V	Overrange
27649	6C01			
27648	6C00	10 V	5 V	Nominal range
20736	5100	7.5 V	3.75 V	
1	1	361.7 µV	180.8 µV	
0	0	0 V	0 V	
-1	FFFF			
-20736	AF00	-7.5 V	-3.75 V	
-27648	9400	-10 V	-5 V	
-27649	93FF			Underrange
-32512	8100	-11.759 V	-5.879 V	
-32768	8000	<-11.759 V	<-5.879 V	Underflow

Table B- 5 Voltage measuring range 1 to 5 V and 0 to 10 V

Values		Voltage measuring range		Range
Dec.	**Hex.**	**1 to 5 V**	**0 to 10 V**	
32767	7FFF	>5.704 V	>11.759 V	Overflow
32511	7EFF	5.704 V	11.759 V	Overrange
27649	6C01			
27648	6C00	5 V	10 V	Nominal range
20736	5100	4 V	7.5 V	
1	1	1 V + 144.7 µV	0 V + 361.7 µV	
0	0	1 V	0 V	
-1	FFFF			Underrange **
-4864	ED00	0.296 V	-1.759 V *	
-32768	8000	<0.296 V	<-1.759 V *	Underflow **

* negative values are only possible if the module (6ES7134-6GD**01**-0BA1) with FW version V2.0.0 and higher is configured.
** no underrange/underflow if the predecessor module (6ES7134-6GD**00**-0BA1) is configured.

B.3 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 6 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		**Current measuring range**		**Range**
Dec.	**Hex.**	**0 to 20 mA ***	**4 to 20 mA**	
32767	7FFF	>23.52 mA	>22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	<-3.52 mA	<1.185 mA	Underflow

* For measuring type "2-wire transducer", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

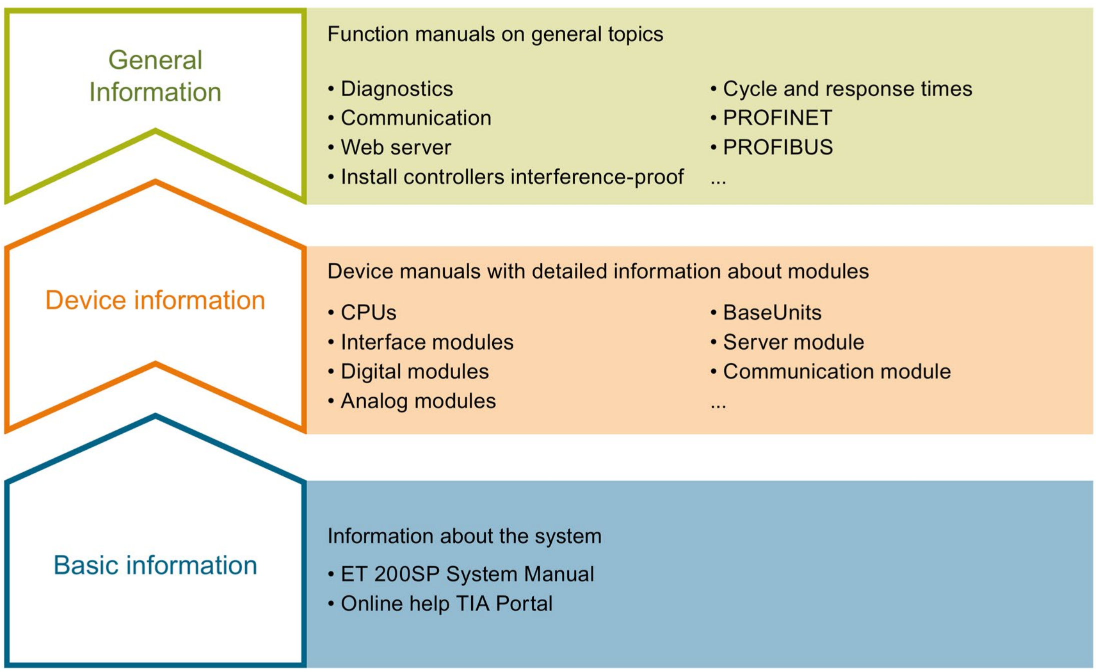
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

⑥ LED for supply voltage	

Image 2-1 View of the module AI 2×U ST

Properties

The module has the following technical properties:

- Analog input module with 2 inputs
- Voltage measurement type (can be set per channel)
- Input ranges for voltage measurement:
  - ±5 V, resolution 16 bits including sign
  - ±10 V, resolution 16 bits including sign
  - 1 to 5 V, resolution 15 bits
  - 0 to 10 V, resolution 15 bits
- Electrically isolated from supply voltage L+
- Permitted common mode voltage: 10 V_{ss}
- Configurable diagnostics (per module)

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy
- Value status

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 2xU ST module with the terminal assignments.

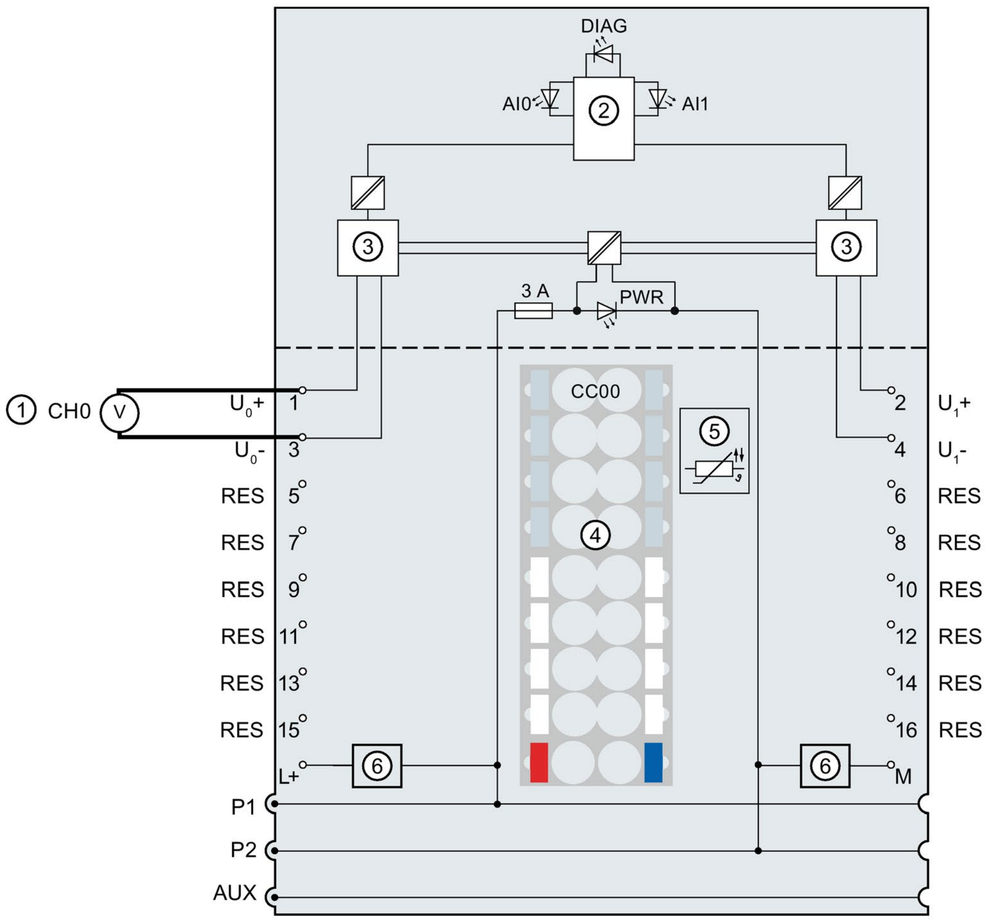
You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: Voltage measurement 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 2xU ST on the BaseUnit BU type A0/A1.



①	2-wire connection for voltage measurement	Un+	Voltage input positive, channel n
②	Backplane bus interface	Un-	Voltage input negative, channel n
③	Analog-to-digital converter (ADC)	RES	Reserve, must remain unused for future function extensions
④	Color-coded label with color code CC00 (optional)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Temperature recording for BU type A1 only (function cannot be used for this module)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Filter connection supply voltage (only when light-colored BaseUnit is present)	DIAG	Diagnostics LED (green, red)
		AI0, AI1	Channel status LED (green)
		PWR	Power LED (green)

4 Parameters/address space

4.1 Measuring types and ranges

The analog input module AI 2×U ST has the following measuring ranges:

Table 4- 1 Measuring ranges

Measurement type	Measuring range	Resolution
Voltage	± 5 V	16 bits incl. sign
	± 10 V	16 bits incl. sign
	1 to 5 V	15 bits
	0 to 10 V	15 bits

You will find the tables of the measuring ranges as well as overflow, overrange, etc., in the section Representation of analog values (Page 32).

4.2 Parameters

Parameters of the AI 2xU ST

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of the parameter data record (Page 28).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Parameter reassign-ment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Overflow [1]	• Disable • Enable	Disable	Yes	Module	Module [1]
Diagnostics: Underflow [1]	• Disable • Enable	Disable	Yes	Module	
Measurement type/measuring range	• Deactivated • Voltage +/- 5 V • Voltage +/- 10 V • Voltage 0..10 V • Voltage 1..5 V	Voltage +/- 10 V	Yes	Channel	Channel
Smoothing	• None • Weak • Medium • Strong	None	Yes	Channel	Channel

Parameter	Range of values	Default	Parameter reassign-ment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Interference frequency suppression	• 60 Hz (50 ms) • 50 Hz (60 ms) [2] • 16.6 Hz (180 ms) • None	50 Hz (60 ms)	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark Ba-seUnit) • Enable new potential group (module plugged in-to light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 4 bytes.

[2] Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

Note

Unused channels

Disable the unused channels in the parameter assignment.

A deactivated channel always returns the value $7FFF_H$.

4.3 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Diagnostics are enabled when both input signals are short-circuited in the range 1 to 5 V.

The short-circuit and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, however, the short-circuit diagnostics suppresses the underflow diagnostics. Short-circuit is output as the diagnostics event.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Measurement type/measuring range

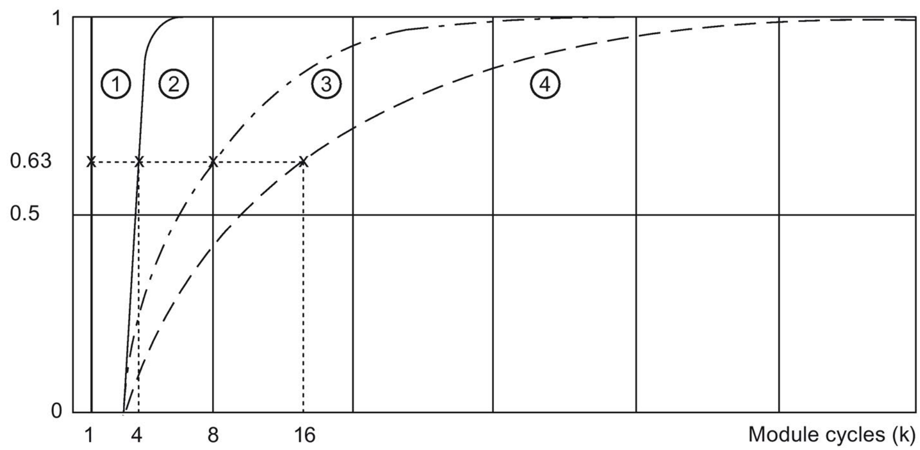
Refer to the section Measuring types and ranges (Page 13).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) × cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This applies to every signal change at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Image 4-1 Smoothing for AI 2xU ST

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network can negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 and 1 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: No fault is present on the channel.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AI 2×U ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

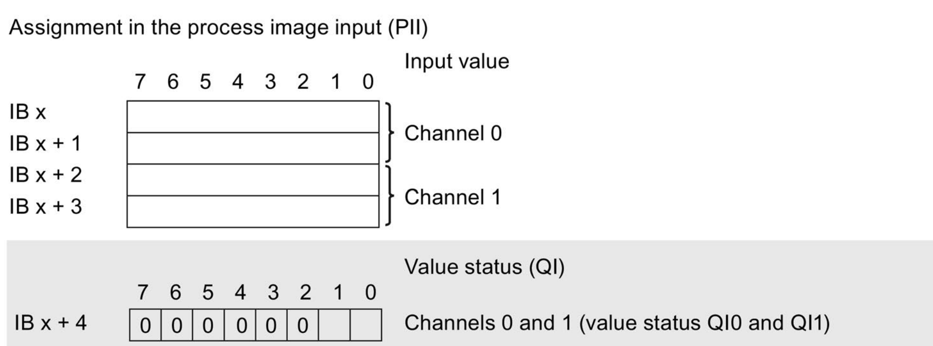


Image 4-2 Address space of the AI 2×U ST with value status

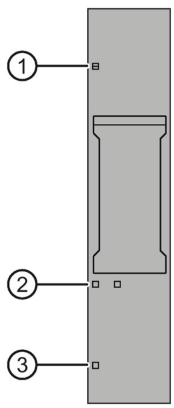
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The following figure shows you the LED display of the AI 2xU ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Image 5-1 LED display

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 22).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel disabled
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The AI 2×U ST analog input module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit (voltage 1 V to 5 V)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (1 to 5 V)	1_H	Short-circuit of input signal	Correct interplay between module and encoder
		Open input	Connect input
High limit violated	7_H	Value is above the overrange.	Correct interplay between module and encoder
Low limit violated	8_H	Value is below the underrange.	Correct interplay between module and encoder
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not read process values in this state.	• Wait for firmware update. • Restart the firmware update.

Technical specifications 6

6.1 Technical specifications

Technical specifications of the AI 2×U ST

	6ES7134-6FB00-0BA1
General information	
Product type designation	ET 200SP, AI 2xU Standard
Firmware version	V1.0
• FW update possible	Yes
Usable BaseUnits	BU type A0, A1
Color code for module-specific color identification label	CC00
Product function	
I&M data	Yes; I&M0 to I&M3
Scalable measuring range	No
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
Oversampling	No
MSI	No
CiR Configuration in RUN	
Configuration in RUN possible	Yes
Calibration in RUN possible	No
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	19.2 V
Valid range, high limit (DC)	28.8 V
Polarity reversal protection	Yes
Input current	
Current consumption, max.	37 mA
Encoder supply	
24 V encoder supply	
24 V	No
Additional 24 V encoder supply	
24 V	No

	6ES7134-6FB00-0BA1
Power loss	
Power loss, typ.	0.9 W
Address area	
Address space per module	
Address space per module, max.	4 bytes; + 1 byte for QI information
Analog inputs	
Number of analog inputs	2
Maximum permissible input voltage for voltage input (destruction limit)	30 V
Cycle time (all channels), min.	500 μs
Input ranges (rated values), voltages	
0 to +10 V	Yes; 15 bits
Input resistance (0 to 10 V)	180 kΩ
1 V to 5 V	Yes; 15 bits
Input resistance (1 V to 5 V)	180 kΩ
-10 V to +10 V	Yes; 16 bits incl. sign
Input resistance (-10 V to +10 V)	180 kΩ
-5 V to +5 V	Yes; 16 bits incl. sign
Input resistance (-5 V to +5 V)	180 kΩ
Cable length	
Shielded, max.	200 m
Formation of analog values for the inputs	
Measuring principle	Sigma Delta
Integration and conversion time/resolution per channel	
Resolution with overrange (bit including sign), max.	16 bits
Integration time configurable	Yes
Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz / off
Conversion time (per channel)	50 ms @ 60 Hz, 60 ms @ 50 Hz, 180 ms @ 16.6 Hz, 250 μs without filter
Measured value smoothing	
Number of levels	4
Configurable	Yes
Setting: None	Yes; 1 x cycle time
Setting: Weak	Yes; 4 x cycle time
Setting: Medium	Yes; 8 x cycle time
Setting: Strong	Yes; 16 x cycle time

	6ES7134-6FB00-0BA1
Encoders	
Connection of the signal transmitters	
For voltage measurement	Yes
Errors/accuracies	
Linearity error (in relation to input range), (+/-)	0.01%
Temperature error (in relation to input range), (+/-)	0.005%/K
Crosstalk between inputs, min.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to input range), (+/-)	0.05%
Operational limit in the entire temperature range	
Voltage in relation to input range, (+/-)	0.5%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to input range, (+/-)	0.3%
Interference voltage suppression for f = n x (f1 +/-1%), f1 = interference frequency	
Series-mode interference (peak of the interference < rated value of the input range), min.	70 dB
Common mode voltage, max.	10 V
Common mode interference, min.	90 dB
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Interrupts	
Diagnostics interrupt	Yes
Limit interrupt	No
Diagnostics alarms	
Diagnostics	Yes
Monitoring of the supply voltage	Yes
Wire break	No
Short-circuit	Yes; with 1 to 5 V
Group error	Yes
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green/red DIAG LED

	6ES7134-6FB00-0BA1
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and backplane bus	Yes
Between the channels and voltage supply of the electronics	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic isolation)
Between the inputs (UCM)	10 Vss
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Measurement type	Measuring range	Diagnostics			
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow
Deactivated		*	*	*	*
Voltage	±5 V	x	-	x	x
	±10 V	x	-	x	x
	1 V to 5 V	x	x	x	x
	0 V to 10 V	x	-	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Measurement type	Measuring range	Diagnostics			
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow
Deactivated		*	*	*	*
Voltage	±5 V	x	-	x	x
	±10 V	x	-	x	x
	1 V to 5 V	x	x	x	x
	0 V to 10 V	x	-	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

You can reassign the module parameters in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

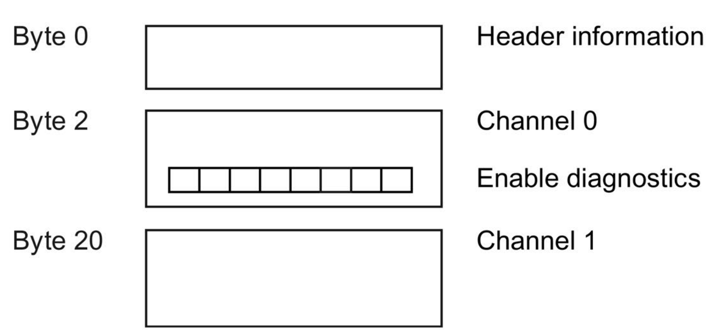

Image A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

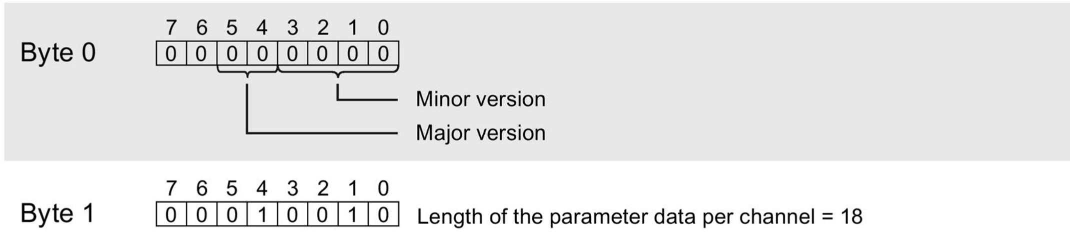

Image A-2 Header information

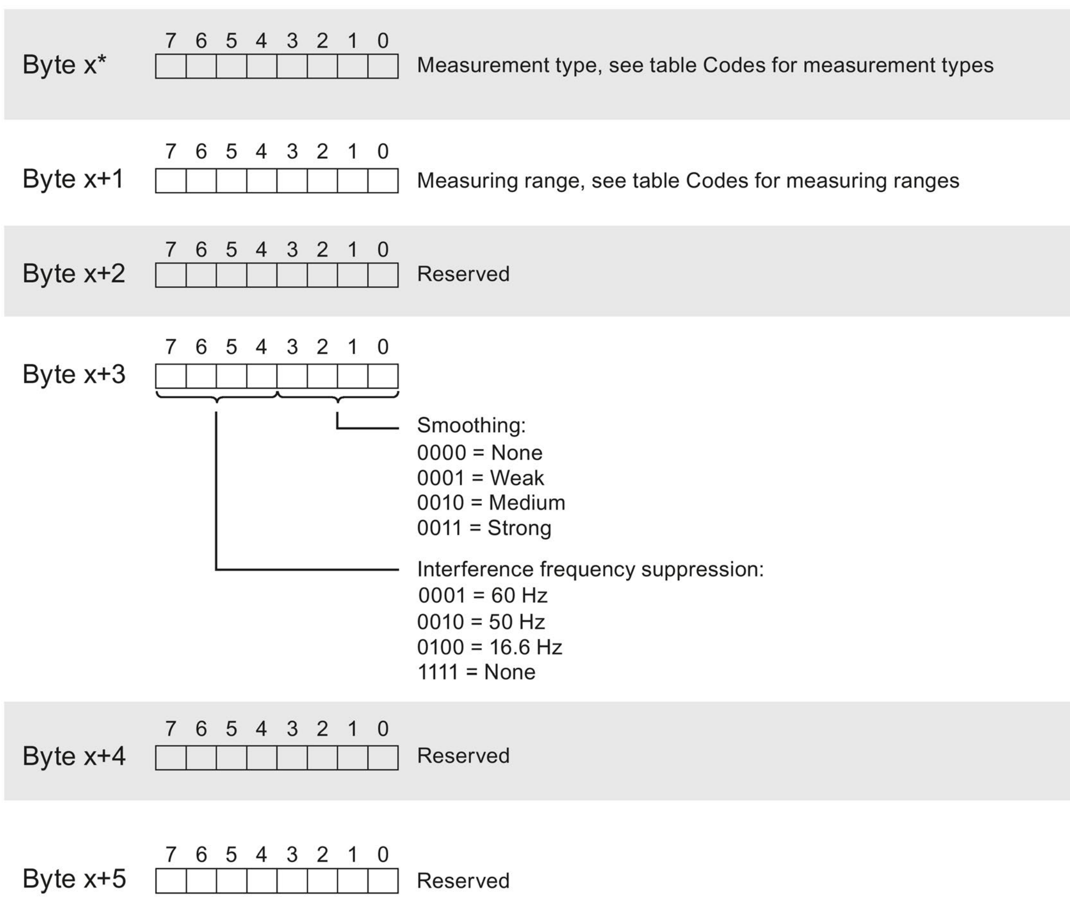
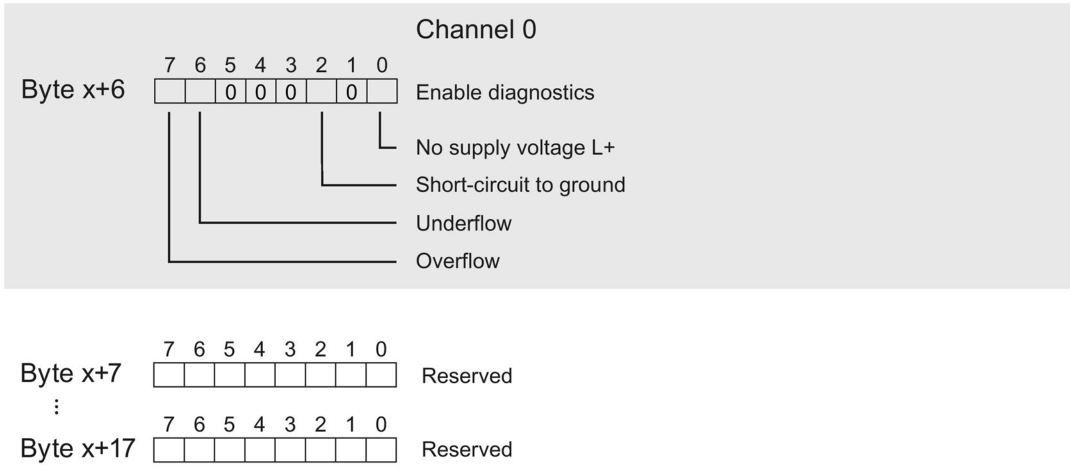
Parameters

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".





* x = 2 + (channel number × 18); channel number = 0 and 1

Image A-3 Structure of bytes x to x+17 for channels 0 and 1

Codes for measurement types

The following table contains the codes for the measuring types of the analog input module. You must enter these codes at byte x (see previous figure).

Table A- 1 Codes for measurement types

Measurement type	Code
Deactivated	0000 0000
Voltage	0000 0001

Codes for measuring ranges

The following table contains the codes for the measuring ranges of the analog input module. You enter these codes at byte x+1 (see previous figure).

Table A- 2 Codes for measuring ranges

Measurement type	Code
Voltage	
±5 V	0000 1000
±10 V	0000 1001
1 to 5 V	0000 1010
0 to 10 V	0000 1011

Error transmitting the data record

The module always checks all values of the transmitted data record. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error codes if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine if the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	I0	xx	Incorrect version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	I1	xx	Parameter error	Check the parameters of the module.

Representation of analog values B

B.1 Representation of analog values

This appendix shows the analog values for all measuring ranges that you can use with the analog input module.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its assigned parameters.

The table below shows the representation of binary analog values and of the associated decimal and hexadecimal units of the analog values.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.2 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	**Measured value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to the previous version

Compared to the previous version, this manual contains the following changes:

- Connection diagram has been updated
- Technical specifications have been updated:
- Comments on the previous version of this manual were included in the current edition.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

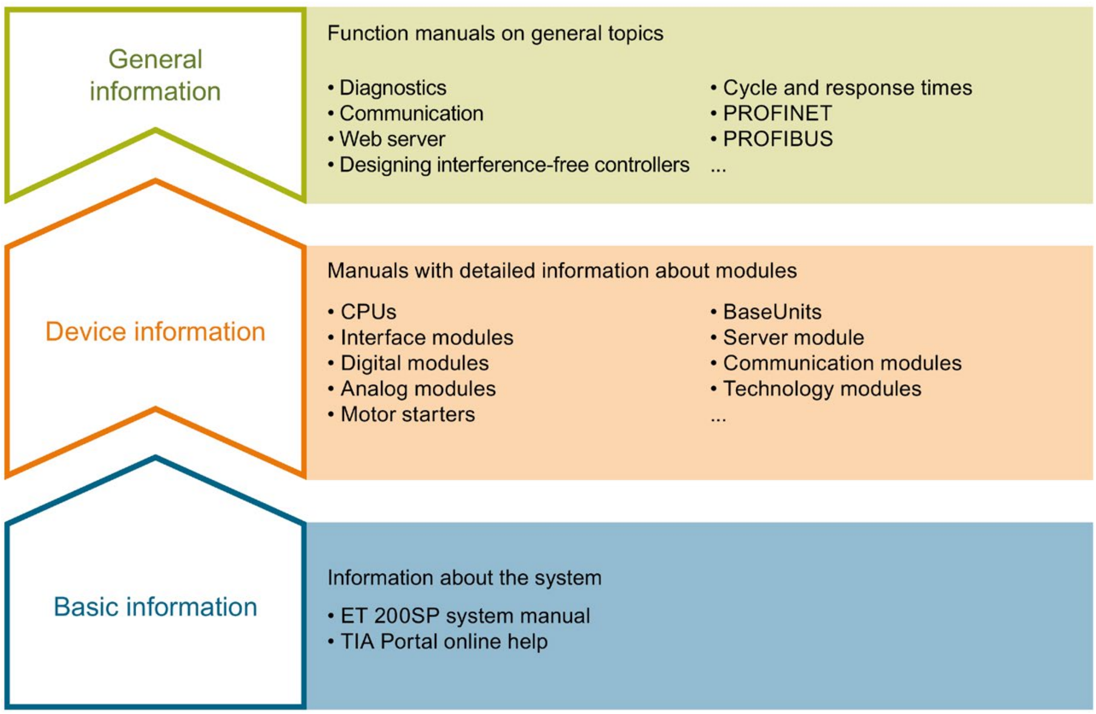
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

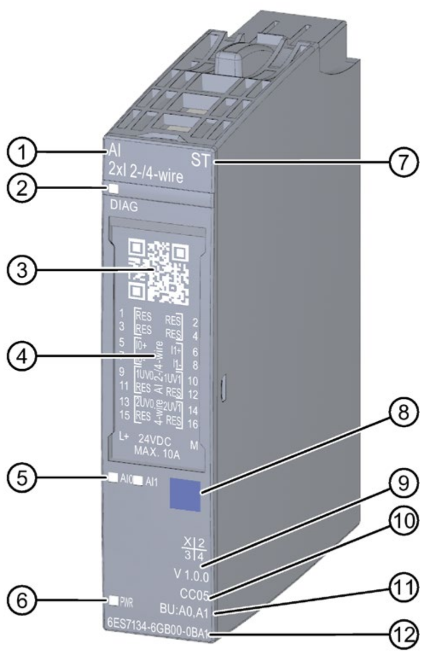
2

2.1 Properties

Article number

6ES7134-6GB00-0BA1

View of the module



①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color coding module type
③	2D matrix code	⑨	Function and firmware version
④	Wiring diagram	⑩	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the module AI 2×I 2-/4-wire ST

Properties

The module has the following technical properties:

- Analog input module with 2 inputs
- Measuring type current for 2- and 4-wire transducers
- Input ranges for current measurement:
  - 0 mA to 20 mA, resolution 15 bits
  - 4 to 20 mA, resolution 15 bits
  - ± 20 mA, resolution 16 bit incl. sign
- Electrically isolated from supply voltage L+
- Permitted common mode voltage: 10 V_{pp}/3.5 V_{rms}
- Configurable diagnostics (per module)
- Constant cycle time for processing measured values
  - 500 μs, regardless of the number of channels used and the configuration

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V1.0.0 or higher	V13 SP1 or higher	as of V5.5 SP4 with HSP 0227 V6.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V1.0.0 or higher	V13 SP1 or higher	as of V5.5 SP4 with HSP 0227 V6.0 or higher	X	X
Configuration in RUN	FS01	V1.0.0 or higher	V13 SP1 or higher	as of V5.5 SP4 with HSP 0227 V6.0 or higher	X	X
Value status	FS01	V1.0.0 or higher	V13 SP1 or higher	as of V5.5 SP4 with HSP 0227 V6.0 or higher	X	
PROFIenergy	FS01	V1.0.0 or higher	V13 SP1 or higher	as of V5.5 SP4 with HSP 0227 V6.0 or higher	X	X

You can configure the module with STEP 7 and with GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 2xI 2-/4-wire ST module with the various terminal assignments for a 2- und 4-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

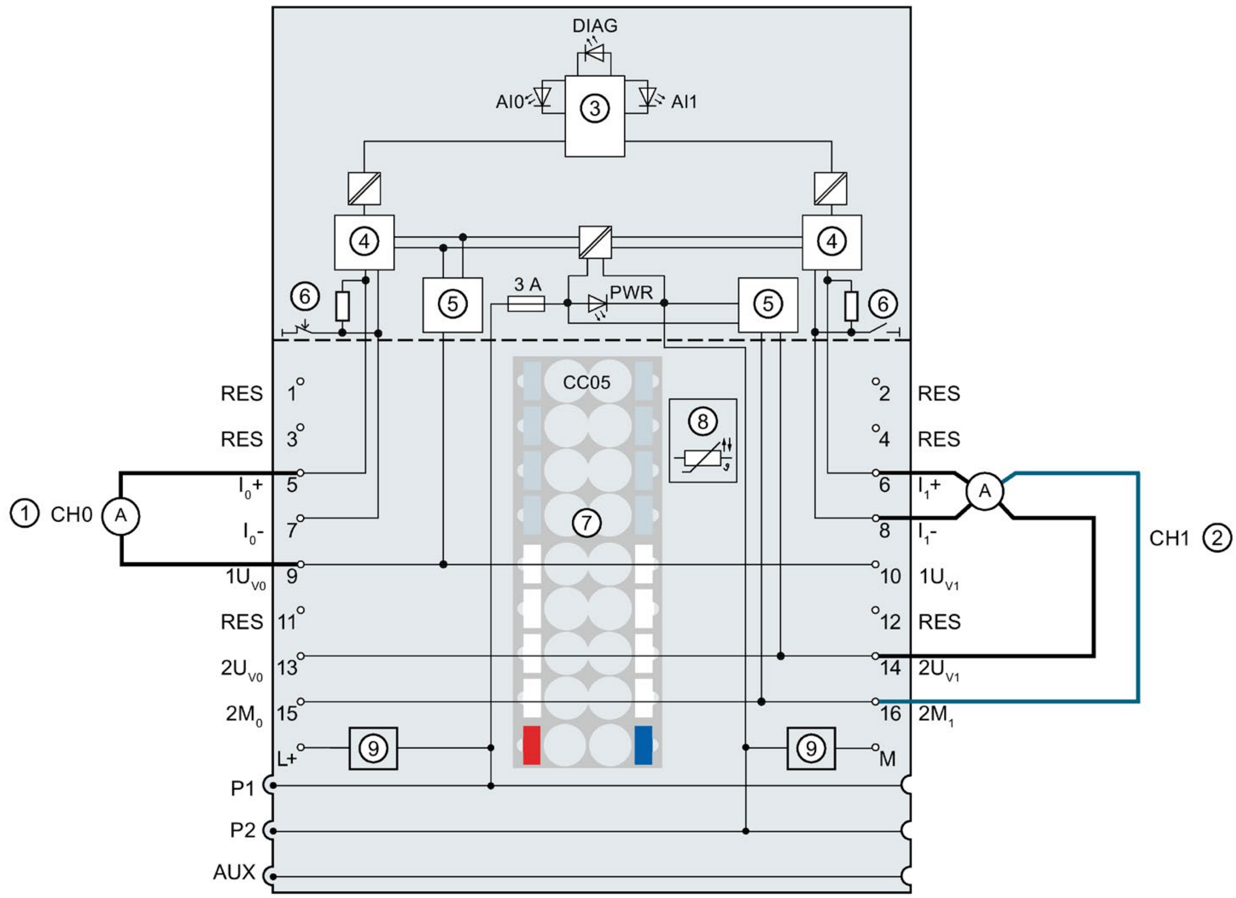
You can use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: Current measurement 2-wire and 4-wire connection (2-wire and 4-wire transducer)

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 2xI 2-/4-wire ST on the BaseUnit BU type A0/A1.



①	2-wire connection for current measurement (2-wire transducer)	I_n+	Current input positive, channel n
②	4-wire connection for current measurement (4-wire transducer)	I_n-	Current input negative, channel n
③	Backplane bus interface	$1U_{Vn}$	Supply voltage (2-wire transducer), channel n
④	Analog-to-digital converter (ADC)	$2U_{Vn}$	Supply voltage (4-wire transducer), channel n
⑤	Current limitation	$2M_n$	Reference potential (4-wire transducer)
⑥	Switchover 2-wire / 4-wire	RES	Reserve, must remain unused for future function extensions
⑦	Color-coded label with color code CC05 (optional)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑧	Temperature recording for BU type A1 only (function cannot be used for this module)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑨	Filter connection supply voltage (only when light-colored BaseUnit is present)	DIAG	Diagnostics LED (green, red)
		AI0, AI1	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for current measurement 2-wire and 4-wire connection (2-wire and 4-wire transducer)

Parameters/address space 4

4.1 Measurement types and measuring ranges

The analog input module AI 2×I 2-/4-wire ST has the following measuring ranges:

Table 4- 1 Measuring ranges

Measurement type	Measuring range	Resolution
Current (2-wire transducer)	0 to 20 mA	15 bits
	4 mA to 20 mA	15 bits
Current (4-wire transducer)	0 mA to 20 mA	15 bit
	4 mA to 20 mA	15 bits
	± 20 mA	16 bits incl. sign

You can find the tables of measuring ranges and overflow, overrange, etc. in the section Representation of analog values in the current measuring ranges (Page 38) and the "Analog value processing" function manual.

4.2 Parameters

Parameters of AI 2xI 2-/4-wire ST

During configuration of the module with STEP 7, define the properties of the module via various parameters. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of the parameter data record (Page 32).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

<table>
<tr><th rowspan="2">Parameter</th><th rowspan="2">Range of values</th><th rowspan="2">Default</th><th rowspan="2">Configuration in RUN</th><th colspan="2">Effective range with configuration software, e.g. STEP 7 (TIA Portal)</th></tr>
<tr><th>GSD file PROFINET IO</th><th>GSD file PROFIBUS DP</th></tr>
<tr><td>Diagnostics:
No supply voltage L+</td><td>• Disable
• Enable</td><td>Disable</td><td>Yes</td><td>Channel</td><td>Channel</td></tr>
<tr><td>Diagnostics:
Short-circuit to ground</td><td>• Disable
• Enable</td><td>Disable</td><td>Yes</td><td>Channel</td><td>Channel</td></tr>
<tr><td>Diagnostics:
Overflow [1]</td><td>• Disable
• Enable</td><td>Disable</td><td>Yes</td><td>Channel</td><td rowspan="2">Channel [1]</td></tr>
<tr><td>Diagnostics:
Underflow [1]</td><td>• Disable
• Enable</td><td>Disable</td><td>Yes</td><td>Channel</td></tr>
<tr><td>Diagnostics:
Wire break</td><td>• Disable
• Enable</td><td>Disable</td><td>Yes</td><td>Channel</td><td>Channel</td></tr>
</table>

Parameter	Range of values	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Measurement type/measuring range	• Deactivated • Current (4-wire transducer) 0 to 20 mA • Current (4-wire transducer) 4 to 20 mA • Current (4-wire transducer) +/- 20 mA • Current (2-wire transducer) 0 to 20 mA • Current (2-wire transducer) 4 to 20 mA	Current (4-wire transducer) 4 to 20 mA	Yes	Channel	Channel
Smoothing	• None • Weak • Medium • Strong	None	Yes	Channel	Channel
Interference frequency suppression [2]	• 60 Hz (50 ms) • 50 Hz (60 ms) [3] • 16.6 Hz (180 ms) • None	• 50 Hz (60 ms)	Yes	Channel	Module
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. The parameter length of the I/O module is 4 bytes for PROFIBUS GSD configuration. If necessary, you can set this parameter by using the data record 128, see the appendix "Parameter data record".

[2] The settings in the "Interference frequency suppression" parameter have a direct effect on the conversion time of the channel. The analog value is therefore also affected by additionally set filtering via the "Smoothing" parameter.

[3] Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

Note

Unused channels

"Deactivate" the unused channels in the parameter assignment.

A deactivated channel always returns the value $7FFF_H$.

4.3 Description of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics alarm for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics in the event of a short-circuit of the encoder supply to ground or of an input to the encoder supply.

The short-circuit and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the short-circuit diagnostics is output.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics: Wire break

Enabling of the diagnostics if the module has no current flow or has too little current for the measurement in the range of 4 mA to 20 mA.

The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the wire break diagnostics is output.

Measurement type/measuring range

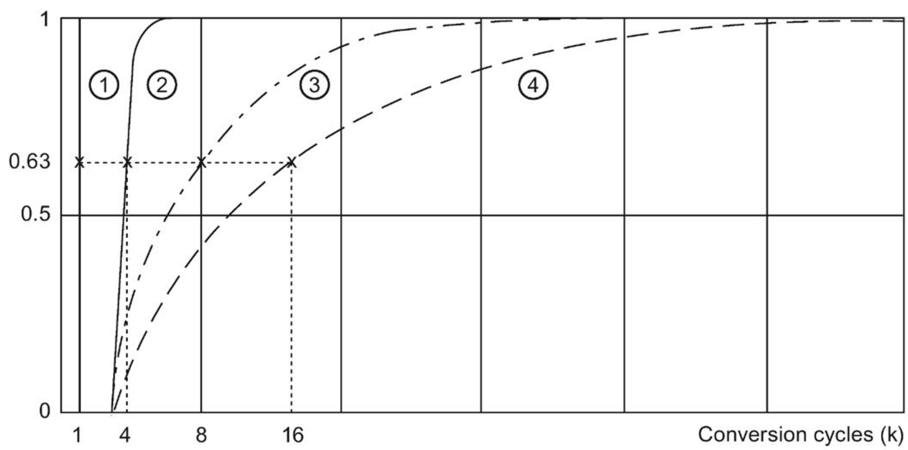
See the section Measurement types and measuring ranges (Page 16).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 4 levels.

Smoothing time = Number of conversion cycles (k) x conversion time (≙ of the integration time set in the "Interference frequency suppression" parameter) of the channel.

The following figure shows how many conversion cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This applies to every signal change at the analog input.



① No smoothing
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-1 Smoothing for AI 2×I 2-/4-wire ST

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network can negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Note:

The interference frequency suppression works parallel to the sampling of channels 0 and 1. The cycle time of the module is 500 μs regardless of the number of channels used and the configured interference frequency suppression.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 to 1 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: There are no errors on the module.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AI 2xI 2-/4-wire ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

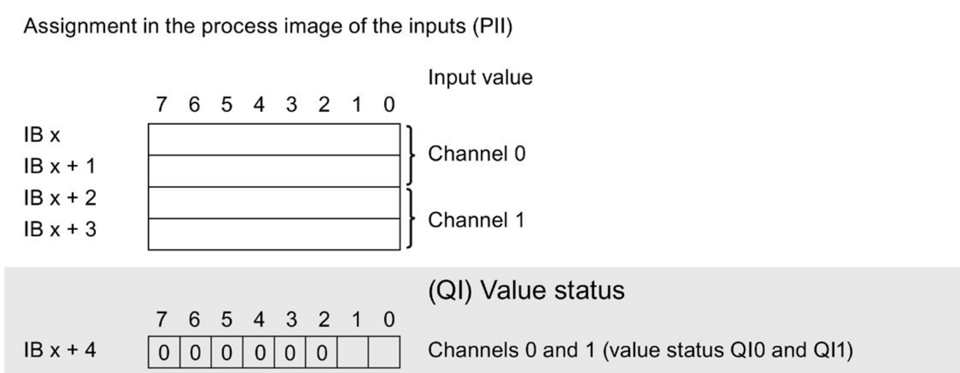


Figure 4-2 Address space of the AI 2xI 2-/4-wire ST with value status

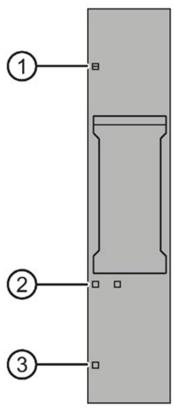
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The following figure shows you the LED display of the AI 2×I 2-/4-wire ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 26).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status	Meaning
Off	Channel disabled
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The AI 2×I 2-/4-wire ST analog input module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit (encoder supply)
- Wire break (current 4 to 20 mA)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (encoder supply) [1]	1_H	Encoder supply to ground	Correct interplay between module and encoder
		Input after encoder supply	
Wire break (current 4 to 20 mA)	6_H	Impedance of encoder circuit too high	Use a different encoder type or modify the wiring, e.g. use cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Deactivate channel • Connect the encoder contacts
High limit violated	7_H	Value is above the overrange.	Correct interplay between module and encoder
Low limit violated	8_H	Value is below the underrange.	Correct interplay between module and encoder
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies for the entire module).	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment (wire break diagnostics set only with the permitted measuring ranges).
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module does not read any process values in this state.	• Wait for firmware update. • Restart the firmware update.

[1] Since the module has no encoder supply for separate channels, a short-circuit in a channel has a permanent effect on the other channel.

6 Technical specifications

6.1 Technical specifications

Technical specifications of AI 2xI 2-/4-wire ST

Article number	6ES7134-6GB00-0BA1
General information	
Product type designation	AI 2xI 2-/4-wire ST
Firmware version	V1.0
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC05
Product function	
• I&M data	Yes; I&M0 to I&M3
• Measuring range scalable	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
• STEP 7 configurable/integrated as of version	V5.5 SP3
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	V2.3 / -
Operating mode	
• Oversampling	No
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	45 mA; without sensor supply

Article number	6ES7134-6GB00-0BA1
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes
• Output current, max.	50 mA; Total current for both channels (two-wire)
Additional 24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes; Module-wise
• Output current, max.	200 mA; Total current for both channels (four-wire)
Power loss	
Power loss, typ.	1.1 W
Address area	
Address space per module	
• Address space per module, max.	4 byte; + 1 byte for QI information
Analog inputs	
Number of analog inputs	2
• For current measurement	2
permissible input current for current input (destruction limit), max.	50 mA
Cycle time (all channels), min.	500 µs
Input ranges (rated values), currents	
• 0 to 20 mA	Yes; 15 bit
• Input resistance (0 to 20 mA)	130 Ω; 90 ohms with two wires
• -20 mA to +20 mA	Yes; 16 bit incl. sign
• Input resistance (-20 mA to +20 mA)	130 Ω
• 4 mA to 20 mA	Yes; 15 bit
• Input resistance (4 mA to 20 mA)	130 Ω; 90 ohms with two wires
Cable length	
• shielded, max.	1 000 m
Analog value generation for the inputs	
Measurement principle	Sigma Delta
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz / off

Article number	6ES7134-6GB00-0BA1
Smoothing of measured values	
• Number of smoothing levels	4
• parameterizable	Yes
• Step: None	Yes; 1x conversion time
• Step: low	Yes; 4x conversion time
• Step: Medium	Yes; 8x conversion time
• Step: High	Yes; 16x conversion time
Encoder	
Connection of signal encoders	
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.01 %
Temperature error (relative to input range), (+/-)	0.005 %/K
Crosstalk between the inputs, min.	-50 dB
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.05 %
Operational error limit in overall temperature range	
• Current, relative to input range, (+/-)	0.5 %
Basic error limit (operational limit at 25 °C)	
• Current, relative to input range, (+/-)	0.3 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	70 dB
• Common mode voltage, max.	10 V
• Common mode interference, min.	90 dB

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Measurement type	Measuring range	Diagnostics				
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow	Wire break
Deactivated		*	*	*	*	*
Current (4-wire transducer)	0 mA to 20 mA	x	x	x	x	-
	4 mA to 20 mA	x	x	x	x	x
	±20 mA	x	x	x	x	-
Current (2-wire transducer)	0 mA to 20 mA	x	x	x	-	-
	4 mA to 20 mA	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Measurement type	Measuring range	Diagnostics			
		No supply voltage L+	Short-circuit to ground	Overflow/underflow	Wire break
Deactivated		*	*	*	*
Current (4-wire transducer)	0 mA to 20 mA	x	x	x	-
	4 mA to 20 mA	x	x	x	x
	+/- 20 mA	x	x	x	-
Current (2-wire transducer)	0 mA to 20 mA	x	x	x	-
	4 mA to 20 mA	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

You can reassign the module parameters in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128 for entire module

Note

Channel 0 includes the diagnostics enable for the entire module.

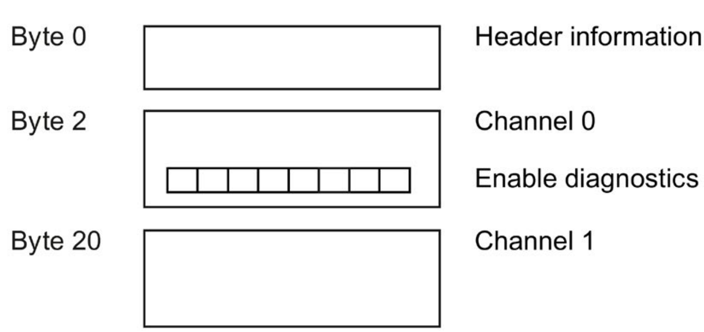

Figure A-1 Structure of data record 128 for entire module

Header information

The figure below shows the structure of the header information.

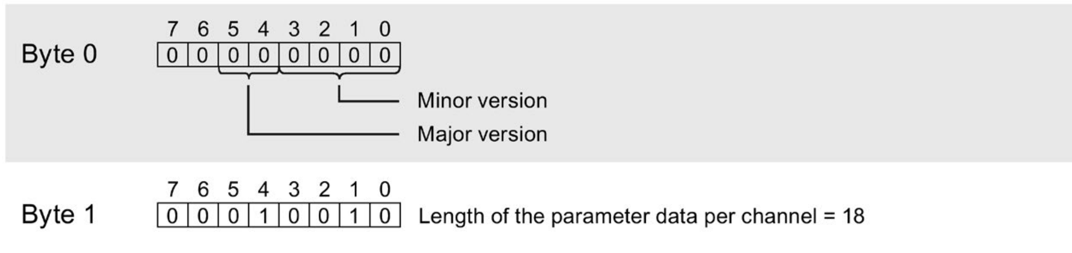

Figure A-2 Header information

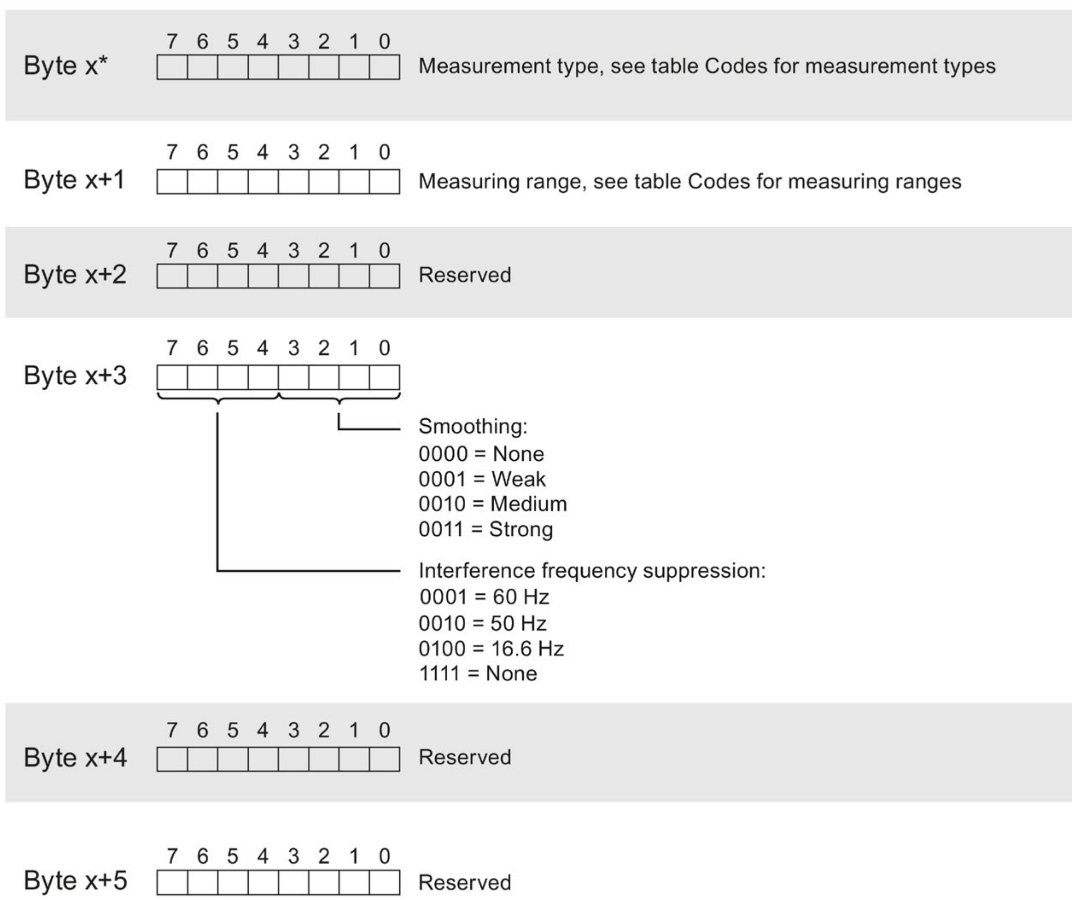
Parameters

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".



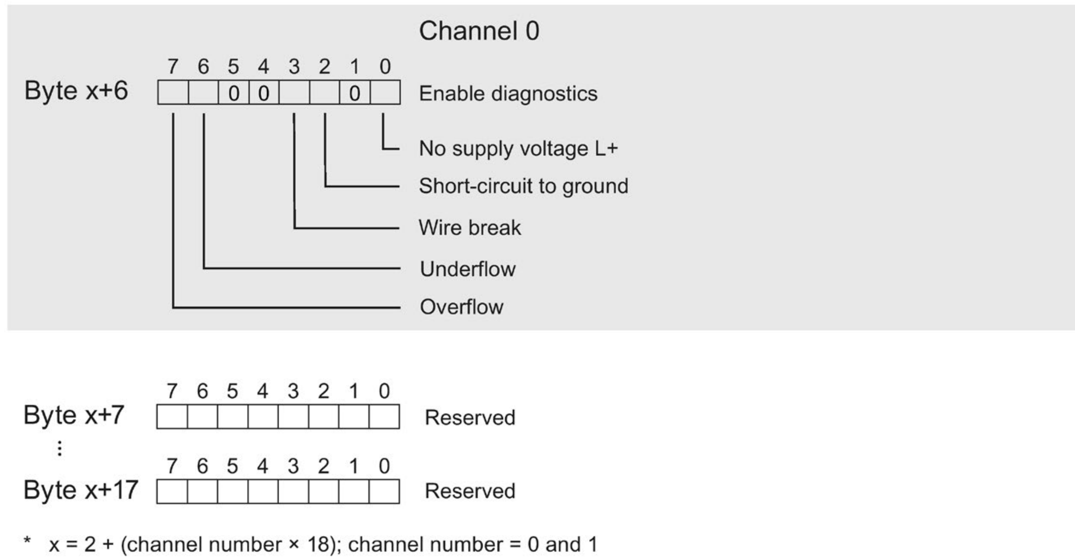


Figure A-3 Structure of bytes x to x+17 for channels 0 and 1

Codes for measurement types

The following table contains the codes for the measuring types of the analog input module. You must enter these codes in byte x (see channel parameter block figure).

Table A- 1 Codes for measurement types

Measurement type	Code
Deactivated	0000 0000
Current, 4-wire transducer	0000 0010
Current, 2-wire transducer	0000 0011

Codes for measuring ranges

The following table contains the codes for the measuring ranges of the analog input module. You must enter these codes in byte x+1 (see channel parameter block figure).

Table A- 2 Codes for measuring ranges

Measuring range	Coding
Current	
0 mA to 20 mA	0000 0010
4 mA to 20 mA	0000 0011
±20 mA	0000 0100

Error transmitting the data record

The module always checks all values of the transmitted data record. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error codes if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine if the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	I0	xx	Incorrect version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	I1	xx	Parameter error	Check the parameters of the module.

Representation of analog values — B

B.1 Representation of analog values for analog inputs

This appendix shows the analog values for all measuring ranges that you can use with the analog module.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

The table below shows the representation of binary analog values and of the associated decimal and hexadecimal units of the analog values.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.2 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table B- 3 Unipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	<-17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.3 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 4 Current measuring range ±20 mA

Values		**Current measuring range**	**Range**
Dec.	**Hex.**	**±20 mA**	
32767	7FFF	> 23.52 mA	Overflow
32511	7EFF	23.52 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	15 mA	
1	1	723.4 nA	
0	0	0 mA	
-1	FFFF		
-20736	AF00	-15 mA	
-27648	9400	-20 mA	
-27649	93FF		Underrange
-32512	8100	-23.52 mA	
-32768	8000	< -23.52 mA	Underflow

Table B- 5 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		**Current measuring range**		**Range**
Dec.	**Hex.**	**0 to 20 mA***	**4 to 20 mA**	
32767	7FFF	> 23.52 mA	> 22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	< -3.52 mA	< 1.185 mA	Underflow

* For measurement type "2-wire transducer", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Wiring and block diagram for current measurement 2-wire and 4-wire connection has been changed.

Conventions

CPU: When the term "CPU" is used in the following, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

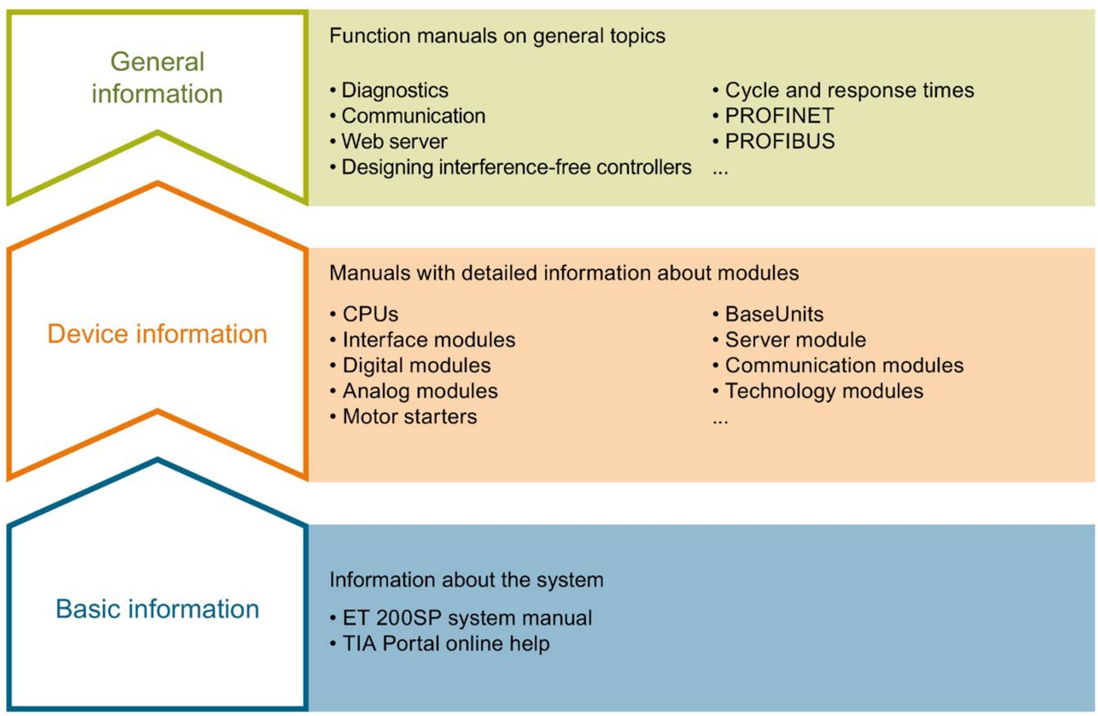
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation Guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the AI 2×U/I 2-/4-wire HS module

Properties

The module has the following technical properties:

- Analog input module with 2 inputs
- Measurement types voltage and current for 2-/4-wire transducers
- Input ranges for voltage measurement:
  - ±10 V, resolution 16 bit including sign
  - ±5 V, resolution 15 bit incl. sign
  - 1 to 5 V, resolution 13 bit
  - 0 to 10 V, resolution 15 bit
- Input ranges for current measurement:
  - ±20 mA, resolution 16 bit incl. sign
  - 4 to 20 mA, resolution 14 bit
  - 0 to 20 mA, resolution 15 bit
- Electrically isolated between the channels
- Electrically isolated from supply voltage L+
- Permitted common mode voltage: 100 V_{pp}/35 V_{rms}
- Configurable diagnostics (per channel)
- Hardware interrupt on limit violation can be set per channel (two high and two low limits per channel)

The module supports the following functions:

- Firmware update
- I&M identification data
- Reconfiguration in RUN
- PROFIenergy

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of
Basic version	1	V1.0.0
Isochronous mode with send clock up to 250 µs	2	V1.1.0
Value status	2	V1.1.0
Oversampling channel 0	2	V1.1.0
Oversampling channel 0 and 1	2	V2.0.0
Isochronous mode with send clock up to 125 µs	2	V2.0.1

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Connecting 3

3.1 Wiring and block diagram

This section contains the block diagram of the AI 2xU/I 2-/4-wire HS module with the various terminal assignments for a 2-wire and 4-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

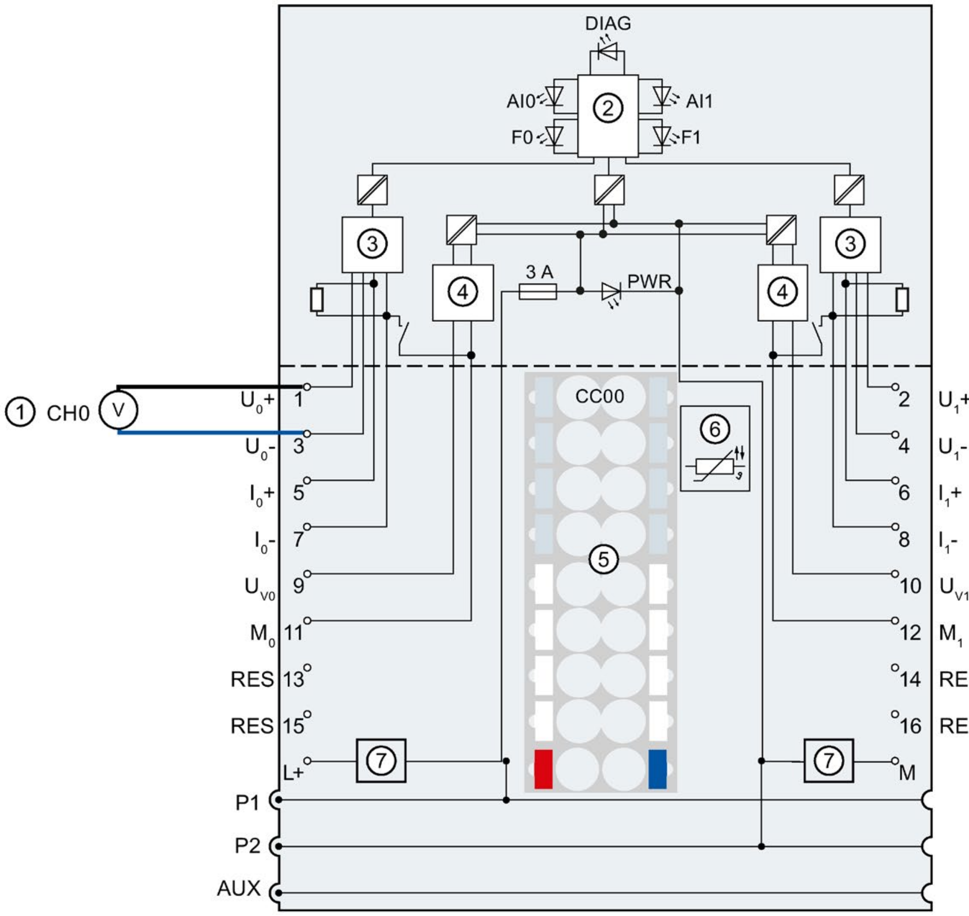
You can use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.

Wiring: Voltage measurement 2-wire connection

The following figure shows the block diagram and an example for the terminal assignment of the analog input module AI 2xU/I 2-/4-wire HS on the BaseUnit BU type A0/A1.

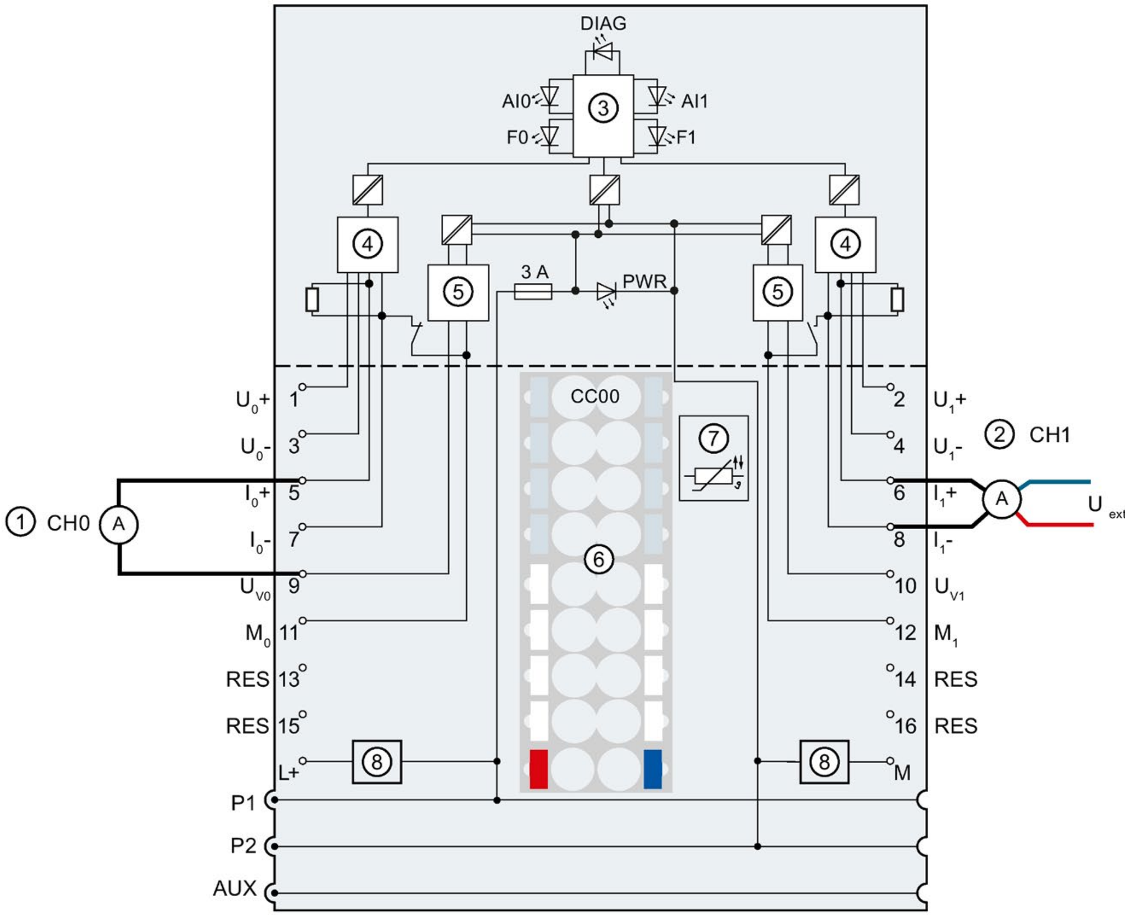


①	2-wire connection for voltage measurement	U_{Vn}	Supply voltage, channel n
②	Backplane bus interface	RES	Reserve, must remain unused for future function extensions
③	Analog-to-digital converter (ADC)	M_n	Reference ground to U_{Vn}, channel n
④	Current limitation	L+	24 V DC (infeed only with light BaseUnit)
⑤	Color identification label CCxx (optional)	M	Ground
⑥	Temperature recording for BU type A1 only (function cannot be used for this module)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
⑦	Supply voltage filter circuit (only when light BaseUnit is present)	DIAG	Diagnostics LED (green, red)
U_n+	Voltage input positive, channel n	AI0, AI1	Channel status LED (green)
U_n-	Voltage input negative, channel n	F0, F1	Channel fault LED (red)
I_n+	Current input positive, channel n	PWR	Power LED (green)
I_n-	Current input negative, channel n		

Figure 3-1 Wiring and block diagram for voltage measurement 2-wire connection

Wiring: Current measurement 2-wire and 4-wire connection

The following figure shows the block diagram and an example for the terminal assignment of the analog input module AI 2xU/I 2-/4-wire HS on the BaseUnit BU type A0/A1.



①	2-wire connection for current measurement	U_n+	Voltage input positive, channel n
②	4-wire connection for current measurement	U_n-	Voltage input negative, channel n
③	Backplane bus interface	U_{Vn}	Supply voltage, channel n
④	Analog-to-digital converter (ADC)	RES	Reserve, must remain unused for future function extensions
⑤	Current limitation	M_n	Reference ground to U_{Vn}, channel n
⑥	Color identification label CCxx (optional)	L+	24 V DC (infeed only with light BaseUnit)
⑦	Temperature recording for BU type A1 only (function cannot be used for this module)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
⑧	Supply voltage filter circuit (only when light BaseUnit is present)	DIAG	Diagnostics LED (green, red)

I_n+	Current input positive, channel n	F0, F1	Channel fault LED (red)
I_n-	Current input negative, channel n	PWR	Power LED (green)

Figure 3-2 Wiring and block diagram for current measurement 2-wire and 4-wire connection

Parameters/address space 4

4.1 Measurement types and measuring ranges

The analog input module AI 2×U/I 2/4-wire HSF has the following measuring ranges:

Table 4- 1 Measuring ranges

Measurement type	Measuring range	Resolution
Voltage	±10 V	16 bit incl. sign
	±5 V	15 bit incl. sign
	0 to 10 V	15 bit
	1 to 5 V	13 bit
Current (2-/4-wire transducers)	±20 mA [1]	16 bit incl. sign
	0 to 20 mA	15 bit
	4 to 20 mA	14 bit

You can find the tables of measuring ranges and overflow, overrange, etc. in the section Representation of analog values (Page 45) and the "Analog Value Processing" function manual.

[1] Measuring range "+/-20 mA" is only possible with the measurement type "Current (4-wire transducer)".

4.2 Parameters

Parameters of the AI 2xU/I 2/4-wire HS

The effective range of the parameters depends on the type of configuration. The following configurations are possible:

- Central operation on an ET 200SP CPU or on an ET 200SP Open Controller
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

In addition to assigning parameters with the configuration software, you can also set the parameters in RUN mode (dynamically) using the user program. When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records; see section Parameter assignment and structure of parameter data record (Page 39).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	**GSD file PROFIBUS DP**
Sampling rate	1 value/cycle	1 value/cycle	No	Module	Module
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Overflow	• Disable • Enable	Disable	Yes	Channel	Channel [1]
Diagnostics: Underflow	• Disable • Enable	Disable	Yes	Channel	
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Channel	Channel
Type/range of measurement	• Deactivated • Voltage 1 to 5 V • Voltage +/- 5 V • Voltage +/- 10 V • Voltage 0 to 10 V • Current (4-wire transducer) 0 to 20 mA • Current (4-wire transducer) +/- 20 mA • Current (4-wire transducer) 4 to 20 mA • Current (2-wire transducer) 0 to 20 mA • Current (2-wire transducer) 4 to 20 mA	Current (4-wire transducer) 4 to 20 mA	Yes	Channel	Channel
Smoothing	• None • 2 times • 4 times • 8 times • 16 times • 32 times • 64 times	None	Yes	Channel	Channel

Parameter	Value range	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Hardware interrupt high limit 1	• Disable • Enable	Disable	Yes	Channel	- [1]
Hardware interrupt low limit 1	• Disable • Enable	Disable	Yes	Channel	
Hardware interrupt high limit 2	• Disable • Enable	Disable	Yes	Channel	
Hardware interrupt low limit 2	• Disable • Enable	Disable	Yes	Channel	
High limit 1	• Value	27648	Yes	Channel	Channel [1]
Low limit 1	• Value	0	Yes	Channel	
High limit 2	• Value	27648	Yes	Channel	
Low limit 2	• Value	0	Yes	Channel	
Potential group	• Use potential group of the left module (dark-colored BaseUnit) • Enable new potential group (light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 4 bytes.

Note

Unused channels

"Deactivate" the unused channels in the parameter assignment.

A deactivated channel always returns the value $7FFF_H$.

4.3 Description of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics alarm for missing or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics in the event of a short-circuit of the encoder supply to ground or of an input to the encoder supply. A short-circuit is also detected in the range of 1 to 5 V if the input signal is short-circuited or the input is not connected.

The short-circuit and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the short-circuit diagnostics is output.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics: Wire break

Enabling of the diagnostics if the module has no current flow or has too little current for the measurement in the range of 4 mA to 20 mA.

The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the wire break diagnostics is output.

Measurement type/measuring range

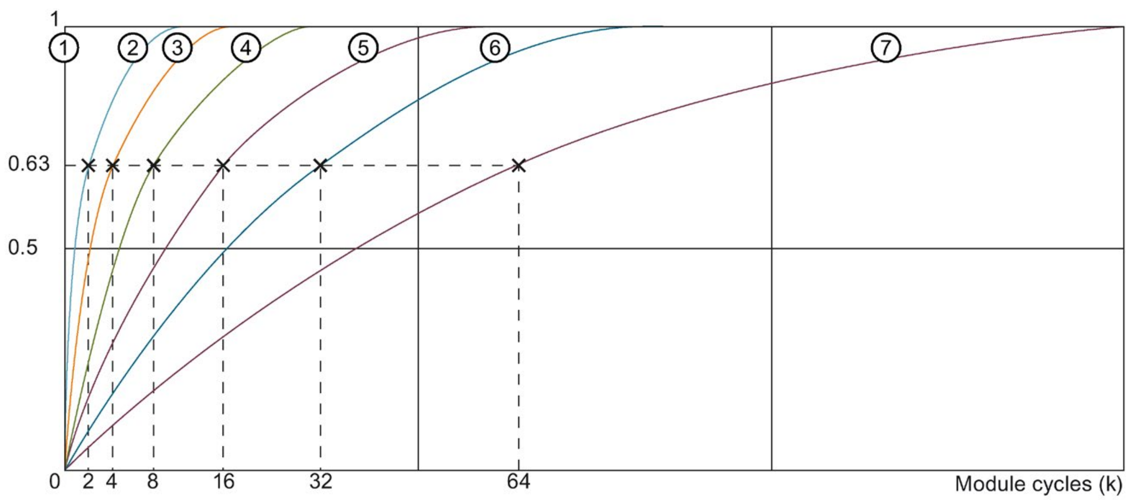
See the section Measurement types and measuring ranges (Page 16).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 7 levels.

Smoothing time = number of module cycles (k) × cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This is valid for all signal changes at the analog input.



① No smoothing
② 2x smoothing
③ 4x smoothing
④ 8x smoothing
⑤ 16x smoothing
⑥ 32x smoothing
⑦ 64x smoothing

Figure 4-1 Smoothing with AI 2×U/I 2-/4-wire HS

Potential group

You can use the "Potential group" parameter to specify whether the module is inserted in a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the dark-colored BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

4.4 Oversampling

Function

Oversampling is the acquisition of data in constant bus cycle segments (sub-cycles). The configured number n of sub-cycles corresponds to one PROFINET bus cycle.

Oversampling is useful whenever you require acquisition of data with high time resolution but without using an extremely short PROFINET bus cycle and thus fast CPU cycles.

With oversampling, a PROFINET bus cycle is divided into constant bus sub-cycles:

- One measured value is acquired in each sub-cycle.
- The minimum PROFINET bus cycle is 250 μs. Only a subset of functions is available for shorter sub-cycles.
- The shortest possible sub-cycle is 50 μs.
- You can configure oversampling:
  - For channel 0 (1-channel operation)
  - For channel 0/1 (2-channel operation)
- The number of sub-cycles can be set as follows:
  - From 2 to 16 for one channel
  - From 2 to 8 for two channels

Requirement

Oversampling is only possible when isochronous mode is set.

Configuration

You configure oversampling with the following parameter:

- Sampling rate

Note

Do not use a reduction ratio for blocks in the case of configuration with oversampling in the runtime groups of your user program. This will ensure that the data processing in the user program of the CPU is synchronized with the acquisition on the module.

Overview of the operating modes

Function	Normal operation	Oversampling in normal operation		Oversampling in high-speed	
		1-channel operation	2-channel operation	1-channel operation	2-channel operation
Isochronous mode	Yes, optional	Yes, required		Yes, required	
• Shortest send clock	125 µs	500 µs		250 µs	
Oversampling	No	Yes		Yes	
• Number of oversampling levels (sampling rate)	-	2 to 16	2 to 8	2 to 16	2 to 8
• Shortest sub-cycle (= shortest sampling time)	-	250 µs		50 µs	
Hardware interrupt	x	-		-	
Smoothing	x	x		-	
±10 V	x	x		x	
0 to 10 V	x	x		-	
±5 V	x	x		-	
1 to 5 V	x	x		-	
±20 mA	x	x		x	
0 to 20 mA	x	x		-	
4 to 20 mA	x	x		-	
Overflow/underflow	x	x		x[1)]	
Wire break 4 to 20 mA	x	x		-	
Short-circuit (1 to 5 V)	x	x		-	
Short-circuit encoder supply with current measuring ranges	x	x		x	
Load voltage diagnostics	x	x		x	
Value status (QI)	x	-		-	
Address space	4 bytes	32 bytes		32 bytes	

[1] For product version 1, the result must be present for at least one fieldbus cycle + 250 µs for a reliable detection of the diagnostics (overflow/underflow) as of firmware version 1.x.

Sampling interval

The duration of a subcycle is the sampling interval. The cycle time T (send clock) for isochronous mode is specified in the configuration software. This time, divided by the configured sampling rate n_{Sample}, yields the sampling interval t_{Sample} of the module.

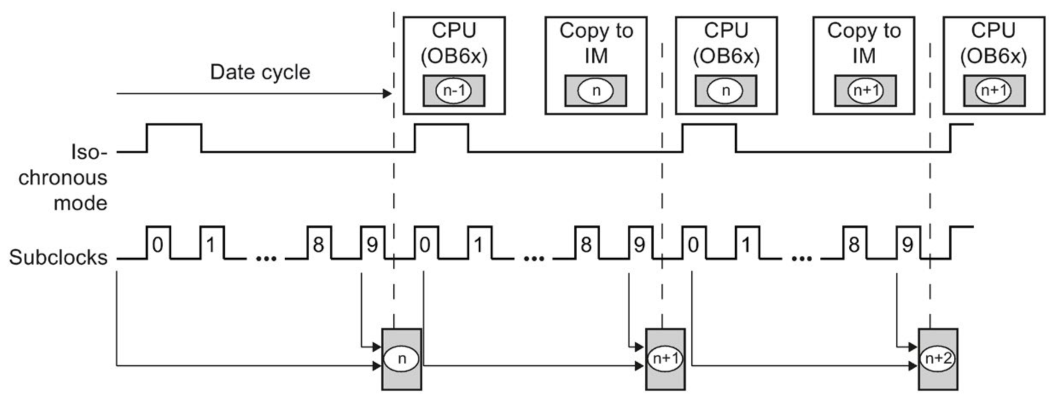
Example calculation:

$$t_{Sample} = \frac{T}{n_{Sample}} = \frac{1\text{ ms}}{16} = 62{,}5\ \mu s$$

Figure 4-2 Example of calculating the sampling interval

Chronological sequence

The figure shows the chronological sequence for oversampling. The acquired measured vales of a data cycle with oversampling are only copied to the interface module in the subsequent bus cycle and are then available to the processing CPU one bus cycle later.



① n = measured values from bus cycle n

Figure 4-3 Oversampling

4.5 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the analog module. Bits 0 to 1 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit =1: No fault is present on the channel.

Bit =0: The wiring, the value created on the channel, or similar is incorrect.

Address space

The following figure shows the assignment of the address space for the AI 2xU/I 2-/4-wire HS with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

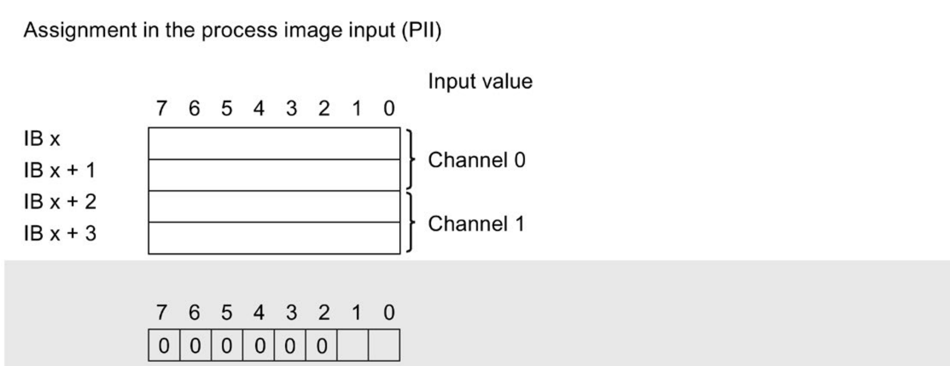


Figure 4-4 Address space of the AI 2xU/I 2-/4-wire HS with value status

Address space of the AI 2×U/I 2-/4-wire HS for oversampling with one channel

The following figure shows the assignment of the address space for oversampling with one channel. Writing always starts from IB x. If fewer than 16 sub-cycles are set, the addresses that are then unused are filled with $7FFF_H$.

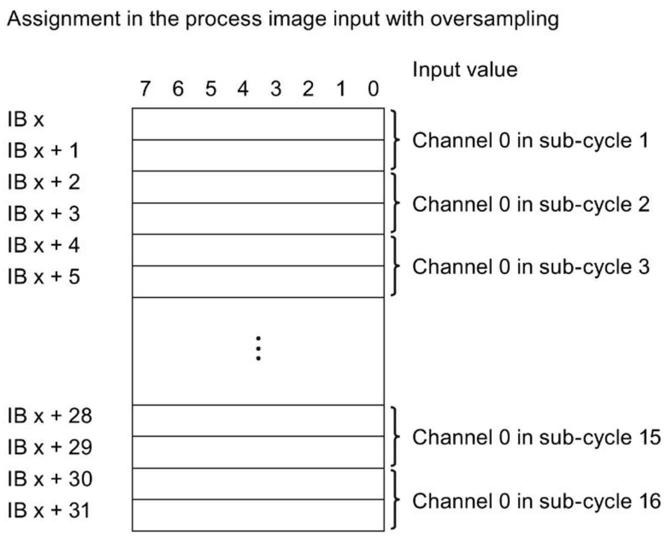

Figure 4-5 Address space of AI 2xU/I 2-/4-wire HS for oversampling with one channel

Address space of the AI 2×U/I 2-/4-wire HS for oversampling with two channels

The following figure shows the assignment of the address space for oversampling with two channels. Writing always starts from IB x. Only a maximum of 8 sub-cycles are possible. If fewer than 8 sub-cycles are set, the addresses that are then unused are filled with $7FFF_H$.

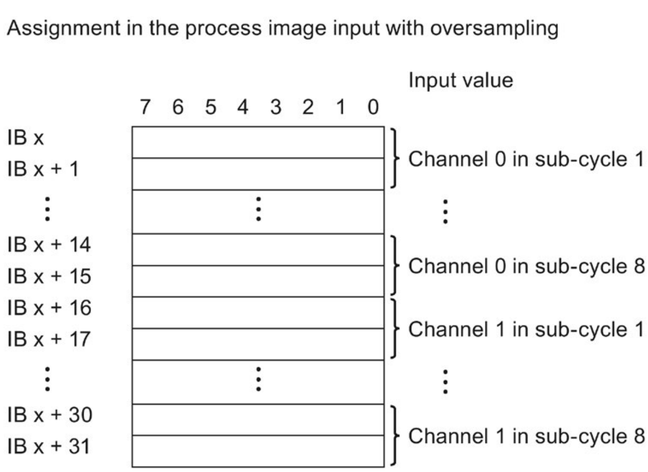

Figure 4-6 Address space of AI 2xU/I 2-/4-wire HS for oversampling with two channels

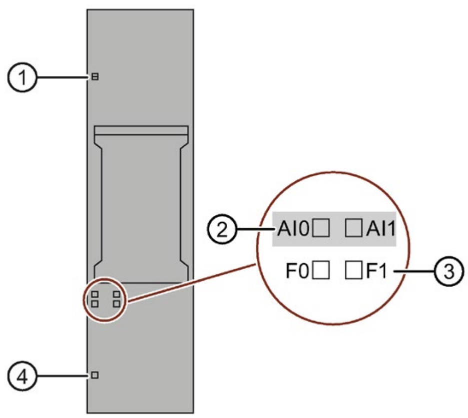
Interrupts/diagnostics interrupts 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays of the AI 2×U/I 2-/4-wire HS.



① DIAG (green/red)
② Channel status (green)
③ Channel fault (red)
④ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following tables contain the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 30).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status/channel fault LED

Table 5- 2 Status/error display of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Channel deactivated or no load voltage L+
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
On	On	Not permitted (error)

PWR LED

Table 5- 3 Status display of the PWR LED

PWR	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The analog input module AI 2×U/I 2-/4-wire HS supports hardware and diagnostic interrupts.

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- Low limit 1 violated
- High limit 1 violated
- Low limit 2 violated
- High limit 2 violated

If an interrupt occurs, a corresponding interrupt OB is called in the CPU of the IO controller.

S7-1500

Detailed information on the event is available in the STEP 7 online help.

The block interface is shown here with optimized block access, which is set in the TIA Portal by default.

Name	Data type	Comment
LADDR	HW_IO	Hardware identifier of the module triggering the interrupt
USI	WORD	USI (High/Low)
IChannel	USInt	Channel that triggered the hardware interrupt
EventType	Byte	Error event

S7-300/400 or a different CPU

You can obtain detailed information on the event in the hardware interrupt organization block with the instruction "RALARM" (read additional interrupt info) and in the STEP 7 online help.

The channel of the module that triggered the hardware interrupt is entered in the start information of OB4x in the OB4x_POINT_ADDR tag. The following figure shows the assignment to the bits of double word 8 in local data.

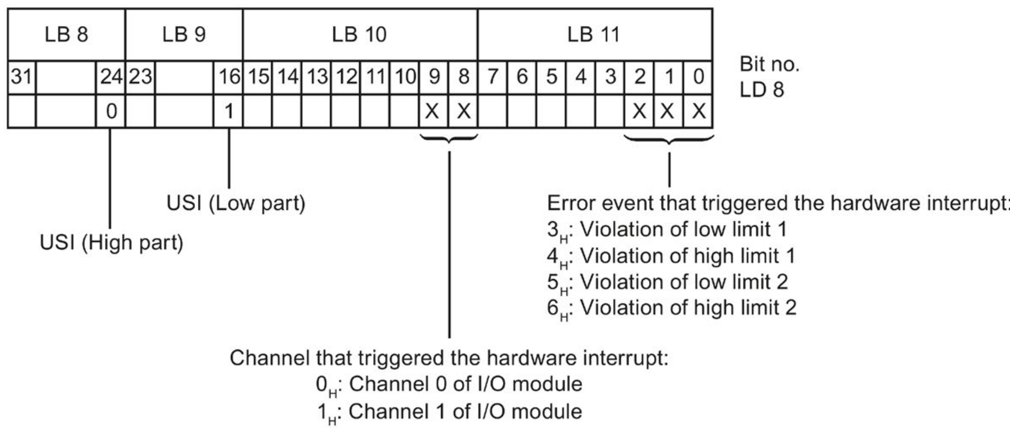


Figure 5-2 OB4x_POINT_ADDR tag

Structure of the additional interrupt information

Table 5- 4 Structure of USI = W#16#0001

Data block name		Content	Comment	Bytes
USI		W#16#0001	User Structure Identifier: Additional interrupt info for hardware interrupts of the I/O module	2
The channel that triggered the hardware interrupt follows.				
	Channel	B#16#00 to B#16#01	Channel 0 and 1 of the I/O module	1
The error event that triggered the hardware interrupt follows.				
	Error event	B#16#03	Low limit 1 violated	1
		B#16#04	High limit 1 violated	
		B#16#05	Low limit 2 violated	
		B#16#06	High limit 2 violated	

Diagnostics interrupt

The module generates a diagnostics interrupt at the following events:

- Short-circuit (current and voltage 1 to 5 V)
- Wire break (current)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- No load voltage
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (current)	1_H	Encoder supply to ground	Correct interplay between module and encoder
		Input after encoder supply	
Short-circuit (1 to 5 V)	1_H	Short circuit of input signal	Correct interplay between module and encoder
		Open input	Connect input
Wire break (current)	6_H	Impedance of encoder circuit too high	Use a different encoder type or modify the wiring, for example, using cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Deactivate diagnostics • Connect the encoder contacts
High limit violated	7_H	Value is above overrange.	Correct the output value
Low limit violated	8_H	Value is below underrange.	Correct the output value
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies for the entire module).	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment (wire break diagnostics set only with the permitted measuring ranges).

Diagnostics alarm	Error code	Meaning	Solution
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module does not read any process values in this state.	• Wait for firmware update • Restart the firmware update

6 Technical specifications

6.1 Technical specifications

Technical specifications of AI 2xU/I 2-/4-wire HS

The following table shows the technical specifications as of 09/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6HB00-0DA1/td?dl=en).

Article number	6ES7134-6HB00-0DA1
General information	
Product type designation	AI 2xU/I 2-/4-wire HS
Firmware version	V2.0.1
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
• Measuring range scalable	No
• Scalable measured values	No
• Adjustment of measuring range	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
• STEP 7 configurable/integrated as of version	V5.5 SP3 / -
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• Oversampling	Yes; 2 channels per module
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	No

Article number	6ES7134-6HB00-0DA1
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	39 mA; without sensor supply
24 V encoder supply	
• 24 V	Yes; For current measurement
• Short-circuit protection	Yes
• Output current, max.	20 mA; max. 50 mA per channel for a duration < 10 s
Power loss	
Power loss, typ.	0.95 W; without sensor supply
Address area	
Address space per module	
• Address space per module, max.	4 byte; + 1 byte for QI information (32 bytes in the oversampling operating mode)
Hardware configuration	
Selection of BaseUnit for connection variants	
• 2-wire connection	BU type A0, A1
• 4-wire connection	BU type A0, A1
Analog inputs	
Number of analog inputs	2; Differential inputs
• For current measurement	2
• For voltage measurement	2
permissible input voltage for voltage input (destruction limit), max.	30 V
permissible input current for current input (destruction limit), max.	50 mA
Cycle time (all channels), min.	125 µs
Analog input with oversampling	Yes
• Values per cycle, max.	16
• Resolution, min.	50 µs

Article number	6ES7134-6HB00-0DA1
Input ranges (rated values), voltages	
• 0 to +10 V	Yes; 15 bit
• Input resistance (0 to 10 V)	75 kΩ
• 1 V to 5 V	Yes; 13 bit
• Input resistance (1 V to 5 V)	75 kΩ
• -10 V to +10 V	Yes; 16 bit incl. sign
• Input resistance (-10 V to +10 V)	75 kΩ
• -5 V to +5 V	Yes; 15 bit incl. sign
• Input resistance (-5 V to +5 V)	75 kΩ
Input ranges (rated values), currents	
• 0 to 20 mA	Yes; 15 bit
• Input resistance (0 to 20 mA)	130 Ω
• -20 mA to +20 mA	Yes; 16 bit incl. sign
• Input resistance (-20 mA to +20 mA)	130 Ω
• 4 mA to 20 mA	Yes; 14 bit
• Input resistance (4 mA to 20 mA)	130 Ω
Cable length	
• shielded, max.	1 000 m; 200 m for voltage measurement
Analog value generation for the inputs	
Measurement principle	Actual value encryption (successive approximation)
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Interference voltage suppression for interference frequency f1 in Hz	No
• Conversion time (per channel)	10 µs
Smoothing of measured values	
• Number of smoothing levels	7; none; 2-/4-/8-/16-/32-/64-fold
• parameterizable	Yes

Article number	6ES7134-6HB00-0DA1
Encoder	
Connection of signal encoders	
• for voltage measurement	Yes
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.03 %
Temperature error (relative to input range), (+/-)	0.01 %/K
Crosstalk between the inputs, min.	-50 dB
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.1 %
Operational error limit in overall temperature range	
• Voltage, relative to input range, (+/-)	0.3 %
• Current, relative to input range, (+/-)	0.3 %
Basic error limit (operational limit at 25 °C)	
• Voltage, relative to input range, (+/-)	0.2 %
• Current, relative to input range, (+/-)	0.2 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Common mode voltage, max.	35 V
• Common mode interference, min.	90 dB
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Filtering and processing time (TCI), min.	80 µs
Bus cycle time (TDP), min.	125 µs; Starting from firmware Version V2.0.1
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes; two upper and two lower limit values in each case

Article number	6ES7134-6HB00-0DA1
Diagnostic messages	
• Wire-break	Yes; channel-by-channel, at 4 to 20 mA only
• Short-circuit	Yes; channel-by-channel, at 1 to 5 V or for current measuring ranges short-circuit in encoder supply
• Group error	Yes
• Overflow/underflow	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	Yes
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	75 V DC/60 V AC
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	32 g

Dimension drawing

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Measurement type	Measuring range	Diagnostics					Hardware interrupts
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow	Wire break	
Deactivated		*	*	*	*	*	*
Voltage	1 to 5 V	x	x	x	x	-	x
	±5 V	x	-	x	x	-	x
	±10 V	x	-	x	x	-	x
	0 to 10 V	x	-	x	x	-	x
Current (4-wire transducer)	0 to 20 mA	x	x	x	x	-	x
	±20 mA	x	x	x	x	-	x
	4 to 20 mA	x	x	x	x	x	x
Current (2-wire transducer)	0 to 20 mA	x	x	x	-	-	x
	4 to 20 mA	x	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Measurement type	Measuring range	Diagnostics				Hardware interrupts
		No supply voltage L+	Short-circuit to ground	Overflow/underflow	Wire break	
Deactivated		*	*	*	*	*
Voltage	1 to 5 V	x	x	x	-	-
	+/- 5 V	x	-	x	-	-
	+/- 10 V	x	-	x	-	-
	0 to 10 V	x	-	x	-	-
Current (4-wire transducer)	0 to 20 mA	x	x	x	-	-
	+/- 20 mA	x	x	x	-	-
	4 to 20 mA	x	x	x	x	-
Current (2-wire transducer)	0 to 20 mA	x	x	x	-	-
	4 to 20 mA	x	x	x	x	-

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

The module can be re-configured in RUN (for example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels).

Note

Following a firmware update, you need to re-configure the I/O module before you can use the new functions.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment results in a brief exit from clocked measuring mode and renewed synchronization with the fieldbus cycle. The slowest channel provides the "internal" measuring cycle.

STATUS output parameter

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128 for entire module

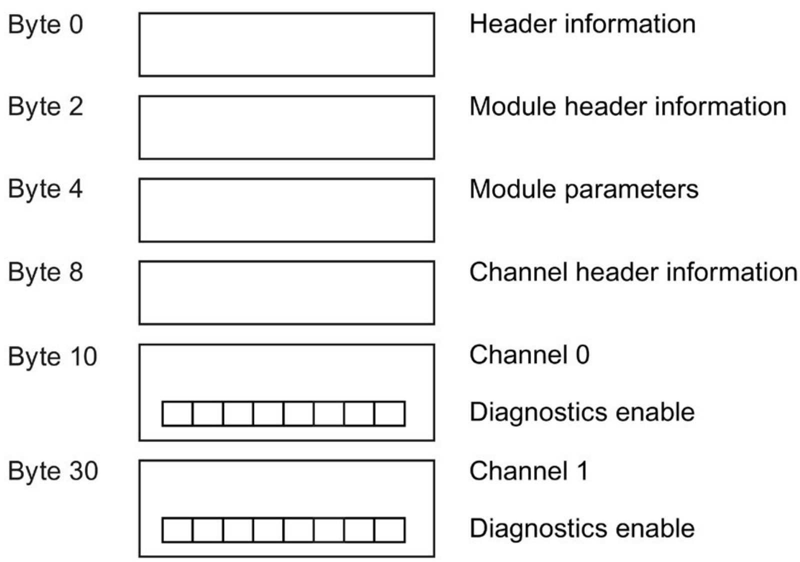

Figure A-1 Structure of data record 128 for entire module

Header information

The figure below shows the structure of the header information.

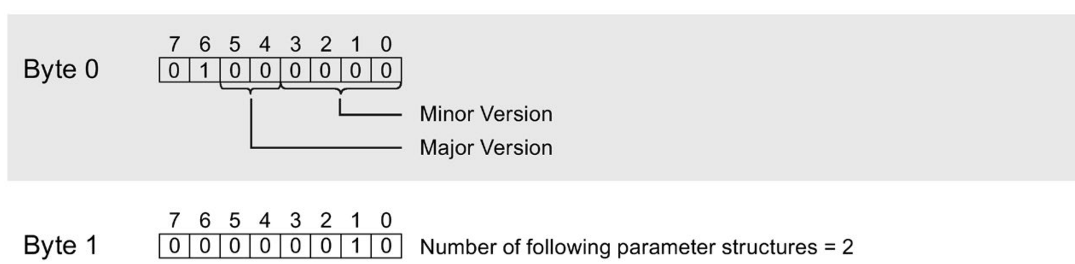

Figure A-2 Header information

Module header information

The figure below shows the structure of the module header information.

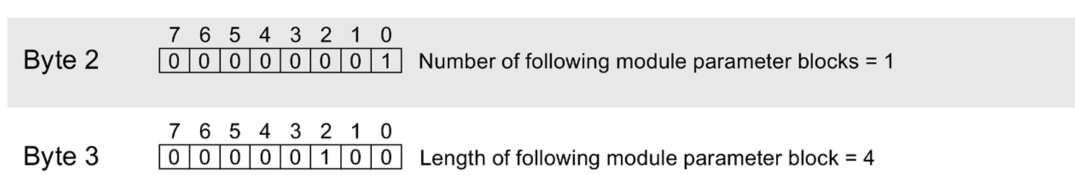

Figure A-3 Module header information

Module parameter block

Enable a parameter by setting the corresponding bit to "1".

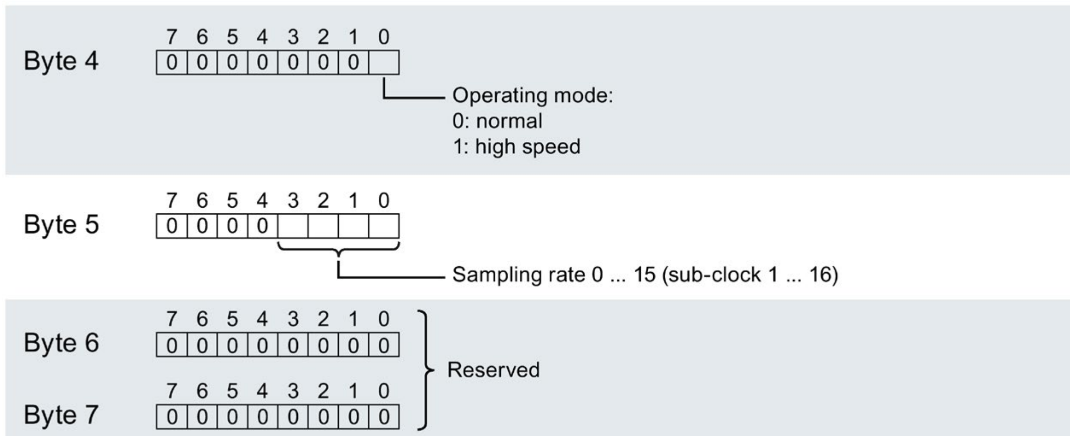

Figure A-4 Module parameter block

Channel header information

The figure below shows the structure of the channel header information.

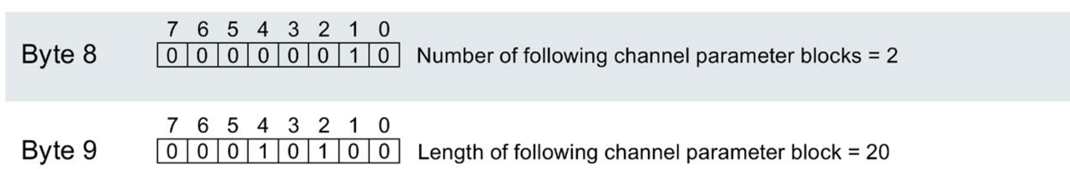

Figure A-5 Channel header information

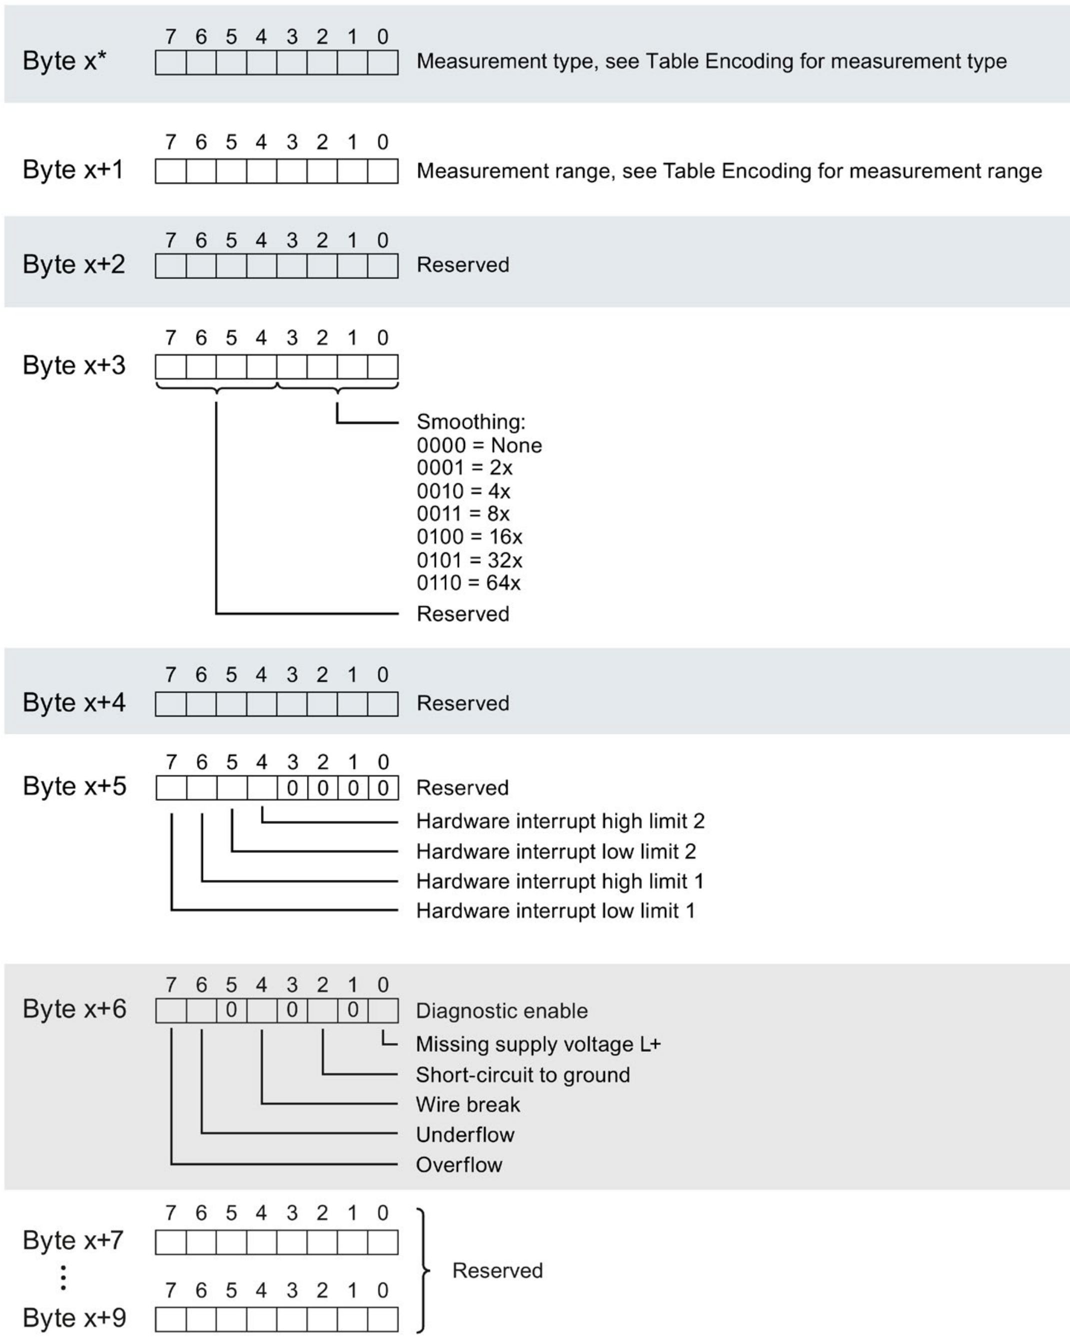
Channel parameter block

The figure below shows the structure of the channel parameter block.

Enable a parameter by setting the corresponding bit to "1".



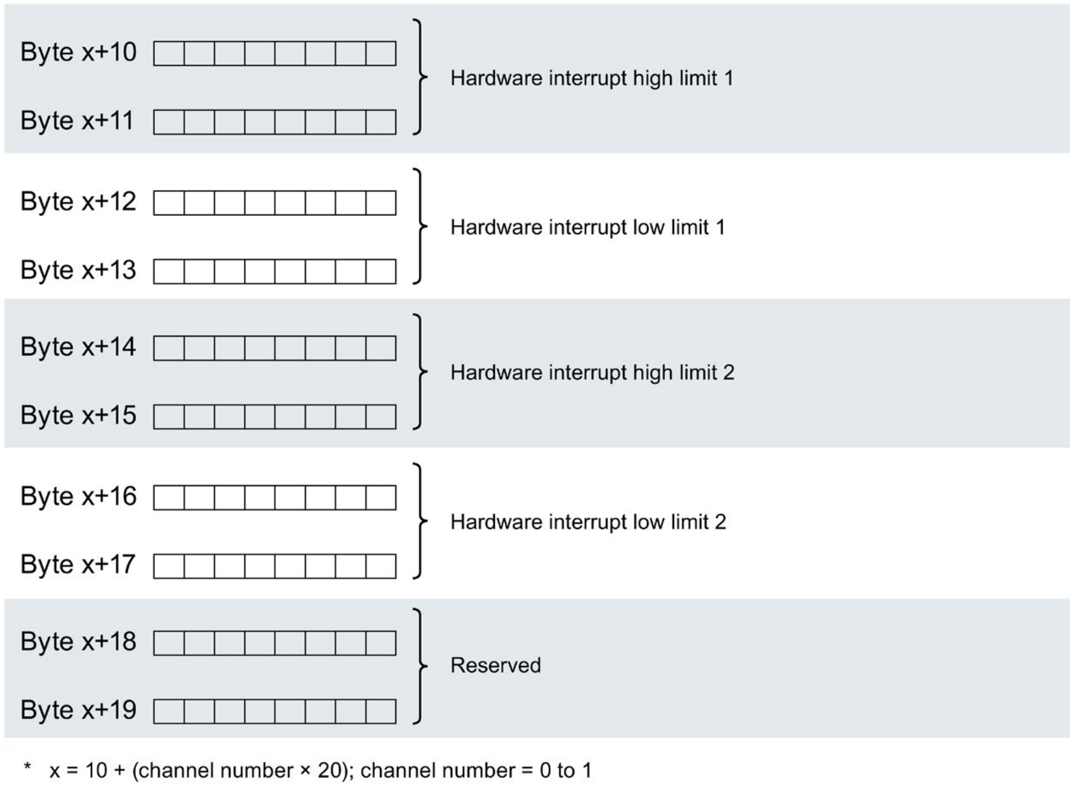


Figure A-6 Structure of byte x to x+19 for channels 0 and 1

Codes for measurement types

The following table contains the codes for the measurement types of the analog input module. You must enter these codes in byte x (see channel parameter block figure).

Table A- 1 Codes for measurement types

Measurement type	Code
Deactivated	0000 0000
Voltage	0000 0001
Current, 4-wire transducer	0000 0010
Current, 2-wire transducer	0000 0011

Codes for measuring ranges

The following table contains the codes for the measuring ranges of the analog input module. You must enter these codes in byte x+1 (see channel parameter block figure).

Table A- 2 Codes for measuring ranges

Measuring range	Code
Voltage	
±5 V	0000 1000
±10 V	0000 1001
1 to 5 V	0000 1010
0 to 10 V	0000 1011

4 to 20 mA	0000 0011

Representation of analog values

B

This appendix shows the analog values for all measuring ranges that you can use with the analog module.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

The table below shows the representation of binary analog values and of the associated decimal and hexadecimal units of the analog values.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	**Values**		**Analog value**	
	Decimal	**Hexadecimal**	**High byte**	**Low byte**
13	8	8_H	Sign 0 0 0 0 0 0 0	0 0 0 0 1 x x x
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	**Measured value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Nominal range
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table B- 3 Unipolar input ranges

Dec. value	**Measured value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	<-17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.2 Representation of analog values in voltage measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible voltage measuring ranges.

Table B- 4 Voltage measuring range ±10 V and ±5 V

Values		Voltage measuring range		Range
Dec.	**Hex.**	**±10 V**	**±5 V**	
32767	7FFF	> 11.759 V	> 5.879 V	Overflow
32511	7EFF	11.759 V	5.879 V	Overrange
27649	6C01			
27648	6C00	10 V	5 V	Nominal range
20736	5100	7.5 V	3.75 V	
1	1	361.7 µV	180.8 µV	
0	0	0 V	0 V	
-1	FFFF			
-20736	AF00	-7.5 V	-3.75 V	
-27648	9400	-10 V	-5 V	
-27649	93FF			Underrange
-32512	8100	-11.759 V	-5.879 V	
-32768	8000	< -11.759 V	< -5.879 V	Underflow

Table B- 5 Voltage measuring range 1 V to 5 V and 0 V to 10 V

Values		Voltage measuring range		Range
Dec.	**Hex.**	**1 to 5 V**	**0 to 10 V**	
32767	7FFF	> 5.704 V	> 11.759 V	Overflow
32511	7EFF	5.704 V	11.759 V	Overrange
27649	6C01			
27648	6C00	5 V	10 V	Nominal range
20736	5100	4 V	7.5 V	
1	1	1 V + 144.7 µV	361.7 µV	
0	0	1 V	0 V	
-1	FFFF			Underrange
-4864	ED00	0.296 V	-1.759 V	
-32768	8000	< 0.296 V	< -1.759 V	Underflow

B.3 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 6 Current measuring range ±20 mA

Values		Current measuring range	Range
Dec.	**Hex.**	**±20 mA**	
32767	7FFF	> 23.52 mA	Overflow
32511	7EFF	23.52 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	15 mA	
1	1	723.4 nA	
0	0	0 mA	
-1	FFFF		
-20736	AF00	-15 mA	
-27648	9400	-20 mA	
-27649	93FF		Underrange
-32512	8100	-23.52 mA	
-32768	8000	< -23.52 mA	Underflow

Table B- 7 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		Current measuring range		Range
Dec.	**Hex.**	**0 to 20 mA***	**4 to 20 mA**	
32767	7FFF	> 23.52 mA**	> 22.81 mA**	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	< -3.52 mA	< 1.185 mA	Underflow

* For measurement type "2-wire transducer", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

** For measurement type "2-wire transducer", the behavior described here is supported for overflow up to max. 35 mA.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

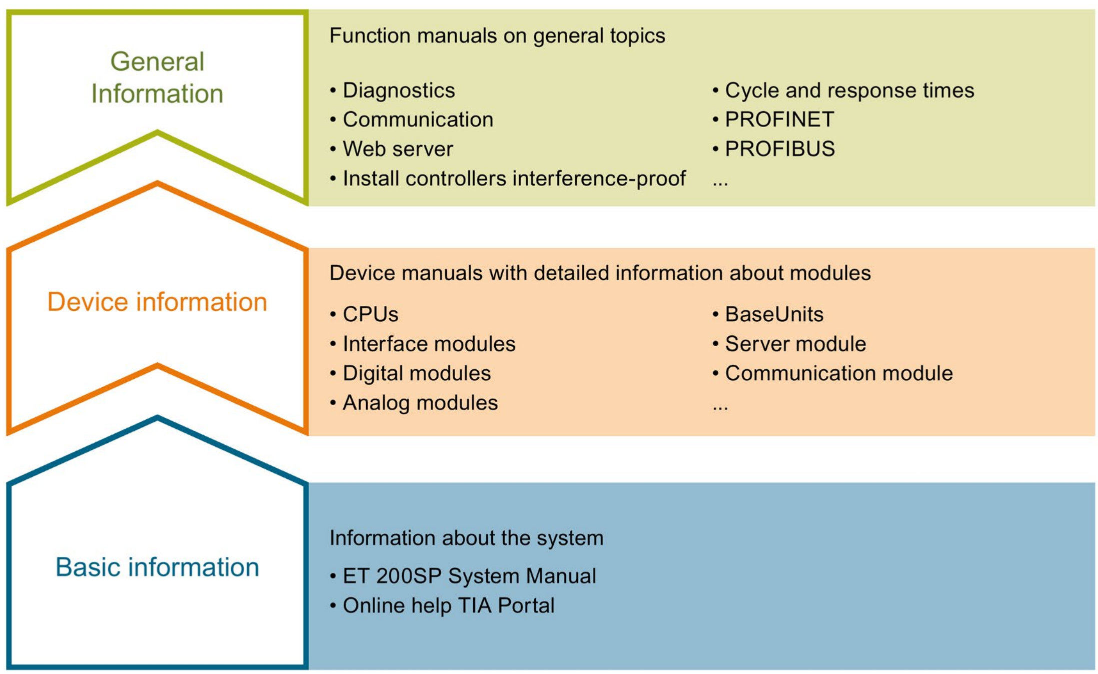
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

⑧ Color coding module type
⑨ Function and firmware version
⑩ Color code for selecting the color identification labels
⑪ Article number

Image 2-1 View of the module AI 2×U/I 2-/4-wire HF

Properties

The module has the following technical properties:

- Analog input module with 2 inputs
- Resolution: Up to 16 bits including sign
- Single channel electrical isolation
- Voltage measurement type can be set per channel
- Current measuring type can be set per channel (for 2-wire or 4-wire transducer)
- Configurable diagnostics (per channel)

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy
- Calibration in runtime
- Isochronous mode (PROFINET IO only)
- Value status (PROFINET IO only)

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of
Measuring range adjustment	1	V2.0.0
Scaling of measured values	1	V2.0.0
Module-internal shared input (MSI)	1	V2.0.0

You can configure the module with STEP 7 (TIA Portal) and with a GSD file [1].

[1] Version required for STEP 7: V5.5 SP4 HF7

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 2xU/I 2-/4-wire HF module with the various terminal assignments for a 2- und 4-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

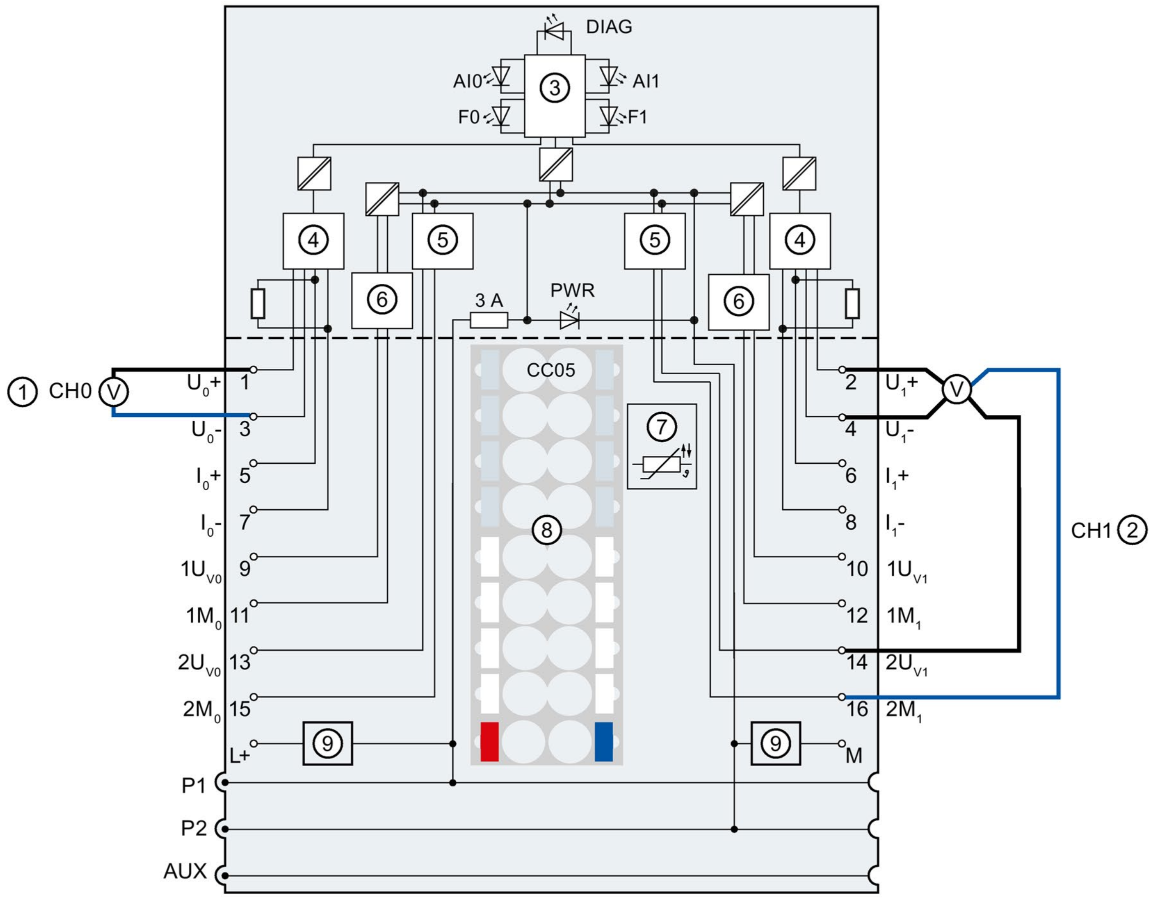
You can use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: Voltage measurement 2-wire and 4-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 2xU/I 2-/4-wire HF on the BaseUnit BU type A0/A1.



①	2-wire connection for voltage measurement	I_n+	Current input positive, channel n
②	4-wire connection for voltage measurement	I_n-	Current input negative, channel n
③	Backplane bus interface	U_{Vn}	Supply voltage, channel n
④	Analog-to-digital converter (ADC)	M_n	Reference ground to U_{Vn}, channel n
⑤	Current limitation (4-wire)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑥	Current limitation (2-wire)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑦	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
⑧	Color-coded label with color code CC05 (optional)	AI0, AI1	Channel status LED (green)
⑨	Filter connection supply voltage (only when light-colored BaseUnit is present)	F0, F1	Channel fault LED (red)
U_n+	Voltage input positive, channel n	PWR	Power LED (green)
Un-	Voltage input negative, channel n

Parameters/address space 4

4.1 Measurement types and measuring ranges

The following table shows the measurement types and the respective measuring range.

Table 4- 1 Measurement types and measuring ranges

Measurement type	Measuring range	Resolution
Voltage	± 5 V ± 10 V 1 to 5 V 0 to 10 V	16 bits incl. sign 16 bits incl. sign 15 bits 15 bits
Current	0 to 20 mA (2-wire and 4-wire transducer) 4 to 20 mA (2-wire and 4-wire transducer) ± 20 mA (only with 4-wire transducer)	15 bits 15 bits 16 bit including sign

You can find the tables of measuring ranges and overflow, overrange, etc. in the appendix Representation of analog values (Page 52) and the "Analog value processing" function manual.

Measuring range adjustment

See Measuring range adjustment (Page 21).

Scaling of measured values

See Scaling of measured values (Page 24).

4.2 Parameters

Parameters of the AI 2xU/I 2-/4-wire HF

The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the WRREC instruction to transfer the parameters to the module by means of data records; refer to the section Parameter assignment and structure of parameter data record (Page 42).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Range of values	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to ground	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Overflow	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Underflow	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Channel	Channel

Parameter	Range of values	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Measurement type/measuring range	• Deactivated • Voltage – ±5 V – ±10 V – 1 V to 5 V – 0 V to 10 V • Current (4-wire transducer) – 0 to 20 mA – 4 to 20 mA – ±20 mA • Current (2-wire transducer) – 0 to 20 mA – 4 to 20 mA	Current (4-wire transducer) 4..20 mA	Yes	Channel	Channel
Smoothing	• None • 2 times • 4 times • 8 times • 16 times • 32 times	None	Yes	Channel	Channel
Interference frequency suppression [2]	• 16.6 Hz (67.5 ms) • 50 Hz (22.5 ms) • 60 Hz (18.75 ms) • 300 Hz (10 ms) • 600 Hz (5 ms) • 1.2 kHz (2.5 ms) • 2.4 kHz (1.25 ms) • 4.8 kHz (0.625 ms)	50 Hz (22.5 ms)	Yes	Channel	Channel
Measuring range adjustment [1]	• Disable • Enable	Disable	Yes	Channel	-
Measuring range adjustment high limit [1]	Value within the nominal range of the measuring range in mV or µA	0	Yes	Channel	-
Measuring range adjustment low limit [1]	Value within the nominal range of the measuring range in mV or µA	0	Yes	Channel	-
Scaled high nominal range limit [3]	REAL	20.0	Yes	Channel	-
Scaled low nominal range limit [3]	REAL	4.0	Yes	Channel	-

Parameter	Range of values	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Hardware interrupt high limit 1 [1]	• Disable • Enable	Disable	Yes	Channel	-
Hardware interrupt low limit 1 [1]	• Disable • Enable	Disable	Yes	Channel	-
Hardware interrupt high limit 2 [1]	• Disable • Enable	Disable	Yes	Channel	-
Hardware interrupt low limit 2 [1]	• Disable • Enable	Disable	Yes	Channel	-
Hardware interrupt high limit 1 [1]	• Value (INT) • Value (REAL) [3]	• 27648 • 0.0 [3]	Yes	Channel	-
Hardware interrupt low limit 1 [1]	• Value (INT) • Value (REAL) [3]	• 0 • 0.0 [3]	Yes	Channel	-
Hardware interrupt high limit 2 [1]	• Value (INT) • Value (REAL) [3]	• 27648 • 0.0 [3]	Yes	Channel	-
Hardware interrupt low limit 2 [1]	• Value (INT) • Value (REAL) [3]	• 0 • 0.0 [3]	Yes	Channel	-
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 7 bytes.

[2] In normal operation, different interference frequency suppression settings can be configured for both channels. These cause different integration times for the analog-to-digital conversion. The module-internal time for updating the user data is now based on the longer integration time for both channels.
In isochronous mode, both channels must be configured with the same interference frequency suppression of 4.8 kHz.

[3] Only for configuration SCALE.

Note

Unused channels

Deactivate the unused inputs in the parameter assignment.

A deactivated input always returns the value $7FFF_H$ or $7F800000_H$ with measured value scaling.

Property of the module in isochronous mode

The permitted interference frequency suppression of both channels for isochronous mode of the modules is 4.8 kHz (0.625 ms).

Note that no instantaneous value for the time Ti is returned in isochronous mode. The analog module AI 2xU/I 2-/4-wire HF returns a mean value for the range of 0.625 ms starting at Ti.

4.3 Explanation of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs. A short-circuit is also detected in the range of 1 to 5 V if the input signal is short-circuited or the input is not connected.

The short-circuit and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the short-circuit diagnostics is output.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics: Wire break

Enable the diagnostics if the module has no current flow or has too little current for the measurement in the range of 4 to 20 mA.

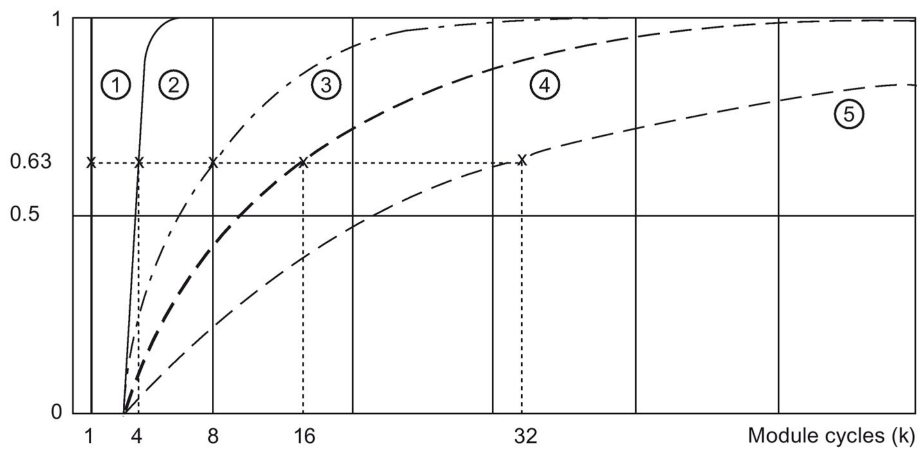
The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the wire break diagnostics is output.

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 5 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This applies to every signal change at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)
⑤ Very strong (k = 32)

Image 4-1 Smoothing AI 2×U/I 2-/4-wire HF

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network can negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Measuring range adjustment

The measuring range adjustment is a limited section of a measuring range supported by the analog input module. It is available for current and voltage measurements.

A limited measuring range in S7 format is shown, which is defined by the high and low limits of the measuring range adjustment.

Scaling of measured values

With measured value scaling, the user data of an analog input module is displayed as REAL (32-bit floating point) instead of S7 format.

The representation of the measuring range is defined by the scaled high and low limits of nominal range limit (as REAL).

The measured value scaling can be combined with the measuring range adjustment. In this case, the measuring range is adjusted first and then the representation of the measuring range is scaled.

BaseUnit with incoming supply voltage

Specifies that a light-colored BaseUnit with incoming supply voltage is located on this slot (see ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual).

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.4 Measuring range adjustment

Introduction

The measuring range adjustment is available for current and voltage measuring ranges.

The measuring range adjustment (base measuring range) is valid for the following ranges:

- Nominal range
- Underrange (of the measuring range adjustment)
- Overrange (of the measuring range adjustment)

Note

Live zero measuring ranges are not supported.

Function

The measuring range adjustment is a limited section of a measuring range supported by the module.

It allows you to increase the resolution for a configurable part of the measuring range in S7 format.

- The function is enabled with the "Measuring range adjustment" parameter
- The "Measuring range adjustment high limit" parameter sets the high limit of the measuring range in mV or µA.
- The "Measuring range adjustment low limit" parameter sets the low limit of the measuring range in mV or µA.

Note

The "Measuring range adjustment" function can be used in combination with the "Measured value scaling" function. See also Scaling of measured values (Page 24).

Note

When the "Measuring range adjustment high limit" and "Measuring range adjustment low limit" parameters are too close together, resolution may be lost, which means it may no longer be possible to show every value.

Rules

- The limits of the measuring range adjustment must be selected within the nominal range of the base measuring range. They are specified in integers.
- The measuring range adjustment is resolved depending on the base measuring range from 0_H to $6C00_H$ or 9400_H to $6C00_H$.
- Underranges/overranges apply in accordance with the S7 format and the base measuring range.
  Special consideration: Negative values are not possible for "Current (2-wire transducer) 0..20 mA". With a measuring range adjustment, an underrange is offered when possible and cut off at 0 mA. If the underrange limit ($ED00_H$) is > 0 mA, QI = 0 and the analog value 8000_H are output when it is violated.

Example

The following values result, for example:

Table 4- 3 Example of measuring range adjustment

Measuring range adjustment	**Measuring range resolution**	
	Bipolar	**Unipolar**
Base measuring range	±10 V	0 V to 10 V
Adjusted measuring range	+2 V to +5 V	+2 V to +5 V
Measuring range adjustment high limit	5000 mV (S7: +27648)	5000 mV (S7: +27648)
Measuring range adjustment low limit	2000 mV (S7: -27648)	2000 mV (S7: 0)

The following example illustrates the effect of a measuring range adjustment:

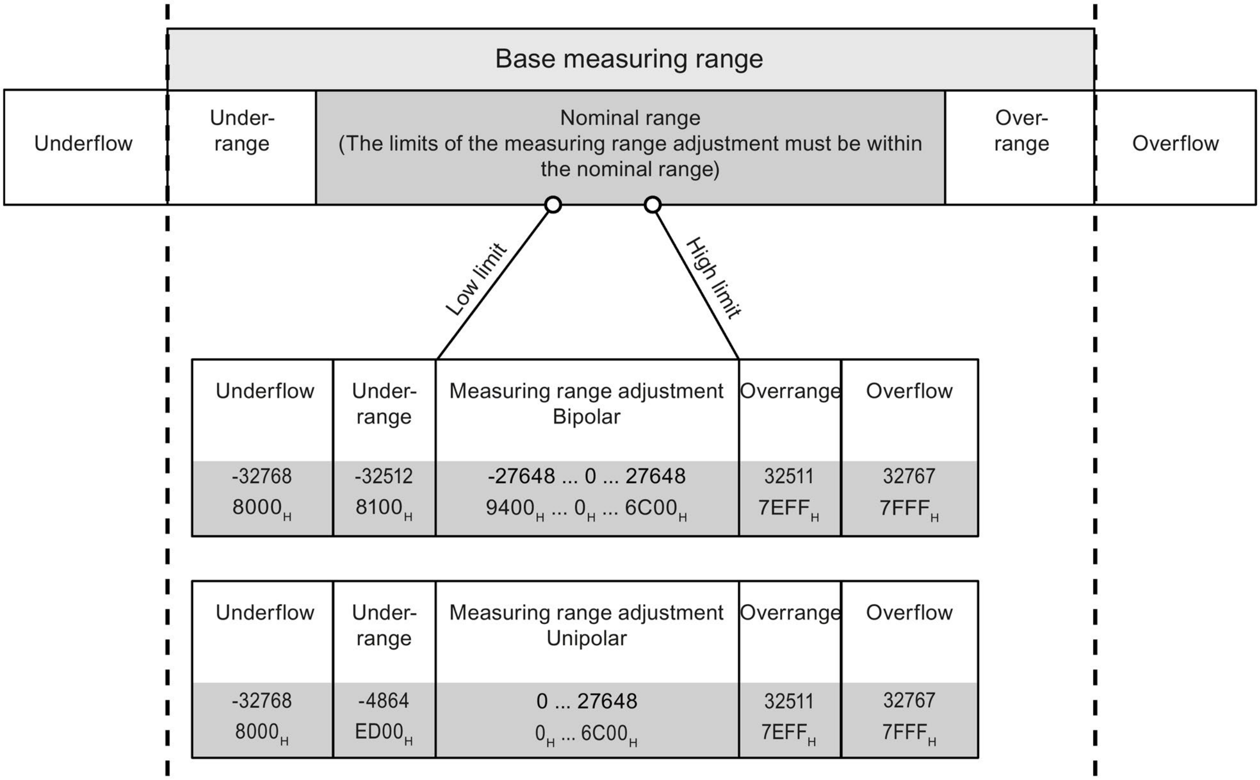


Image 4-2 Example of a measuring range adjustment

Configuration

The following figure shows an example of a configuration:

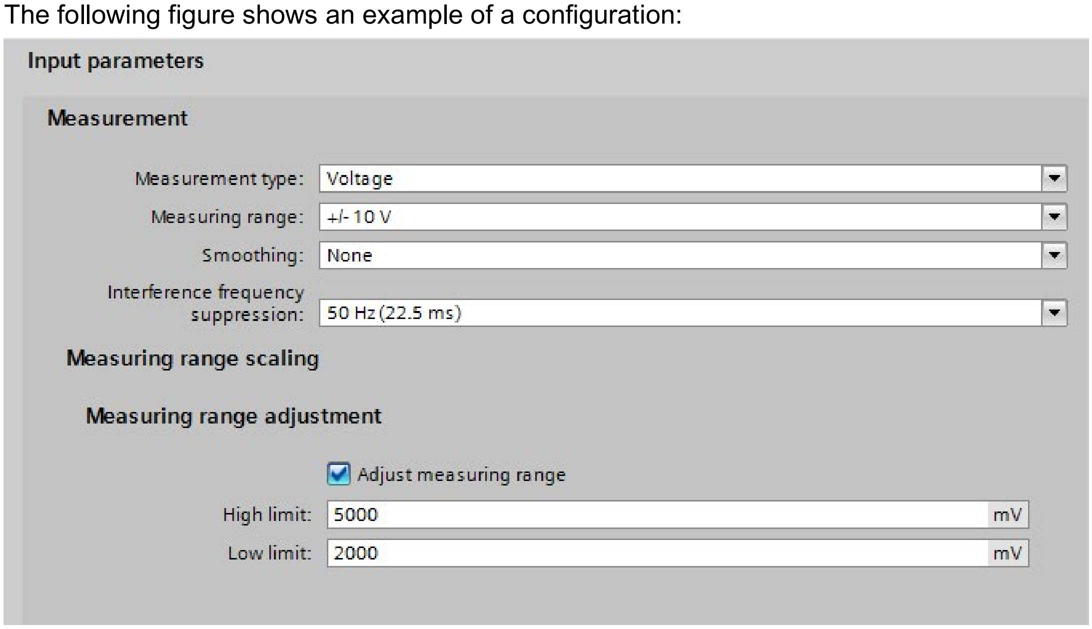

Image 4-3 Example of a configuration

In the configuration example, a measuring range adjustment of 2000 mV to 5000 mV is displayed.

4.5 Scaling of measured values

Introduction

The measured value scaling can be combined with the measuring range adjustment. In this case, the measuring range is adjusted first and then the representation of the measuring range is scaled.

Function

With measured value scaling, the user data of an AI 2xU/I 2-/4-wire HF module is displayed as REAL (32-bit floating point) instead of S7 format.

The representation of the measuring range is defined by the following parameters:

- The "Scaled high nominal range limit" parameter sets the desired display value (in REAL) for the high nominal range limit of the measuring range.
- The "Scaled low nominal range limit" parameter sets the desired display value (in REAL) for the low nominal range limit of the measuring range.

Note

With measured value scaling, the substitute value is minus infinity for underflow (FF800000H) and plus infinity for overflow (7F800000H).

Note

Effects of inversion

It is possible to set the "Scaled high nominal range limit" parameter lower than the "Scaled low nominal range limit" parameter, whereby the representation of the measuring range will be inverted compared to the terminal value (V, mA).

Overflow/underflow and hardware interrupts are always based on representation in REAL. A terminal value of > 11.76 V triggered an underflow for an inverted measured value scaling. Hardware interrupts react similarly.

Note

When the Parameter "Scaled high nominal range limit" and "Scaled low nominal range limit" parameters are too close together, resolution may be lost, which means it may no longer be possible to show every value.

Example

The following values result, for example:

Table 4- 4 Example of measured value scaling

	Low nominal range limit	High nominal range limit
Base measuring range	-10 V	+10 V
S7 format	-27648	+27648
Scaling of measured values	1.00	7.00

As shown in the table, -10 V corresponds to 1.00 and +10 V corresponds to 7.00.

Combination with measuring range adjustment

If the measuring range adjustment is enabled in addition to measured value scaling, first the measuring range is scaled and then the representation of the measuring range. The table below shows an example of the combination of measured value scaling and measuring range adjustment.

Table 4- 5 Example for a combination of measured value scaling and measuring range adjustment

	Low nominal range limit	High nominal range limit
Measuring range adjustment	-4000 mV	8000 mV
S7 format	-27648	+27648
Scaling of measured values	1.00	7.00

As shown in the table, -4 V corresponds to 1.00 and +8 V corresponds to 7.00.

Configuration

The following figures show examples of a configuration in STEP 7:

Configuration of measured value scaling

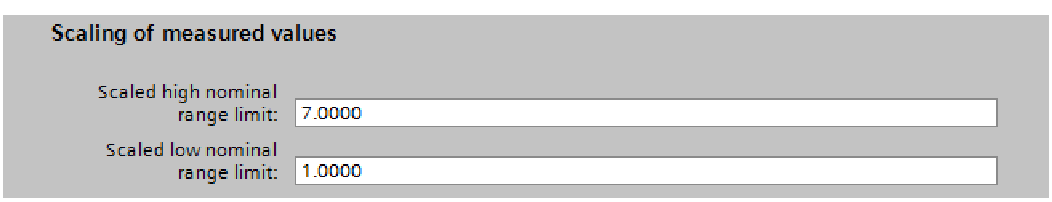

Image 4-4 Configuration of measured value scaling

Configuration with measuring range adjustment and measured value scaling

In the configuration example, a measuring range adjustment of -4000 mV to 8000 mV is displayed and additionally converted to a scaled high and low nominal range limit of 1.00 to 7.00.

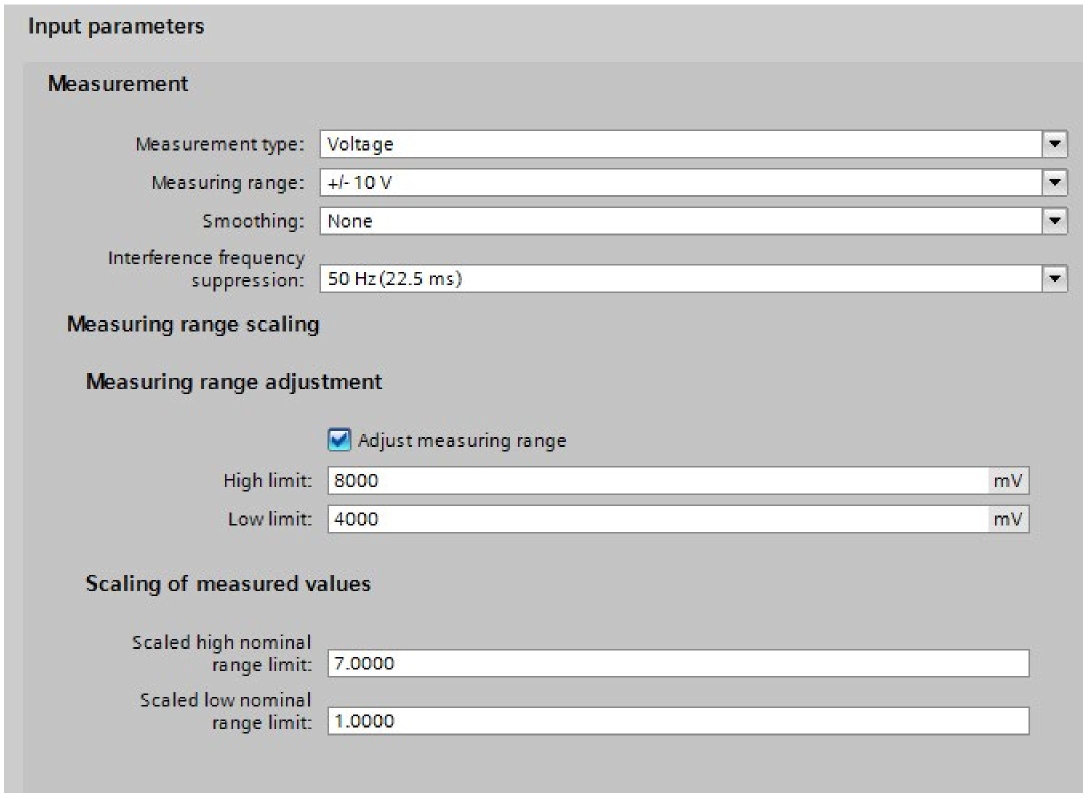

Image 4-5 Configuration with measuring range adjustment and measured value scaling

4.6 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image of the inputs.

Configuration options of AI 2xU/I 2-/4-wire HF

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 6 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, as of V13, SP1	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 2-channel without value status	AI 2xU/I 2-, 4-wire HF V1.0	X	X	X
1 x 2-channel with value status	AI 2xU/I 2-, 4-wire HF V1.0, QI	X	X	---
1 x 2-channel without value status	AI 2xU/I 2-, 4-wire HF V2.0	---	X	X
1 x 2-channel with value status	AI 2xU/I 2-, 4-wire HF V2.0, QI	---	X	---
1 x 2-channel with value status for module-internal Shared Input with up to 4 submodules	AI 2xU/I 2-, 4-wire HF V2.0, MSI	---	X	---
1 x 2-channel with value status and measured value scaling	AI 2xU/I 2-, 4-wire HF V2.0, SCALE	---	X	---

Value status (Quality Information, QI)

The value status is always activated for the following module names:

- AI 2xU/I 2-, 4-wire HF, QI,
- AI 2xU/I 2-, 4-wire HF, MSI
- AI 2xU/I 2-, 4-wire HF, SCALE

An additional bit is assigned to each channel for the value status. The value status bit indicates whether the read in analog value is valid. (0 = value is incorrect).

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 1 and 0 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: No fault is present on the channel.

Bit = 0: The wiring, the value created on the channel, etc. is incorrect.

Address space for configuration as 1 x 2-channel AI 2×U/I 2-/4-wire HF, QI

The following figure shows the assignment of the address space for the AI 2xU/I 2-/4-wire HF, QI with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

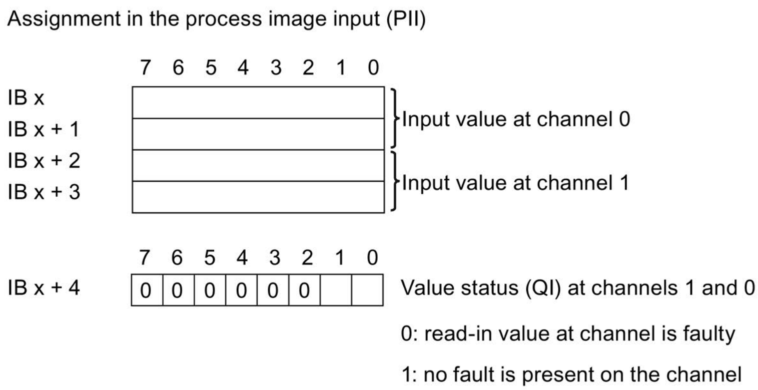

Image 4-6 Address space of the analog input module AI 2xU/I 2-/4-wire HF, QI with value status

Address space for configuration as 1 x 2-channel AI 2×U/I 2-/4-wire HF MSI

For the configuration as a 1 x 2-channel module (module-internal shared input, MSI), channels 0 and 1 of module are copied to up to four submodules. Channels 0 and 1 are then available with identical input values in various submodules. These submodules can be assigned to up to four IO controllers when the module is used in a shared device. Each IO controller has read access to the same channels.

The number of usable submodules is dependent on the interface module used. Please observe the information in the manual for the particular interface module.

Value status (Quality Information, QI)

The meaning of the value status depends on the submodule on which it occurs.

For the 1st submodule (=basic submodule), the value status 0 indicates that the value is incorrect.

For the 2nd to 4th submodule (=MSI submodule), the value status 0 indicates that the value is incorrect or the basic submodule has not yet been configured (not ready).

The following figure shows the assignment of the address space with submodules 1 and 2.

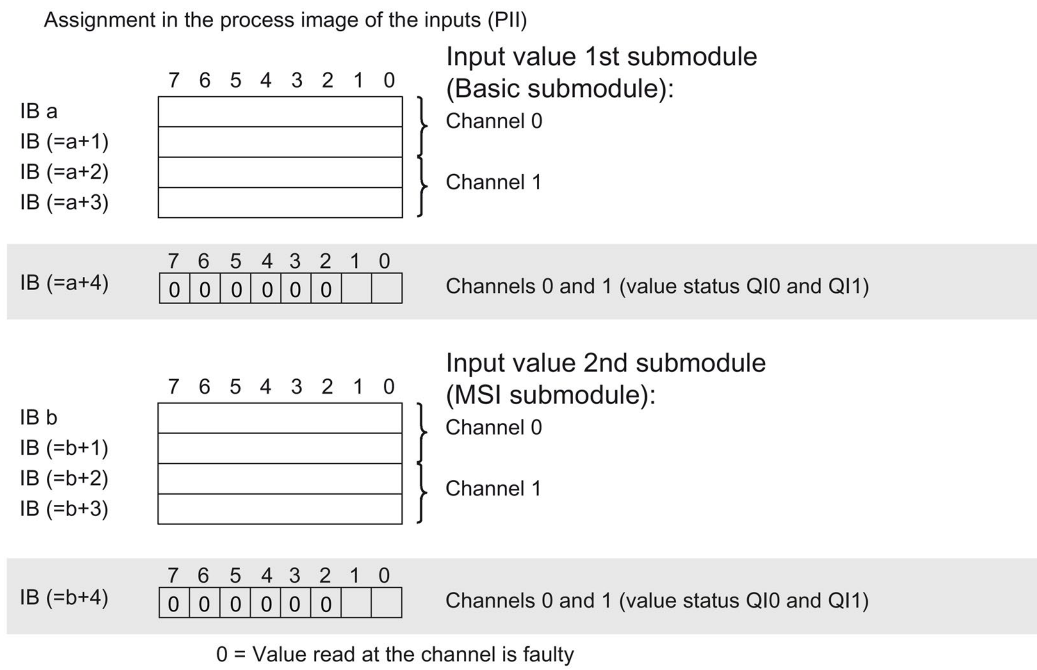

Image 4-7 Address space for configuration as 1x 2-channel AI 2×U/I 2-/4-wire HF MSI with value status

The figure below shows the assignment of the address space with submodules 3 and 4.

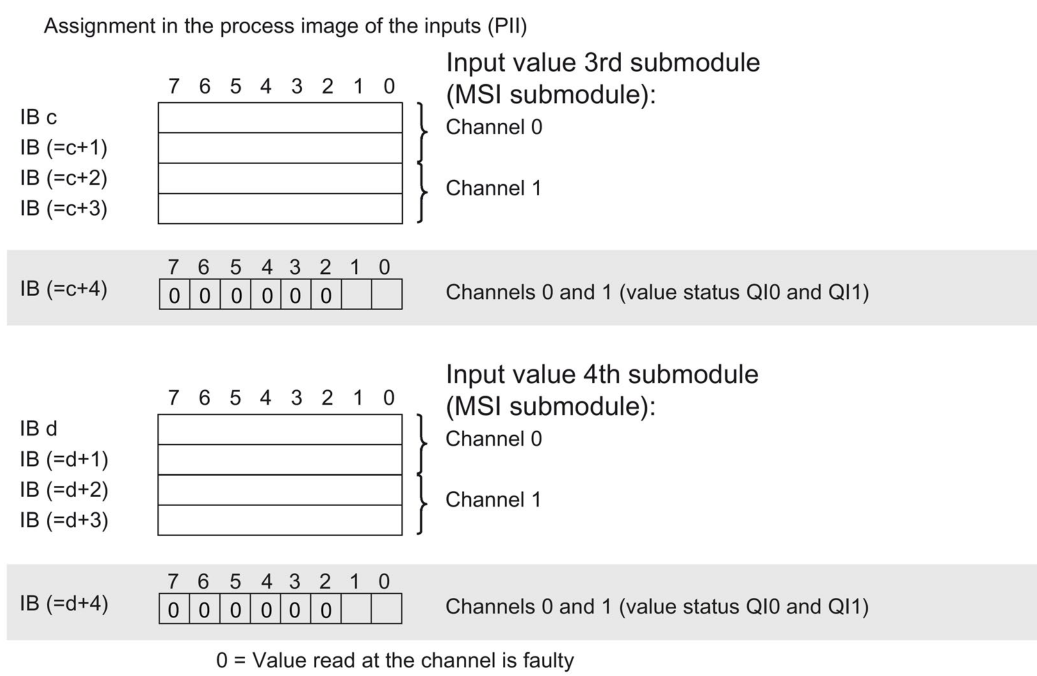

Image 4-8 Address space for configuration as 1x 2-channel AI 2×U/I 2-/4-wire HF MSI with value status

Address space for configuration as 1 x 2-channel AI 2×U/I 2-/4-wire HF SCALE

The following figure shows the assignment of the address space for the AI 2xU/I 2-/4-wire HF, SCALE with value status (Quality Information (QI)). The value status cannot be deselected for this configuration.

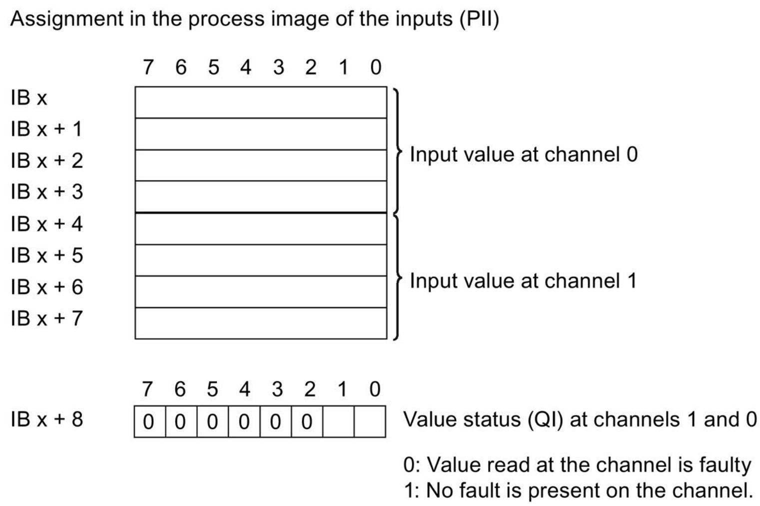

Image 4-9 Address space for configuration as 1 x 2-channel AI 2×U/I 2-/4-wire HF, SCALE with value status

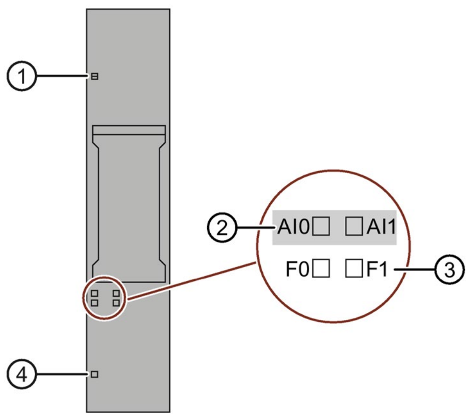
Interrupts/diagnostics alarms

5

5.1 Status and error displays

LED displays

The following figure shows you the LED display of the AI 2xU/I 2-/4-wire HF.



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Image 5-1 LED display

Meaning of the LED displays

The following tables contain the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostics alarms (Page 35).

Table 5- 1 Error display DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Table 5- 2 Status and error display LED channel status / channel error

LEDs		Meaning
Channel status	Channel error	
Off	Off	Channel deactivated or load voltage missing
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
On	On	Not permitted (error)

Table 5- 3 PWR LED status display

PWR LED	Meaning
Off	Load voltage missing
On	Load voltage present

5.2 Interrupts

The analog input module AI 2×U/I 2-/4-wire HF supports hardware and diagnostic interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit (current: sensor supply; voltage: 1 to 5 V, encoder supply)
- Wire break (current: 4 to 20 mA)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- Hardware interrupt lost
- Supply voltage missing
- Channel temporarily unavailable

Hardware interrupts

The module generates a hardware interrupt at the following events:

- Violation of low limit 1
- Violation of high limit 1
- Violation of low limit 2
- Violation of high limit 2

S7-1500

Detailed information on the event is available in the STEP 7 online help.

The block interface is represented here with optimized block access, which is set in the TIA Portal by default.

Name	Data type	Comment
LADDR	HW_IO	Hardware identifier of the module triggering the interrupt
USI	WORD	USI (High/Low)
IChannel	USInt	Channel that triggered the hardware interrupt
EventType	Byte	Error event

S7-300/400 or a different CPU

You can obtain detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of double word 8 in local data.

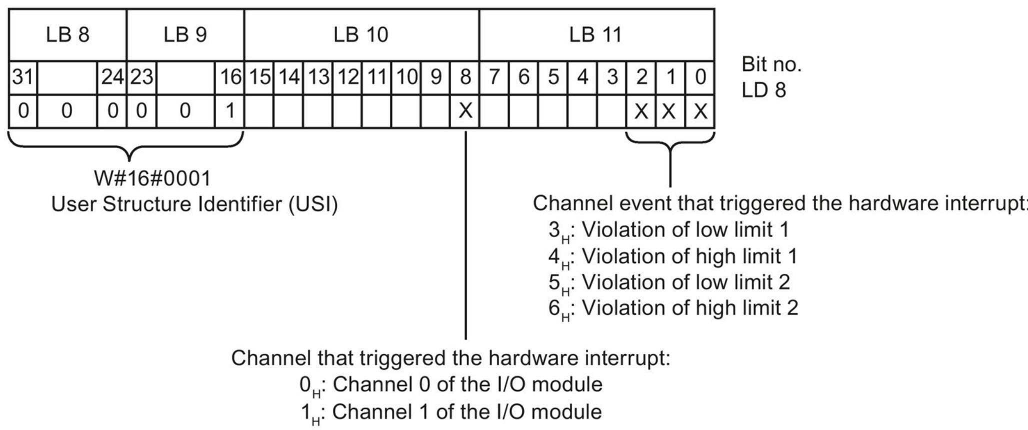


Image 5-2 OB start information

Structure of the additional interrupt information

Table 5- 4 Structure of the additional interrupt information

Data block name	Content	Comment	Bytes
USI **(User Structure Identifier)**	W#16#0001	Additional interrupt information for hardware interrupts of the I/O module	2
Channel that triggered the hardware interrupt.			
Channel	B#16#00 to B#16#01	Channel 0 and 1 of the I/O module	1
Event that triggered the hardware interrupt.			
Error event	B#16#03	Violation of low limit 1	1
	B#16#04	Violation of high limit 1	
	B#16#05	Violation of low limit 2	
	B#16#06	Violation of high limit 2	

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (encoder supply)	1_H	Short-circuit encoder supply to ground	Correct interplay between module and encoder
Short-circuit (1 to 5 V)	1_H	Short-circuit of input signal	Correct interplay between module and encoder
		Open input	Connect input
Wire break (current 4 to 20 mA)	6_H	Impedance of encoder circuit too high	Use a different encoder type or modify the wiring, e.g. use cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect the encoder contacts
High limit violated	7_H	Value is above the overrange.	Correct interplay between module and encoder
Low limit violated	8_H	Value is below the underrange.	Correct interplay between module and encoder
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies for the entire module).	Replace module
Parameter assignment error	10_H	The module cannot evaluate parameters for the channel: Incorrect parameter assignment.	• Correct the parameter assignment (wire break diagnostics set only with the permitted measuring ranges).
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Hardware interrupt lost	16_H	Error is reported when a hardware interrupt (high/low limit) could not be reported.	• Limits might be assigned twice. • If necessary, reduce the bus cycle. • If necessary, use higher SFU.
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not read process values in this state.	• Wait for firmware update • Restart the firmware update
		Switch to user calibration	

Technical specifications 6

Temperature error (in relation to input range), (+/-)	0.003%/K
Crosstalk between inputs, min.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to input range), (+/-)	0.01%
Operational limit in the entire temperature range	
Voltage in relation to input range, (+/-)	0.1%
Current in relation to input range, (+/-)	0.1%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to input range, (+/-)	± 0.05%; 0.1% with SFU 4.8 kHz
Current in relation to input range, (+/-)	± 0.05%; 0.1% with SFU 4.8 kHz
Interference voltage suppression for f = n x (f1 +/- 1%), f1 = interference frequency	
Common mode voltage, max.	35 V
Common mode interference, min.	90 dB
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes
Filtering and processing time (TCI), min.	800 µs
Bus cycle time (TDP), min.	1 ms
Jitter, max.	5 µs

	6ES7134-6HB00-0CA1
Interrupts/diagnostics/status information	
Interrupts	
Diagnostics interrupt	Yes
Limit interrupt	Yes; two high limits and two low limits each
Diagnostics alarms	
Diagnostics	Yes
Monitoring of the supply voltage	Yes
Wire break	Yes, measuring range 4 to 20 mA only
Short-circuit	Yes; for 1 to 5 V, and for current measuring ranges for short-circuit in sensor supply
Group error	Yes
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	Yes
Between the channels and backplane bus	Yes
Between the channels and voltage supply of the electronics	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic isolation)
Between the inputs (UCM)	75 V DC/60 V AC
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	32 g

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Measurement type	Measuring range	Diagnostics					Hardware interrupts
		Underflow	Overflow	Wire break	Short-circuit to ground	Missing supply voltage L+	
Deactivated	*	*	*	*	*	*	*
Voltage	±5 V	x	x	–	x [1]	x	x
	±10 V	x	x	–	x [1]	x	x
	1 V to 5 V	x	x	–	x	x	x
	0 V to 10 V	x	x	–	x [1]	x	x
Current (4-wire transducer)	0 mA to 20 mA	x	x	–	x	x	x
	4 mA to 20 mA	x	x	x	x	x	x
	±20 mA	x	x	-	x	x	x
Current (2-wire transducer)	0 mA to 20 mA	x [1 2]	x	–	x	x	x
	4 mA to 20 mA	x	x	x	x	x	x

x = property is allowed, – = property is **not allowed**, * = property is not relevant

1 only possible as of firmware V2.0

2 The diagnostics Underflow can always be enabled for "Current (2-wire transducer) 0..20 mA", but it is only reported when a complete underflow range is created by the measuring range adjustment.

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Table A- 1 Dependencies of the measurement type and measuring range PB

Measure-ment type	**Measuring range**	**Diagnostics**						**Hardware interrupts**
		Underflow	**Overflow**	**Wire break**	**Load voltage L+**	**Short-circuit to ground**	**Smoothing / interfer-ence fre-quency suppres-sion**	
Deactivated	*	*	*	*	*	*	*	*
Voltage	±5 V	x	x	–	x	x [1]	x	–
	±10 V	x	x	–	x	x [1]	x	–
	1 V to 5 V	x	x	–	x	x	x	–
	0 V to 10 V	x	x	–	x	x [1]	x	–
Current (4-wire transducer)	0 mA to 20 mA	x	x	–	x	x	x	–
	4 mA to 20 mA	x	x	x	x	x	x	–
	±20 mA	x	x	-	x	x	x	–
Current (2-wire transducer)	0 mA to 20 mA	–	x	–	x	x	x	–
	4 mA to 20 mA	x	x	x	x	x	x	–

x = property is allowed, – = property is **not allowed**, * = property is not relevant

[1] only possible as of firmware V2.0

A.2 Parameter assignment and structure of parameter data record

The data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Parameter assignment in the user program

You can reassign the module parameters in RUN. For example, the measuring range of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment results in a brief exit from clocked measuring mode and renewed synchronization with the fieldbus cycle. The slowest channel provides the "internal" measuring cycle.

Note

Changing parameter settings in runtime can cause the process values to freeze for the duration of the parameter assignment for the module.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. However, the STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

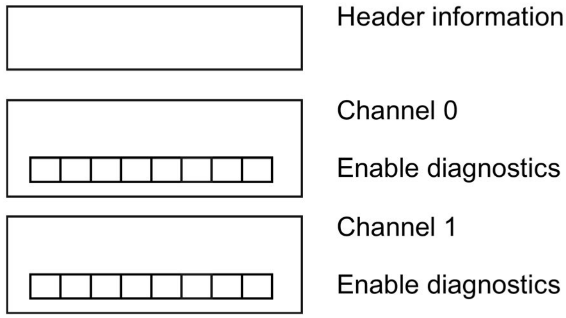

Image A-1 Structure of data record 128

Header information (V1.0)

The figure below shows the structure of the header information (V1.0).

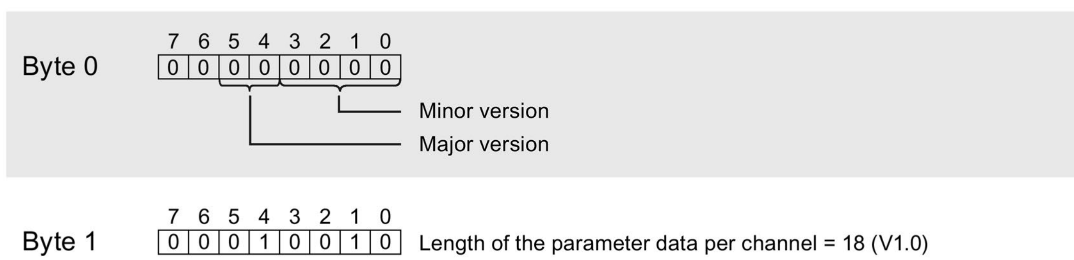

Image A-2 Header information (V1.0)

Header information (V2.0)

The figure below shows the structure of the header information (V2.0).

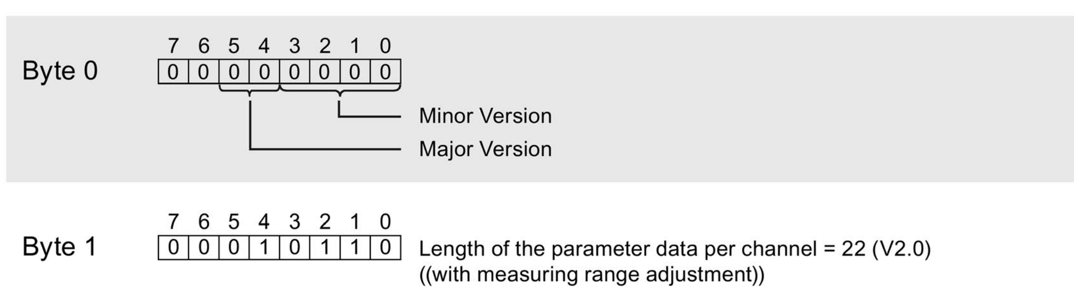

Image A-3 Header information (V2.0)

Header information (V2.0 SCALE)

The figure below shows the structure of the header information.

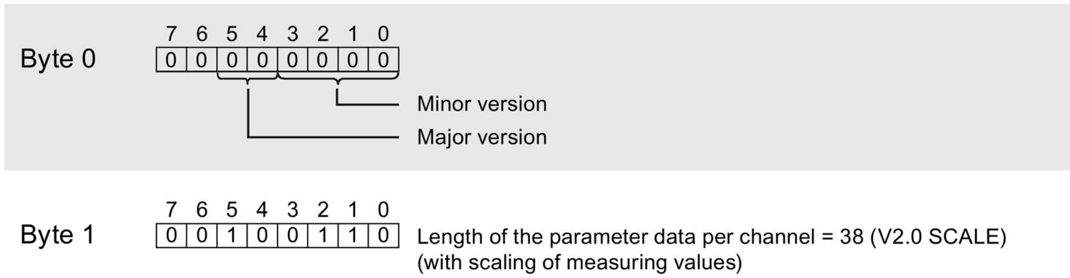

Image A-4 Header information (V2.0 SCALE)

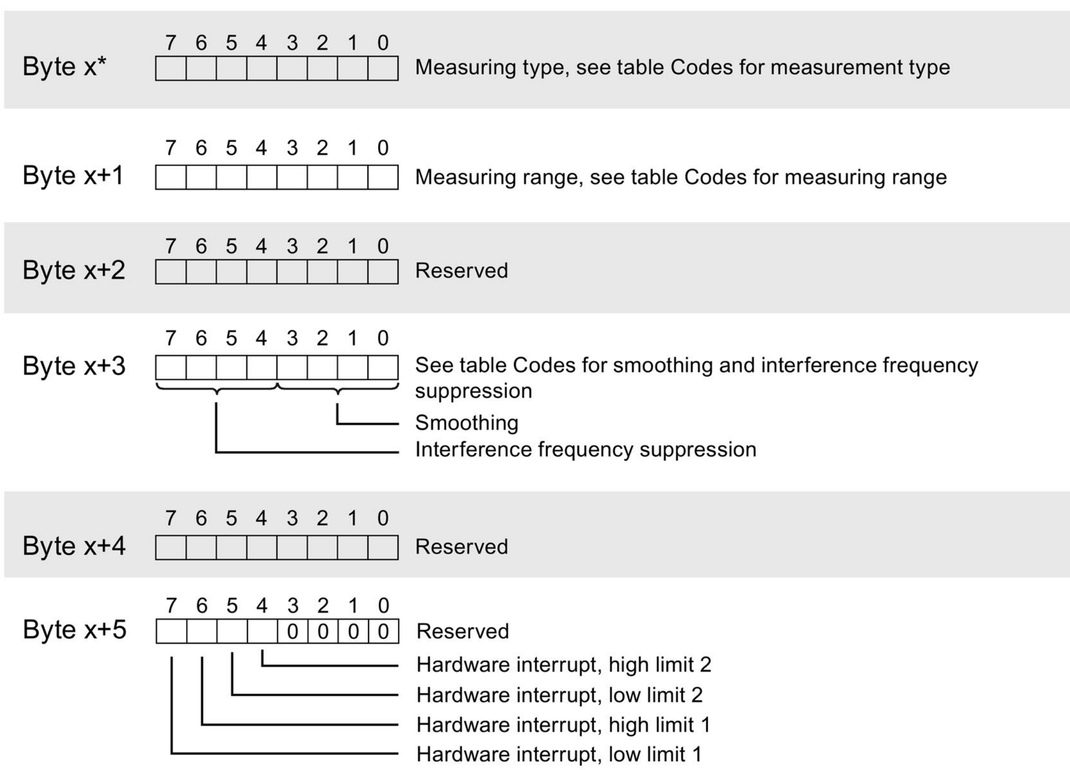
Parameter (V1.0)

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number x 18); channel number is 0 or 1



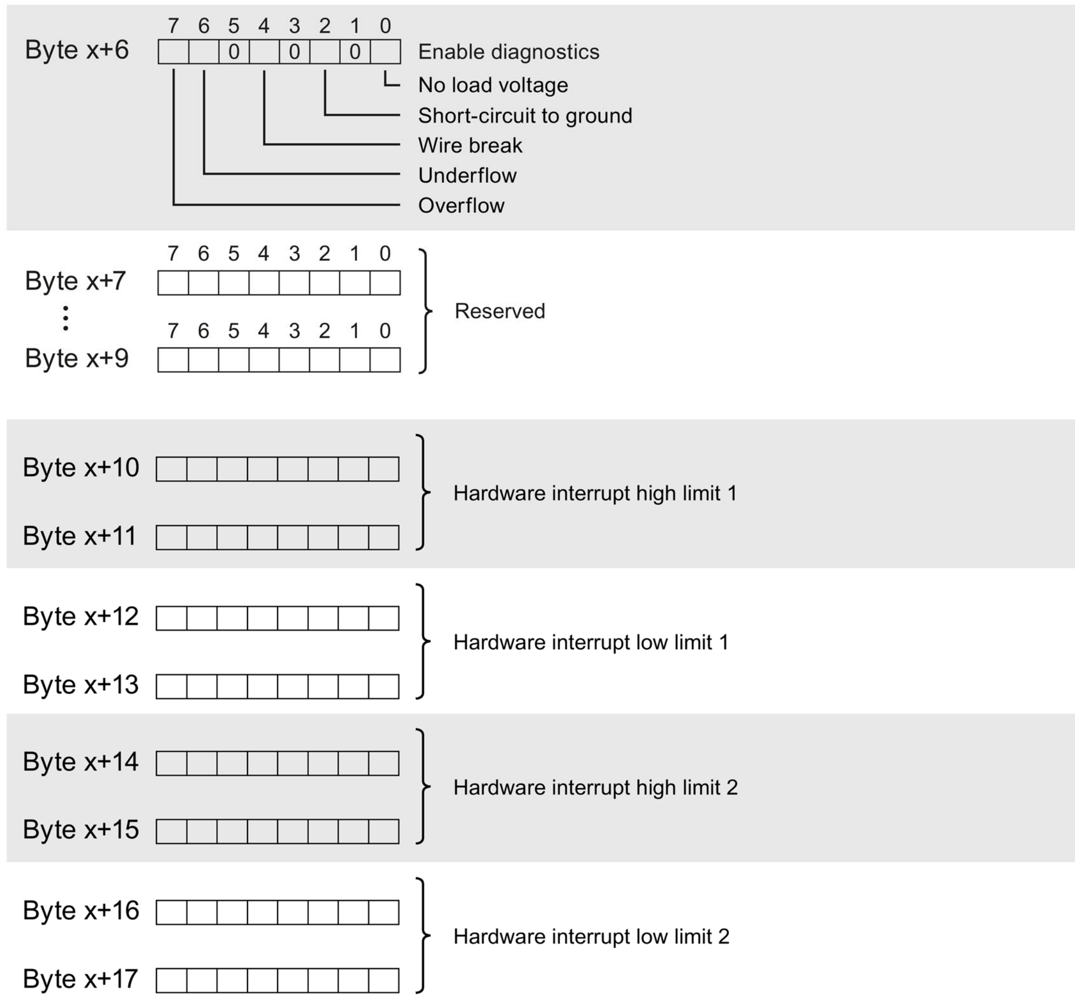


Image A-5 Structure of byte x to x+17 for channel 0 and 1

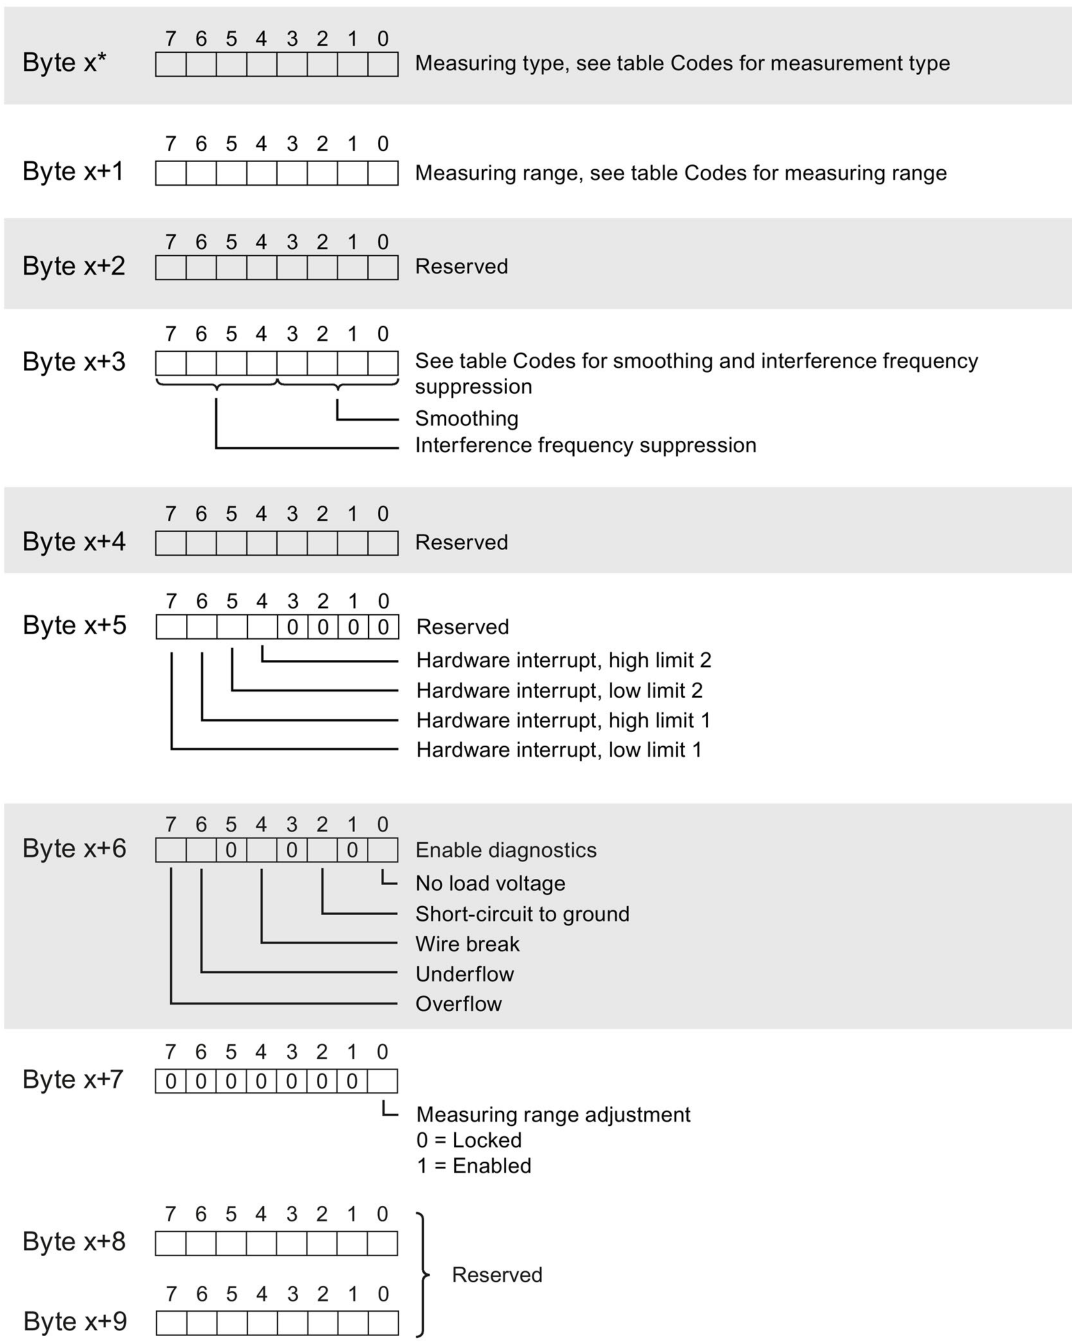
Parameter (V2.0)

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number x 22); channel number is 0 or 1



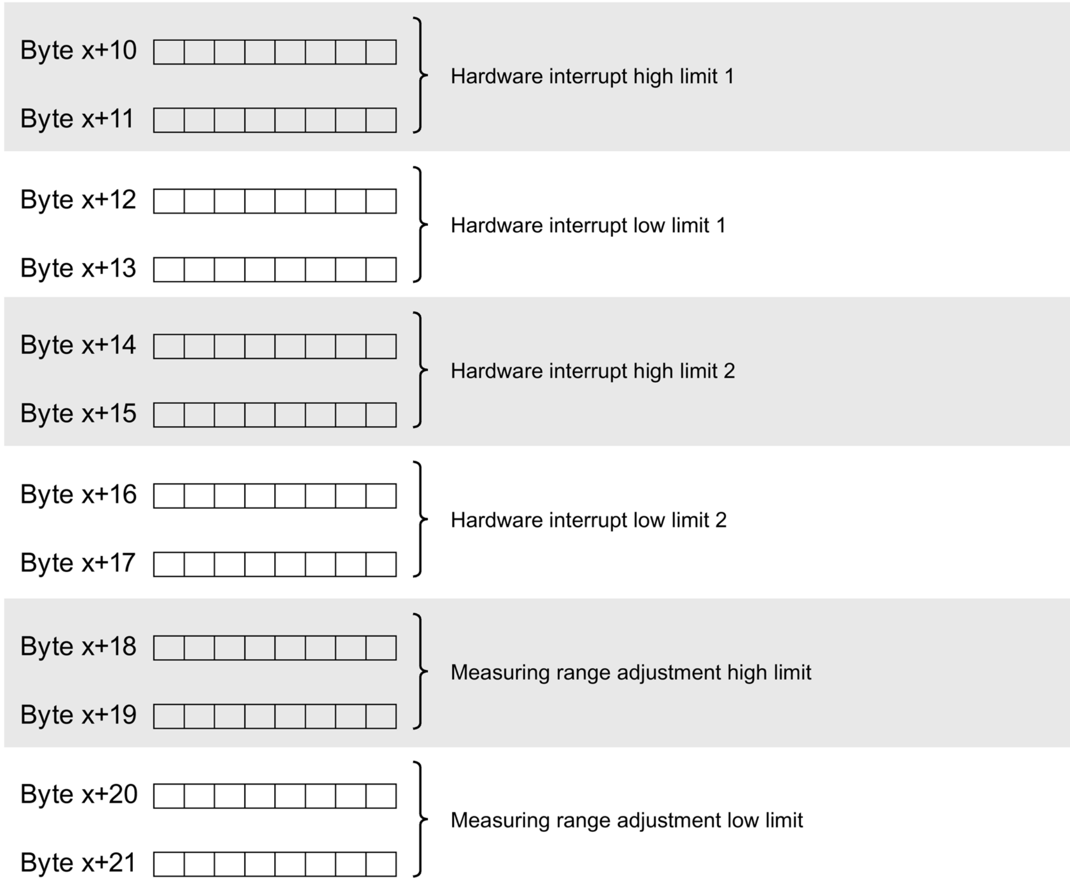


Image A-6 Structure of bytes x to x+21 for channels 0 and 1

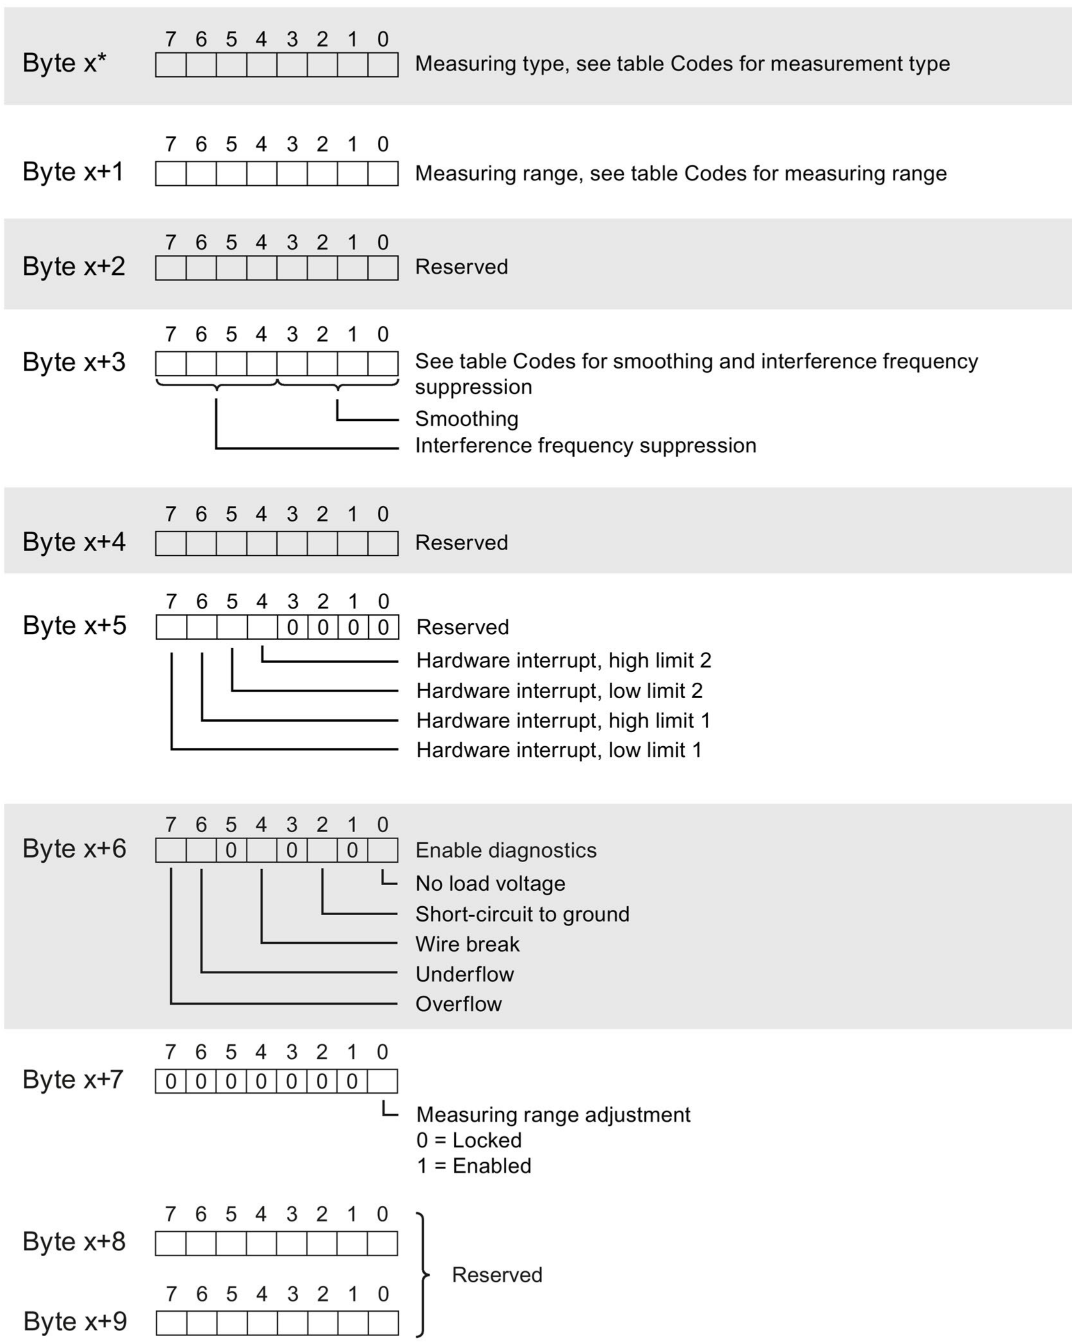
Parameter (V2.0 SCALE)

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number x 38); channel number is 0 or 1



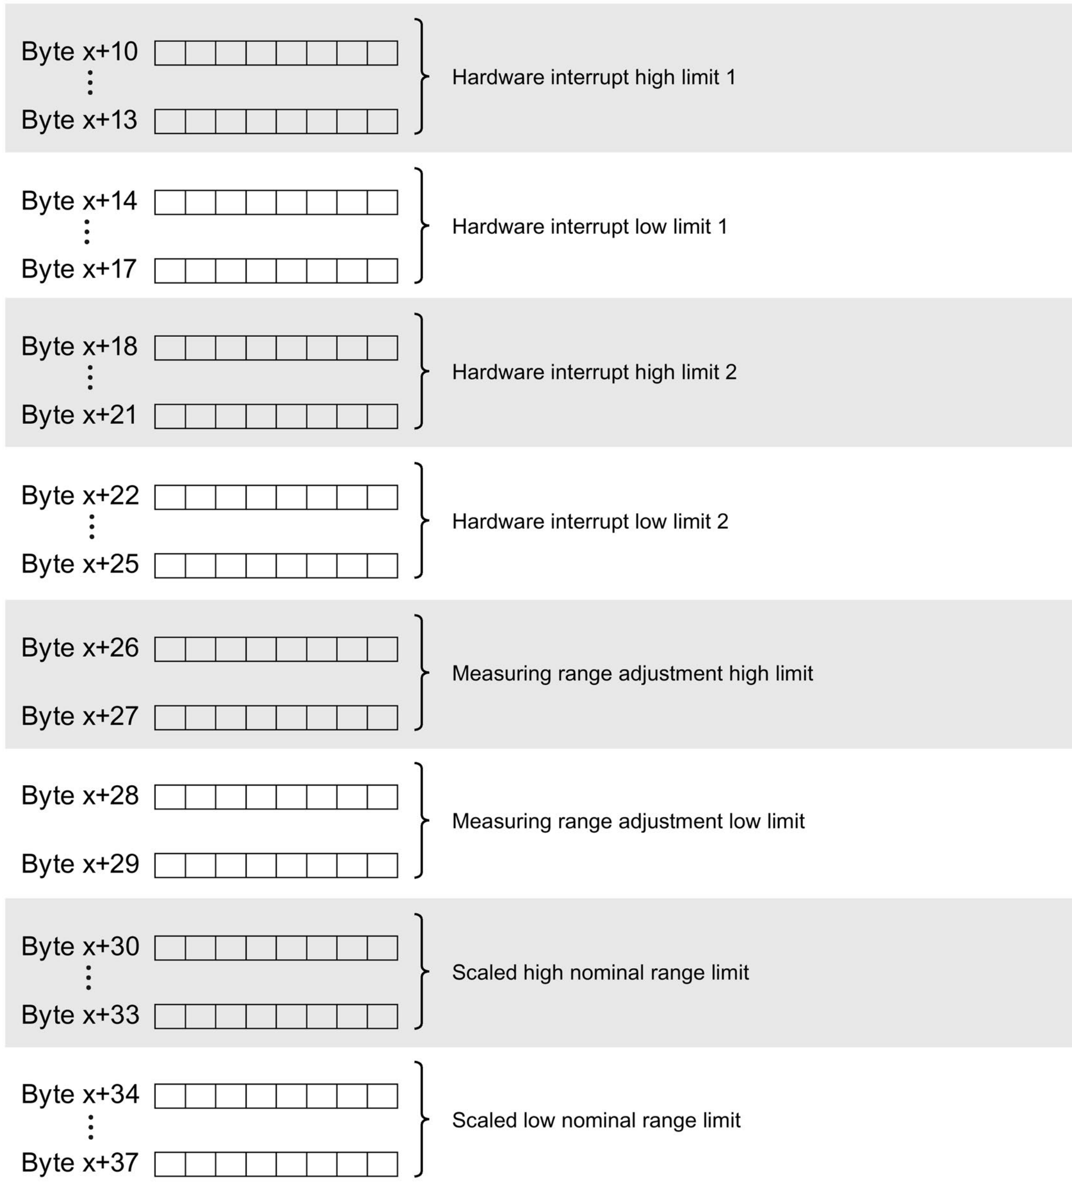


Image A-7 Structure of bytes x to x+37 for channels 0 and 1

Codes for measurement types

The following table contains all the measurement types of the analog input module with its codes. You must enter these codes at byte x (see previous figure).

Table A- 2 Codes for measurement types

Measurement type	Code
Deactivated	0000 0000
Voltage	0000 0001
Current, 4-wire transducer	0000 0010
Current, 2-wire transducer	0000 0011

Codes for measuring ranges

The following table contains all codes for the measuring ranges of the analog input module. You must enter these codes at byte x+1 (see previous figure).

Table A- 3 Codes for measuring ranges

Measuring range	Code
Voltage	
±5 V	0000 1000
±10 V	0000 1001
1 to 5 V	0000 1010
0 to 10 V	0000 1011
Current	
0 mA to 20 mA	0000 0010
4 mA to 20 mA	0000 0011
±20 mA	0000 0100

Codes for smoothing and interference frequency suppression

The following table contains all coding for smoothing and interference frequency suppression. You must enter these codes at byte x (see previous figure).

Table A- 4 Codes for smoothing

Smoothing	Code
None	0000
2 times	0100
4 times	0001
8 times	0101
16 times	0010
32 times	0011

Table A- 5 Codes for interference frequency suppression

Interference frequency suppression	Code
16.6 Hz (67.5 ms)	0100
50 Hz (22.5 ms)	0010
60 Hz (18.75 ms)	0001
300 Hz (10 ms)	0101
600 Hz (5 ms)	0110
1.2 kHz (2.5 ms)	0111
2.4 kHz (1.25 ms)	1000
4.8 kHz (0.625 ms)	1001

Error transmitting the data record

The module always checks all values of the transmitted data record. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error codes if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine if the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	I0	xx	Incorrect version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	I1	xx	Parameter error	Check the parameters of the module.

Representation of analog values B

This section shows the analog values for all measuring ranges supported by the analog input module AI 2xU/I 2-/4wire HF.

Measured value resolution

The digitized analog value is the same for input and output values at the same nominal range. The analog values are represented as a fixed point number in the two's complement.

The resolutions 15 and 16 bits including sign are displayed. Each analog value is entered in the ACCU left-justified. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

The tables below set out the digitized representation of the input ranges by bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
32767	> 117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	< -117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table B- 3 Unipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	> 117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	< -17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.2 Representation of analog values in voltage measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible voltage measuring ranges.

Table B- 4 Voltage measuring range ±10 V and ±5 V

Values		Voltage measuring range		Range
Dec.	Hex.	±10 V	±5 V	
32767	7FFF	> 11.759 V	> 5.879 V	Overflow
32511	7EFF	11.759 V	5.879 V	Overrange
27649	6C01			
27648	6C00	10 V	5 V	Nominal range
20736	5100	7.5 V	3.75 V	
1	1	361.7 µV	180.8 µV	
0	0	0 V	0 V	
-1	FFFF			
-20736	AF00	-7.5 V	-3.75 V	
-27648	9400	-10 V	-5 V	
-27649	93FF			Underrange
-32512	8100	-11.759 V	-5.879 V	
-32768	8000	< -11.759 V	< -5.879 V	Underflow

Table B- 5 Voltage measuring range 1 V to 5 V and 0 V to 10 V

Values		Voltage measuring range		Range
Dec.	**Hex.**	**1 to 5 V**	**0 to 10 V**	
32767	7FFF	> 5.704 V	> 11.759 V	Overflow
32511	7EFF	5.704 V	11.759 V	Overrange
27649	6C01			
27648	6C00	5 V	10 V	Nominal range
20736	5100	4 V	7.5 V	
1	1	1 V + 144.7 µV	361.7 µV	
0	0	1 V	0 V	
-1	FFFF			Underrange
-4864	ED00	0.296 V	-1.759 V	
-32768	8000	< 0.296 V	< -1.759 V	Underflow

B.3 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 6 Current measuring range ±20 mA

Values		Current measuring range	Range
Dec.	**Hex.**	**±20 mA**	
32767	7FFF	> 23.52 mA	Overflow
32511	7EFF	23.52 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	15 mA	
1	1	723.4 nA	
0	0	0 mA	
-1	FFFF		
-20736	AF00	-15 mA	
-27648	9400	-20 mA	
-27649	93FF		Underrange
-32512	8100	-23.52 mA	
-32768	8000	< -23.52 mA	Underflow

Table B- 7 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		Current measuring range		Range
Dec.	**Hex.**	**0 to 20 mA***	**4 to 20 mA**	
32767	7FFF	> 23.52 mA	> 22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	< -3.52 mA	< 1.185 mA	Underflow

* For measurement type "2-wire transducer", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

Wiring and block diagram has been modified.

Conventions

CPU: When the term "CPU" is used in the following, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

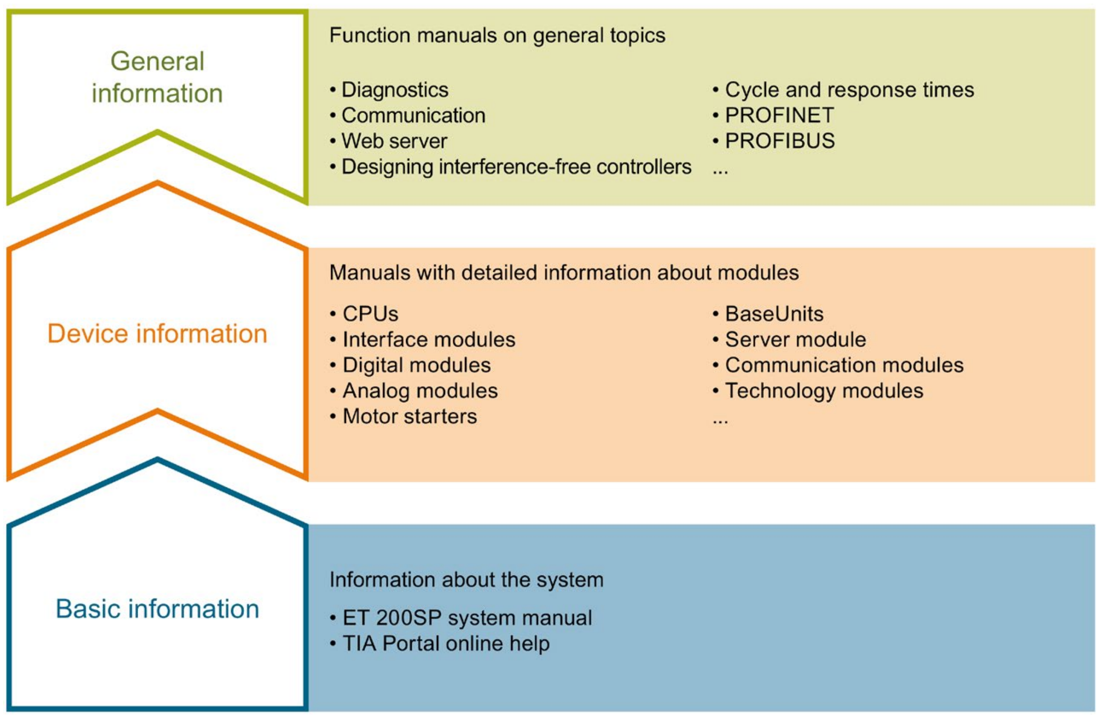
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the module AI 4×I 2-/4-wire ST

Properties

The module has the following technical properties:

- Analog input module with 4 inputs
- Current measuring type for 2- and 4-wire transducers adjustable per channel
- Input ranges
  - 4 to 20 mA, resolution 15 bits
  - 0 to 20 mA, resolution 15 bits
  - ±20 mA, resolution 16 bits including sign
- Electrically isolated from the supply voltage L+ (only for input type 4-wire transducer)
- Permitted common mode voltage: 10 V_{SS}
- Configurable diagnostics per module

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V2.0.0	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V2.0.0	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
Reconfiguration in RUN	FS01	V2.0.0	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
PROFIenergy	FS01	V2.0.0	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X
Value status	FS01	V2.0.0	V14 or higher with HSP 0239	V5.5 SP3 or higher with HSP 0227 V7.0 or higher	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You will find additional information on the accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Wiring up 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 4xI 2-/4-wire ST module with the various terminal assignments for a 2-wire and 4-wire connection.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

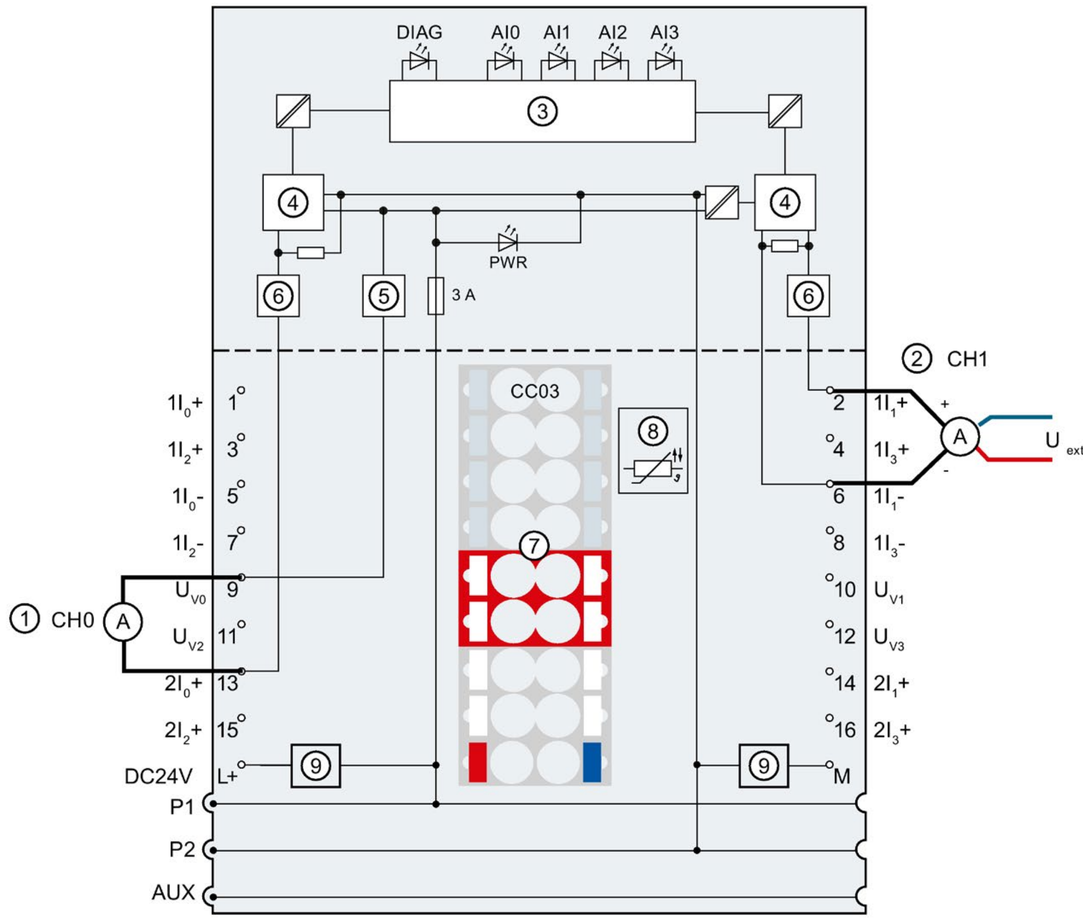
You can use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light BaseUnit. Keep this in mind also during the configuration.

Wiring: Current measurement 2-wire and 4-wire connection (2-wire and 4-wire transducer)

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 4xI 2-/4-wire ST on the BaseUnit BU type A0/A1.



①	2-wire connection for current measurement (2-wire transducer)	$1I_n+$	Current input positive, channel n
②	4-wire connection for current measurement (4-wire transducer)	$1I_n-$	Current input negative, channel n
③	Backplane bus interface	U_{Vn}	Supply voltage, channel n
④	Analog-to-digital converter (ADC)	$2I_n+$	Current input positive, channel n
⑤	Short-circuit protection	L+	24 V DC (infeed only with light BaseUnit)
⑥	Current limitation	M	Ground
⑦	Color-coded label with color code CC03 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark BaseUnit) Connection to left interrupted (light BaseUnit)
⑧	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
U_{ext}	Encoder supply external	AI0, AI1, AI2, AI3	Channel status LED (green)
		PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for current measurement 2-wire and 4-wire connection (2- and 4-wire transducer)

4 Parameters/address space

4.1 Measuring types and ranges

The analog input module AI 4xI 2-/4-wire ST has the following measuring ranges:

Table 4- 1 Measuring ranges

Measuring type	Measuring range	Resolution
Current (2-wire transducer)	0 to 20 mA	15 bits
	4 to 20 mA	15 bits
Current (4-wire transducer)	0 to 20 mA	15 bits
	4 to 20 mA	15 bits
	± 20 mA	16 bits including sign

You will find the tables of the measuring ranges as well as overflow, overrange, etc., in the section Representation of analog values (Page 35).

4.2 Parameters

Parameters of the AI 4xI 2-/4-wire ST

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of the parameter data record (Page 30).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Short-circuit to ground	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Overflow	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Underflow	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Wire break	• Disable • Enable	Disable	Yes	Module	Module
Measuring type/range	• deactivated • Current (4-wire transducer) 0..20 mA • Current (4-wire transducer) 4..20 mA • Current (4-wire transducer) +/-20 mA • Current (2-wire transducer) 0..20 mA • Current (2-wire transducer) 4..20 mA	Current (4-wire transducer) 4..20 mA	Yes	Channel	Channel
Smoothing	• None • weak • medium • strong	None	Yes	Channel	Channel

Parameter	Value range	Default	Configuration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Interference frequency suppression [2]	• 60 Hz • 50 Hz[1] • 16.6 Hz	50 Hz	Yes	Channel	Module [3]
Potential group	• Use potential group of the left module (module plugged into a dark BaseUnit) • Enable new potential group (module plugged into light BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Interference frequency suppression: Interfering signals at 400 Hz are automatically included in the filtering at 50 Hz.

[2] The settings in the "Interference frequency suppression" parameter have a direct effect on the conversion time of the channel. The analog value is therefore also affected by additionally set filtering via the "Smoothing" parameter.

[3] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 5 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter by using the data record 128, see the appendix "Parameter data set".

Note

Unused channels

"Disable" unused channels in the parameter assignment to improve the cycle time of the module.

A disabled channel always returns the value $7FFF_H$.

4.3 Explanation of the parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics Short-circuit to ground

Enabling of the diagnostics in the event of a short-circuit of the encoder supply to ground or of an input to the encoder supply.

Diagnostics overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics Wire break

Enabling of the diagnostics if the module has no current flow or the current is too weak to be measured at the relevant input.

The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the wire break diagnostics info is output.

Type/range of measurement

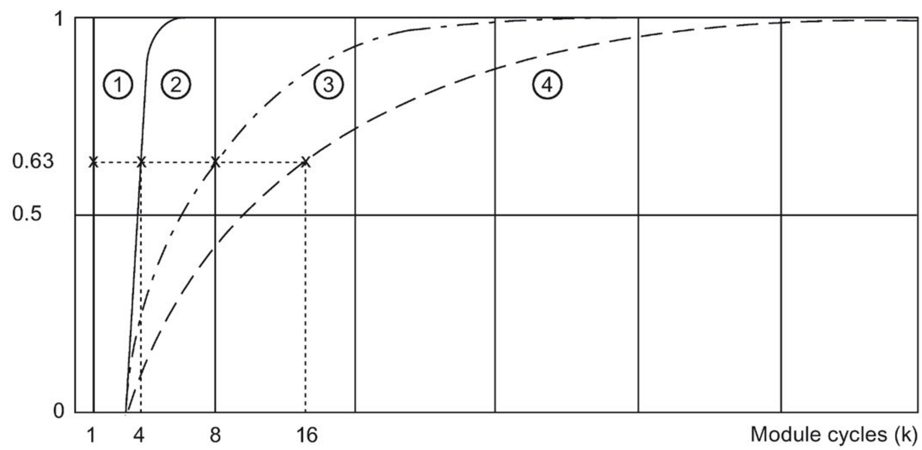
See the section Measuring types and measuring ranges (Page 15).

Smoothing

The individual measured values are smoothed by filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This applies to every signal change at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-1 Smoothing with AI 4xI 2-/4-wire ST

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network can negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the supply frequency that is predominant in the plant.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: There are no faults/errors on the module.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AI 4×I 2-/4-wire ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

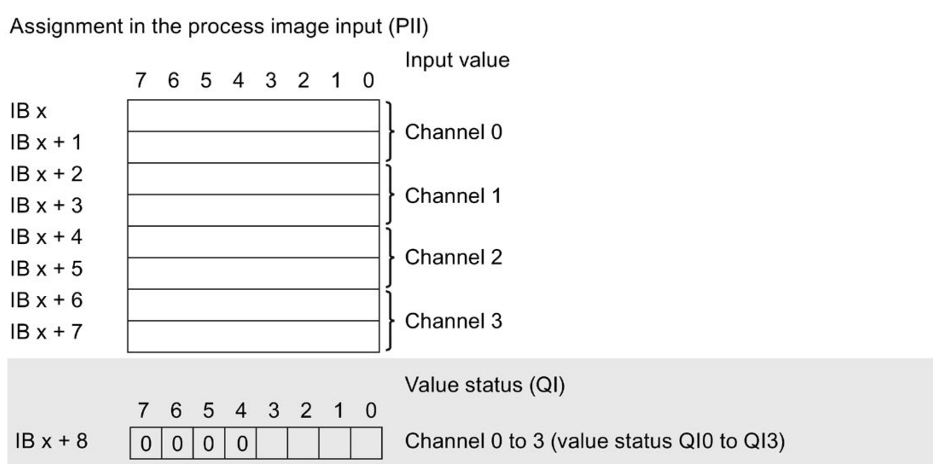


Figure 4-2 Address space of the AI 4×I 2-/4-wire ST with value status

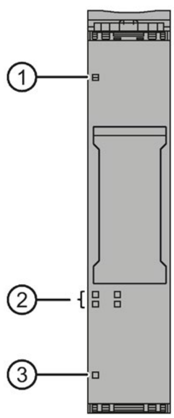
5 Interrupts/diagnostics alarms

5.1 Status and error display

LED display

The figure below shows the LED displays (status and error displays) of the AI 4xI 2-/4-wire ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 23).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
□ Off	Channel disabled
■ On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
□ Off	No supply voltage L+
■ On	Supply voltage L+ present

5.2 Interrupts

The analog input module AI 4xI 2-/4-wire ST supports diagnostics interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt for the following events:

- Channel temporarily unavailable
- Short-circuit (current, 2-wire transducer)
- Wire break (current 4 to 20 mA)
- Low limit violated
- High limit violated
- Error
- Parameter assignment error
- Supply voltage missing

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and how to deal with them

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (2-wire transducer, current)*	1_H	Sensor supply to ground	Correct the module/encoder tuning
		Input to sensor supply	
Wire break (current) **	6_H	Impedance of encoder circuit too high.	Use a different encoder type or modify the wiring, for example, using cables with a larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Disable diagnostics • Connect the sensor contacts
High limit violated	7_H	Value is above the overrange.	Correct the module/encoder tuning
Low limit violated	8_H	Value is below the underrange.	Correct the module/encoder tuning
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update in progress or update has been canceled. The module does not read any process values in this state.	• Wait for firmware update. • Restart the firmware update.

* Short-circuit of the encoder supply to ground and/or of the input signal to the encoder supply of a channel can have a temporary effect on other channels (duration < 0.5 s). This means the short-circuit diagnostics can also be reported for unaffected channels and/or the measured value can be affected temporarily.

** In case of activated smoothing the module calculates the measured values across several module cycles. The module only generates the wire break diagnosis if the smoothed measured value is stable. After the wire break has been eliminated, the module supplies stable measured values again depending on the set smoothing level.

Technical specifications 6

6.1 Technical specifications

Technical specifications of the AI 4×I 2-/4-wire ST

The following table shows the technical specifications as of 09/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6GD01-0BA1/td?dl=en).

Article number	6ES7134-6GD01-0BA1
General information	
Product type designation	ET 200SP, AI 4xI 2-/4-wire ST, PU 1
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC03
Product function	
• I&M data	Yes; I&M0 to I&M3
• Measuring range scalable	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V14 / -
• STEP 7 configurable/integrated as of version	V5.6 and higher
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• Oversampling	No
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	No

Article number	6ES7134-6GD01-0BA1
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	37 mA; without sensor supply
24 V encoder supply	
• 24 V	Yes
• Short-circuit protection	Yes
• Output current, max.	20 mA; max. 50 mA per channel for a duration < 10 s
Power loss	
Power loss, typ.	0.85 W; Without encoder supply voltage
Address area	
Address space per module	
• Address space per module, max.	8 byte; + 1 byte for QI information
Hardware configuration	
Automatic encoding	
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 2-wire connection	BU type A0, A1
• 4-wire connection	BU type A0, A1
Analog inputs	
Number of analog inputs	4; Differential inputs
permissible input current for current input (destruction limit), max.	50 mA
Cycle time (all channels), min.	Sum of the basic conversion times and additional processing times (depending on the parameterization of the active channels)
Input ranges (rated values), currents	
• 0 to 20 mA	Yes; 16 bit incl. sign
• Input resistance (0 to 20 mA)	100 Ω; + approx. 0.7 V diode forward voltage in 2-wire operation
• -20 mA to +20 mA	Yes
• Input resistance (-20 mA to +20 mA)	100 Ω
• 4 mA to 20 mA	Yes; 15 bit
• Input resistance (4 mA to 20 mA)	100 Ω; + approx. 0.7 V diode forward voltage in 2-wire operation

Article number	6ES7134-6GD01-0BA1
Cable length	
• shielded, max.	1 000 m
Analog value generation for the inputs	
Measurement principle	integrating (Sigma-Delta)
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz
• Conversion time (per channel)	180 / 60 / 50 ms
Smoothing of measured values	
• Number of smoothing levels	4; None; 4/8/16 times
• parameterizable	Yes
Encoder	
Connection of signal encoders	
• for voltage measurement	No
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.01 %
Temperature error (relative to input range), (+/-)	0.005 %/K
Crosstalk between the inputs, min.	50 dB; Applies to up to ±5 V overvoltage in other channels
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.05 %
Operational error limit in overall temperature range	
• Current, relative to input range, (+/-)	0.5 %
Basic error limit (operational limit at 25 °C)	
• Current, relative to input range, (+/-)	0.3 %

Article number	6ES7134-6GD01-0BA1
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	70 dB
• Common mode voltage, max.	10 V
• Common mode interference, min.	90 dB
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	No
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; at 4 to 20 mA
• Short-circuit	Yes; 2-wire mode: Short-circuit of the encoder supply to ground or of an input to the encoder supply
• Group error	Yes
• Overflow/underflow	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; Green LED
• Channel status display	Yes; Green LED
• for channel diagnostics	No
• for module diagnostics	Yes; Green/red LED
Potential separation	
Potential separation channels	
• between the channels	Yes; channel group-specific between 2-wire current input group and 4-wire voltage input group
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes; only for 4-wire transducer
Permissible potential difference	
between the inputs (UCM)	10 V DC
Isolation	
Isolation tested with	707 V DC (type test)

Article number	6ES7134-6GD01-0BA1
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation
• horizontal installation, max.	60 °C
• vertical installation, min.	-30 °C; No condensation
• vertical installation, max.	50 °C
• Vertical installation, min.	-30 °C; No condensation
• Vertical installation, max.	50 °C
• Horizontal installation, min.	-30 °C; No condensation
• Horizontal installation, max.	50 °C
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	Up to max. 5 000 m, at installation height > 2 000 m additional restrictions, see manual for details
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	31 g

Parameter data record

A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measuring type and measuring range for PROFINET.

Measuring type	Measuring range	Diagnostics				
		No supply voltage L+	Short-circuit to M	Overflow	Underflow	Wire break
deactivated		*	*	*	*	*
Current (4-wire connection)	0..20 mA	x	-	x	x	-
	4..20 mA	x	-	x	x	x
	±20 mA	x	-	x	x	-
Current (2-wire connection)	0..20 mA	x	x	x	x	-
	4..20 mA	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measuring type and measuring range for PROFIBUS.

Measuring type	Measuring range	Diagnostics			
		No supply voltage L+	Short-circuit to M	Overflow/ Underflow	Wire break
deactivated		*	*	*	*
Current (4-wire connection)	0..20 mA	x	-	x	-
	4..20 mA	x	-	x	x
	±20 mA	x	-	x	-
Current (2-wire connection)	0..20 mA	x	x	x	-
	4..20 mA	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can change the parameters of the module in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

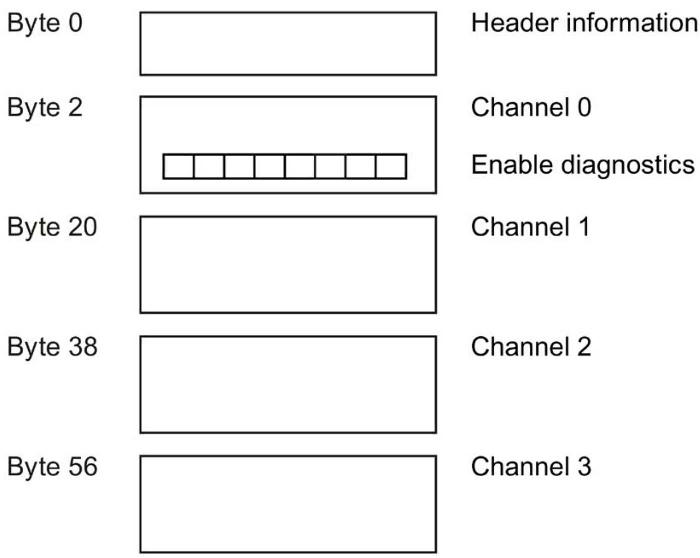

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

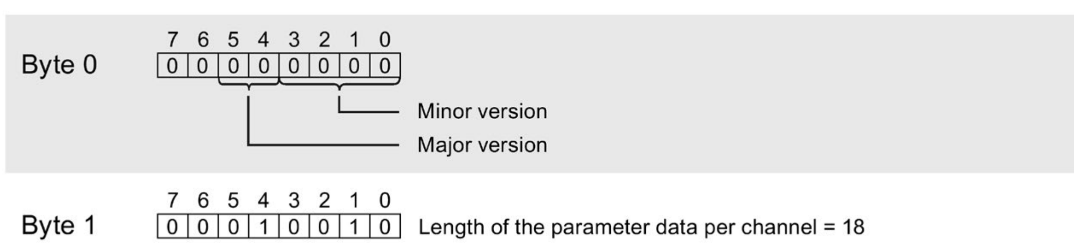

Figure A-2 Header information

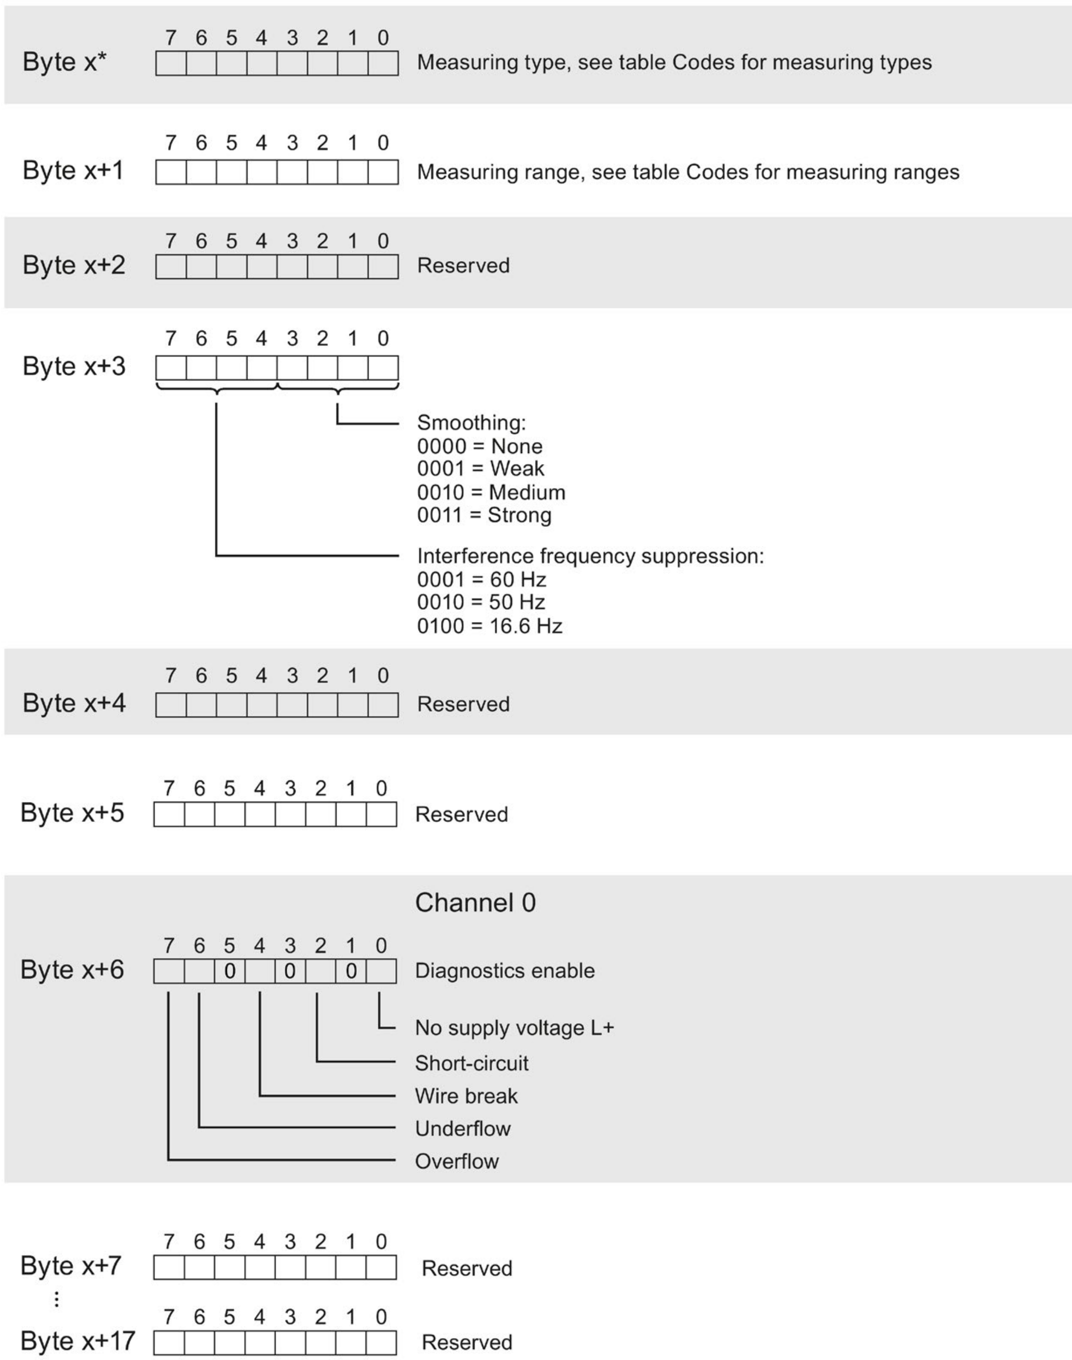
Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 18); channel number= 0 to 3

Figure A-3 Structure of byte x to x+17 for channels 0 to 3

Codes for the measuring type

The following table contains the codes for the measuring types of the analog input module. You must enter these codes at byte x (see previous figure).

Table A- 1 Codes for the measuring type

Measuring type	Coding
Deactivated	0000 0000
Current, 4-wire transducer	0000 0010
Current, 2-wire transducer	0000 0011

Codes for the measuring range

The following table contains the codes for the measuring ranges of the analog input module. You enter these codes at byte x+1 (see previous figure).

Table A- 2 Codes for the measuring range

Measuring range	Coding
0 to 20 mA	0000 0010
4 to 20 mA	0000 0011
±20 mA	0000 0100

A.3 Error in transferring the data record analog input

Error transferring the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station to determine whether the module is plugged or pulled. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	01	Reserved bit set	Check the parameters of the module.
DF	80	E1	02	Invalid diagnostics enable bit set for operating mode.	Check the parameters of the module.
DF	80	E1	05	Invalid coding set for measuring range / measurement type.	Check the parameters of the module.
DF	80	E1	08	Invalid coding set for interference frequency suppression / integration time.	Check the parameters of the module.
DF	80	E1	09	Invalid coding for smoothing.	Check the parameters of the module.

Representation of analog values B

This appendix shows the analog values for all measuring ranges that you can use with the analog module.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its assigned parameters.

The table below shows the representation of binary analog values and of the associated decimal and hexadecimal units of the analog values.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table B- 3 Unipolar input ranges

Dec. val-ue	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	<-17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.2 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 4 Current measuring range ±20 mA

Values		Current measuring range	Range
Dec.	**Hex.**	**±20 mA**	
32767	7FFF	>23.52 mA	Overflow
32511	7EFF	23.52 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	15 mA	
1	1	723.4 nA	
0	0	0 mA	
-1	FFFF		
-20736	AF00	-15 mA	
-27648	9400	-20 mA	
-27649	93FF		Underrange
-32512	8100	-23.52 mA	
-32768	8000	<-23.52 mA	Underflow

Table B- 5 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		Current measuring range		Range
Dec.	**Hex.**	**0 to 20 mA ***	**4 to 20 mA**	
32767	7FFF	>23.52 mA	>22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	<-3.52 mA	<1.185 mA	Underflow

* For measuring type "2-wire transducer", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Validity of the documentation

This manual describes the analog input module AI 4xI 2-wire 4…20mA HART, article number 6ES7134-6TD00-0CA1.

It supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines, and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens’ products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit:
https://www.siemens.com/industrialsecurity

Siemens’ products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer’s exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under
https://www.siemens.com/industrialsecurity.

Documentation guide 1

Introduction

The documentation of the SIMATIC products has a modular structure and covers diverse topics relating to your automation system.

The complete documentation for the ET 200SP system consists of the system manual, function manuals, and manuals for the individual devices.

The STEP 7 information system (online help) also supports you in configuring and programming your automation system.

Overview of documentation for analog input module AI 4xI 2-wire 4…20mA HART

The following table lists further documentation that you will need when using analog input module AI 4xI 2-wire 4…20mA HART.

2.1 Properties

Article number

6ES7134-6TD00-0CA1

View of the module

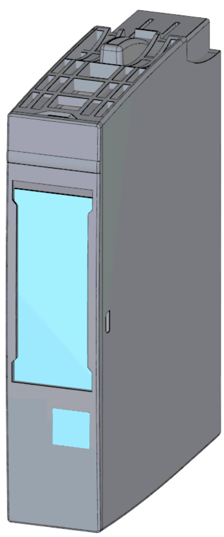

Figure 2-1 View of the AI 4xI 2-wire 4…20mA HART module

Properties

The module has the following technical properties:

- Analog input module with 4 inputs
- Measurement type current for 2-wire HART transducer
- Input range 4 mA to 20 mA
- Resolution 16 bits including sign
- Configurable diagnostics per channel

The module supports the following functions:

- HART communication (Rev. 5 to Rev. 7)
- Firmware update
- I&M identification data

- Configuration in RUN
- Value status (PROFINET IO only)
- Up to four HART variables directly in the input address space

You can configure the module with STEP 7 in the TIA Portal as well as with HW Config and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You will find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring up 3

3.1 Connection and block diagram

The AI 4xI 2-wire 4…20mA HART analog module can be used with all A0 or A1-type BaseUnits.

You connect the transducers to the BaseUnit of the analog module. The infeed of the supply voltage at the light BaseUnit of the associated potential group supplies the module and the transducers connected to the encoder supply voltages.

A new potential group always begins with a light BaseUnit.

BaseUnit

The BaseUnit is not included in the product package of the module and must be ordered separately.

An overview of the BaseUnits that you can use with the analog module can be found in Product information for documentation of the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/73021864)

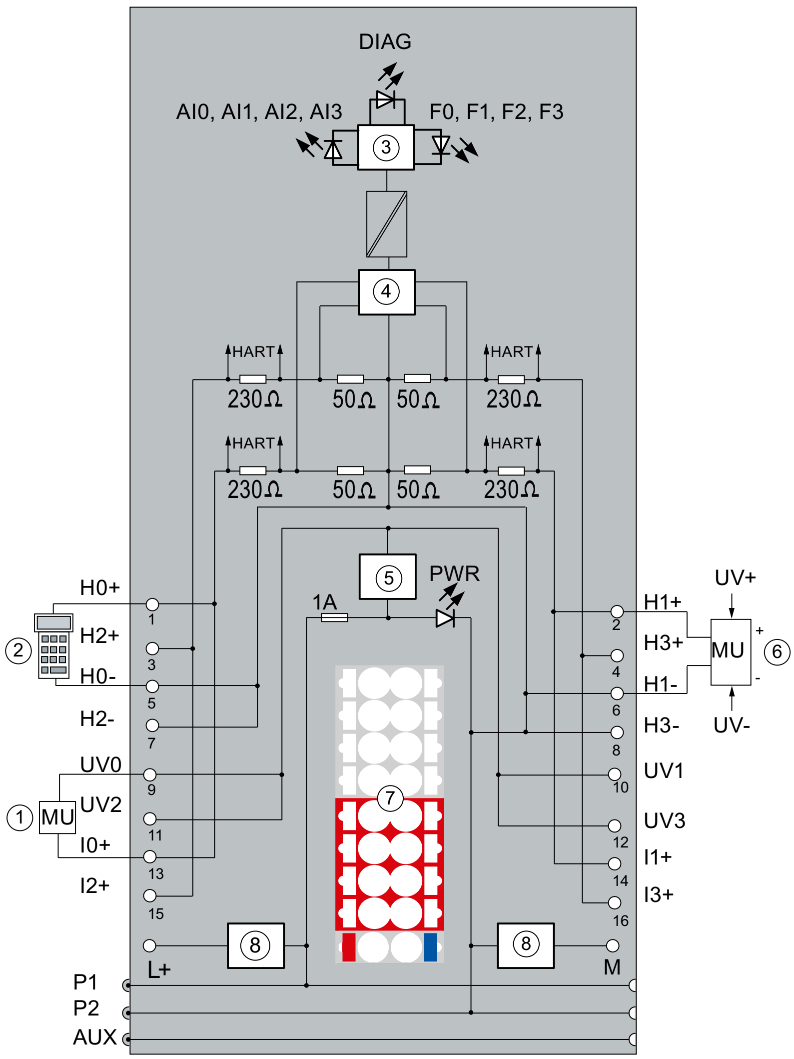
Information regarding selection of the suitable BaseUnit can be found in system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) and in the manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521).

Information regarding wiring of the BaseUnit, creating the cable shield, etc., can be found in system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) in the section "Connecting".

Note

The first BaseUnit of a station must be a light BaseUnit. Also keep this in mind during the configuration.

General terminal assignment



Block diagram AI 4xI 2-wire 4…20mA HART

①	Connection of a 2-wire transducer, at channel 0 in this case

F0 to F3	Channel fault LED (red)
PWR	Power LED (green)

Supply voltage L+/M

Connect supply voltage (24V DC) to terminals L+ and M. An internal protective circuit protects the analog module from reverse polarity. The analog module monitors the connection of the supply voltage.

4 HART function

Definition

"HART" stands for "Highway Addressable Remote Transducer".

The HART functionality also enables you to use the AI 4xI 2-wire 4…20mA HART analog module to exchange data with the connected field devices. The HART protocol is generally accepted as a standard protocol for communication with intelligent field devices: HART is a registered trademark of the HART Communication Foundation (HCF), which owns all the rights to the HART protocol. You can find detailed information about HART in the HART specification.

Advantages of HART

Using the AI 4xI 2-wire 4…20mA HART analog module offers the following advantages:

- Connection compatibility with standard analog modules: Current loop 4 - 20 mA
- Additional digital communication using the HART protocol
- Numerous field devices with HART functions are in use
- The option to use HART is integrated in the S7 system by means of the AI 4xI 2-wire 4…20mA HART analog module.

Use in the system

The AI 4xI 2-wire 4…20mA HART analog module is used in the distributed I/O connected to PROFIBUS DP or PROFINET IO.

You can connect a field device to any channel: The AI 4xI 2-wire 4…20mA HART analog module operates as a HART master, monodrop; the field devices operate as HART devices.

Typical applications

The following applications are typical:

- Commissioning of field devices (centralized parameter assignment)
- Online modification of field device parameters
- Information, maintenance and diagnostic displays for the field devices
- Integration of configuration tools for field devices via the HART interface

4.1 How HART works

Introduction

The HART protocol describes the physical form of the transfer: transfer procedures, message structure, data formats and commands.

HART signal

The figure below shows the analog signal with the modulated HART signal (FSK method), which consists of sine waves of 1200 Hz and 2200 Hz and has a mean value of 0. It can be filtered out using an input filter so that the original analog signal is available again.

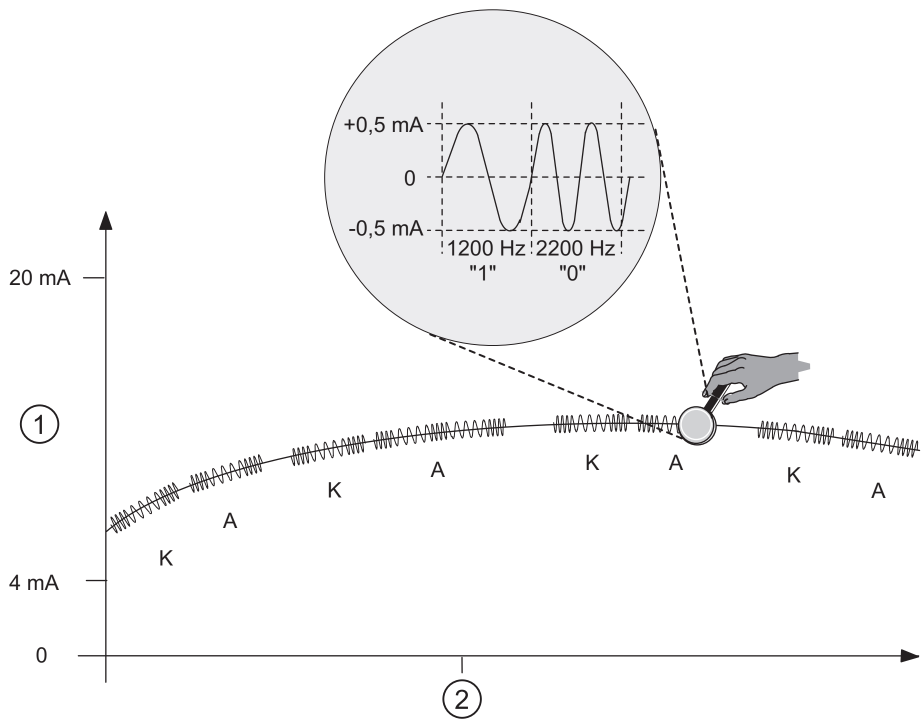

Figure 4-1 The HART signal

①	Analog signal
②	Time (seconds)
K	Command
A	Response

HART communication

The AI 4xI 2-wire 4…20mA HART analog module processes the HART communication in multiplex mode, i.e., consecutively channel-by-channel. As a result, HART commands of the individual channels influence the speed of the HART processing of the other channels.

When HART mode is enabled, the analog module autonomously sends HART commands to the connected field devices. This takes place alternatingly on a channel-specific basis with any pending external HART commands that arrive via the command interface of the module, see section 4.3 "HART command interface".

Commissioning a HART field device

Only HART field devices that are set to the short frame address 0 can be operated. If a HART field device with a different short frame address is connected or a connected field device is reconfigured to a short frame address other than 0 during operation, the module starts a scan of all possible short frame addresses at the next re-establishment of HART communication (command 0 with short frame addresses 1...63). As soon as the connected field device responds, it is converted to the short frame address 0 (HART command 6) by the module. During the scan, the module reports a HART communication error.

HART commands

The assignable properties of the HART field devices (HART parameters) can be set with HART commands and read by means of HART replies. The HART commands and their parameters are divided into three groups with the following properties:

- Universal
- Common practice
- Device-specific

Universal commands must be supported by all manufacturers of HART field devices and common practice commands should be supported. There are also device-specific commands that apply only to the particular field device.

Examples of HART commands

The following two tables show examples of HART commands:

Table 4-1 Examples of universal commands

Command	Function
0	Read manufacturer and device type - only with this command 0 can field devices be addressed by means of a short frame address
11	Read manufacturer and device type
1	Read primary variable and unit
2	Read current output and percent of range, digitally as floating-point number (IEEE 754)
3	Read up to four pre-defined dynamic variables (primary variables, secondary variables, etc.)
13, 18	Read or write tag, descriptor and date (data included in transmission)

Table 4-2 Examples of common practice commands

Command	Function
36	Set upper range value

37	Set lower range value
41	Perform self-test
43	Set the primary variable to zero
109	Switch burst mode on or off

Structure of the HART protocol

Each HART frame sent from the analog module to the connected field device (request frame) and each HART frame from the field device (response frame) has the following basic structure.

PREAMBLE	STRT	ADDR	COM	BCNT	STATUS	DATA	CHK

PREAMBLE: Bytes (0xFF) for synchronizing.
5 to 20 bytes depending on parameter assignment

STRT: Start character (start delimiter)

ADDR: Address of the field device (1 byte; short address or 5 bytes; long address)

COM: HART command number

BCNT: Byte count, number of bytes to follow without checksum

STATUS: HART device status (1st and 2nd status byte). Only present for a response frame. For structure of HART device status, see below.

DATA: Transferred user data / parameters, quantity depending on command (0…230 bytes)

CHK: Checksum

With the exception of the preamble bytes, this structure is contained in the communication data of the HART command interface. See section HART request and response data records (Page 59).

HART replies always contain data. Status information (HART device status; 1st and 2nd status bytes) is always sent together with a HART response. You should evaluate these to make sure the response is correct.

Structure of HART device status (1st and 2nd status bytes).

Table 4-3 1st status byte

When Bit 7 = 1: "Communication error"	
Bit 6 = 1 Bit 5 = 1 Bit 4 = 1 Bit 3 = 1 Bit 2 = 0 Bit 1 = 1 Bit 0 = 0	Parity error Overflow Framing error Checksum error Reserved Overflow in the receive buffer Reserved
When bit 7 = 0: "Specific in line with response frame"	

Table 4-4 2nd status byte

Bit 7 = 1	Device fault
Bit 6 = 1	Configuration changed
Bit 5 = 1	Startup (cold start)
Bit 4 = 1	Additional status information available
Bit 3 = 1	Fixed analog output current setting
Bit 2 = 1	Analog output current saturated
Bit 1 = 1	Secondary variable outside the limits
Bit 0 = 1	Primary variable outside the range

HART-Fast-Mode

The AI 4xI 2-wire 4…20mA HART analog module supports the processing of HART commands as a SHC sequence ("Successive HART Command").
That is, if the analog module detects a HART command with SHC bit set for a channel, the complete HART command processing on the HART analog module is reserved for this channel for approximately 2 s. For all other channels of the analog module, no HART frame processing occurs during this time, see section HART communication interface (Page 20)

Note

- During the time a HART channel of the AI 4xI 2-wire 4…20mA HART analog module is processing an SHC sequence, and thus the complete HART processing of the module is reserved for this channel, the HART variables of all HART channels are no longer updated. They remain unchanged in terms of value and quality code.
- HART commands for other channels are not processed and are acknowledged correspondingly.

Burst mode

The AI 4xI 2-wire 4…20mA HART analog module does not support burst mode. HART commands with set burst bit are ignored and are not forwarded to the connected field device.

4.2 Use of HART

System environment for the use of HART

To use an intelligent field device with HART functionality, you require the following system environment:

- Current loop 4 - 20 mA
  Connection of the transducers to the AI 4xI 2-wire 4…20mA HART analog module
- HART configuration tool "Client":
  You can assign the HART parameters using an external hand-held operating device (HART Handheld) or a HART configuration tool (PDM). Both assume the function of a "client": The configuration tool goes through the AI 4xI 2-wire 4…20mA HART analog module whereas the HART Handheld is connected directly in parallel with the field device. See terminal assignment "HART test connections (terminals 1 to 8)" in the section 3.1 "Terminal assignment".
  PDM (Process Device Manager) is available as a stand-alone unit or integrated in *STEP 7 HW Config*.
- HART system connection:
  The AI 4xI 2-wire 4…20mA HART analog module assumes the function of a "master" by forwarding the commands received from the HART configuration tool or as programmed commands from an S7 user program, for example, to the intelligent field device and sending back the replies. Data records that are transferred via the ET 200SP I/O bus serve as the interface of the AI 4xI 2-wire 4…20mA HART analog module. The data records must be created and interpreted by the client. .

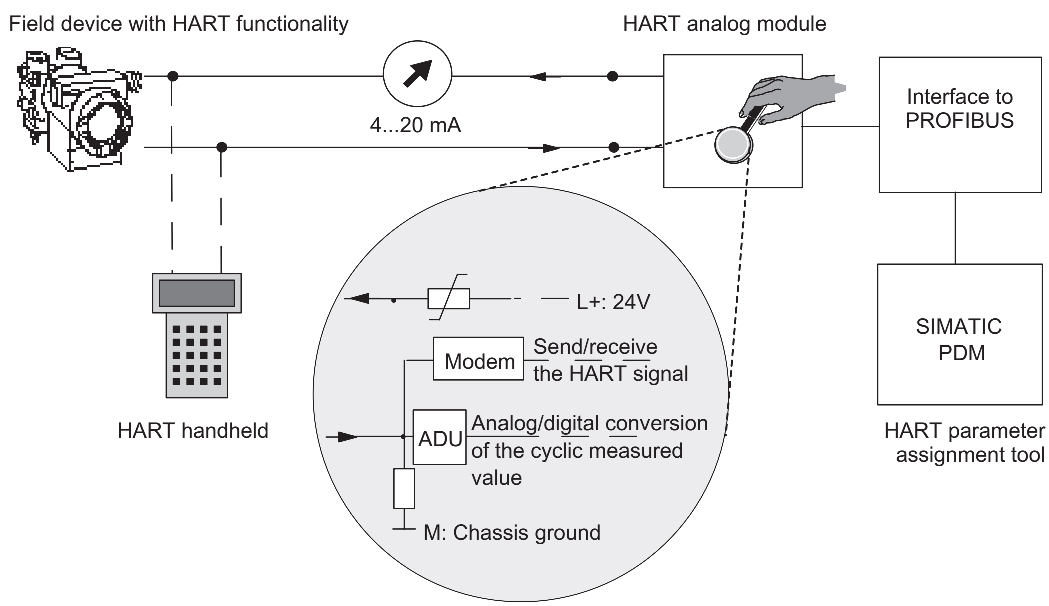

Figure 4-2 System environment for the use of HART

Error management

The two HART status bytes (HART device status) that are transferred with each response of the field device contain error information about the HART communication, HART command, and device status.
This is evaluated by the AI 4xI 2-wire 4…20mA HART analog module and made available in the system via S7 diagnostic messages.

Configuration/commissioning

You configure the AI 4xI 2-wire 4…20mA HART analog module in the SIMATIC system with STEP 7 or the TIA Portal. You assign parameters for the individual channels with respect to the actual analog value acquisition and the use of HART variables in the input address space of the module.
You can configure one field device per channel. By means of this configured field device, the configuration / parameter assignment of the connected field device is then carried out using PDM or the EDD for the ET 200SP.

It is also possible to configure the AI 4xI 2-wire 4…20mA HART analog module using a GSD file for PROFIBUS DP and PROFINET IO. However, in this case, direct configuration / parameter assignment of the connected field devices is not possible.

Parameter reassignment of the field devices

The HART analog module generally accepts parameter reassignments for field devices. Access rights can only be allocated in the configuration tool.

For parameter reassignment of the field devices connected to the HART analog module, proceed as follows:

1. You start the parameter reassignment of a field device using a HART command that you enter using the SIMATIC PDM configuration tool or as a programmed command in the STEP 7 user program.
2. After you have reassigned the parameters of a HART field device, the corresponding bit is set in the device status of the connected field device (in the 2nd status byte).
3. Because of the parameter reassignment of the field device, the HART analog module triggers a diagnostic interrupt "Configuration changed", provided this diagnostic interrupts is enabled. See section 7.3 "Diagnostic alarms". This diagnostic interrupt is to be regarded as information and not as an error and is automatically deleted again by the analog module after approximately 1 minute.

A diagnostic interrupt can also be triggered, if enabled, when parameter reassignment is carried out with the hand-held device.

See also

Connection and block diagram (Page 11)

Diagnostics alarms (Page 40)

4.3 HART communication interface

Data records

The HART commands are sent as so-called external HART requests from the client (e.g., PDM or the STEP 7 user program) to the connected field device via data records. The response of the field device is made available again in the system via data records.

HART communication may only be handled by one client (e.g., PDM) per channel. If a channel is handled by several clients, the response made available by the module cannot be allocated to one client with certainty. The AI 4xI 2-wire 4…20mA HART analog module does not support client management.

Each client/channel is allocated fixed data records:

Table 4-5 Structure of the data records

Channel	Data record number	
	Request to the field device	Response from the field device
0	80	81
1	82	83
2	84	85
3	86	87

The corresponding data records are transferred to the module with the "WRREC" instruction and read by the module with the "RDREC" instruction.

Errors during the transfer are indicated at output parameter STATUS.

Errors during interpretation of the request data record are signaled in the corresponding response data record. The faulty request can be read back again using the request data record.

Rules

- After having written a request data record, a client must read the response data record before it may write another request data record.
- The client can evaluate the "processing status" in the response data record: If the "processing status" indicates "successful" or "error," the response data record contains current response data or error displays.
- The response data record must always be read completely because the analog module may modify the data record after the initial reading with "successful" or "error" status.
If the processing status in the response data record indicates "successful" or "error", the data record contains current response data or error displays.
- The client may only write a request data record to the module again when it has read the response to the previously written request data record via the corresponding response data record. Otherwise, the response from the module is overwritten.
- The STATUS component in the response frame (HART device status in the response data) provides information on whether errors have occurred and, if so, which errors.

Each request is stored on a channel-specific basis, and the corresponding request data record is disabled. Another writing of the same request data record is thus not possible and is

acknowledged with BUSY.
The disable of the request data record is reset after the termination or completion of the requested HART command.

SHC sequence

If a HART command is sent to the module with a set SHC bit, then this channel is reserved for HART commands for 2 seconds. This means that no more internal HART commands are sent to the field device with this channel.

Each time a HART command with a set SHC bit is sent, the module reserves this channel again for another 2 seconds for HART commands. If a HART command without a set SHC bit is detected for this channel, or if no further command occurs for this channel within 2 seconds after the previous HART command, then command 3 or 9 for reading the HART variables is cyclically sent to the field device for this channel.

4.4 HART variables

Introduction

Numerous HART field devices make available additional measured quantities (e.g. sensor temperature).

A maximum of four HART variables supported by the connected field device can be cyclically read per channel with activated HART functionality. The HART variables are read automatically with HART command 3 (for field devices with HART rev. 5 and 6) or with command 9 (for field devices with HART rev. 7 or later).

These four HART variables per channel are always stored in HART variable data record 121 and can be read at any time. See section HART variable data record (Page 56).

In addition, a maximum of 4 HART variables can be configured directly in the input address space of the AI 4xI 2-wire 4…20mA HART analog module. The HART variables are assigned to a channel in the properties dialog of the module. The parameter assignment uses parameter data record 140, see section AUTOHOTSPOT. This makes it easy for you to process measured values directly from the field device as input data in the automation device.

Address assignment

Provided you map HART variables in the input address space of the module by means of the configuration tool or selection of the appropriate configuration, 20 bytes are always additionally allocated for the HART variables.

Configuration of HART variables

You can configure up to 4 HART variables for each channel

- PV (Primary Variable)
- SV (Secondary Variable)
- TV (Tertiary Variable)
- QV (Quaternary)

When HART mode is enabled, the AI 4xI 2-wire 4…20mA HART analog module autonomously and cyclically reads the variables supplied by the connected field devices and makes them available in the input address space according to the configuration.

Each HART variable consists of a 4-byte value and a quality code byte.

Quality code

The quality code describes the process status of the corresponding HART variable.

Basic structure of the quality code

Bit	7….6	5....2	1…0
	Quality 0 0: Bad 0 1: Uncertain 1 0: Good 1 1: Good	Sub-status Coded according to "PROFIBUS PA Profile for Process Control Devices"	Limits 0 0: OK 0 1: Low limit 1 0: High limit 1 1: Constant

The quality codes generated by the AI 4xI 2-wire 4…20mA HART analog module are based on the HART Revision of the utilized field device.

Field devices with HART Revision 5 and 6

The quality code is formed exclusively from the 1st and 2nd Status byte (HART device status) of the response frames (HART command 3).

Quality code	Meaning (process status)	
80_H	Value is okay	Applies even when the following bits are set in the 2nd status byte of the HART response frame: • Configuration changed • Startup (cold start) • Fixed analog output current setting
78_H	Value is uncertain	Applies even when the following bits are set in the 2nd status byte of the HART response frame: • Additional status information available • Analog output current saturated • Secondary variable outside the limits • Primary variable outside the range
84_H	Response code RC8: Update error	
24_H	Response code RC16: Access restricted	Request from field device refused
23_H	Communication error or HART variable not present in the field device	
37_H	Initialization value from analog module	After module startup
00_H	Initialization value from S7 system	

Field devices with HART Revision 7 or higher

The quality code is formed from the 1st status byte (HART device status) and the "Device variable status" (DVS) of the response frames (HART command 9).

Quality code	Meaning (process status)	
80_H	Value is okay	
89_H	"Good" with "Low limit"	Process status, formed from the "Device variable status" (DVS) of the response frames with corresponding limits (see above).
$8A_H$	"Good" with "High limit"	
28_H…$2B_H$	"Bad"	
68_H…$6B_H$	"Poor accuracy"	
78_H…$7B_H$	"Manual" or "Fixed" (manually controlled or fixed value)	
88_H…$8B_H$	"More device variable state available" (additional status information available)	
84_H	Response code RC8: Update error	
24_H	Response code RC16: Access restricted	Request from field device refused
23_H	Communication error or HART variable not present in the field device	
37_H	Initialization value from analog module	After module startup
40_H	Read alternatively via command 3	
00_H	Initialization value from S7 system	

Parameters 5

5.1 Parameters of the AI 4xI 2-wire 4…20mA HART

You specify how the AI 4xI 2-wire 4…20mA HART analog module operates using parameters.

The parameters are subdivided into:

- Channel or technology parameters (data record 128)
  With PROFIBUS DP GSD configuration, there is a reduced configuration via the startup configuration (Prm frame).
- Parameters that define the display of HART variables in the address space of the module; HART mapping parameters (data record 140)

With configuration in the user program, the parameters are transferred to the modules via data records with the "WRREC" instruction; see section Parameter assignment and structure of the channel/technology parameters (Page 48).

5.1.1 Channel/technology parameters

Parameters of the AI 4xI 2-/4-wire ST

The effective range of the parameters depends on the type of configuration. The following configurations are possible:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

Table 5-1 Configurable channel/technology parameters and their default settings

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Module [2]
Diagnostics encoder supply	• Disable • Enable	Disable	Yes	Channel	Module [2]
Diagnostics overflow	• Disable • Enable	Disable	Yes	Channel	Module [2]
Diagnostics underflow	• Disable • Enable	Disable	Yes	Channel	Module [2]

Parameter	Value range	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics wire break	• Disable • Enable	Disable	Yes	Channel	Module [2]
Diagnostics HART	• Disable • Enable	Disable	Yes	Channel	Module [2]
Measuring type/range	• Disabled • Current (2-wire transducer) 4..20 mA • Current (2-wire transducer) 4..20 mA HART	Current (2-wire transducer) 4..20 mA HART	Yes	Channel	Channel
Smoothing	• none • 4-fold (weak) • 16-fold (medium) • 32-fold (strong)	none	Yes	Channel	Channel
Interference frequency suppression	• 60 Hz (integration time 16.6 ms) • 50 Hz [1] (integration time 20 ms) • 10 Hz (integration time 100 ms)	50 Hz	Yes	Channel	Module [2]
Current limit for wire break diagnostics	• 1.185 mA • 3.6 mA	1.185 mA	Yes	Channel	Cannot be changed[2]
Number of HART preamble bytes	5…20	5	Yes	Channel	Cannot be changed[2]
Number of HART repetitions	0…255	5	Yes	Channel	Cannot be changed[2]
Potential group	• Use potential group of the left module • Allow new potential group	Use potential group of the left module	No	Module	Module

1 Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

2 Because the PROFIBUS GSD configuration limits the number of parameters to a maximum of 244 bytes per ET 200SP station, the options for parameter assignment are limited. In this case, the parameter assignment uses data record 245. If required, you can assign this parameter using data record 128 as described in the "GSD File PROFINET IO" column (see table above).

Note

Unused channels

"Disable" unused channels in the parameter assignment to improve the cycle time of the module.

A disabled channel always supplies the analog value $7FFF_H$.

See also

Parameter assignment and structure of the channel/technology parameters (Page 48)

5.1.2 Explanation of the channel/technology parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics encoder supply

Enabling of the diagnostics in the event of a short-circuit of the encoder supply to ground or of an input to the encoder supply.

The short-circuit and underflow diagnostics can be enabled simultaneously. If both diagnostic events occur simultaneously, the short-circuit diagnostics information is output.

Diagnostics overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics underflow

Enabling of the diagnostics when the measured value falls below the underrange.

Diagnostics wire break

Enabling of the diagnostics when the module has no current flow at the input or the current flow at the input is below the configured wire break limit.

The wire break and underflow diagnostics can be activated simultaneously. If both diagnostics events occur simultaneously, the wire break diagnostics information is output.

Diagnostics HART

Enabling of the diagnostics of the HART frame-specific monitoring and the status information supplied by the connected field device in the HART frame (HART device status).

Current limit for wire break diagnostics

You use this to specify the current limit for detecting wire breaks. If the current falls below the configured wire break limit, the measured value is declared invalid and, if wire break diagnostics is enabled, corresponding diagnostics information is generated. When value status is configured, the analog value is marked as invalid.

With a wire break limit of 3.6 mA, the measured value becomes invalid when the current falls below 3.6 mA and is marked as valid again when it rises above 3.8 mA.

There is no hysteresis for a wire break limit of 1.185 mA.

Measuring type/range

The AI 4xI 2-wire 4…20mA HART analog input module has the following measuring ranges:

Table 5-2 Measuring ranges

Measuring type	Measuring range	Resolution
Disabled	-	-
Current (2-wire transducer)	4 to 20 mA	15 bits + sign
Current (2-wire transducer)	4 to 20 mA HART	15 bits + sign

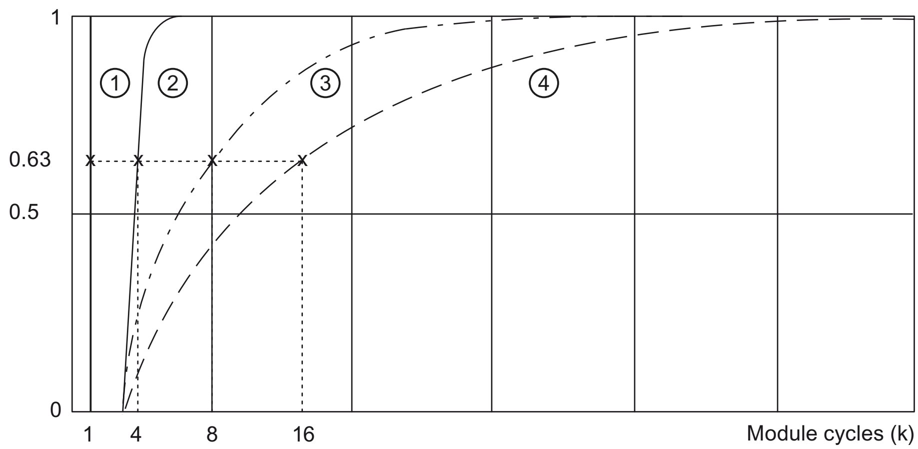
An overview of the measuring range as well as overflow, overrange, etc., can be found in the section Analog value representation (Page 65) and in Analog Value Processing function manual.

Smoothing

The individual measured values are smoothed by filtering. Smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This applies to every signal change at the analog input.



① No smoothing (k = 1)

② Weak (k = 4)

③ Medium (k = 8)

④ Strong (k = 16)

Figure 5-1 Smoothing of the analog value

Interference frequency suppression

Suppresses the interference affecting analog input modules that is caused by the frequency of the AC voltage network used.

The frequency of the AC supply system may interfere with the measured value, in particular in low voltage ranges. .

Number of HART preamble bytes

Specifies the number of preamble bytes that the module prefixes to each HART frame to be sent (FF_H). These bytes are used for synchronizing the frames.

Number of HART repetitions

Specifies the number of HART frame repetitions. If the analog module receives no response or receives a response with error to a HART frame sent to the field device, the frame is accordingly repeated, i.e., resent to the field device.

Because HART communication of the individual channels uses multiplex operation, faulty HART frames affect the other channels when the number of HART repetitions is high. In other words, the other channels are processed less frequently.

Potential group

Specifies that a BaseUnit with supply voltage infeed is located in this slot (see system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)).

See also

Parameters of the AI 4xI 2-wire 4…20mA HART (Page 25)

5.1.3 HART mapping parameters

The HART mapping parameters allow a maximum of 4 HART variables to be configured (mapped) in the address space of the module.

Each HART variable occupies 5 bytes of input data. As soon as you configure (map) at least one HART variable in the input address space, the addresses for all four variables are occupied (20 bytes).

With PROFIBUS DP GSD configuration with HART variables, the HART variables cannot be directly configured. The four secondary variables are supplied in ascending channel order in the address space of the module.
When required, this can be changed using data record 140; see section AUTOHOTSPOT.

Parameters

Table 5-3 Configurable HART mapping parameters

Parameter		Value range	Default	Configuration in RUN	With GSD file PROFIBUS DP
Variable 0	Channel	0…3	0	Yes	0
	Type	• Non / Cir • Primary • Secondary • Tertiary • Quartenary	Non / Cir	Yes	Secondary
Variable 1	Channel	0…3	0	Yes	1
	Type	• Non / Cir • Primary • Secondary • Tertiary • Quartenary	Non / Cir	Yes	Secondary
Variable 2	Channel	0…3	0	Yes	2
	Type	• Non / Cir • Primary • Secondary • Tertiary • Quartenary	Non / Cir	Yes	Secondary

Parameter		Value range	Default	Configuration in RUN	With GSD file PROFIBUS DP
Variable 3	Channel	0…3	0	Yes	3
	Type	• Non / Cir • Primary • Secondary • Tertiary • Quartenary	Non / Cir	Yes	Secondary

Configuring/address space 6

6.1 Configuring

You configure the analog module AI 4xI 2-wire 4…20mA HART

- In the TIA Portal V13.0.1 or higher
- With STEP 7 V5.5 + SP4 or higher (HSP0263)
- Using GSD/GSDML

The GSD files for the ET 200SP Distributed I/O System can be downloaded from the Internet:

- GSDML (http://support.automation.siemens.com/WW/view/en/57138621)
- GSD (http://support.automation.siemens.com/WW/view/en/ 73016883)

Configuration options

The following configurations are possible:

- Without value status and without HART variables ("AI 4xI 2-wire 4…20 mA HART")
- Without value status, with HART variables ("AI 4xI 2-wire 4…20 mA HART, 4 variables")
- With value status and without HART variables ("AI 4xI 2-wire 4…20 mA HART, QI")
- With value status, with HART variables ("AI 4xI 2-wire 4…20 mA HART, 4 variables, QI")

With GSD/GSDML configuration, you must select one of the possible configurations directly.

The configuration for STEP 7 (TIA Portal or HW Config) is made indirectly via the parameters.

Restrictions

- Value status is not available for a PROFIBUS DP station.
- Downstream of a Standard IM (V1.1), the module can be operated only in the "Without value status and without HART variables" configuration.
- TIA Portal:
  - The module behind a standard IM (V1.1) is not available.
  - TIA Portal as of V14.0.1
    The module can be centrally configured on the following CPU:
    - CPU 1510SP-1 (as of V2.1)
    - CPU 1512SP-1 PN (as of V2.1)
  - TIA Portal as of V15.0.0
    The module can be configured as an open controller.
  - The module cannot be used behind fail-safe controllers.

6.2 Address space

The following figure shows the allocation of the address space of the AI 4xI 2-wire 4…20mA HART module for a configuration with value status (Quality Information, QI) and with HART variables.

The addresses for the value status are only available if the value status has been enabled or the corresponding configuration has been configured from the GSDML.

The addresses for the HART variables are only available if configuration/parameter assignment of the HART variables has been carried out or the corresponding configuration has been configured from the GSD/GSDML.

If the HART variables are configured and there is no value status configuration or parameter assignment, the HART variables begin directly after the analog values, thus starting from IB x + 8.

Table 6-1 Address space of analog input module AI 4xI 2-wire 4…20mA HART

Assignment in the process image input (PII)		
	7 6 5 4 3 2 1 0	Input value
IB x		Channel 0
IB x + 1		
IB x + 2		Channel 1
IB x + 3		
IB x + 4		Channel 2
IB x + 5		
IB x + 6		Channel 3
IB x + 7		
	7 6 5 4 3 2 1 0	Value status (QI)
IB x + 8	0 0 0 0	Channel 0 to 3 (value status QI0 to QI3)
IB x+9 …. IB x+12	Value	Configured HART variable 0
IB x+13	Quality code	
IB x+14 …. IB x+17	Value	Configured HART variable 1
IB x+18	Quality code	
IB x+19 …. IB x+22	Value	Configured HART variable 2
IB x+23	Quality code	
IB x+24 …. IB x+27	Value	Configured HART variable 3
IB x+28	Quality code	

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 to 3 in this byte are assigned to the corresponding channel. The provide information about the validity of the analog value, namely irrespective of the diagnostics enables.

Bit = 1: There is no error in the analog value or the analog value acquisition of the channel.

Bit = 0: The analog value of the channel cannot be correctly acquired.
The channel is disabled; there is a fault in the wiring or module.

Evaluating HART variables

If you have configured (mapped) HART variables for the analog module, four HART variables with 5 bytes each are stored in the input address space.

Each HART variable consists of a 4-byte real value and a quality code byte. The quality code describes the validity of the value; see section HART variables (Page 22) .

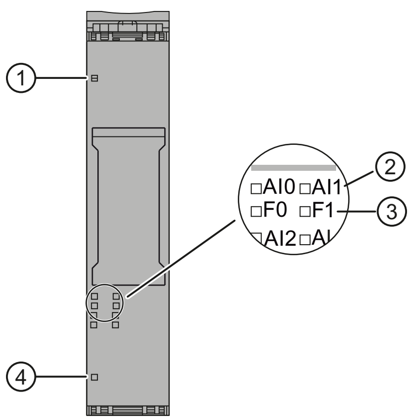
Interrupts/diagnostics alarms

7

7.1 Status and error displays

LED displays

The figure below shows the status and error displays of the AI 4xI 2-wire 4…20mA HART analog input module.



① DIAG (green/red)

② Channel status (green)

③ Channel fault (red)

④ PWR (green)

Figure 7-1 LED displays

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostic alarms can be found in the section Diagnostics alarms (Page 40).

Table 7-1 Status display of the channel status/channel fault LEDs

LEDs		Meaning
Channel status	**Channel fault**	
□ Off	□ Off	Channel disabled or module switched off
■ On	□ Off	Channel enabled and no channel diagnostics present

LEDs		Meaning
Channel status	**Channel fault**	
Off	On	Channel enabled and channel diagnostics present
On	On	Channel enabled and **only** HART channel diagnostics present

Table 7-2 DIAG LED error display

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP is not OK or switched off
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics, at least one error is currently present

Table 7-3 Status display of the PWR LED

PWR LED	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

7.2 Interrupts

The AI 4xI 2-wire 4…20mA HART analog input module supports diagnostic interrupts.

Diagnostic interrupt

The module generates a diagnostic interrupt for the following events:

- Channel/component temporarily unavailable
- Short-circuit / Overload of encoder voltage
- Wire break
- Low limit violated
- High limit violated
- Error
- No supply voltage L+
- HART communication error or HART field device error

7.3 Diagnostics alarms

A diagnostic alarm is generated for each detected diagnostic event. The DIAG LED flashes on the module.

There is additionally a channel-specific display of the diagnostics through the corresponding channel fault/channel status LEDs.

The diagnostic alarms can, for example, be read from the diagnostic buffer of the CPU or be displayed in STEP 7 using the Online and Diagnostics view. You can evaluate the error codes with the user program.

Table 7-4 Diagnostic alarms, their meaning and how to deal with them

Diagnostic alarm	Error code	Meaning	Remedy
Channel/component temporarily unavailable	$1F_H$	• Update of the firmware is being performed or has been canceled. The module does not perform any measurements during this time.	
Short-circuit/overload at external encoder supply *	$10E_H$	• Short-circuit of the encoder supply to M • Short-circuit of the input to the encoder supply • Overload of the encoder supply	• Correct the module/encoder tuning
Wire break	6_H	• Impedance of encoder circuit too high. • Wire break between the module and sensor • Channel not connected (open)	• Use a different encoder type or modify the wiring, for example, using cables with a larger cross-section • Connect the cable • Disable diagnostics • Connect the sensor contacts
High limit violated	7_H	• The analog value is above the overrange.	• Correct the module/encoder tuning
Low limit violated	8_H	• The analog value is below the underrange.	• Correct the module/encoder tuning
Error	9_H	• Internal module error occurred.	• Replace module
No supply voltage	11_H	• No or insufficient supply voltage L+	• Check wiring of the supply voltage L+ on the BaseUnit • Check BaseUnit type
HART communication error	141_H	• HART field device is not responding • Timing error • HART field device has not understood the sent command (1st status byte)	• Check the process wiring • Correct the parameter assignment • Set output current of ≥4 mA • Increase the number of assigned repetitions

Diagnostic alarm	Error code	Meaning	Remedy
HART primary variable outside range	142_H	• Incorrect parameters in the HART field device • HART field device is at "Primary variable outside the limits" in simulation mode • Incorrect measuring point • Primary variable assigned outside the limits	• Check the parameter assignment of the HART device • Correct the simulation • Check whether the correct transducer is connected
HART output current of the field device saturated	143_H	The output current of the HART field device is saturated: • Incorrect parameters in the HART field device • HART field device is set to a measured value that is too high in simulation mode • Incorrect measuring point	
HART output current of the field device specified	144_H	The output current of the HART field device is set to a fixed value: • Incorrect parameters in the HART field device • HART field device is set to a measured value that is too high in simulation mode • Incorrect measuring point	
HART secondary variable outside the limits	149_H	• Incorrect parameters in the HART field device • HART field device is at "Non-primary variable outside the limits" in simulation mode • Incorrect measuring point • Non-primary variable assigned outside the limits	
HART - more status available	145_H	• The identifier for "Additional status information available" of the HART field device was set in the HART device status (in the 2nd status byte).	• Read status using HART command 48 and eliminate error/cause, if necessary
HART configuration changed (reset again automatically by the module after approximately 1 minute)	146_H	• The identifier for "Parameter reassignment" of the HART field device was set in the HART device status (in the 2nd status byte).	• If you do not want a diagnostic interrupt to be triggered for parameter reassignment, the diagnostic interrupt must not be enabled.
HART malfunction in field device	147_H	• The field device signals a malfunction in the HART device status (in the 2nd status byte)	• Read status using HART command 48 and eliminate error/cause, if necessary • Replace the field device

* Short-circuit of the encoder supply to ground and/or of the input signal to the encoder supply of a channel can have a temporary effect on other channels (duration < 0.5 s). This means the short-circuit diagnostic information can also be signaled on unaffected channels and/or the measured value can be affected temporarily.

Technical specifications 8

8.1 Technical specifications of the AI 4xI 2-wire 4…20mA HART

Technical specifications of the AI 4xI 2-wire 4…20mA HART

Parameter data records 9

Parameter assignment in the user program

You have the option of reassigning parameters for individual channels of the module and for the mapping of HART variables in RUN without affecting the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module.

- Channel/technology parameters using data record 128
- The HART mapping using data record 140.

The parameters assigned with STEP 7 are not changed permanently in the CPU, which means the parameters assigned with STEP 7 are valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Parameters

Only the values specified in each case in the following are permitted. Values that are not listed are rejected by the analog module.

Each parameter data record is checked by the analog module. If an incorrect parameter is detected, the complete data record is discarded and the parameters of the analog module remain unchanged.

9.1 Parameter assignment and structure of the channel/technology parameters

Structure of data record 128

Data record 128 has a length of 42 bytes and contains the channel/technology parameters of all four channels (10 bytes per channel).

The parameters are divided into parameters that influence the actual analog value acquisition, diagnostic enables, and basic parameters of HART communication.

You can use data records 131 to 134 to assign and change additional parameters and HART-specific settings. See section HART-specific settings (Page 57).

Byte 0		Header information
Byte 2	Analog value acquisition Diagnostics enable HART	Channel 0 parameters
Byte 12	Analog value acquisition Diagnostics enable HART	Channel 1 parameters
Byte 22	Analog value acquisition Diagnostics enable HART	Channel 2 parameters
Byte 32	Analog value acquisition Diagnostics enable HART	Channel 3 parameters

Figure 9-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

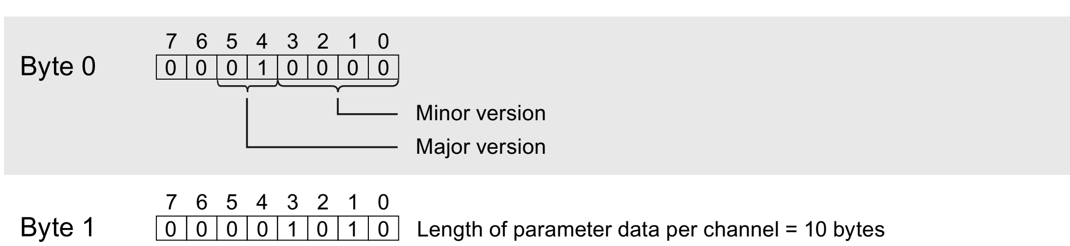

Figure 9-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

All unused bits and the bits or bytes marked with "reserved" must be set to zero.
You enable a parameter by setting the corresponding bit to "1" or the appropriate value.

	7	6	5	4	3	2	1	0	
Byte x+8									Number of HART preamble bytes: 5...20 (default = 5)

	7	6	5	4	3	2	1	0	
Byte x+9									Number of HART retries: 0...255, internally limited to maximum 10 (default = 5)

* x = 2 + (channel number * 10); with channel number 0 ….3

Figure 9-3 Structure of bytes x to x+39 for channels 0 to 3

9.2 Parameter assignment and structure of the HART mapping parameters

Structure of data record 140

Data block 140 has a total length of 12 bytes.

Using the parameters of data record 140, you can configure/map up to four HART variables of the individual channels in the input address space of the module if the corresponding configuration is selected, see "Configuring (Page 33)".

Header information

The figure below shows the structure of the header information.

	Bits 7 6 5 4 3 2 1 0	
Byte 0		Version = 0
Byte 1		Block length = 11 bytes
Byte 2		Block type = 75
Byte 3		Reserved = 0

Figure 9-4 Header information

Parameters

The following figure shows the parameter assignment of the four HART variables 0...3.

	Bits 7 6 5 4 3 2 1 0	
Byte x*		Channel number: 0...3
Byte x+1		Variable marking: 0 = non 1 = Primary 2 = Secondary 3 = Tertiary 4 = Quartenary 15 = CiR

* x = 4 + (HART variable * 2); with HART variable 0….3

Figure 9-5 Parameters

Note

Memory area

Allocation of the memory area based on the configuration of the HART variables:

- All four HART variables are set to 0 = "none":
  No memory area is reserved/allocated for HART variables in the input address range.
- As least one HART variable is set to not equal to 0 = "none":
  The entire memory area always allocated to the four HART variables in the input address space. All remaining HART variables are preset to 15 = "CiR" and 0 = "none" is no longer allowed.

HART operating data records 10

Reading/writing data in RUN

HART operating data records are transferred to the module with the "WRREC" instruction and read from the module with the "RDREC" instruction.

Errors during the transfer are indicated at output parameter STATUS of the "WRREC" or "RDREC".

The following HART operating data records are available:

Data record number	Description	Length (bytes)	Writable	Readable
80	HART request Channel 0	240	Yes	Yes
81	HART response Channel 0	240	No	Yes
80	HART request Channel 1	240	Yes	Yes
81	HART response Channel 1	240	No	Yes
80	HART request Channel 2	240	Yes	Yes
81	HART response Channel 2	240	No	Yes
80	HART request Channel 3	240	Yes	Yes
81	HART response Channel 3	240	No	Yes
121	HART variables	80	No	Yes
131	HART parameters Channel 0	8	Yes	Yes
132	HART parameters Channel 1	8	Yes	Yes
133	HART parameters Channel 2	8	Yes	Yes
134	HART parameters Channel 3	8	Yes	Yes
148	HART directory	17	No	Yes
149	HART feature data	3	No	Yes

10.1 HART directory

Structure of the HART directory

Byte	Meaning	Comment
0	Profile Revision Number	= 2, 0 (Revision 2.0)
1		
2	Index of Client Management	= 255 (not relevant)
3	Number of Clients	= 1
4	Number of Channels	= 4
5	Write Read Index Offset	= 1 (The response to a request data record is made with the data record number of the request data record + 1)
6	Index of HMD Feature Parameter	= 149
7	Index of HMD Module Parameter	= 255 (not relevant)
8	Start Index of Burst Buffer Area	= 255 (not relevant)
9+n	Index of HMD Channel Parameter (Channel n)	= 131+n
9+n+4	Index of HART Client Channel Message Data	= 80+(2*n) The HART request data records cannot be configured. Data records starting from data record number 80 (80, 82, 84, 86) are used.

10.2 HART feature data

Structure of the HART feature data

Byte	Meaning	Comment
0	Byte 0	= 0x62 Bit1 = 1: "Parameter check result is given with a read response" Bit5 = 1: "Compact format is supported"
1	Byte 1	= 0
2	Max Length Data Unit	= 240 (maximum length of the HART request data records)

10.3 HART variable data record

The AI 4xI 2-wire 4…20mA HART analog module supports a maximum of 4 HART variables per channel that are read cyclically, provided this is supported by the connected field device. These 16 HART variables are are made available in a readable manner in HART variable data record 121.

Each HART variable consists of a 4-byte real value and a quality code byte. See section 4.4.1 "Quality code".

Structure of the HART variable data record

Byte	Meaning	
Channel 0		
0…3	Value	Primary Variable (PV)
4	Quality code	
5…8	Value	Secondary Variable (SV)
9	Quality code	
10…13	Value	Tertiary (TV)
14	Quality code	
15…18	Value	Quartenary (QV)
19	Quality code	
Channel 1		
20…39	HART variables same as for Channel 0	
Channel 2		
40…59	HART variables same as for Channel 0	
Channel 3		
60…79	HART variables same as for Channel 0	

If HART is not enabled or the respective HART variable is not supplied from the connected field device, the corresponding variable = 0 and the QC = 0x37 (initialization value from the analog module).

10.4 HART-specific settings

The HART communication is available using standard parameter assignment (see section 9.1 "Parameter assignment and structure of the channel/technology parameters").

Additional HART-specific settings can be specified on a channel-specific basis using data records 131 to 134.

The parameters assigned with STEP 7 are not changed permanently in the CPU, which means the parameters assigned with STEP 7 are valid again after a restart.

Each parameter reassignment of the analog module resets the HART-specific settings back to the initial values from parameter data record 128.

Where there is no supply voltage L+, the module does not assume the HART-specific settings.

Channel	Data record number
0	131
1	132
2	133
3	134

Structure of the HART-specific settings

	7 6 5 4 3 2 1 0	
Byte 0	Must be 128	Bit 7 is reset after evaluation of data record by module
Byte 1	Must be 5	Offset for manufacturer-specific parameters according to HART specification
Byte 2		Number of HART retries (0....255, internally limited to 10) Initial value from parameter data record 128
Byte 3		Number of HART preamble bytes (0, 5...20, 255) * Initial value from parameter data record 128
Byte 4	Must be 0	Field device mode according to HART specification
Byte 5		Client timeout in s (1 ... 255 s) Initial value = 60 s
Byte 6	0 0 0 0 0 0 _ _ Bit 0: 1 = Enable HART, 0 = Disable HART Bit 1: 1 = Primary master, 0 = Secondary master	Initial value according to HART activation from parameter data record 128 Always as primary master
Byte 7	Must be 0	Reserved

Figure 10-1 Settings

* When the number of HART preamble bytes = 0, the number of preamble bytes required by the connected field device are used, but no fewer than 5.
When the number of HART preamble bytes = 255, then 20 preamble bytes are used.

10.5 HART request and response data records

HART commands are processed on a channel-specific basis via a separate command interface with one request data record and one response data record in each case.

Channel	Data record number	
	Request to the field device	Response from the field device
0	80	81
1	82	83
2	84	85
3	86	87

Structure of request data records 80, 82, 84, 86

Byte	Meaning	Comment
0	Request control	
1	Number of preamble bytes	5....20, 255
2…239	Communication data according to HART specification	

Coding "Request control":

Bit 0…1: Reserved = 0

Bit 2: 0 = Parameters are not checked

Bit 3...4: Reserved = 0

Bit 5: 0 = Transparent format *
1 = Compact format

Bit 6: 1 = Enable SHC mode **

Bit 7: 0 = HART Request

* HART commands are processed by the analog module in transparent message format and in compact message format. However, the response data from the module is always made available in transparent message format.

** Processing of a sequence of HART commands as an SHC sequence affects all other channels with HART enabled. See section 4.3 "HART command interface", SHC sequence.

Note

When "Number of Preamble Bytes" = 255, the number of preambles set with the parameters is used. The default setting is five. You can re-configure the number of preamble bytes using the parameters and HART-specific settings (see section HART-specific settings (Page 57)).

Structure of response data records 81, 83, 85, 87

In case of response error

Byte	Meaning	Comment
0	Response control	
1	HART group error display	
2	Protocol error	
3…239	Response data according to HART specification	Only present when "Response result" = 6 = "Error, with data"

In case of response error

Byte	Meaning	Comment
0	Response control	
1	HART group error display	
2…239	Response data according to HART specification	Only present when "Response result" = 4 = "Successful, with data"

Coding "Response control":

Bits 0-2:	Response result (processing status) 0 = Inactive 1 = Inactive (reserved) 2 = Waiting 3 = Waiting, executing 4 = Successful, with data 5 = Successful, without data 6 = Error, with data 7 = Error, without data
Bit 3:	0 = Burst mode not active;
Bit 4:	0 = Response data come directly from the HART device
Bit 5:	0 = Response data in transparent message format
Bit 6:	0 = SHC mode not active 1 = SHC mode active
Bit 7:	0 = HART response

Coding "HART group error display"

Bit number	Meaning	Explanation
0	Additional status information available	(2nd HART status byte) You obtain additional status information, if required, with HART command 48.
1	HART communication error	The field device has detected a communication error when receiving the command. The error information can be found in the 1st HART status byte.
2	Parameter check	0: HMD parameters unchanged 1: Check HMD parameters

Bit number	Meaning	Explanation
3	Reserved	Always 0
4…7	HART protocol error during response	0: Unspecified error 1: HMD error 2: Channel fault 3: Command error 4: Query error 5: Response error 6: Query rejected 7: Profile query rejected 8: Manufacturer-specific query rejected 9 - 15: Not used

Coding "HART protocol error during response"

HART protocol error during response	Meaning	Explanation
0	Unspecified error	Always 0
1	HMD error	0: Not specified 1: Internal communication error 2: Parameter assignment error 3: HW fault 4: Wait time expired 5: HART timer expired 6…127: Reserved 128...255: Manufacturer-specific
2	Channel fault	0: Not specified 1: Line fault 2: Short-circuit 3: Open line 4: Low current output 5: Parameter assignment error 6…127: Reserved 128…255: Manufacturer-specific
3	Command error	0-127: HART protocol, Bit 7 = Always 0
4	Query error	Bit 0 = 0: Reserved Bit 1 = 1: Receive buffer overflow Bit 2 = 0: Reserved Bit 3 = 1: Checksum error Bit 4 = 1: Framing error Bit 5 = 1: Overflow error Bit 6 = 1: Parity error Bit 7 = 1: Reserved

HART protocol error during response	Meaning	Explanation
5	Response error	Bit 0 = 1: GAP timeout Bit 1 = 1: Receive buffer overflow Bit 2 = 1: Timeout Bit 3 = 1: Checksum error Bit 4 = 1: Framing error Bit 5 = 1: Overflow error Bit 6 = 1: Parity error Bit 7 = 1: Reserved
6	Query rejected	0: Unspecified 1: Compact format not supported 2: SHC not supported 3: Impermissible command 4: No resources 5...127: Reserved 128...255: Manufacturer-specific
7	Profile query rejected	0: Not specified (not supported)
8	Manufacturer-specific query rejected	0: Not specified (not supported)

Example of HART programming (HART command interface)

For HART channel 0, the command 01 is to be sent in transparent message format to the HART field device with address "98 CF 38 84 F0".
A positive edge at input 4.0 of a digital input module leads to the writing of the HART command.

The following assumptions are made:

- The module address of the AI 4xI 2-wire 4…20mA HART analog module is 512 (200_H).
- The data record is stored in DB80: starting from address 0.0, length of 11 bytes.
- In this example, DB80 (request data record for channel 0) consists of 11 bytes.

```
STL                                 Explanation
    A I 4.0
    FP M 101.0
    = M 104.0
m2: CALL SFC 58
    REQ :=M104.0                    Write request
    IOID :=B#16#54                  Address range ID
    LADDR :=W#16#200                Module address
    RECNUM :=B#16#50                Data record number 80
    RECORD :=P#DB80.DBX0.0 BYTE     Data record with length of 11 bytes (must corre-
11                                  spond to the exact length that is to be transferred)
```

```
RET_VAL :=MW93                  RET_VAL of SFC 58 (OK/error/...)
BUSY :=M51.0                    Write operation not yet completed
A M 51.0
SPB m2
BE
```

Table 10-1 DB80: Transparent message format

Byte	Initial value (hex)	Comment (Hex)
0	00	Req_Control (00 = Transparent message format. 40 = Transparent message format with SHC sequence)
1	05	Number of preamble bytes (05-14)
2	82	Start character (02 = Short Frame with command 0) (82 = Long Frame with other commands)
3	98	Address (with command 0, the address is exactly 1 byte long and has the value 0.)
4	CF	
5	38	
6	84	
7	F0	
8	01	Command (CMD)
9	00	Length in bytes
10	98	Checksum (CHK) (calculated starting from byte 2 "Start character" up to the next to last byte)

A HART command can also be sent in compact message format. In this case, the data that is transferred via DB 80 is reduced to 4 bytes.

Table 10-2 DB80: Compact message format

Byte	Initial value (hex)	Comment (Hex)
0	20	Req_Control (20 = Compact message format. 60 = Compact message format with SHC sequence)
1	05	Number of preamble bytes (05-14)
2	01	Command (CMD)
3	00	Length in bytes

You can learn when the response from the field device was received by cyclically reading data record DS81 for HART channel 0. The response is always supplied in transparent message format.

Table 10-3 FC81: Reading of the response to DB81 with SFC 59

```
STL                             Explanation
m3: CALL SFC 59
```

```
    REQ :=1                        Read request
    IOID :=B#16#54                 Address range ID
    LADDR :=W#16#200               Module address of the HART-AI
    RECNUM :=B#16#51               Data record number 81
    RECORD :=P#DB81.DBX0.0 BYTE    Data record
75
    RET_VAL :=MW100                RET_VAL of SFC 59 (OK/error/...)
    BUSY :=M49.1                   Read operation not yet completed
    A M 49.1
    SPB m3
    BE
```

The program part A M 49.1 to SPB m3 is only required if reading is to occur synchronously.

As long as "0x03" is in byte 0 of DB81, the response has not been received from the field device. Positive response data that you can evaluate is available from the field device as soon as bit 2 = 1 in byte 0.
If there are errors in the response data, see the "HART group fault display" tables in byte 1 or "HART protocol error during response" in byte 2 of the field device response.

11 Analog value representation

Table 11-1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

Representation / Value range

The table below contains the decimal and hexadecimal values (codings) of the possible current measuring ranges.

Table 11-2 Current measuring range 4 to 20 mA / 4…20 mA HART

Values		Current measuring range	Range
Dec.	**Hex.**	**4 to 20 mA**	
32767	7FFF	> 22.81 mA	Overflow
32511	7EFF	22.81 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	16 mA	
1	1	4 mA + 578.7 nA	
0	0	4 mA	
-1	FFFF		Underrange
-4864	ED00	1.185 mA	
-32768	8000	< 1.185 mA	Underflow

11.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table 11-3 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

Table 11-4 Unipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Underrange
-4864	-17.593	1	1	1	0	1	1	0	1	0	0	0	0	0	0	0	0	
-32768	<-17.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

11.2 Representation of analog values in the current measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table 11-5 Current measuring range ±20 mA

Values		Current measuring range	Range
Dec.	**Hex.**	**±20 mA**	
32767	7FFF	>23.52 mA	Overflow
32511	7EFF	23.52 mA	Overrange
27649	6C01		
27648	6C00	20 mA	Nominal range
20736	5100	15 mA	
1	1	723.4 nA	
0	0	0 mA	
-1	FFFF		
-20736	AF00	-15 mA	
-27648	9400	-20 mA	
-27649	93FF		Underrange
-32512	8100	-23.52 mA	
-32768	8000	<-23.52 mA	Underflow

Table 11-6 Current measuring ranges 0 to 20 mA and 4 to 20 mA

Values		Current measuring range		Range
Dec.	**Hex.**	**0 to 20 mA ***	**4 to 20 mA**	
32767	7FFF	>23.52 mA	>22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overrange
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Underrange
-4864	ED00	-3.52 mA	1.185 mA	
-32768	8000	<-3.52 mA	<1.185 mA	Underflow

* For measuring type "2-wire transducer", negative values are not possible for the range "0 to 20 mA". Therefore, no underrange or underflow exists here.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

In the "Technical specifications" section, the operational and basic error limits for thermocouple type C have changed.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

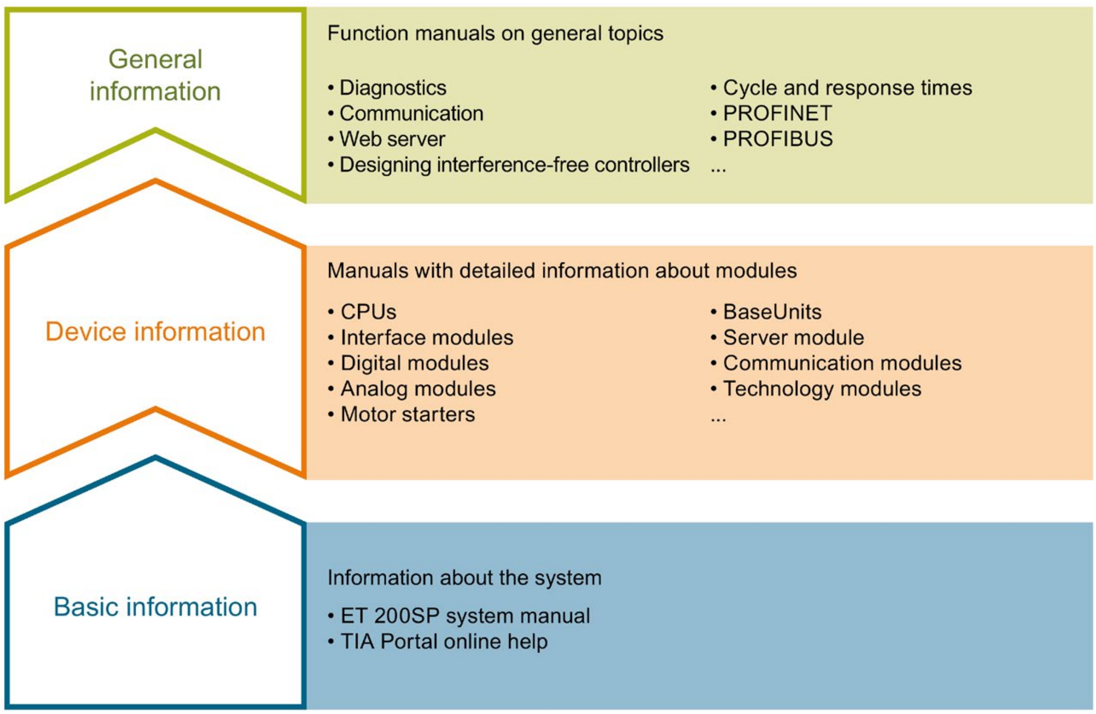
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the module AI 4×RTD/TC 2-/3-/4-wire HF

Properties

The module has the following technical properties:

- Analog input module with 4 inputs
- Resolution: Up to 16 bits including sign
- Voltage measurement type can be set per channel
- Resistor measurement type can be set per channel
- Thermal resistor (RTD) measurement type can be set per channel
- Thermocouple (TC) measurement type can be set per channel
- Configurable diagnostics for each channel
- Hardware interrupt on limit violation can be set per channel (two high and two low limits per channel)
- Automatic compensation of the line resistance with 3-wire connection

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V1.0.0 or higher	V11, SP2 or higher with HSP 0024	V5.5 SP3 or higher with HSP 0227 V1.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V1.0.0 or higher	V11, SP2 or higher with HSP 0024	V5.5 SP3 or higher with HSP 0227 V1.0 or higher	X	X
Reconfiguration in RUN	FS01	V1.0.0 or higher	V11, SP2 or higher with HSP 0024	V5.5 SP3 or higher with HSP 0227 V1.0 or higher	X	X
Value status (PROFINET IO only)	FS01	V1.1.0 or higher	V12, SP1 or higher with HSP 0057	V5.5 SP3 or higher with HSP 0227 V2.0 or higher	X	X
Calibration in runtime	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Scalable measuring range	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V2.0 or higher	X	X
Selectable conductor resistance for 2-wire connection	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Switchable wire break check	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X

You can configure the module with STEP 7 and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connection

See also

You can find more information on accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 4×RTD/TC 2-/3-/4-wire HF module with the terminal assignments.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

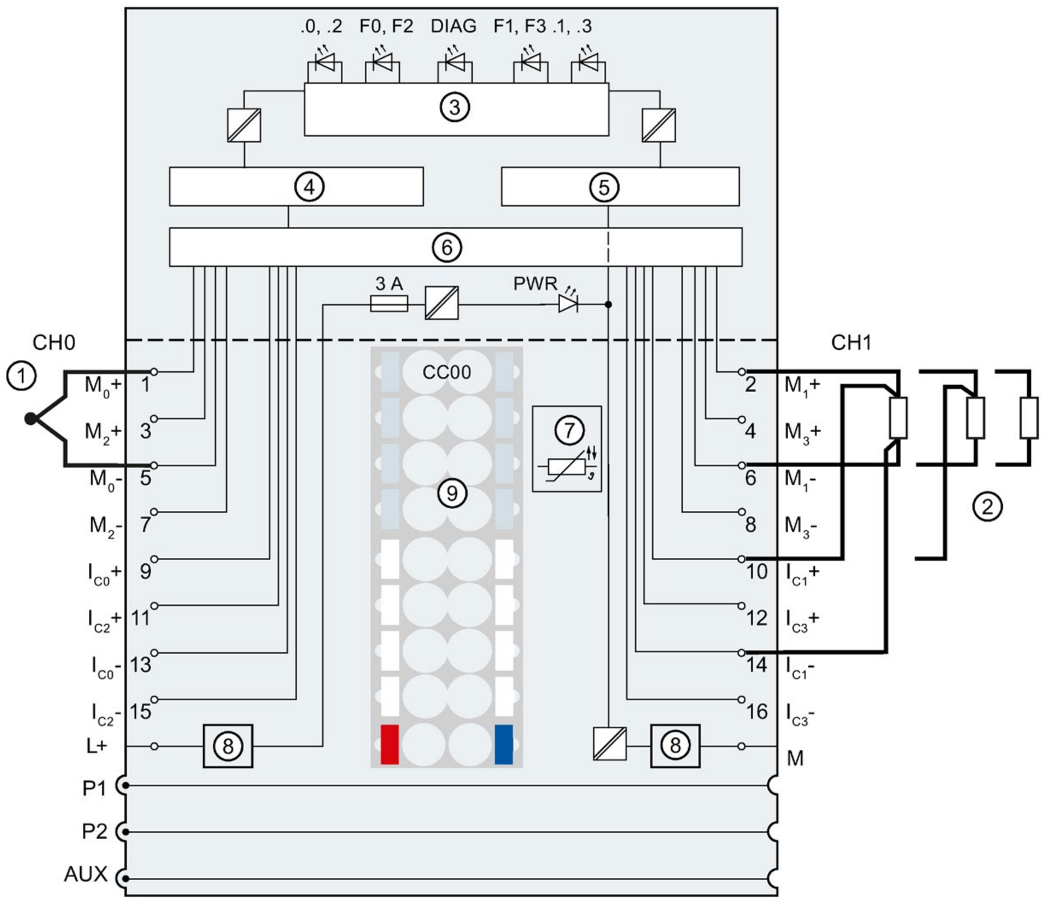
Note

- The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.
- When using floating sensors, bridge the m- connections and connect to ground / FE. This increases the immunity of the module.

  Bridging and connecting are not necessary for disabled and disconnected inputs.

Wiring: 2-wire connection for thermocouples and 4-, 3-, 2-wire connection of resistance-type sensors or thermal resistors (RTD)

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 4xRTD/TC 2-/3-/4-wire HF on the BaseUnit BU type A0/A1.



①	2-wire connection of thermocouple / voltage connection	M_n+	Measuring line positive, channel n
		M_n-	Measuring line negative, channel n
②	4-, 3-, 2-wire connection of resistance-type sensors or thermal resistors (RTD)	I_{Cn}+	Constant current line positive, channel n
		I_{Cn}-	Constant current line negative, channel n
③	Backplane bus interface	L+	24 V DC (infeed only with light-colored BaseUnit)
④	Analog-to-digital converter (ADC)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑤	Constant current power supply	DIAG	Diagnostics LED (green, red)
⑥	Multiplexer	.0 to .3	Channel status LED (green)
⑦	Temperature recording for BU type A1 only	PWR	Power LED (green)
⑧	Filter connection supply voltage (available with light-colored BaseUnit only)	F0 to F3	Channel fault LED (red)
⑨	Color-coded label with color code CC00 (optional)

4 Parameters/address space

4.1 Measurement types and measuring ranges

The following table describes the measuring range and the temperature coefficients you can configure for each measurement type:

Table 4- 1 Measurement types and measuring ranges

Measurement type	Measuring range	Temperature coefficient
Deactivated	–	–
Voltage	±50 mV / ±80 mV / ±250 mV / ±1 V	
Resistor (2-wire connection)	PTC	–
Resistor (2-, 3-, 4-wire connection)	150 Ω / 300 Ω / 600 Ω / 3 kΩ / 6 kΩ	–
Thermal resistor RTD (3-wire connection)	Climatic / Standard Cu 10	Cu 0.00427[1]
Thermal resistor RTD (2, 3, 4-wire connection)	Climatic / Standard Pt 100 Pt 200 Pt 500 Pt 1000	Pt 0.00385 / Pt 0.003916 / Pt 0.003902 / Pt 0.00392 / Pt 0.00385055
	Climatic / Standard Ni 100 Ni 120 Ni 200 Ni 500 Ni 1000	Ni 0.00618 / Ni 0.00672
	Climatic[2] / Standard[2] Ni 1000	Ni 0.005
Thermocouple (TC)	Type E, N, J, K, L, S, R, B, T, C, U, TXK (acc. to GOST)	-

1 The preset temperature coefficients are valid for Europe.

2 For sensors LG-Ni 1000 from Siemens Building Ltd (Landis & Stäfa).

Special features when using Cu10 sensors

- Choose "Thermal resistor (3-wire connection)" and "Cu10" in the parameter assignment.
- Wire the Cu10 sensor into the 3-wire connection technology.
- During operation, automatic, internal compensation of the line resistance of the missing measuring line takes place.

Note

To ensure optimum line compensation with Cu10, please observe the following:

- An accurate measured value is only attained if the cable resistance of the positive constant current line to the Cu10 sensor and the cable resistance of the negative measuring line are identical in value.
- Recommendation: Keep the measuring line as short as possible.
- Different resistance values may also occur due to the connection method used.

Special features when using PTC resistors

PTCs are suitable for monitoring temperature and/or as thermal protection devices of complex drives or transformer windings.

- Choose "Thermal resistor (2-wire)" and "PTC" in the parameter assignment.
- Connect the PTC to the 2-wire connection technology.
- Use the PTC resistors, type A (PTC thermistor) in accordance with DIN/VDE 0660, part 302.
- If "Underflow" diagnostic is enabled, a "Low limit violated" diagnostic is generated for resistance values < 18 Ω, indicating a short-circuit.
- Sensor data for the PTC resistor:

Table 4- 2 Using PTC resistors

Property	Technical specifications	Comment
Switching points	**Behavior with rising temperature**	
	< 550 Ω	**Normal range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "0" (in the PII)
	550 Ω to 1650 Ω	**Prewarning range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "1" (in the PII)
	> 1650 Ω	**Response range:** • SIMATIC S7: Bit 0 = "1", Bit 2 = "0" (in the PII)
	Behavior with falling temperature	
	> 750 Ω	**Response range:** • SIMATIC S7: Bit 0 = "1", Bit 2 = "0" (in the PII)
	750 Ω to 540 Ω	**Prewarning range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "1" (in the PII)
	< 540 Ω	**Normal range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "0" (in the PII)
	Reaction to short-circuit	
	< 18 Ω	• SIMATIC S7: Bit 7 (IB x+1) = "1", Bit 0 = "0" and Bit 2 = "0"

[1] Below 23 kΩ

Assignment in the process image input (PII) with SIMATIC S7

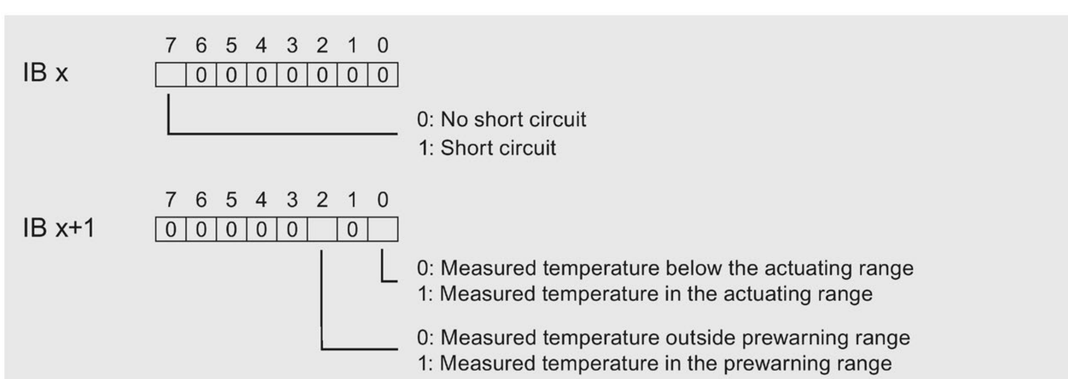

Figure 4-1 Assignment in the process image input (PII)

Notes on programming

- Bits 0+2 are relevant for evaluation in the process image input. You can monitor, for example, the temperature of a motor using bits 0+2.
- Bits 0+2 in the process image input cannot be saved. During parameter assignment, take into consideration that a motor, for example, starts up in a controlled manner (via an acknowledgment).
- Bits 0+2 can never be set at the same time; they are set one after the other.

NOTICE
No measurement is possible in the following cases: • When I/O modules are pulled out • When supply voltage to the I/O module fails • When there is a wire break or short-circuit in the measuring lines Therefore, always evaluate the diagnostics entries of the AI 4×RTD/TC 2-/3-/4-wire HF for safety reasons.

Example

The diagram shows the temperature curve and the associated switching points.

4.2 Parameters

Parameters of the AI 4xRTD/TC 2-/3-/4-wire HF

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the WRREC instruction to transfer the parameters to the module by means of data records, see section Parameter assignment and structure of parameter data record (Page 59). The following parameter settings are possible:

Table 4- 3 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP

1 Diagnostics: Missing supply voltage L+: Detection per module or alarm per channel

2 Interference frequency suppression: Interfering signals at 400 Hz are automatically included in the filtering at 50 Hz.

3 The settings in the "Interference frequency suppression" parameter have a direct effect on the conversion time of the channel. The analog value is therefore also affected by additionally set filtering via the "Smoothing" parameter.

4 Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 13 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter with data record 128, see Appendix "Parameter data record".

5 Only for configuration with PROFIBUS GSD file: The set reference junction is used with the additional parameter "Kx Reference junction activated" in the case of "Enable". In the case of "Disable", "No reference channel mode" is used for RTD and "Fixed reference temperature" is used for TC.

6 For 2-wire connection only

Note

Unused channels

"Deactivate" unused channels in the parameter assignment to improve the cycle time of the module.

A deactivated channel always returns the value $7FFF_H$.

4.3 Explanation of parameters

Diagnostics: Missing supply voltage L+

Enabling of the diagnostics for missing or insufficient supply voltage L+.

Diagnostics: Reference junction

Enabling of the reference junction diagnostics if the reference temperature of the reference junction needs to be determined for the TC channel being operated.

Reference junction using the PROFINET GSD file

A BaseUnit with an internal temperature sensor (BU..T), the reference channel of group 0, 1, 2, 3, or channel 0 of the I/O module can be used as reference junction for the TC measurement, if this has the parameter setting "Thermal resistor Pt100 climatic range Degrees Celsius".

A possible parameter assignment is represented below:

Table 4- 4 RTD channel

Setting	Description
No reference channel mode	The temperature value at channel 0 can be used as a reference value for the entire module.
Reference channel of group 0, 1, 2, 3	The channel acts as a **transmitter** for the reference junction temperature of a group. The distribution is performed via the interface module.

Table 4- 5 TC channel

Setting	Description
Reference channel of the module	The corresponding TC channel uses channel 0 of the same module as the reference junction temperature. This must be configured as "Thermal resistor Pt 100 climatic range Degrees Celsius" and "No reference channel mode"; otherwise, Diagnostics: Reference junction is triggered.
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Diagnostics: Reference junction is triggered if there is an incorrect BaseUnit type.
Reference channel of group 0, 1, 2, 3	The channel acts as a **receiver** for the reference junction temperature of a group.
Fixed reference temperature	The reference temperature of the thermocouple is set to 0 °C. As a result, no temperature compensation is performed.

Note

Shared Device and "Reference channel of group 0, 1, 2, 3"

If the transmitter and receiver for the reference junction temperature of a group are assigned to different IO controllers, then both IO controllers must be performing data exchange with the IO device to ensure error-free operation of the temperature compensation.

Reference junction using the PROFIBUS GSD file

A BaseUnit with an internal temperature sensor (BU..T), the reference channel of group 0, 1, 2, 3, or channel 0 of the I/O module can be used as reference junction for the TC measurement, if this has the parameter setting "Thermal resistor Pt100 climatic range Degrees Celsius".

The set temperature unit (e.g. Degrees Celsius) is valid for the entire module with temperature compensation "Reference channel of the module" and "Reference channel of group 0, 1, 2, 3".

Table 4- 6 **RTD channel**

Setting	Description
No reference channel mode	The temperature value at channel 0 can be used as a reference value for the entire module.
Reference channel of group 0, 1, 2, 3	The channel acts as a **transmitter** for the reference junction temperature of a group. The distribution is performed via the interface module.

Setting	Description
Channel x Reference junction activated	• Disable: Channel x is configured with the setting "No reference channel mode". • Enable: Channel x is configured with the setting selected above.

Table 4- 7 **TC channel**

Setting	Description
Reference channel of the module	The corresponding TC channel uses channel 0 of the same module as the reference junction temperature. This must be configured as "Thermal resistor Pt 100 climatic range Degrees Celsius" and "No reference channel mode"; otherwise, Diagnostics: Reference junction is triggered.
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Diagnostics: Reference junction is triggered if there is an incorrect BaseUnit type.
Reference channel of group 0, 1, 2, 3	The channel acts as a **receiver** for the reference junction temperature of a group.
Fixed reference temperature	The reference temperature of the thermocouple is set to 0 °C. As a result, no temperature compensation is performed.

Setting	Description
Channel x Reference junction activated	• Disable: Channel x is configured with the setting "Fixed reference temperature". • Enable: Channel x is configured with the setting selected above.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics if the measured value falls below the underrange.

Diagnostics: Wire break

Enabling of the diagnostics if the module has no current flow or the current is insufficient for measurement at the correspondingly assigned input.

Type/range of measurement

See the section Measurement types and measuring ranges (Page 17).

Temperature coefficient

The temperature coefficient depends on the chemical composition of the material. In Europe, only one value is used per sensor type (default value).

The temperature coefficient (α value) indicates by how much the resistance of a specific material changes relatively if the temperature increases by 1 °C.

The other values facilitate a sensor-specific setting of the temperature coefficient and enhance accuracy.

Temperature unit

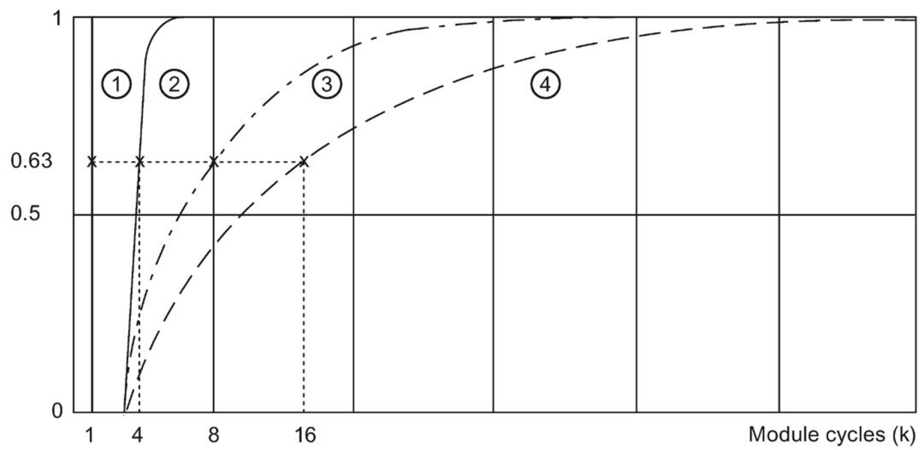
Selection between Degrees Celsius, Fahrenheit and Kelvin as the temperature unit for the selected measuring range.

Smoothing

The individual measured values are smoothed using filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This specification is valid for all signal changes at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-3 Smoothing for AI 4×RTD/TC 2-/3-/4-wire HF

Interference frequency suppression

Suppresses the interferences affecting analog input modules that are caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network is likely to have a negative effect on measured values particularly with measurement in the low voltage range and on thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Measuring range resolution

Parameters for the measurement type thermal resistor standard and thermocouple.

Allows you to increase the resolution to 2 or 3 decimal places for a configurable section of the measuring range. See the Scalable measuring range (Page 32) section.

Measuring range center

Determines the temperature over which the scalable measuring range is symmetrically spanned. The value must be within the nominal range of the underlying measuring range. It is specified in integers.

Maximum / Minimum

Corresponds to overflow / underflow for the scalable measuring range.

Conductor resistance

Parameters for the measurement types resistor and thermal resistor (2-wire connection).

Used to compensate for the conductor resistance without having to interfere with the sensor wiring.

If the "Conductor resistor" parameter is configured higher than a value 0 mΩ, the module then automatically uses the factory calibration data.

Hardware interrupt enable

Enabling of a hardware interrupt if the high limit 1/2 or the low limit 1/2 is violated.

Low limit 1/2

Specify a threshold which triggers a hardware interrupt when violated.

High limit 1/2

Specify a threshold which triggers a hardware interrupt when violated.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.4 Scalable measuring range

Introduction

The scalable measuring range is available for the temperature measuring ranges of thermal resistors (RTD) standard and thermocouples. The measuring ranges for voltage, resistor and thermal resistor climatic are not supported.

The scalable measuring range is valid for the following ranges:

- Nominal range
- Underrange
- Overrange

Function

The scalable measuring range is a limited section of a measuring range supported by the module.

It allows you to increase the resolution for a configurable section.

- The "Measuring range resolution" parameter determines the resolution to 2 or 3 decimal places.
- The "Measuring range center" parameter determines the temperature over which the scalable measuring range is symmetrically spanned.

Value ranges

Table 4- 8 Value ranges

Scalable measuring range	Measuring range resolution		Values hex.
	2 decimal places	3 decimal places	
Overflow	>325.11	>32.511	$7FFF_H$
High limit	325.11	32.511	$7EFF_H$
Measuring range center	0	0	0_H
Low limit	-325.12	-32.512	8100_H
Underflow	<-325.12	<-32.512	8000_H

To obtain an absolute temperature, the measuring range center in the application program (as offset) must be calculated with the value of the user data of the scalable measuring range.

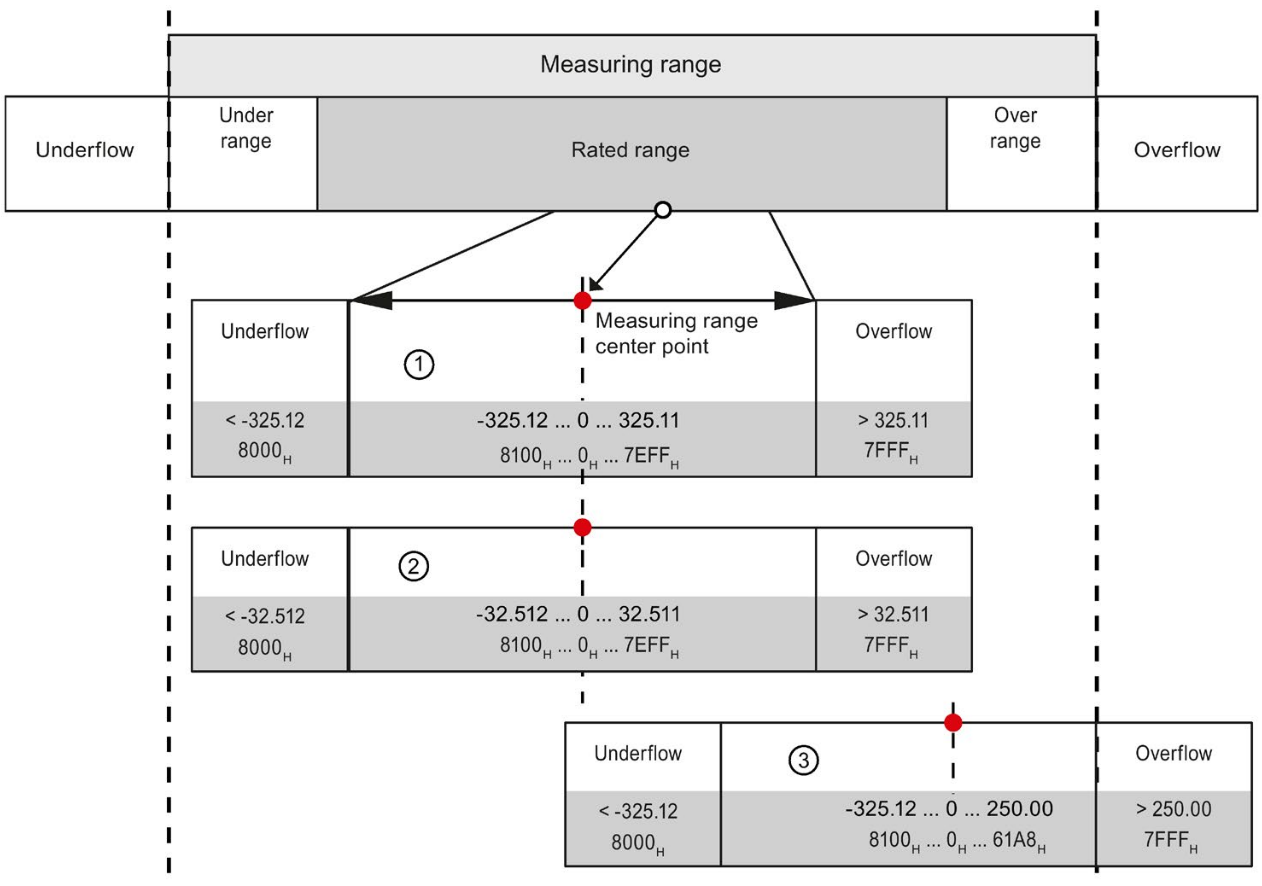
The measuring range center is always output in the user data as the value "0". The user data are correspondingly mapped to the bipolar input ranges in S7 format. Underflow / overflow is also formed in accordance with the limits of S7.

Rules

- The measuring range center must be within the nominal range of the underlying measuring range. It is specified in integers.
- The scalable measuring range is spanned symmetrically over the measuring range center. Depending on the resolution, various value ranges result (①, ②).
- The scalable measuring range is limited by underflow and overflow of the underlying measuring range:
  - It is clipped at the underflow when it falls below the limit.
  - It is clipped at the overflow when it exceeds the limit (③).

Example

The following example illustrates the effect of scalable measuring ranges:



① Scalable measuring range with 2 decimal places in hexadecimal S7 format
② Scalable measuring range with 3 decimal places in hexadecimal S7 format
③ Scalable measuring range which is cut off at the overflow of the underlying measuring range (clipping)

Figure 4-4 Examples of scalable measuring ranges

4.4.1 Configuration

Requirement

You must select a valid temperature measuring range for configuration.

Configuration

The function is activated using the "Scalable measuring range" parameter.

The following figure shows an example of a configuration in STEP 7:

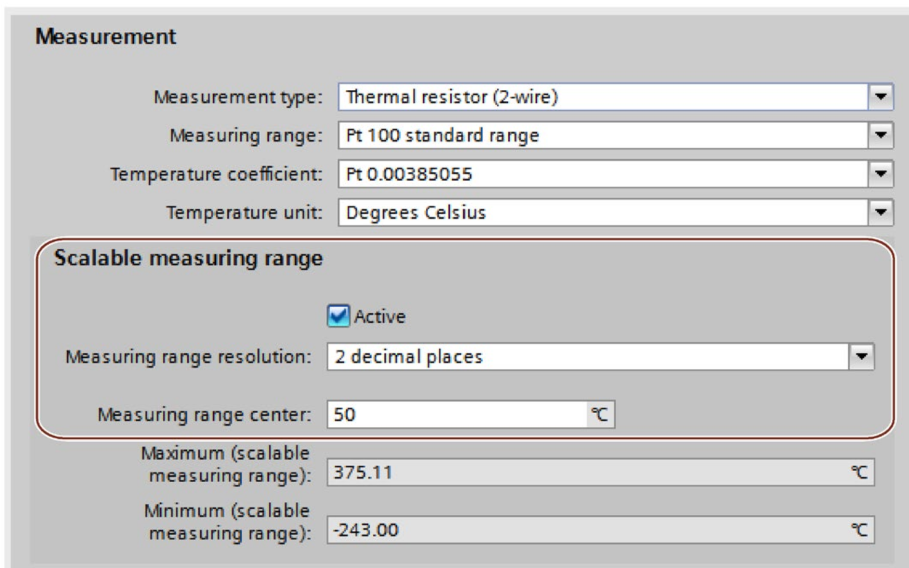


Figure 4-5 Configuration for the scalable measuring range

Reference

You will find more information on the configuration in the STEP 7 online help.

4.4.2 Evaluating data record 235

Evaluation in the user program

In the user program, you can evaluate the status and the limits of the scalable measuring range with data record 235, which may result by reaching underflow/overflow.

Structure of data record 235

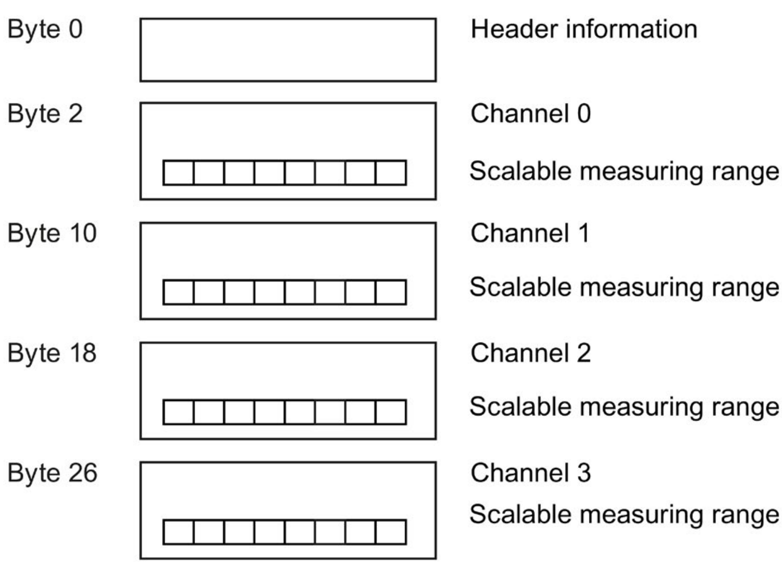

Figure 4-6 Structure of data record 235

Header information

The figure below shows the structure of the header information.

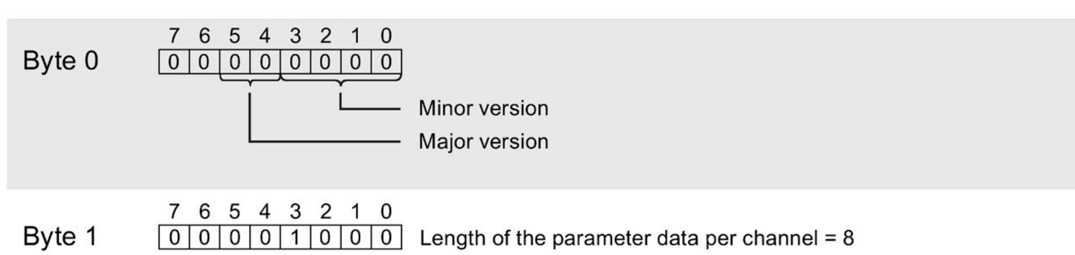

Figure 4-7 Header information of data record 235

Parameters

The figure below shows the structure of the parameter.

If the corresponding bit is set to "1", the parameter is activated.

* x = 2 + (channel number x 8)

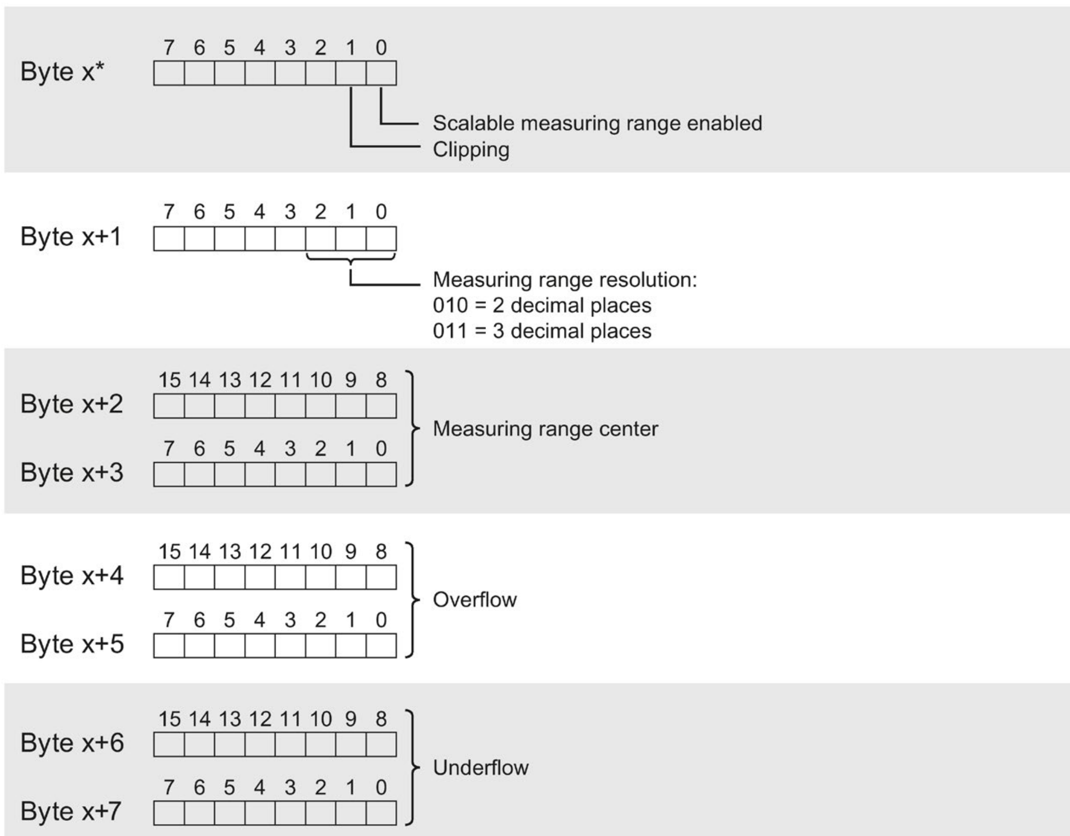

Figure 4-8 Structure of data record 235 - channel parameter byte x to x+7

Description of the parameters

Table 4- 9 Description **of the parameters from data record 235**

Parameter	Description
Scalable measuring range enabled	1 = Function is active for this channel.
Clipping	1 = Scalable measuring range cut off at the overflow / underflow of the underlying measuring range (see Figure (Page 33)).
Resolution	2 or 3 decimal places
Measuring range center	Temperature in whole °C / °F / K ("working point" for the scaling)
Overflow/underflow	Limits of the scalable measuring range

Example

The following example shows the values for a thermal resistor Pt 100 Standard, °C:

Table 4- 10 Example of a thermal resistor Pt 100 Standard

Hex. value	Dec. value	Evaluation of data record 235
00_H	0	V0.0
08_H	8	8 bytes
03_H	3	Scalable measuring range active and clipped (clipping)
02_H	2	Resolution: 2 decimal places
$02EE_H$	750	Measuring range center: 750 °C
$61A8_H$	25000	Overflow (Maximum): 250.**00** + 750 = 1000.00 °C Scalable measuring range is clipped at the overflow.
8100_H	-32512	Underflow (Minimum): -325.**12** + 750 = 424.88 °C

4.5 Address space

Address space of the analog input module AI 4×RTD/TC 2-/3-/4-wire HF

The following figure shows the assignment of the address space with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

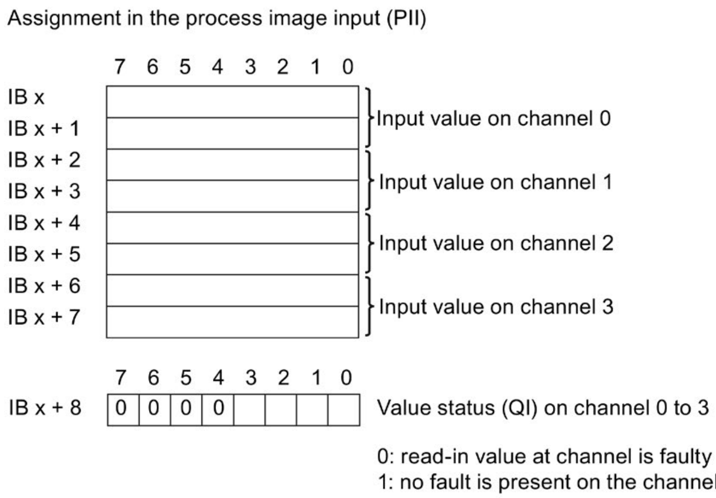

Figure 4-9 Address space AI 4×RTD/TC 2-/3-/4-wire HF with value status

Configuration options of the AI 4xRTD/TC 2-/3-/4-wire HF

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status (as of firmware version V1.01)

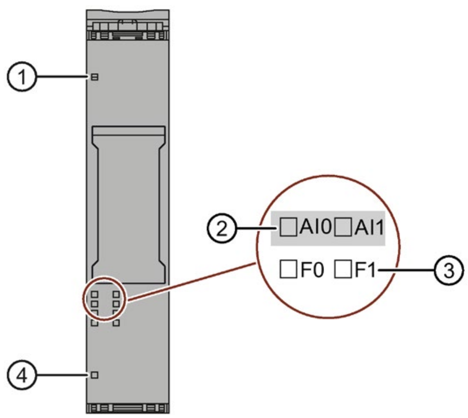
An additional byte is occupied in the input address space if you enable the value status for the analog module. Bit 0 to 3 in this byte is assigned to one channel and provides information on the validity of the analog value (0 = value is incorrect).

5 Interrupts/diagnostics alarms

5.1 Status and error display

LED display

The figure below shows the LED displays of the AI 4xRTD/TC 2-/3-/4-wire HF:



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables contain the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostics alarms (Page 43).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status/channel error LED

Table 5- 2 Status and error display of the LED channel status / channel error

LEDs		Meaning
Channel status	Channel error	
□ Off	□ Off	Channel deactivated
■ On	□ Off	Channel activated and no channel diagnostics
□ Off	■ On	Channel activated and channel diagnostics
■ On	■ On	Not permitted (error)

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ present

5.2 Interrupts

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- Violation of low limit 1
- Violation of high limit 1
- Violation of low limit 2
- Violation of high limit 2

You can obtain detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of double word 8 in local data.

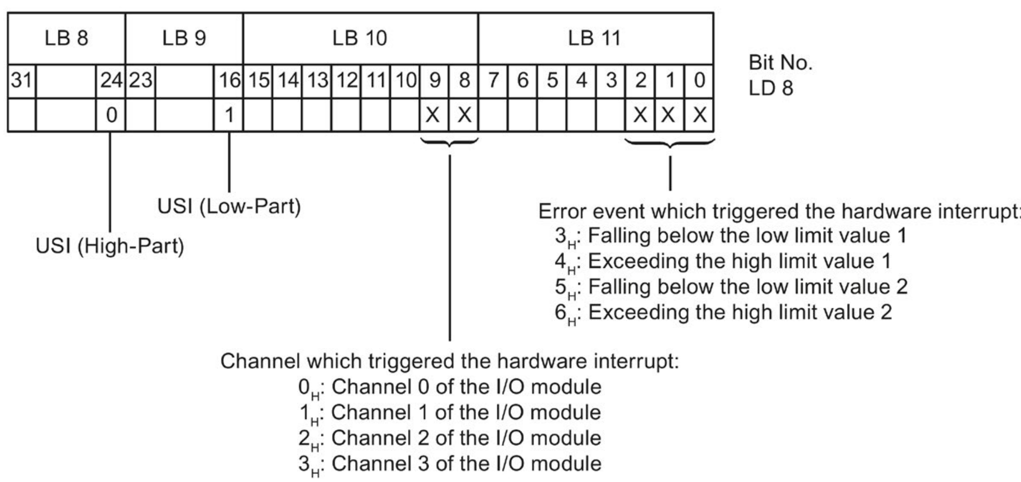


Figure 5-2 OB start information

Structure of the additional interrupt information

Table 5- 4 Structure of the additional interrupt information

Data block name		Content	Comment	Bytes
USI (User Structure Identifier)		W#16#0001	additional interrupt information for hardware interrupts of the I/O module	2
Channel that triggered the hardware interrupt.				
	Channel	B#16#00 to B#16#03	Channel 0 to 3 of the I/O module	1
Event that triggered the hardware interrupt.				
	Event	B#16#03	Violation of low limit 1	1
		B#16#04	Violation of high limit 1	
		B#16#05	Violation of low limit 2	
		B#16#06	Violation of high limit 2	

Diagnostic error interrupt

The module generates a diagnostic error interrupt at the following events:

- Channel temporarily unavailable
- Hardware interrupt lost
- Reference channel error
- Error
- Violation of low limit
- Violation of high limit
- Wire break
- Supply voltage missing
- Parameter assignment error

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meaning and remedies

Diagnostics alarms	Error code	Meaning	Remedy
Wire break	6_H	Resistance of sensor circuit too high	Use a different sensor type or modify the wiring, for example, using cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Deactivate diagnostics • Connect or deactivate the channel
Violation of high limit[1]	7_H	Value lies above the overrange.	Correct module/sensor interplay
		Wire break[2]	See Wire break
Violation of low limit[1]	8_H	Value lies below the underrange.	Correct module/sensor interplay
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies to the entire module).	Replace module
Parameter assignment error	10_H	The module cannot evaluate parameters for the channel. Incorrect parameter assignment.	• Correct the configuration (comparison of preset and actual setup). • Correct the parameter assignment (diagnostics wire break set only with the permitted measuring ranges).
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Reference channel error (reference junction)	15_H	Reference temperature of the reference junction for the TC channel being operated with compensation is invalid.	• Check BaseUnit type • Select correct reference junction through parameter assignment[3] • Check whether the reference junction (reference channel of the group 0, 1, 2, 3) is only assigned once as the sender in the entire setup.

Diagnostics alarms	Error code	Meaning	Remedy
Hardware interrupt lost	16_H	At least one hardware interrupt could not be reported because there were too many pending hardware interrupts.	Correct the program or the process
Channel temporarily unavailable	$1F_H$	• Firmware update in progress or update has been canceled. The module does not read any process values in this state. • The channel is currently being calibrated.	• Wait for firmware update. • Restart the firmware update. • Complete calibration.

1 The alarm refers to the diagnostics and depends on the configured measuring range.

2 For resistor and thermal resistor measuring ranges with deactivated diagnostics for "wire break", this is reported by the "Violation of high limit" diagnostic.

3 Shared Device and diagnostics "Reference temperature": If the sender and receiver of the reference junction temperature of a group are assigned to different IO controllers, you may need to download both configurations again in the case of diagnostics. First download the configuration containing the receiver.

Technical specifications 6

6.1 Technical specifications

Technical specifications of AI 4×RTD/TC 2-/3-/4-wire HF

The following table shows the technical specifications as of 09/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6JD00-0CA1/td?dl=en).

Article number	6ES7134-6JD00-0CA1
General information	
Product type designation	AI 4xRTD/TC 2-/3-/4-wire HF
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V12 SP1 / V13
• STEP 7 configurable/integrated as of version	V5.5 SP3 / V5.5 SP4
• PCS 7 configurable/integrated as of version	V8.1 SP1
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• Oversampling	No
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	Yes

Article number	6ES7134-6JD00-0CA1
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	35 mA
Power loss	
Power loss, typ.	0.75 W
Address area	
Address space per module	
• Address space per module, max.	8 byte; + 1 byte for QI information
Analog inputs	
Number of analog inputs	4
• For voltage measurement	4
• For resistance/resistance thermometer measurement	4
• For thermocouple measurement	4
permissible input voltage for voltage input (destruction limit), max.	30 V
Constant measurement current for resistance-type transmitter, typ.	0.7 mA; 1.7 mA for Cu10 sensors
Cycle time (all channels), min.	Sum of the basic conversion times and additional processing times (depending on the parameterization of the active channels); for line compensation in case of a three-wire connection, an additional cycle is necessary
Technical unit for temperature measurement adjustable	Yes; °C/°F/K
Input ranges (rated values), voltages	
• -1 V to +1 V	Yes; 16 bit incl. sign
• Input resistance (-1 V to +1 V)	1 MΩ
• -250 mV to +250 mV	Yes; 16 bit incl. sign
• Input resistance (-250 mV to +250 mV)	1 MΩ
• -50 mV to +50 mV	Yes; 16 bit incl. sign
• Input resistance (-50 mV to +50 mV)	1 MΩ
• -80 mV to +80 mV	Yes; 16 bit incl. sign
• Input resistance (-80 mV to +80 mV)	1 MΩ

Article number	6ES7134-6JD00-0CA1
Input ranges (rated values), thermocouples	
• Type B	Yes; 16 bit incl. sign
• Input resistance (Type B)	1 MΩ
• Type C	Yes; 16 bit incl. sign
• Input resistance (Type C)	1 MΩ
• Type E	Yes; 16 bit incl. sign
• Input resistance (Type E)	1 MΩ
• Type J	Yes; 16 bit incl. sign
• Input resistance (type J)	1 MΩ
• Type K	Yes; 16 bit incl. sign
• Input resistance (Type K)	1 MΩ
• Type L	Yes; 16 bit incl. sign
• Input resistance (Type L)	1 MΩ
• Type N	Yes; 16 bit incl. sign
• Input resistance (Type N)	1 MΩ
• Type R	Yes; 16 bit incl. sign
• Input resistance (Type R)	1 MΩ
• Type S	Yes; 16 bit incl. sign
• Input resistance (Type S)	1 MΩ
• Type T	Yes; 16 bit incl. sign
• Input resistance (Type T)	1 MΩ
• Type U	Yes; 16 bit incl. sign
• Input resistance (Type U)	1 MΩ
• Type TXK/TXK(L) to GOST	Yes; 16 bit incl. sign
• Input resistance (Type TXK/TXK(L) to GOST)	1 MΩ

Article number	6ES7134-6JD00-0CA1
Input ranges (rated values), resistance thermometer	
• Cu 10	Yes; 16 bit incl. sign
• Input resistance (Cu 10)	1 MΩ
• Ni 100	Yes; 16 bit incl. sign
• Input resistance (Ni 100)	1 MΩ
• Ni 1000	Yes; 16 bit incl. sign
• Input resistance (Ni 1000)	1 MΩ
• LG-Ni 1000	Yes; 16 bit incl. sign
• Input resistance (LG-Ni 1000)	1 MΩ
• Ni 120	Yes; 16 bit incl. sign
• Input resistance (Ni 120)	1 MΩ
• Ni 200	Yes; 16 bit incl. sign
• Input resistance (Ni 200)	1 MΩ
• Ni 500	Yes; 16 bit incl. sign
• Input resistance (Ni 500)	1 MΩ
• Pt 100	Yes; 16 bit incl. sign
• Input resistance (Pt 100)	1 MΩ
• Pt 1000	Yes; 16 bit incl. sign
• Input resistance (Pt 1000)	1 MΩ
• Pt 200	Yes; 16 bit incl. sign
• Input resistance (Pt 200)	1 MΩ
• Pt 500	Yes; 16 bit incl. sign
• Input resistance (Pt 500)	1 MΩ

Article number	6ES7134-6JD00-0CA1
Input ranges (rated values), resistors	
• 0 to 150 ohms	Yes; 15 bit
• Input resistance (0 to 150 ohms)	1 MΩ
• 0 to 300 ohms	Yes; 15 bit
• Input resistance (0 to 300 ohms)	1 MΩ
• 0 to 600 ohms	Yes; 15 bit
• Input resistance (0 to 600 ohms)	1 MΩ
• 0 to 3000 ohms	Yes; 15 bit
• Input resistance (0 to 3000 ohms)	1 MΩ
• 0 to 6000 ohms	Yes; 15 bit
• Input resistance (0 to 6000 ohms)	1 MΩ
• PTC	Yes; 15 bit
• Input resistance (PTC)	1 MΩ
Thermocouple (TC)	
Temperature compensation	
– parameterizable	Yes
– Reference channel of the module	Yes
– internal comparison point	Yes; with BaseUnit type A1
– Reference channel of the group	Yes
– Number of reference channel groups	4; Group 0 to 3
– fixed reference temperature	Yes
Cable length	
• shielded, max.	200 m; 50 m with thermocouples
Analog value generation for the inputs	
Measurement principle	integrating (Sigma-Delta)
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Basic conversion time, including integration time (ms)	
– additional processing time for wire-break check	2 ms; In the ranges resistance thermometers, resistors and thermocouples
– additional power line wire-break check	2 ms; for 3/4 wire transducer (resistance thermometer and resistor)
• Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz
• Conversion time (per channel)	180 / 60 / 50 ms

Article number	6ES7134-6JD00-0CA1
Smoothing of measured values	
• Number of smoothing levels	4; None; 4/8/16 times
• parameterizable	Yes
Encoder	
Connection of signal encoders	
• for voltage measurement	Yes
• for resistance measurement with two-wire connection	Yes
• for resistance measurement with three-wire connection	Yes
• for resistance measurement with four-wire connection	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.01 %; ±0.1 % for resistance thermometers and resistance
Temperature error (relative to input range), (+/-)	0.0009 %/K; ±0.005 % / K at thermocouple
Crosstalk between the inputs, min.	-50 dB
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.05 %
Operational error limit in overall temperature range	
• Voltage, relative to input range, (+/-)	0.1 %
• Resistance, relative to input range, (+/-)	0.1 %
Basic error limit (operational limit at 25 °C)	
• Voltage, relative to input range, (+/-)	0.05 %
• Resistance, relative to input range, (+/-)	0.05 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	70 dB
• Common mode voltage, max.	10 V
• Common mode interference, min.	90 dB
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No

Article number	6ES7134-6JD00-0CA1
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes; two upper and two lower limit values in each case
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; channel by channel
• Group error	Yes
• Overflow/underflow	Yes; channel by channel
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	10 V DC
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Operational and basic error limits for resistance thermometers

Error limits for resistance thermometers	
Operational limit (in the entire temperature range, in relation to input range)	
• Pt 100, Pt 200, Pt 500, Pt 1000 standard	±1.0 K
• Pt 100, Pt 200, Pt 500, Pt 1000 climatic	± 0.25 K
• Ni 100, Ni 120, Ni 200, Ni 500, Ni 1000 standard and climatic	± 0.4 K
• Cu 10	±1.5 K
Basic error limit (operational limit at 25 °C, in relation to input range)	
• Pt 100, Pt 200, Pt 500, Pt 1000 standard	± 0.6 K
• Pt 100, Pt 200, Pt 500, Pt 1000 climatic	± 0.13 K
• Ni 100, Ni 120, Ni 200, Ni 500, Ni 1000 standard and climatic	± 0.2 K
• Cu 10	±1.0 K

Operational and basic error limits for thermocouples [1]

Error limits for thermocouples	
Operational limit for thermocouples (in the entire temperature range)	±1.5 K
Basic error limit for thermocouples (operational limit at 25 °C)	±1 K
Overall error limits when using internal compensation	
• Operational limit (in the entire temperature range at static thermal state, ambient temperature change < 0.3 K/min)	± 2.5 K
• Basic error limit (operational limit at 25 °C at static thermal state, ambient temperature change < 0.3 K/min)	±1.5 K

[1] The indicated error limits apply as of the following temperatures:
Thermocouple type T: -200 °C
Thermocouple type K: -100 °C
Thermocouple type B: +700 °C
Thermocouple type N: -150 °C
Thermocouple type E: -150 °C
Thermocouple type R: +200 °C
Thermocouple type S: +100 °C

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Table A- 1 Dependencies of the measurement type / measuring range

Measurement type	Measuring range	Temperature coefficient	Reference junction	Temperature unit	Conductor resistance
Deactivated	*	*	*	*	*
Voltage	±50 mV, ±80 mV, ±250 mV, ±1 V	*	*	*	*
Resistor (2, 3, 4-wire connection)	150 Ω, 300 Ω, 600 Ω, 3 kΩ, 6 kΩ	*	*	*	x (with 2-wire connection)
Resistor (2-wire connection)	PTC	*	*	*	*
Thermal resistor (2, 3, 4-wire connection)	Pt100 climatic	Pt 0.00385055 Pt 0.003916 Pt 0.003902 Pt 0.00392 Pt 0.00385	Reference channel of group 0, 1, 2, 3	Degrees Celsius	x (with 2-wire connection)
			No reference channel mode	Degrees Celsius Degrees Fahrenheit	
	Pt200 Pt500 Pt1000 climatic		No reference channel mode	Degrees Celsius Degrees Fahrenheit	
	Ni100 Ni120 Ni200 Ni500 Ni1000 climatic	Ni 0.00618 Ni 0.00672			
	LG-Ni 1000 climatic	LG-Ni 0.005			

Measurement type	Measuring range	Temperature coefficient	Reference junction	Temperature unit	Conductor resistance
(3-wire connection)	Cu 10 climatic	Cu 0.00427			*
Thermal resistor (2, 3, 4-wire connection)	Pt100 Pt200 Pt500 Pt1000 standard	Pt 0.00385055 Pt 0.003916 Pt 0.003902 Pt 0.00392 Pt 0.00385	No reference channel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x (with 2-wire connection)
	Ni100 Ni120 Ni200 Ni500 Ni1000 standard	Ni 0.00618 Ni 0.00672			
	LG-Ni 1000 standard	LG-Ni 0.005			
Thermal resistor (3-wire connection)	Cu 10 standard	Cu 0.00427			*
Thermocouple	Type B, N, E, R, S, J, L, T, K, U, C, TXK	*	Reference channel of the module[1] Internal reference junction Reference channel of group 0, 1, 2, 3[2]	Degrees Celsius Degrees Fahrenheit Kelvin	*
			Fixed reference temperature		

x = property is allowed, – = property is **not allowed**, * = property is not relevant

1 Use of "Reference channel of the module":
- Channel 0 must be set as "Pt100 climatic" with temperature unit: "Degrees Celsius".
- For each TC channel of this module that is intended to use channel 0 as reference, "Reference junction" must be set to "Reference channel of the module".

2 Use of "Reference channel of group 0, 1, 2, 3":
- An RTD channel must be set as "Pt100 climatic" with temperature unit: "Degrees Celsius".
- "Reference channel of group 0, 1, 2, 3" must be set as the "Reference junction" of this channel.
- There must only be one RTD channel with "Reference junction" = "Reference channel of group 0, 1, 2, 3" per group 0, 1, 2, 3 and IO device!
- For each TC channel in the IO device that is intended to use this reference, "Reference junction" must be set to "Reference channel of group 0, 1, 2, 3".
- If the reference channel is on channel 0, it can also be used as "Reference channel of the module" at the same time.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type for PROFINET.

Table A- 2 Dependencies on the measurement type

Measurement type	Scalable measuring range	Measuring range resolution	Diagnostics				
			Underflow	Overflow	Wire break	Missing supply voltage L+	Reference junction
Deactivated	*	*	*	*	*	*	*
Voltage	–	*	x	x	–	x	–
Resistor (2, 3, 4-wire connection)	–	*	x	x	x	x	–
Resistor PTC (2-wire connection)	–	*	x	–	–	x	–
Thermal resistor (2, 3, 4-wire connection)	x	2 and 3 decimal places	x	x	x	x	–
Thermocouple	x	2 and 3 decimal places	x	x	x	x	x[1)]

x = property is allowed, – = property is **not allowed**, * = property is not relevant

1 Property is not relevant if "Fixed reference temperature" is used

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Measurement type	Measuring range	Temperature coefficient	Slot reference junction	Temperature unit	Diagnostics			
					Underflow / overflow	Wire break	Missing supply voltage L+	Reference junction
Deactivated	*	*	*	*	*	*	*	*
Voltage	±50 mV, ±80 mV, ±250 mV, ±1 V	*	*	*	x	–	x	–
Resistor (2, 3, 4-wire connection)	150 Ω, 300 Ω, 600 Ω, 3 kΩ, 6 kΩ	*	*	*	x	x	x	–
Resistor (2-wire connection)	PTC³	*	*	*	x	–	x	–
Thermal resistor (2, 3, 4-wire connection)	Pt100 climatic	Pt 0.00385055 Pt 0.003916 Pt 0.003902 Pt 0.00392 Pt 0.00385	Reference channel of group 0, 1, 2, 3	Degrees Celsius	x	x	x	–
			No reference channel mode	Degrees Celsius Degrees Fahrenheit	x	x	x	–
	Pt200 Pt500 Pt1000 climatic	Pt 0.00385055 Pt 0.003916 Pt 0.003902 Pt 0.00392 Pt 0.00385	No reference channel mode	Degrees Celsius Degrees Fahrenheit	x	x	x	–
Thermal resistor (2, 3, 4-wire connection)	Pt100 Pt200 Pt500 Pt1000 standard	Pt 0.00385055 Pt 0.003916 Pt 0.003902 Pt 0.00392 Pt 0.00385	No reference channel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	–
	Ni100 Ni120 Ni200 Ni500 Ni1000 climatic	Ni 0.00618 Ni 0.00672	No reference channel mode	Degrees Celsius Degrees Fahrenheit	x	x	x	–
	Ni100 Ni120 Ni200 Ni500 Ni1000 standard	Ni 0.00618 Ni 0.00672	No reference channel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	–

Measurement type	Measuring range	Temperature coefficient	Slot reference junction	Temperature unit	Diagnostics			
					Underflow / overflow	Wire break	Missing supply voltage L+	Reference junction
Thermal resistor (2, 3, 4-wire connection)	LG-Ni 1000 climatic	LG-Ni 0.005	No reference channel mode	Degrees Celsius Degrees Fahrenheit	x	x	x	–
	LG-Ni 1000 standard	LG-Ni 0.005	No reference channel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	–
Thermal resistor (3-wire connection)	Cu 10 climatic	Cu 0.00427	No reference channel mode	Degrees Celsius Degrees Fahrenheit	x	x	x	–
	Cu 10 standard	Cu 0.00427	No reference channel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	–

Measurement type	Measuring range	Temperature coefficient	Slot reference junction	Temperature unit	Diagnostics			
					Underflow / overflow	Wire break	Missing supply voltage L+	Reference junction
Thermocouple	Type B, N, E, R, S, J, L, T, K, U, C, TXK	*	Reference channel of the module[1] Internal reference junction Reference channel of group 0, 1, 2, 3[2]	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	x
			Fixed reference temperature	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	*

x = property is allowed, – = property is **not allowed**, * = property is not relevant

1 Use of the "Reference channel of the module":
- Channel 0 must be set to "Pt100 climatic" with the temperature unit "Degrees Celsius".
- For each TC channel of this module that is intended to use channel 0 as reference, "Reference junction" must be set to "Enable".

2 Use of "Reference channel of group 0":
- An RTD channel must be set as "Pt100 climatic" with temperature unit "Degrees Celsius".
- "Reference channel of group 0, 1, 2, 3" must be set as the "Reference junction" of this channel.
- There may be only one RTD channel with "Reference junction active" = "Enable" per group and row.
- For each TC channel of this row that is intended to use this reference, "Reference junction active" must be set to "Enable".

3 Underflow = 8000_H; wire break and overflow lead to 01_H (triggered) → (no diagnostics), wire break and overflow are therefore not relevant.

A.2 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 will not be changed on the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

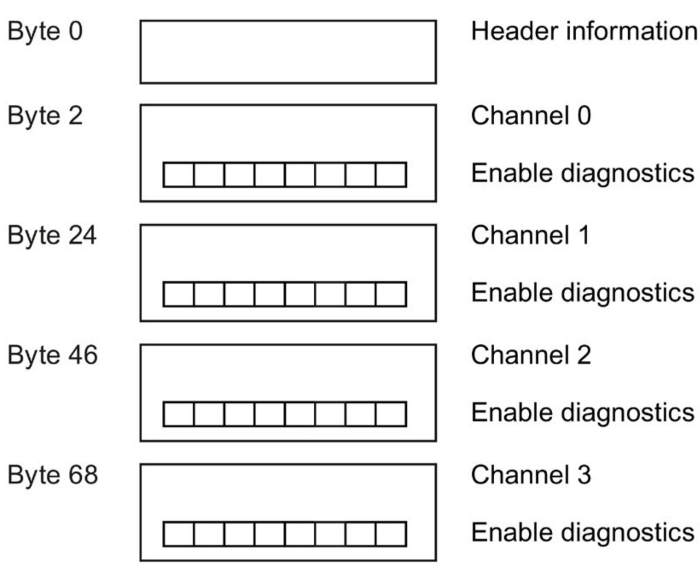

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

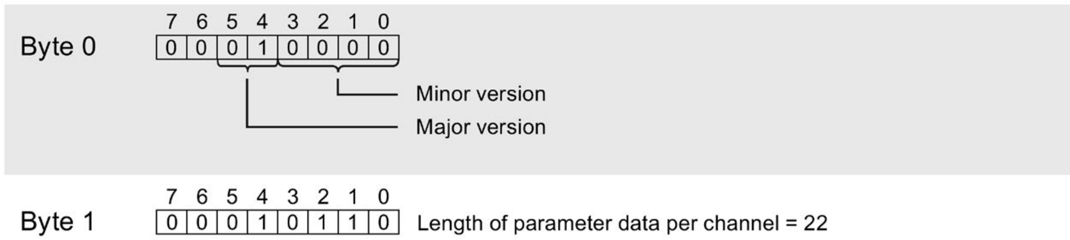

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You can activate a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number * 22); channel number = 0 to 3

Byte	Bits	Meaning
Byte x*	7–0	Measurement type, see table Codes for measurement type
Byte x+1	7–0	Measuring range, see table Codes for measuring range
Byte x+2	7–0	Temperature coefficient, see table Codes for temperature coefficient
Byte x+3	3–0	Smoothing: 0000 = None 0001 = Weak 0010 = Medium 0011 = Strong
	7–4	Interference frequency suppression: 0001 = 60 Hz 0010 = 50 Hz 0100 = 16.6 Hz
Byte x+4	1–0	Temperature unit: 00 = Degrees Celsius 01 = Degrees Fahrenheit 10 = Kelvin (not for measuring range climate)
	7–4	Reference junction: (for RTD as sender reference channel, for TC as receiver reference channel) 0000 = No reference channel mode 0010 = Reference channel of the module 0011 = Internal reference junction 1000 = Reference channel of group 0 1001 = Reference channel of group 1 1010 = Reference channel of group 2 1011 = Reference channel of group 3 1111 = Fixed reference temperature
Byte x+5	4	Enable hardware interrupt, high limit 2
	5	Enable hardware interrupt, low limit 2
	6	Enable hardware interrupt, high limit 1
	7	Enable hardware interrupt, low limit 1
Byte x+6		Enable diagnostics
	0	Missing supply voltage L+:
	4	Wire break
	5	Reference junction
	6	Underflow
	7	Overflow

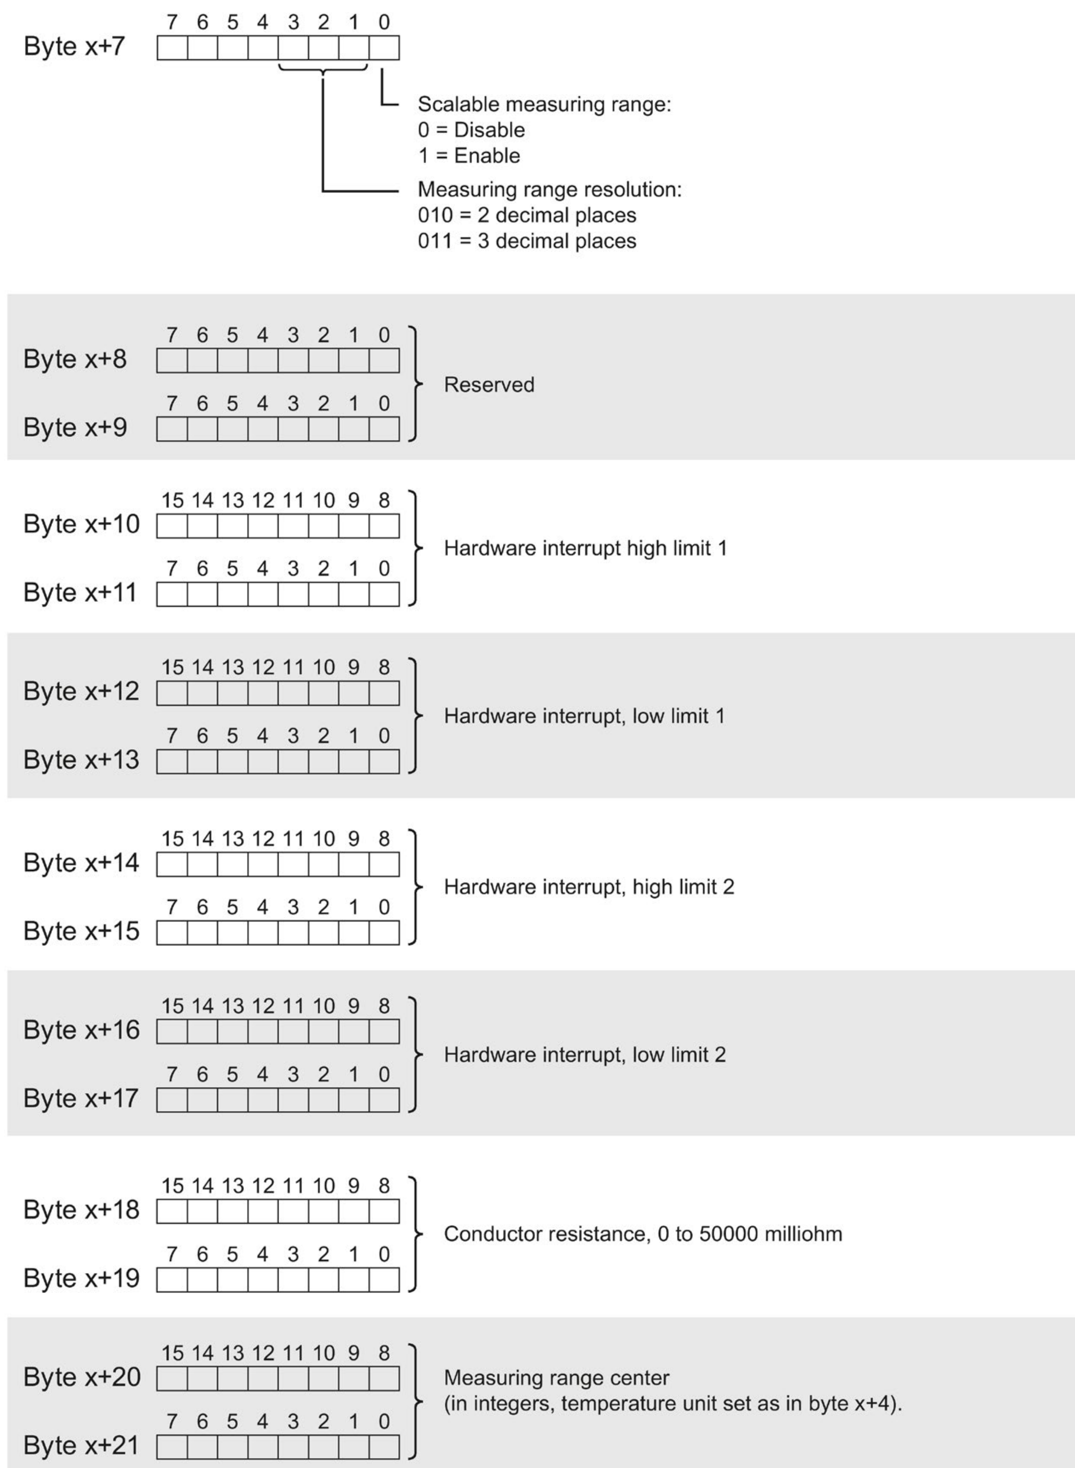

Figure A-3 Structure of byte x to x+21 for channel 0 to 3

Codes for measurement type

The following table contains the codes for the measurement types of the analog input module. You must enter these codes at byte x (see previous figure).

Table A- 3 Codes for measurement type

Measurement type	Code
Deactivated	0000 0000
Voltage	0000 0001
Resistor, 4-wire connection	0000 0100
Resistor, 3-wire connection	0000 0101
Resistor, 2-wire connection	0000 0110

Codes for temperature coefficient for temperature measurement

The following table contains the codes for the temperature coefficients of the analog input module. You must enter these codes at byte x+2 (see previous figure).

Table A- 5 Codes for temperature coefficient for temperature measurement

Temperature coefficient	Code
Pt 0.00385055	0000 0000
Pt 0.003916	0000 0001
Pt 0.003902	0000 0010
Pt 0.00392	0000 0011
Pt 0.00385	0000 0100
Ni 0.00618	0000 1000
Ni 0.00672	0000 1001
LG-Ni 0.005	0000 1010
Cu 0.00427	0000 1100

Limits for hardware interrupts

The following tables contain the permitted limits for hardware interrupts (in each case, the usable value is given). The limits depend on the selected measurement type and the selected measuring range. The value for the overflow must be larger than the value for the underflow. The limits are specified as decimal values. The conversion to the respective temperature unit is (1 digit = 0.1) for the standard range and (1 digit = 0.01) for the climate range, see section Representation of analog values (Page 69).

Table A- 6 Limits for resistor and voltage

Resistor (all possible measuring range settings)	Voltage	
32510	32510	Overflow
1	-32511	Underflow

Table A- 7 Limits for thermocouple types B, C, and E

A.3 Errors when transferring the data record

Error transferring the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station to determine whether the module is plugged or pulled. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	xx	Parameter error	Check the parameters of the module.

A.4 Switchable wire break check

Function

The "Switchable wire break check" is available for thermocouples. It switches off the wire break check for the module.

This is required, for example, to calibrate thermocouples, since the test current necessary for a wire break check leads to measurement errors during calibration.

The function has no effect on channels that are not assigned in the thermocouple mode.

Note

Startup and parameter reassignment

The wire break check is switched on again at each startup and during any parameter reassignment of the module.

Switch-off via the user program

You can deactivate the wire break check using data record 237.

Table A- 12 Structure of data record 237, switchable wire break check

Byte	Function	Format	Value	Description
0	Command	UBYTE	80_H	Wire break check
1	Identifier	UBYTE	00_H	Not relevant
2	Channel number	UBYTE	FF_H	All channels
3	Calibration step	UBYTE	FF_H	First triggering
4	Measurement type	UBYTE	00_H	Not relevant
5	Measuring range	UBYTE	00_H	Not relevant
6	Action	UBYTE	01_H	Deactivate wire break check
			02_H	Activate wire break check
7...17	Reserved	UBYTE	00_H	Not relevant

Representation of analog values

B

This appendix shows the analog values for all measuring ranges supported by the analog input module AI 4xRTD/TC 2-/3-/4-wire HF.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Note

Temperature values

The digitized temperature values are the result of a conversion in the analog module. The following resolution therefore does not apply to temperature values.

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow

-27649	93FF				Underrange
-32512	8100	-294.0 mV	-94.1 mV	-58.8 mV	
-32768	8000	<-294.0 mV	<-94.1 mV	<-58.8 mV	Underflow

B.3 Representation of analog values for resistance-type sensors

The following tables list the decimal and hexadecimal values (codes) of the possible resistance-type sensor ranges.

Table B- 6 Resistance-type sensors from 150 Ω to 6000 Ω

Values		Resistance-type sensor range					Range
Dec.	**Hex.**	**150 Ω**	**300 Ω**	**600 Ω**	**3000 Ω**	**6000 Ω**	
32767	7FFF	> 176.38 Ω	> 352.77 Ω	> 705.53 Ω	> 3527.7 Ω	> 7055.3 Ω	Overflow
32511	7EFF	176.38 Ω	352.77 Ω	705.53 Ω	3527.7 Ω	7055.3 Ω	Overrange
27649	6C01						
27648	6C00	150 Ω	300 Ω	600 Ω	3000 Ω	6000 Ω	Nominal range
20736	5100	112.5 Ω	225 Ω	450 Ω	2250 Ω	4500 Ω	
1	1	5.43 mΩ	10.85 mΩ	21.70 mΩ	108.5 mΩ	217 mΩ	
0	0	0 Ω	0 Ω	0 Ω	0 Ω	0 Ω	
-32768	8000	(negative values are physically impossible)					Underflow[1]

[1] If the resistors are not connected correctly or the conductor resistance is too high

B.4 Representation of analog values for thermal resistors

Note

A higher resolution can be configured for the measuring range for the standard resistance thermometers, see section Scalable measuring range (Page 32).

The tables below list the decimal and hexadecimal values (codes) of the thermal resistors.

Table B- 7 Thermal resistor Pt 100, 200, 500, 1000 standard

Pt x00 Standard in °C (1 digit = 0.1°C)	**Values**		**Pt x00 Standard in °F (1 digit = 0.1 °F)**	**Values**		**Pt x00 standard in K (1 digit = 0.1 K)**	**Values**		**Range**

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Compared to the previous version, this manual contains the following change:

In the "Technical specifications" section, the operational and basic error limits for thermocouple type C have changed.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

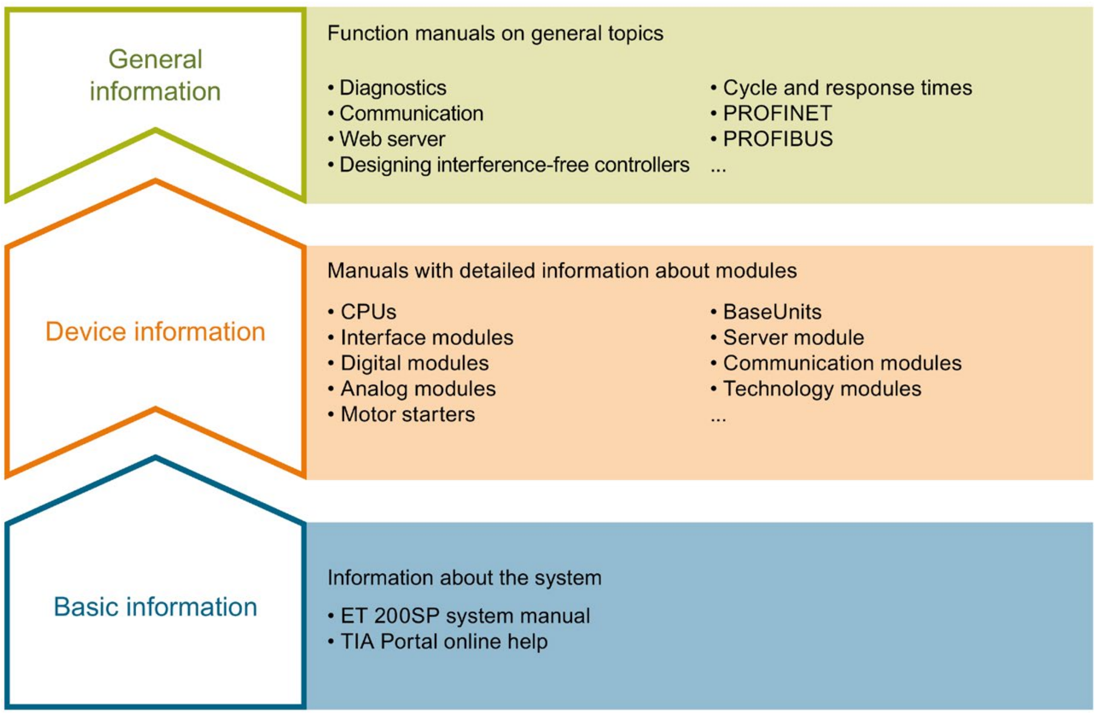
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the module AI 8×RTD/TC 2-wire HF

Properties

The module has the following technical properties:

- Analog input module with 8 inputs
- Resolution: Up to 16 bits including sign
- Voltage measurement type can be set per channel
- Resistor measurement type can be set per channel
- Thermal resistor (RTD) measurement type can be set per channel
- Thermocouple (TC) measurement type can be set per channel
- Configurable diagnostics for each channel
- Hardware interrupt on limit violation can be set per channel (two high and two low limits per channel)

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Identification data I&M0 to I&M3	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Reconfiguration in RUN	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Calibration in runtime	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Value status (PROFINET IO only)	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Configurable conductor resistance for 2-wire connection	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X
Switchable wire-break check	FS01	V2.0.0 or higher	V13 or higher	V5.5 SP3 or higher with HSP 0227 V3.0 or higher	X	X

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connection

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 8xRTD/TC 2-wire HF module with the terminal assignments.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

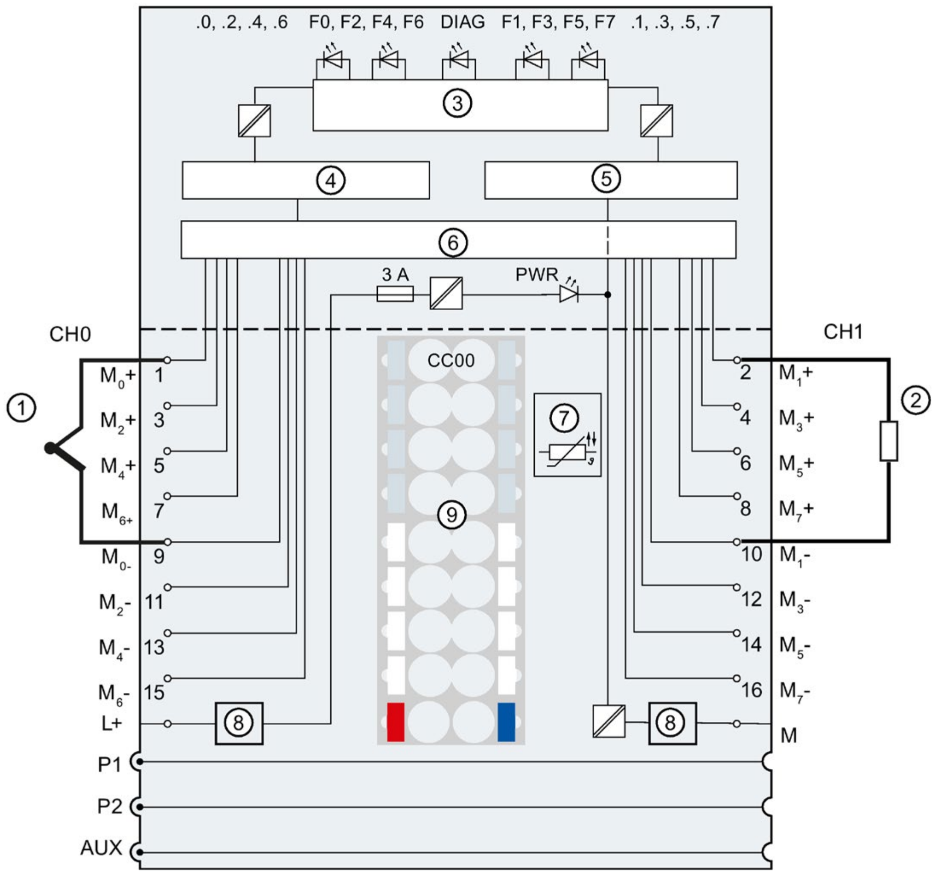
Note

- The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.
- When using floating sensors, bridge the m- connections and connect to ground / FE. This increases the immunity of the module.

  Bridging and connecting are not necessary for disabled and disconnected inputs.

Wiring: 2-wire connection for thermocouples, resistance-type sensors or thermal resistors (RTD)

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 8×RTD/TC 2-wire HF on the BaseUnit BU type A0/A1.



①	2-wire connection of thermocouples	Mn+	Measuring line positive, channel n
		Mn-	Measuring line negative, channel n
②	2-wire connection of resistance-type sensors or thermal resistors (RTD)	L+	24 V DC (infeed only with light-colored BaseUnit)
③	Backplane bus interface	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Analog-to-digital converter (ADC)	DIAG	Diagnostics LED (green, red)
⑤	Constant current power supply	.0 to .7	Channel status LED (green)
⑥	Multiplexer	PWR	Power LED (green)
⑦	Temperature recording for BU type A1 only	F0 to F7	Channel fault LED (red)
⑧	Filter connection supply voltage (available with light-colored BaseUnit only)		
⑨	Color-coded label with color code CC00 (optional)

4 Parameters/address space

4.1 Measurement types and measuring ranges

The following table describes the measuring range and the temperature coefficients you can configure for each measurement type:

Table 4- 1 Measurement types and measuring ranges

Measurement type	Measuring range	Temperature coefficient
Deactivated	–	–
Voltage	±50 mV / ±80 mV / ±250 mV / ±1 V	
Resistor (2-wire connection)	150 Ω / 300 Ω / 600 Ω / 3 kΩ / 6 kΩ	–
	PTC	-
Thermal resistor RTD (2-wire connection)	Climatic / Standard Pt 100 Pt 200 Pt 500 Pt 1000	Pt 0.00385 / Pt 0.003916 / Pt 0.003902 / Pt 0.00392 / Pt 0.00385055
	Climatic / Standard Ni 100 Ni 120 Ni 200 Ni 500 Ni 1000	Ni 0.00618 / Ni 0.00672
	Climatic[1] / Standard[1] Ni 1000	Ni 0.005
Thermocouple (TC)	Type E, N, J, K, L, S, R, B, T, C, U, TXK (acc. to GOST)	-

[1] For sensors LG-Ni 1000 from Siemens Building Ltd (Landis & Stäfa).

Special features when using PTC resistors

PTCs are suitable for monitoring temperature and as thermal protection devices for complex drives or transformer windings.

- Choose "Resistor (2-wire)" and "PTC" in the parameter assignment.
- Connect the PTC to the 2-wire connection technology.
- Use the PTC resistors, type A (PTC thermistor) in accordance with DIN/VDE 0660, part 302.
- If "Underflow" diagnostics is enabled, a "Violation of low limit" diagnostics is generated for resistance values < 18 Ω, indicating a short-circuit.
- Sensor data for the PTC resistor:

Table 4- 2 Using PTC resistors

Property	Technical specifications	Comment
Switching points	**Behavior with rising temperature**	
	< 550 Ω	**Normal range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "0" (in the PII)
	550 Ω to 1650 Ω	**Prewarning range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "1" (in the PII)
	> 1650 Ω	**Response range:** • SIMATIC S7: Bit 0 = "1", Bit 2 = "0" (in the PII)
	Behavior with falling temperature	
	> 750 Ω	**Response range:** • SIMATIC S7: Bit 0 = "1", Bit 2 = "0" (in the PII)
	750 Ω to 540 Ω	**Prewarning range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "1" (in the PII)
	< 540 Ω	**Normal range:** • SIMATIC S7: Bit 0 = "0", Bit 2 = "0" (in the PII)
	Reaction to short-circuit	
	< 18 Ω	• SIMATIC S7: Bit 7 (IB x+1) = "1", Bit 0 = "0" and Bit 2 = "0"
(RRT-5) °C (RRT+5) °C (RRT+15) °C Measuring voltage/ voltage at the PTC	Max. 550 Ω min. 1330 Ω min. 4000 Ω Max. 7.5 V[1]	TNF = Rated response temperature of the sensor (according to DIN/VDE 0660)

[1] Below 23 kΩ

Assignment in the process image input (PII) with SIMATIC S7

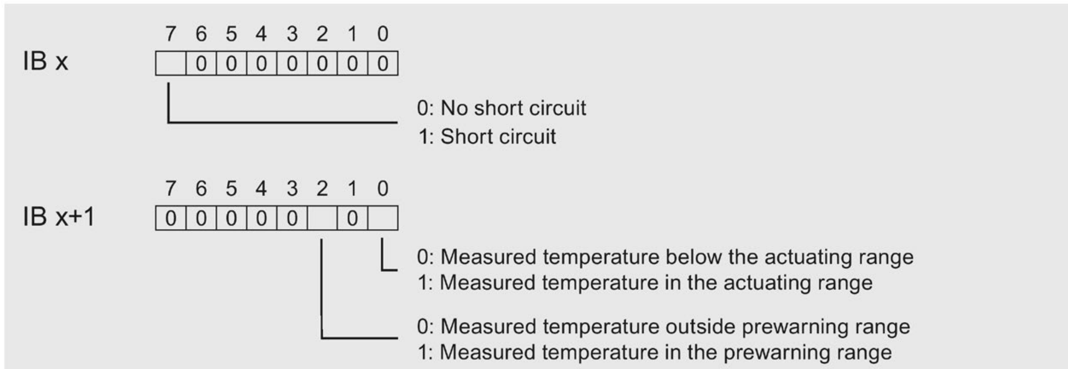

Figure 4-1 Assignment in the process image input (PII)

Notes on programming

- Bits 0+2 are relevant for evaluation in the process image input. You can monitor, for example, the temperature of a motor using bits 0+2.
- Bits 0+2 in the process image input cannot be saved. During parameter assignment, take into consideration that a motor, for example, starts up in a controlled manner (via an acknowledgment).
- Bits 0+2 can never be set at the same time; they are set one after the other.

NOTICE
No measurement is possible in the following cases: • When I/O modules are pulled out • When supply voltage to the I/O module fails • When there is a wire break or short-circuit in the measuring lines You should therefore always evaluate the diagnostic entries of AI 8×RTD/TC 2-wire HF for safety reasons.

Example

The diagram shows the temperature curve and the associated switching points.

4.2 Parameters

Parameters of the AI 8xRTD/TC 2-wire HF

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the WRREC instruction to transfer the parameters to the module by means of data records; see section Parameter assignment and structure of parameter data record (Page 57). The following parameter settings are possible:

Table 4- 3 Configurable parameters and their defaults (GSD file)

Parameters	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g., STEP 7 (TIA Portal)	
				GSD file PROFINET IO	**GSD file PROFIBUS DP**

Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

1 Diagnostics: Missing supply voltage L+: Detection per module or alarm per channel

2 Interference frequency suppression: Interfering signals at 400 Hz are automatically included in the filtering at 50 Hz.

3 The settings in the "Interference frequency suppression" parameter have a direct effect on the conversion time of the channel. The analog value is therefore also affected by additionally set filtering via the "Smoothing" parameter.

4 Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. The parameter length of the I/O module is 24 bytes with PROFIBUS GSD configuration. If necessary, you can set this parameter with data record 128, see Appendix "Parameter data record".

5 Only for configuration with PROFIBUS GSD file: The set reference junction is used with the additional parameter "Kx Reference junction activated" in the case of "Enable". In the case of "Disable", "No reference channel mode" is used for RTD and "Fixed reference temperature" is used for TC.

Note

Unused channels

"Deactivate" unused inputs in the parameter assignment to shorten the cycle time of the module.

A deactivated input always returns the value $7FFF_H$.

4.3 Explanation of parameters

Diagnostics: Missing supply voltage L+

Enabling of the diagnostics for missing or insufficient supply voltage L+.

Diagnostics: Reference junction

Enabling of the reference junction diagnostics if the reference temperature of the reference junction needs to be determined for the TC channel being operated.

Reference junction using the PROFINET GSD file

A BaseUnit with an internal temperature sensor (BU..T), the reference channel of group 0, 1, 2, 3, or channel 0 of the I/O module can be used as reference junction for the TC measurement, if this has the parameter setting "Thermal resistor Pt100 climatic range Degrees Celsius".

A possible parameter assignment is represented below:

Table 4- 4 RTD channel

Setting	Description
No reference channel mode	The temperature value at channel 0 can be used as a reference value for the entire module.
Reference channel of group 0, 1, 2, 3	The channel acts as a **transmitter** for the reference junction temperature of the group. The distribution is performed via the interface module.

Table 4- 5 TC channel

Setting	Description
Reference channel of the module	The corresponding TC channel uses channel 0 of the same module as the reference junction temperature. This must be configured as "Thermal resistor Pt 100 climatic range Degrees Celsius" and "No reference channel mode"; otherwise, Diagnostics: Reference junction is triggered.
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Diagnostics: Reference junction is triggered if there is an incorrect BaseUnit type.
Reference channel of group 0, 1, 2, 3	The channel acts as a **receiver** for the reference junction temperature of a group.
Fixed reference temperature	The reference temperature of the thermocouple is set to 0 °C. As a result, no temperature compensation is performed.

Note

Shared Device and "Reference channel of group 0, 1, 2, 3"

If the transmitter and receiver for the reference junction temperature of a group are assigned to different IO controllers, then both IO controllers must be performing data exchange with the IO device to ensure error-free operation of the temperature compensation.

Reference junction using the PROFIBUS GSD file

A BaseUnit with an internal temperature sensor (BU..T), the reference channel of group 0, 1, 2, 3, or channel 0 of the I/O module can be used as reference junction for the TC measurement, if this has the parameter setting "Thermal resistor Pt100 climatic range Degrees Celsius".

The set temperature unit (e.g. Degrees Celsius) is valid for the entire module with temperature compensation "Reference channel of the module" and "Reference channel of group 0, 1, 2, 3".

Table 4- 6 **RTD channel**

Setting	Description
No reference channel mode	The temperature value at channel 0 can be used as a reference value for the entire module.
Reference channel of group 0, 1, 2, 3	The channel acts as a **transmitter** for the reference junction temperature of a group. The distribution is performed via the interface module.

Setting	Description
Channel x Reference junction activated	• Disable: Channel x is configured with the setting "No reference channel mode". • Enable: Channel x is configured with the setting selected above.

Table 4- 7 **TC channel**

Setting	Description
Reference channel of the module	The corresponding TC channel uses channel 0 of the same module as the reference junction temperature. This must be configured as "Thermal resistor Pt 100 climatic range Degrees Celsius" and "No reference channel mode"; otherwise, Diagnostics: Reference junction is triggered.
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Diagnostics: Reference junction is triggered if there is an incorrect BaseUnit type.
Reference channel of group 0, 1, 2, 3	The channel acts as a **receiver** for the reference junction temperature of the group.
Fixed reference temperature	The reference temperature of the thermocouple is set to 0 °C. As a result, no temperature compensation is performed.

Setting	Description
Channel x Reference junction activated	• Disable: Channel x is configured with the setting "Fixed reference temperature". • Enable: Channel x is configured with the setting selected above.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics if the measured value falls below the underrange.

Diagnostics: Wire break

Enabling of the diagnostics if the module has no current flow or the current is insufficient for measurement at the correspondingly assigned input.

Type/range of measurement

See the section Measurement types and measuring ranges (Page 17).

Temperature coefficient

The temperature coefficient depends on the chemical composition of the material. In Europe, only one value is used per sensor type (default value).

The temperature coefficient (α value) indicates by how much the resistance of a specific material changes relatively if the temperature increases by 1 °C.

The other values facilitate a sensor-specific setting of the temperature coefficient and enhance accuracy.

Temperature unit

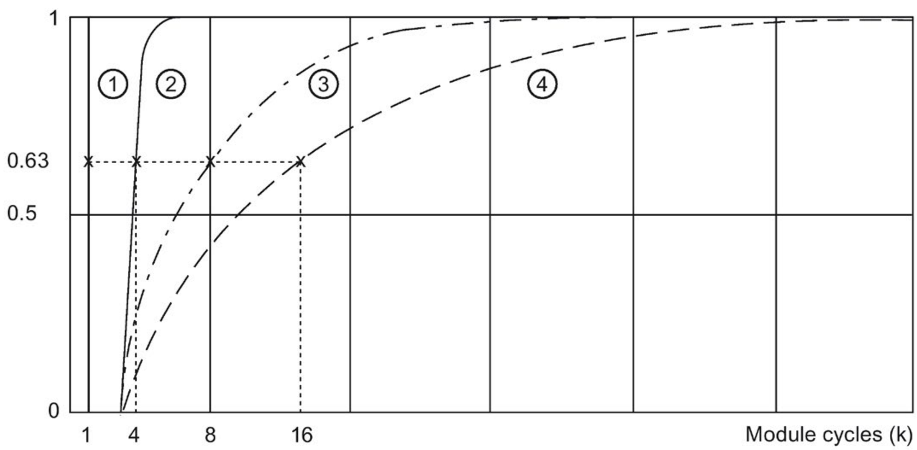
Selection between Degrees Celsius, Fahrenheit and Kelvin as the temperature unit for the selected measuring range.

Smoothing

The individual measured values are smoothed using filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This specification is valid for all signal changes at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-3 Smoothing for AI 8×RTD/TC 2-wire HF

Interference frequency suppression

Suppresses the interferences affecting analog input modules that are caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network is likely to have a negative effect on measured values particularly with measurement in the low voltage range and on thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Measuring range resolution

Parameters for the measurement type thermal resistor standard and thermocouple.

Allows you to increase the resolution to 2 or 3 decimal places for a configurable section of the measuring range. See the Scalable measuring range (Page 31) section.

Measuring range center

Determines the temperature over which the scalable measuring range is symmetrically spanned. The value must be within the nominal range of the underlying measuring range. It is specified in integers.

Maximum / Minimum

Corresponds to overflow / underflow for the scalable measuring range.

Conductor resistance

Parameters for the measurement types resistor and thermal resistor.

Used to compensate for the conductor resistance without having to interfere with the sensor wiring.

If the "Conductor resistor" parameter is configured higher than a value 0 mΩ, the module then automatically uses the factory calibration data.

Hardware interrupt enable

Enabling of a hardware interrupt if the high limit 1/2 or the low limit 1/2 is violated.

Low limit 1/2

Specify a threshold which triggers a hardware interrupt when violated.

High limit 1/2

Specify a threshold which triggers a hardware interrupt when violated.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

4.4 Scalable measuring range

Introduction

The scalable measuring range is available for the temperature measuring ranges of thermal resistors (RTD) standard and thermocouples. The measuring ranges for voltage, resistor and thermal resistor climatic are not supported.

The scalable measuring range is valid for the following ranges:

- Nominal range
- Underrange
- Overrange

Function

The scalable measuring range is a limited section of a measuring range supported by the module.

It allows you to increase the resolution for a configurable section.

- The "Measuring range resolution" parameter determines the resolution to 2 or 3 decimal places.
- The "Measuring range center" parameter determines the temperature over which the scalable measuring range is symmetrically spanned.

Value ranges

Table 4- 8 Value ranges

Scalable measuring range	Measuring range resolution		Values hex.
	2 decimal places	3 decimal places	
Overflow	>325.11	>32.511	$7FFF_H$
High limit	325.11	32.511	$7EFF_H$
Measuring range center	0	0	0_H
Low limit	-325.12	-32.512	8100_H
Underflow	<-325.12	<-32.512	8000_H

To obtain an absolute temperature, the measuring range center in the application program (as offset) must be calculated with the value of the user data of the scalable measuring range.

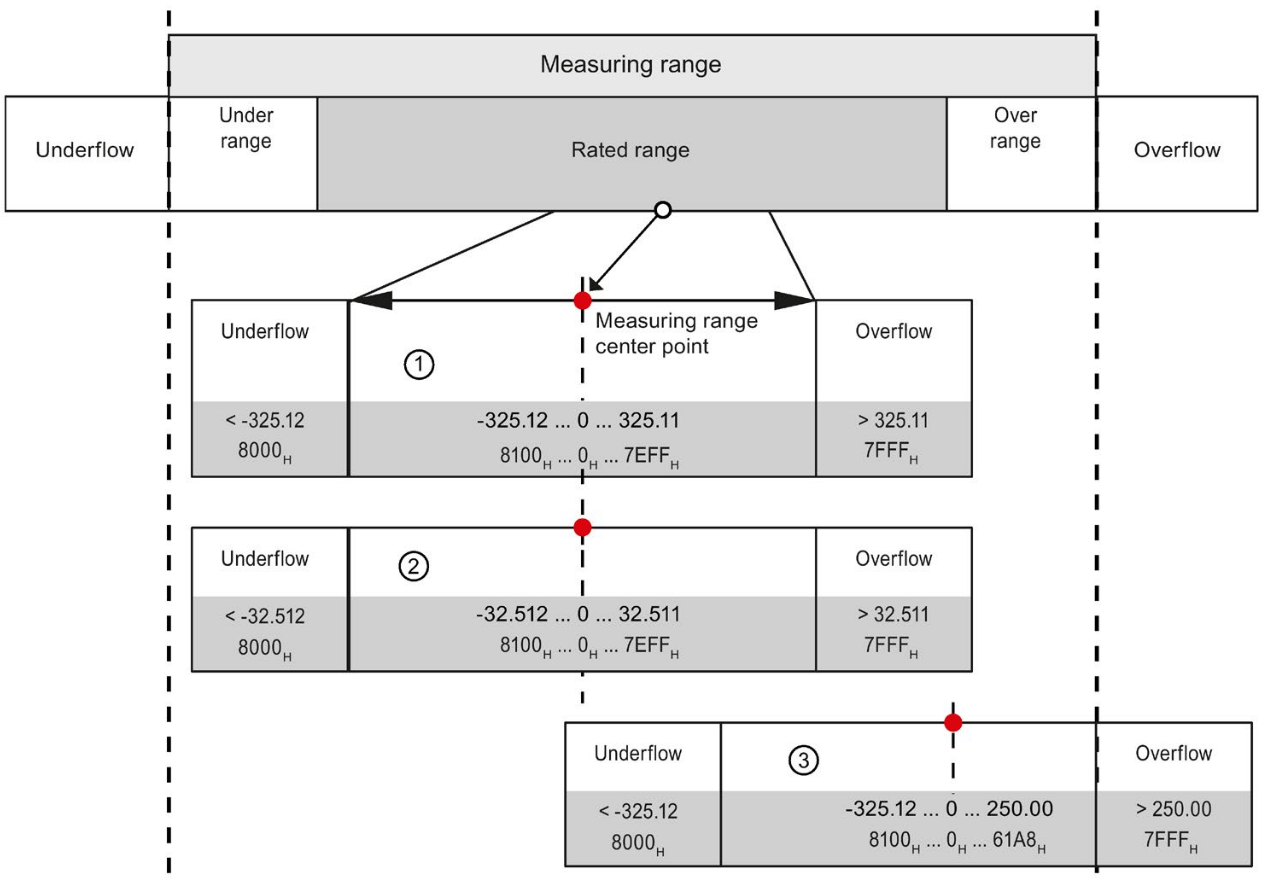
The measuring range center is always output in the user data as the value "0". The user data are correspondingly mapped to the bipolar input ranges in S7 format. Underflow / overflow is also formed in accordance with the limits of S7.

Rules

- The measuring range center must be within the nominal range of the underlying measuring range. It is specified in integers.
- The scalable measuring range is spanned symmetrically over the measuring range center. Depending on the resolution, various value ranges result (①, ②).
- The scalable measuring range is limited by underflow and overflow of the underlying measuring range:
  - It is clipped at the underflow when it falls below the limit.
  - It is clipped at the overflow when it exceeds the limit (③).

Example

The following example illustrates the effect of scalable measuring ranges:



① Scalable measuring range with 2 decimal places in hexadecimal S7 format
② Scalable measuring range with 3 decimal places in hexadecimal S7 format
③ Scalable measuring range which is cut off at the overflow of the underlying measuring range (clipping)

Figure 4-4 Examples of scalable measuring ranges

4.4.1 Configuration

Requirement

You must select a valid temperature measuring range for configuration.

Configuration

The function is activated using the "Scalable measuring range" parameter.

The following figure shows an example of a configuration in STEP 7:

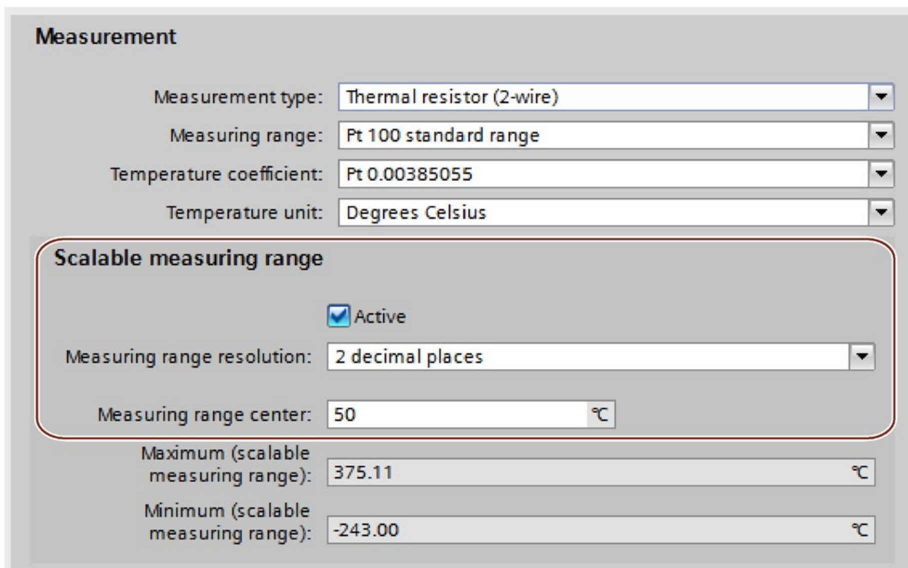


Figure 4-5 Configuration for the scalable measuring range

Reference

You will find more information on the configuration in the STEP 7 online help.

4.4.2 Evaluating data record 235

Evaluation in the user program

In the user program, you can evaluate the status and the limits of the scalable measuring range with data record 235, which may result by reaching underflow/overflow.

Structure of data record 235

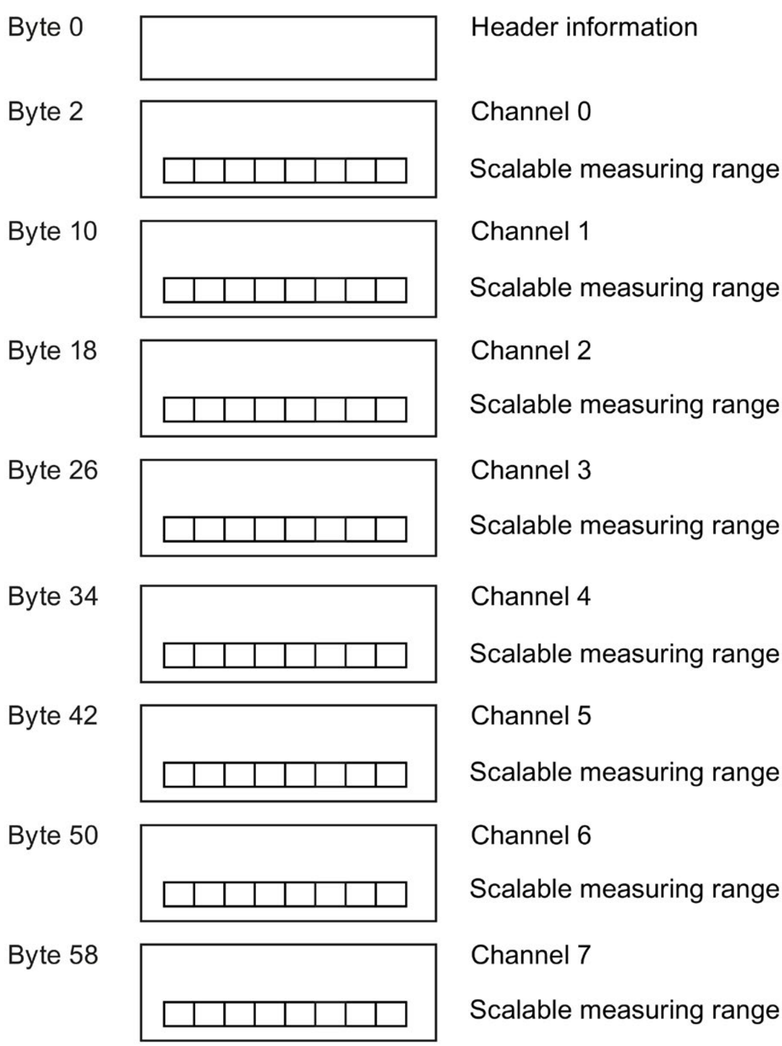

Figure 4-6 Structure of data record 235

Header information

The figure below shows the structure of the header information.

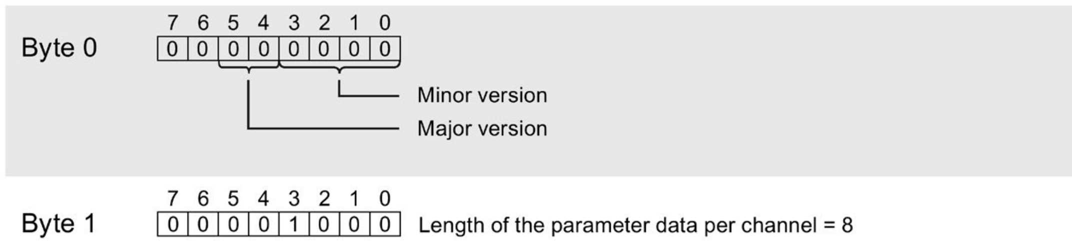

Figure 4-7 Header information of data record 235

Parameters

The figure below shows the structure of the parameter.

If the corresponding bit is set to "1", the parameter is activated.

* x = 2 + (channel number x 8)

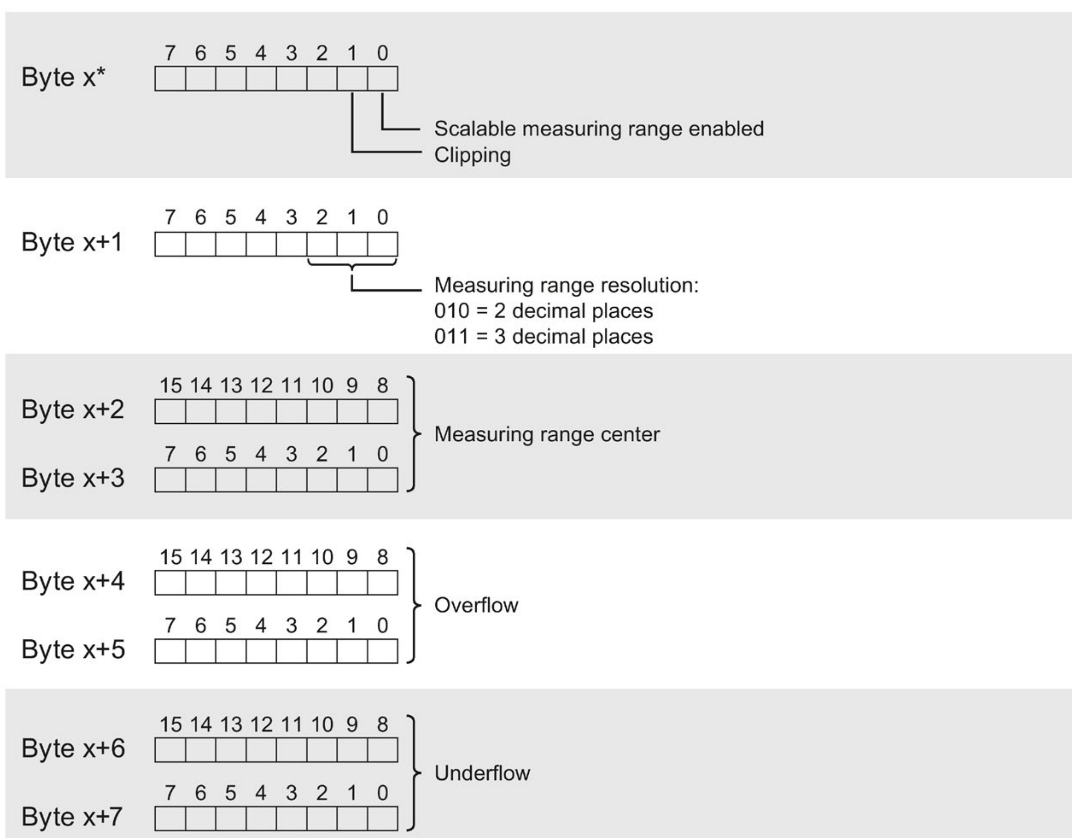

Figure 4-8 Structure of data record 235 - channel parameter byte x to x+7

Description of the parameters

Table 4- 9 Description **of the parameters from data record 235**

Parameter	Description
Scalable measuring range enabled	1 = Function is active for this channel.
Clipping	1 = Scalable measuring range cut off at the overflow / underflow of the underlying measuring range (see Figure (Page 32)).
Resolution	2 or 3 decimal places
Measuring range center	Temperature in whole °C / °F / K ("working point" for the scaling)
Overflow/underflow	Limits of the scalable measuring range

Example

The following example shows the values for a thermal resistor Pt 100 Standard, °C:

Table 4- 10 Example of a thermal resistor Pt 100 Standard

Hex. value	Dec. value	Evaluation of data record 235
00_H	0	V0.0
08_H	8	8 bytes
03_H	3	Scalable measuring range active and clipped (clipping)
02_H	2	Resolution: 2 decimal places
$02EE_H$	750	Measuring range center: 750 °C
$61A8_H$	25000	Overflow (Maximum): 250.**00** + 750 = 1000.00 °C Scalable measuring range is clipped at the overflow.
8100_H	-32512	Underflow (Minimum): -325.**12** + 750 = 424.88 °C

Scalable measuring range (Page 31)

4.5 Address space

Address space of the analog input module AI 8×RTD/TC 2-wire HF

The following figure shows the assignment of the address space with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

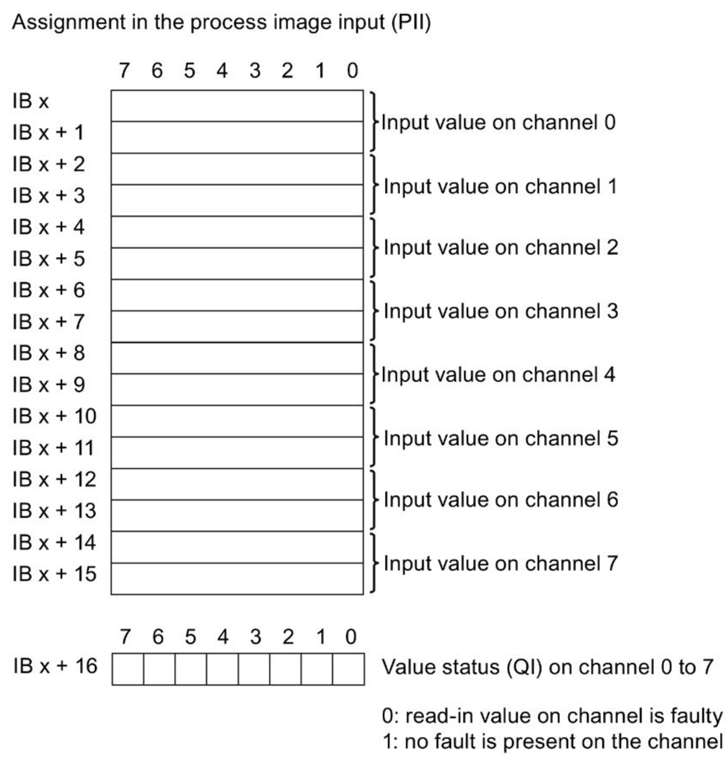

Figure 4-9 Address space of the AI 8×RTD/TC 2-wire HF with value status

Configuration options of the AI 8xRTD/TC 2-wire HF

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

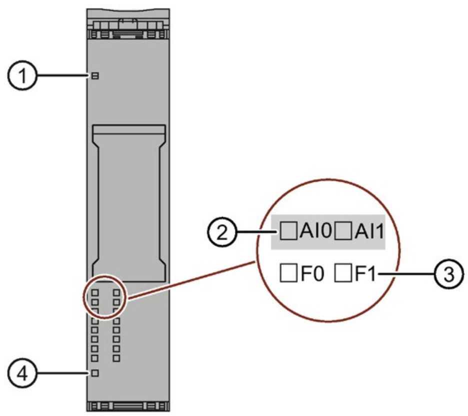
An additional byte is occupied in the input address space if you enable the value status for the analog module. Each bit 0 to 7 in this byte is assigned to one channel and provides information on the validity of the analog value (0 = value is incorrect).

Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays of the AI 8xRTD/TC 2-wire HF:



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables contain the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostics alarms (Page 42).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status/channel error LED

Table 5- 2 Status and error display of the LED channel status / channel error

LEDs		Meaning
Channel status	Channel error	
□ Off	□ Off	Channel deactivated
■ On	□ Off	Channel activated and no channel diagnostics
□ Off	■ On	Channel activated and channel diagnostics
■ On	■ On	Not permitted (error)

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ present

5.2 Interrupts

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- Violation of low limit 1
- Violation of high limit 1
- Violation of low limit 2
- Violation of high limit 2

You can obtain detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of double word 8 in local data.

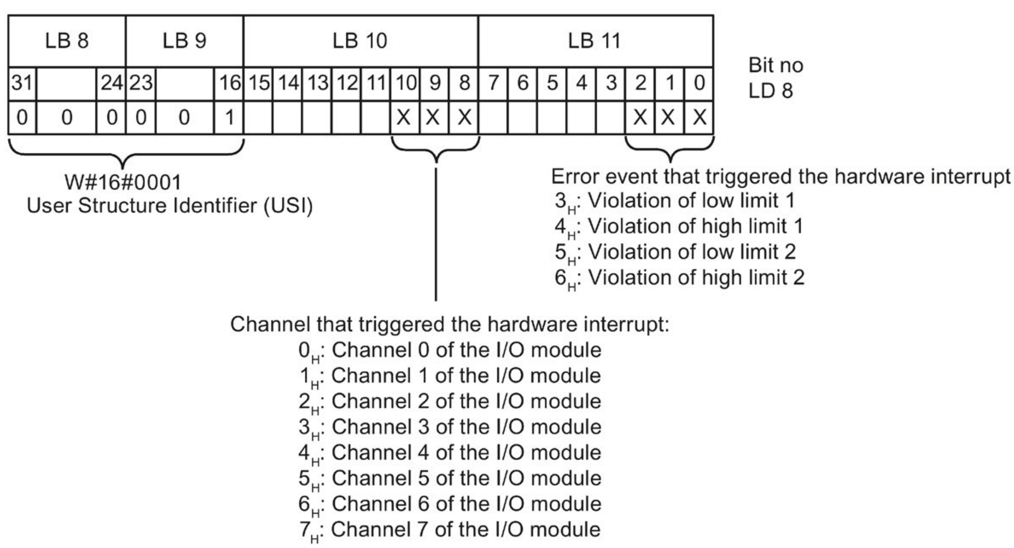


Figure 5-2 OB start information

Structure of the additional interrupt information

Table 5- 4 Structure of the additional interrupt information

Data block name		Content	Comment	Bytes
USI (User Structure Identifier)		W#16#0001	additional interrupt information for hardware interrupts of the I/O module	2
Channel that triggered the hardware interrupt.				
	Channel	B#16#00 to B#16#07	Channel 0 to 7 of the I/O module	1
Event that triggered the hardware interrupt.				
	Event	B#16#03	Violation of low limit 1	1
		B#16#04	Violation of high limit 1	
		B#16#05	Violation of low limit 2	
		B#16#06	Violation of high limit 2	

Diagnostic error interrupt

The module generates a diagnostic error interrupt at the following events:

- Channel temporarily unavailable
- Hardware interrupt lost
- Reference channel error
- Error
- Violation of low limit
- Violation of high limit
- Wire break
- Supply voltage missing
- Parameter assignment error

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meaning and remedies

Diagnostics alarms	Error code	Meaning	Remedy
Wire break	6_H	Resistance of sensor circuit too high	Use a different sensor type or modify the wiring, for example, using cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Deactivate diagnostics • Connect or deactivate the channel
Violation of high limit[1]	7_H	Value lies above the overrange.	Correct module/sensor interplay
		Wire break[2]	See Wire break
Violation of low limit[1]	8_H	Value lies below the underrange.	Correct module/sensor interplay
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies to the entire module).	Replace module
Parameter assignment error	10_H	The module cannot evaluate parameters for the channel. Incorrect parameter assignment.	• Correct the parameter assignment (diagnostics wire break set only with the permitted measuring ranges).
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Reference channel error (reference junction)	15_H	Reference temperature of the reference junction for the TC channel being operated with compensation is invalid.	• Check BaseUnit type • Select correct reference junction through parameter assignment[3] • Check whether the reference junction (reference channel of the group 0, 1, 2, 3) is only assigned once as the sender in the entire setup.

Diagnostics alarms	Error code	Meaning	Remedy
Hardware interrupt lost	16_H	At least one hardware interrupt could not be reported because there were too many pending hardware interrupts.	Correct the program or the process
Channel temporarily unavailable	$1F_H$	• Firmware update in progress or update has been canceled. The module does not read any process values in this state. • The channel is currently being calibrated.	• Wait for firmware update. • Restart the firmware update. • Complete calibration.

1 The alarm refers to the diagnostics and depends on the configured measuring range.

2 For resistor and thermal resistor measuring ranges with deactivated diagnostics for "wire break", this is reported by the "Violation of high limit" diagnostic.

3 Shared Device and diagnostics "Reference temperature": If the sender and receiver of the reference junction temperature of a group are assigned to different IO controllers, you may need to download both configurations again in the case of diagnostics. First download the configuration containing the receiver.

6 Technical specifications

Technical specifications of the AI 8xRTD/TC 2-wire HF

The following table shows the technical specifications as of 09/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6JF00-0CA1/td?dl=en).

Article number	6ES7134-6JF00-0CA1
General information	
Product type designation	AI 8xRTD/TC 2-wire HF
Firmware version	V2.0
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13
• STEP 7 configurable/integrated as of version	V5.5 / -
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• Oversampling	No
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	35 mA

Article number	6ES7134-6JF00-0CA1
Power loss	
Power loss, typ.	0.75 W
Address area	
Address space per module	
• Address space per module, max.	16 byte; + 1 byte for QI information
Analog inputs	
Number of analog inputs	8
• For voltage measurement	8
• For resistance/resistance thermometer measurement	8
• For thermocouple measurement	8
permissible input voltage for voltage input (destruction limit), max.	30 V
Constant measurement current for resistance-type transmitter, typ.	2 mA
Cycle time (all channels), min.	Sum of the basic conversion times and additional processing times (depending on the parameterization of the active channels)
Technical unit for temperature measurement adjustable	Yes; °C/°F/K
Input ranges (rated values), voltages	
• -1 V to +1 V	Yes; 16 bit incl. sign
• Input resistance (-1 V to +1 V)	1 MΩ
• -250 mV to +250 mV	Yes; 16 bit incl. sign
• Input resistance (-250 mV to +250 mV)	1 MΩ
• -50 mV to +50 mV	Yes; 16 bit incl. sign
• Input resistance (-50 mV to +50 mV)	1 MΩ
• -80 mV to +80 mV	Yes; 16 bit incl. sign
• Input resistance (-80 mV to +80 mV)	1 MΩ

Article number	6ES7134-6JF00-0CA1
Input ranges (rated values), thermocouples	
• Type B	Yes; 16 bit incl. sign
• Input resistance (Type B)	1 MΩ
• Type C	Yes; 16 bit incl. sign
• Input resistance (Type C)	1 MΩ
• Type E	Yes; 16 bit incl. sign
• Input resistance (Type E)	1 MΩ
• Type J	Yes; 16 bit incl. sign
• Input resistance (type J)	1 MΩ
• Type K	Yes; 16 bit incl. sign
• Input resistance (Type K)	1 MΩ
• Type L	Yes; 16 bit incl. sign
• Input resistance (Type L)	1 MΩ
• Type N	Yes; 16 bit incl. sign
• Input resistance (Type N)	1 MΩ
• Type R	Yes; 16 bit incl. sign
• Input resistance (Type R)	1 MΩ
• Type S	Yes; 16 bit incl. sign
• Input resistance (Type S)	1 MΩ
• Type T	Yes; 16 bit incl. sign
• Input resistance (Type T)	1 MΩ
• Type U	Yes; 16 bit incl. sign
• Input resistance (Type U)	1 MΩ
• Type TXK/TXK(L) to GOST	Yes; 16 bit incl. sign
• Input resistance (Type TXK/TXK(L) to GOST)	1 MΩ

Article number	6ES7134-6JF00-0CA1
Input ranges (rated values), resistance thermometer	
• Ni 100	Yes; 16 bit incl. sign
• Input resistance (Ni 100)	1 MΩ
• Ni 1000	Yes; 16 bit incl. sign
• Input resistance (Ni 1000)	1 MΩ
• LG-Ni 1000	Yes; 16 bit incl. sign
• Input resistance (LG-Ni 1000)	1 MΩ
• Ni 120	Yes; 16 bit incl. sign
• Input resistance (Ni 120)	1 MΩ
• Ni 200	Yes; 16 bit incl. sign
• Input resistance (Ni 200)	1 MΩ
• Ni 500	Yes; 16 bit incl. sign
• Input resistance (Ni 500)	1 MΩ
• Pt 100	Yes; 16 bit incl. sign
• Input resistance (Pt 100)	1 MΩ
• Pt 1000	Yes; 16 bit incl. sign
• Input resistance (Pt 1000)	1 MΩ
• Pt 200	Yes; 16 bit incl. sign
• Input resistance (Pt 200)	1 MΩ
• Pt 500	Yes; 16 bit incl. sign
• Input resistance (Pt 500)	1 MΩ
Input ranges (rated values), resistors	
• 0 to 150 ohms	Yes; 15 bit
• Input resistance (0 to 150 ohms)	1 MΩ
• 0 to 300 ohms	Yes; 15 bit
• Input resistance (0 to 300 ohms)	1 MΩ
• 0 to 600 ohms	Yes; 15 bit
• Input resistance (0 to 600 ohms)	1 MΩ
• 0 to 3000 ohms	Yes; 15 bit
• Input resistance (0 to 3000 ohms)	1 MΩ
• 0 to 6000 ohms	Yes; 15 bit
• Input resistance (0 to 6000 ohms)	1 MΩ
• PTC	Yes; 15 bit
• Input resistance (PTC)	1 MΩ

Article number	6ES7134-6JF00-0CA1
Thermocouple (TC)	
Temperature compensation	
– parameterizable	Yes
– Reference channel of the module	Yes
– internal comparison point	Yes; with BaseUnit type A1
– Reference channel of the group	Yes
– Number of reference channel groups	4; Group 0 to 3
– fixed reference temperature	Yes
Cable length	
• shielded, max.	200 m; 50 m with thermocouples
Analog value generation for the inputs	
Measurement principle	integrating (Sigma-Delta)
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Basic conversion time, including integration time (ms)	
– additional processing time for wire-break check	2 ms; In the ranges resistance thermometers, resistors and thermocouples
• Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz
• Conversion time (per channel)	180 / 60 / 50 ms
Smoothing of measured values	
• Number of smoothing levels	4; None; 4/8/16 times
• parameterizable	Yes
Encoder	
Connection of signal encoders	
• for voltage measurement	Yes
• for resistance measurement with two-wire connection	Yes
• for resistance measurement with three-wire connection	No
• for resistance measurement with four-wire connection	No

Article number	6ES7134-6JF00-0CA1
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.01 %; ±0.1 % for resistance thermometers and resistance
Temperature error (relative to input range), (+/-)	0.0009 %/K; ±0.005 % / K at thermocouple
Crosstalk between the inputs, min.	-50 dB
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.05 %
Operational error limit in overall temperature range	
• Voltage, relative to input range, (+/-)	0.1 %
• Resistance, relative to input range, (+/-)	0.1 %
Basic error limit (operational limit at 25 °C)	
• Voltage, relative to input range, (+/-)	0.05 %
• Resistance, relative to input range, (+/-)	0.05 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	70 dB
• Common mode voltage, max.	10 V
• Common mode interference, min.	90 dB
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes; two upper and two lower limit values in each case
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; channel by channel
• Group error	Yes
• Overflow/underflow	Yes; channel by channel

Article number	6ES7134-6JF00-0CA1
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	10 V DC
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	32 g

Operational and basic error limits for thermal resistors

Error limits for thermal resistors	
Operational limit (in the entire temperature range, in relation to input range)	
• Pt 100, Pt 200, Pt 500, Pt 1000 standard	±1.0 K
• Pt 100, Pt 200, Pt 500, Pt 1000 climatic	± 0.25 K
• Ni 100, Ni 120, Ni 200, Ni 500, Ni 1000 standard and climatic	± 0.4 K
Basic error limit (operational limit at 25 °C, in relation to input range)	
• Pt 100, Pt 200, Pt 500, Pt 1000 standard	± 0.6 K
• Pt 100, Pt 200, Pt 500, Pt 1000 climatic	± 0.13 K
• Ni 100, Ni 120, Ni 200, Ni 1000 standard and climatic	± 0.2 K

Operational and basic error limits for thermocouples [1]

Error limits for thermocouples	
Operational limit for thermocouples (in the entire temperature range)	±1.5 K
Basic error limit for thermocouples (operational limit at 25 °C)	±1 K
Overall error limits when using internal compensation	
• Operational limit (in the entire temperature range at static thermal state, ambient temperature change < 0.3 K/min)	± 2.5 K
• Basic error limit (operational limit at 25 °C at static thermal state, ambient temperature change < 0.3 K/min)	±1.5 K

[1] The indicated error limits apply as of the following temperatures:
Thermocouple type T: -200 °C
Thermocouple type K: -100 °C
Thermocouple type B: +700 °C
Thermocouple type N: -150 °C
Thermocouple type E: -150 °C
Thermocouple type R: +200 °C
Thermocouple type S: +100 °C

Dimension drawing

			Fixed reference temperature		

x = property is allowed, – = property is **not allowed**, * = property is not relevant

1 Use of "Reference channel of the module":
- Channel 0 must be set as "Pt100 climatic" with temperature unit: "Degrees Celsius".
- For each TC channel of this module that is intended to use channel 0 as reference, "Reference junction" must be set to "Reference channel of the module".

2 Use of "Reference channel of group 0, 1, 2, 3":
- An RTD channel must be set as "Pt100 climatic" with temperature unit: "Degree Celsius".
- The "Reference junction" of this channel must be configured with "Reference channel of group 0, 1, 2, 3".
- There must only be one RTD channel with "Reference junction" = "Reference channel of group 0, 1, 2, 3" per group 0, 1, 2, 3 and I/O device!
- Each TC channel in the I/O device which is to use this reference must be configured with "Reference channel of group 0, 1, 2, 3" at "Reference junction".
- If the reference channel is on channel 0, it can be used simultaneously as "Reference channel of the module".

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type for PROFINET.

Table A- 2 Dependencies on the measurement type

Measurement type	Scalable measuring range	Measuring range resolution	Diagnostics				
			Underflow	Overflow	Wire break	Missing supply voltage L+	Reference junction
Deactivated	*	*	*	*	*	*	*
Voltage	–	*	x	x	–	x	–

	Ni100 Ni120 Ni200 Ni500 Ni1000 standard	Ni 0.00618 Ni 0.00672	No refer-ence chan-nel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	–
Thermal resistor	LG-Ni 1000 climatic	LG-Ni 0.005	No refer-ence chan-nel mode	Degrees Celsius Degrees Fahrenheit	x	x	x	–
	LG-Ni 1000 standard	LG-Ni 0.005	No refer-ence chan-nel mode	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	–

Meas-urement type	Measuring range	Tempera-ture coeffi-cient	Slot refer-ence junc-tion	Tempera-ture unit	Diagnostics			
					Underflow / overflow	Wire break	Missing supply voltage L+	Reference junction
Thermo-couple	Type B, N, E, R, S, J, L, T, K, U, C, TXK	*	Reference channel of the module[1] Internal reference junction Reference channel of group 0, 1, 2, 3[2]	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	x
			Fixed refer-ence tem-perature	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x	*

x = property is allowed, – = property is **not allowed**, * = property is not relevant

[1] Use of the "Reference channel of the module":
- Channel 0 must be set to "Pt100 climatic" with the temperature unit "Degrees Celsius".
- For each TC channel of this module that is intended to use channel 0 as reference, "Reference junction" must be set to "Enable".

[2] Use of "Reference channel of group 0":
- An RTD channel must be configured as "Pt100 climatic" with temperature unit "Degree Celsius".
- "Reference channel of group 0, 1, 2, 3" must be configured as the "Reference junction" of this channel.
- There must only be one RTD channel with "Reference junction activated" = "Enabled" per group and line!
- Each TC channel of this line which is to use this reference must be configured with "Enabled" for "Reference junction activated".

[3] Underflow = 8000_H; wire break and overflow lead to 01_H (triggered) → (no diagnostics), wire break and overflow are therefore not relevant.

A.2 Parameter assignment and structure of parameter data record

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can reassign the module parameters in RUN. For example, the measuring range of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 will not be changed on the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

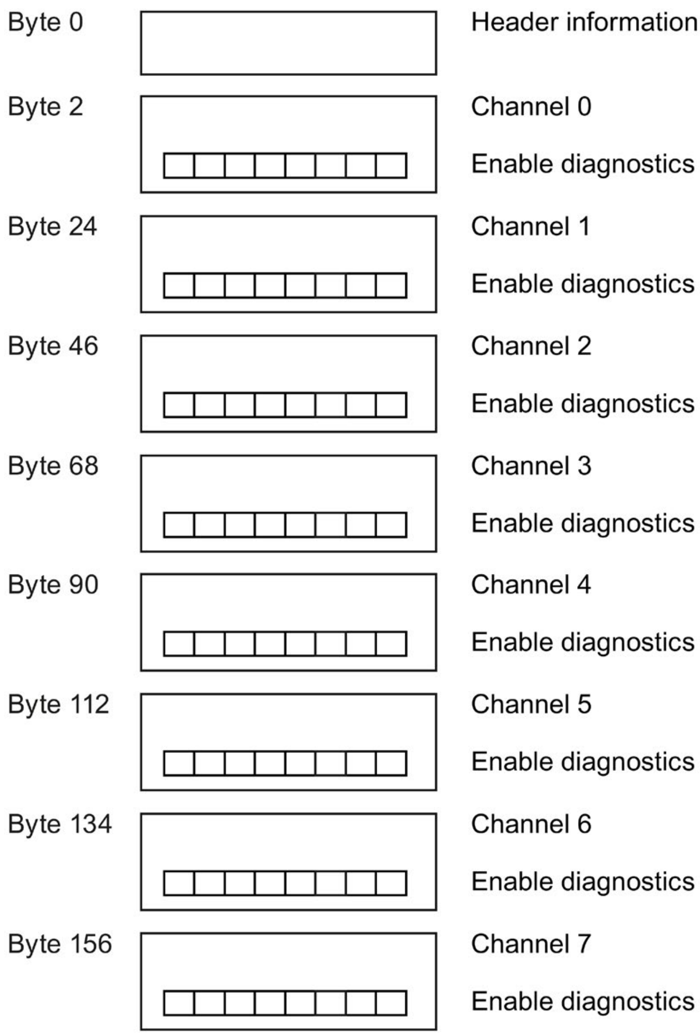

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

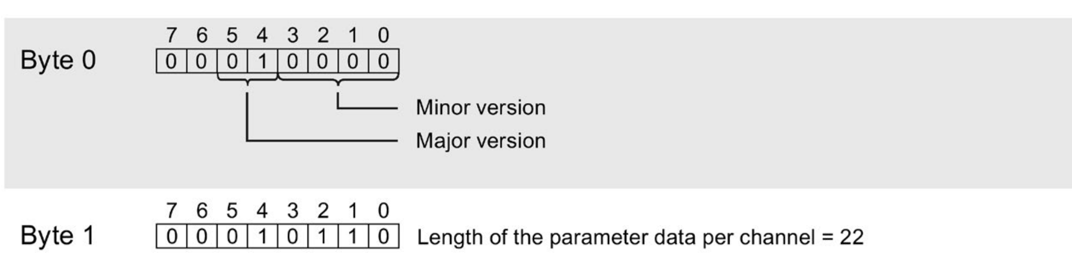

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 7.

You can activate a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number x 22); channel number = 0 to 7

Codes for temperature coefficient

The following table contains the codes for the temperature coefficients of the analog input module. You must enter these codes at byte x+2 (see previous figure).

Table A- 5 Codes for temperature coefficient for temperature measurement

Temperature coefficient	Code
Pt 0.00385055	0000 0000
Pt 0.003916	0000 0001
Pt 0.003902	0000 0010
Pt 0.00392	0000 0011
Pt 0.00385	0000 0100
Ni 0.00618	0000 1000
Ni 0.00672	0000 1001
LG-Ni 0.005	0000 1010

Limits for hardware interrupts

The following tables contain the permitted limits for hardware interrupts (in each case, the usable value is given). The limits depend on the selected measurement type and the selected measuring range. The value for the overflow must be larger than the value for the underflow. The limits are specified as decimal values. The conversion to the respective temperature unit is (1 digit = 0.1) for the standard range and (1 digit = 0.01) for the climate range, see section Representation of analog values (Page 67).

Table A- 6 Limits for resistor and voltage

Resistor (all possible measuring range settings)	Voltage	
32510	32510	Overflow
1	-32511	Underflow

Ni, Ni-LG	2949	5629	5681	29499	32765	Overflow
	-1049	-1569	1683	-10499	-15699	Underflow

A.3 Errors when transferring the data record

Error transferring the data record

The module always checks all values of the data record to be sent. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter, see also the description of the "STATUS" parameter in the STEP 7 online help).

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown.	Enter a valid number for the data record.
DF	80	B1	xx	Length of the data record incorrect.	Enter a valid value for the data record length.
DF	80	B2	xx	Slot invalid or cannot be accessed.	• Check the station to determine whether the module is plugged or pulled. • Check the assigned values for the parameters of the WRREC instruction.
DF	80	E0	xx	Wrong version or error in the header information.	Correct the version, length and number of parameter blocks.
DF	80	E1	xx	Parameter error	Check the parameters of the module.

A.4 Switchable wire break check

Function

The "Switchable wire break check" is available for thermocouples. It switches off the wire break check for the module.

This is required, for example, to calibrate thermocouples, since the test current necessary for a wire break check leads to measurement errors during calibration.

The function has no effect on channels that are not assigned in the thermocouple mode.

Note

Startup and parameter reassignment

The wire break check is switched on again at each startup and during any parameter reassignment of the module.

Switch-off via the user program

You can deactivate the wire break check using data record 237.

Table A- 12 Structure of data record 237, switchable wire break check

Byte	Function	Format	Value	Description
0	Command	UBYTE	80_H	Wire break check
1	Identifier	UBYTE	00_H	Not relevant
2	Channel number	UBYTE	FF_H	All channels
3	Calibration step	UBYTE	FF_H	First triggering
4	Measurement type	UBYTE	00_H	Not relevant
5	Measuring range	UBYTE	00_H	Not relevant
6	Action	UBYTE	01_H	Deactivate wire break check
			02_H	Activate wire break check
7...17	Reserved	UBYTE	00_H	Not relevant

Representation of analog values B

This appendix shows the analog values for all measuring ranges supported by the analog input module AI 8xRTD/TC 2-wire HF.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Note

Temperature values

The digitized temperature values are the result of a conversion in the analog module. The following resolution therefore does not apply to temperature values.

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow

B.5 Representation of analog values for thermocouples

Note

A higher resolution can be configured for thermocouples, see section Scalable measuring range (Page 31).

The tables below list the decimal and hexadecimal values (codes) of the thermocouples.

Table B- 11 Thermocouple type B

Type B in °C	Values		Type B in °F	Values		Type B in K	Values		Range

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

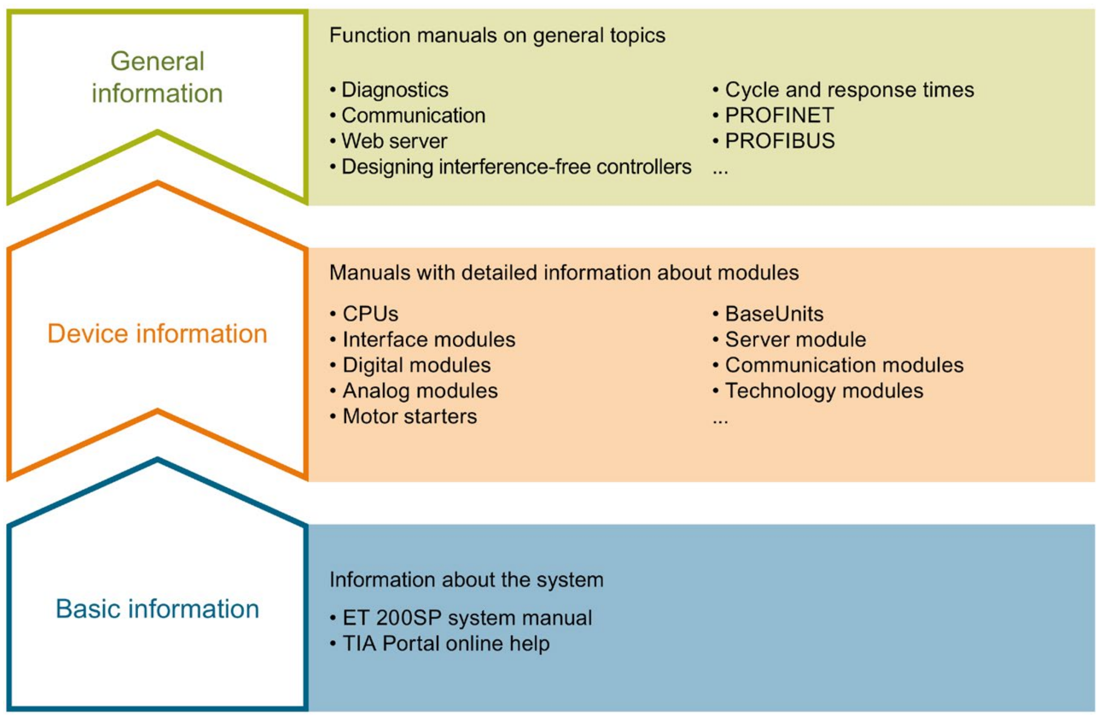
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Properties

The module has the following technical properties:

- Analog input module with 4 inputs
- Resolution: Up to 16 bits including sign
- Limited exchange compatibility with analog input module AI 4xRTD/TC 2-/3-/4-wire HF (6ES7134-6JD00-0CA1), see section Spare part compatibility (Page 13)
- Voltage measurement type can be set per channel
- Thermocouple (TC) measurement type can be set per channel
- Configurable diagnostics for each channel
- Configurable wire break check per channel
- Hardware interrupt on limit violation can be set per channel (two high and two low limits per channel)

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	STEP 7	GSD file	
	TIA Portal	PROFINET IO	PROFIBUS DP
Outlier suppression	as of V15 with HSP 0265	X	X[1]
Firmware update	as of V15 with HSP 0265	X	X
Identification data I&M0 to I&M3	as of V15 with HSP 0265	X	X
Calibration in runtime	as of V15 with HSP 0265	X	X
Module-internal shared input (MSI)	as of V15 with HSP 0265	X	-
REAL representation	as of V15 with HSP 0265	X	-
Scalable measuring range	as of V15 with HSP 0265	X	-
Configuration in RUN	as of V15 with HSP 0265	X	X
Value status (PROFINET IO only)	as of V15 with HSP 0265	X	-

[1] Outlier suppression is always enabled for configuration with the PROFIBUS GSD file. You can set this parameter via data record 128.

You can configure the module with STEP 7 and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connection

See also

You can find more information on accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2 Spare part compatibility

Replacement of an AI 4xRTD/TC 2-/3-/4-wire HF (6ES7134-6JD00-0CA1)

With an AI 4xTC HS (6ES7134-6JD00-0DA1), you can replace an AI 4xRTD/TC 2-/3-/4-wire HF (6ES7134-6JD00-0CA1), that is configured for the "Thermocouple" or "Voltage" measuring ranges.
You do not have to perform new configuration or new wiring. The "Outlier suppression" function is enabled. You can find additional information on outlier suppression in the section Explanation of parameters (Page 21), "Outlier suppression" section.

Note

Restricted measuring range functionality

The AI 4xTC HS module (6ES7134-6JD00-0DA1) does not support RTD and resistance measuring ranges. If you have configured these measuring ranges, the parameter assignment is rejected with the diagnostic message "Parameter assignment error".

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AI 4×TC HS module with the terminal assignments.

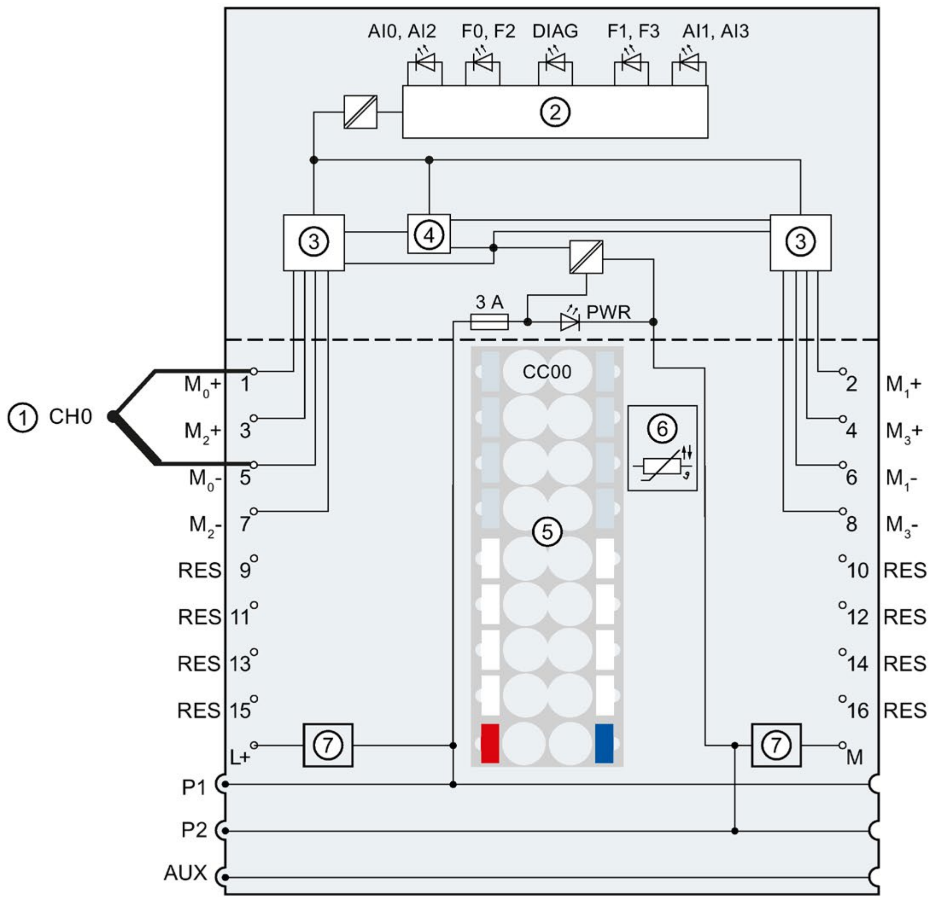
You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: 2-wire connection for thermocouples

The following figure shows the block diagram and an example of the terminal assignment of the analog input module AI 4×TC HS on the BaseUnit BU type A0/A1.



①	2-wire connection of thermocouples	Mn+	Measuring line positive, channel n
		Mn-	Measuring line negative, channel n
②	Backplane bus interface	L+	24 V DC (feed for light-colored BaseUnit only)
③	Multiplexer	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Analog-to-digital converter (ADC)	DIAG	Diagnostics LED (green, red)
⑤	Color-coded label with color code CC00 (optional)	AI0 to AI3	Channel status LED (green)
⑥	Temperature recording for BU type A1 only	F0 to F3	Channel fault LED (red)
⑦	Filter connection supply voltage (only when light-colored BaseUnit is present)	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for connection of thermocouples

4 Parameters/address space

4.1 Measurement types and measuring ranges

The following table lists the measuring range you can set for each measuring type:

Table 4- 1 Measurement types and measuring ranges

Measurement type	Measuring range
Deactivated	–
Thermocouple (TC)	Type E, N, J, K, L, S, R, B, T, C, U, TXK (acc. to GOST)
Voltage	±50 mV / ±80 mV / ±250 mV / ±1 V

See also

Technical specifications (Page 44)

4.2 Parameters

Parameters of the AI 4xTC HS

Specify the module properties with the various parameters in the course of your STEP 7 configuration. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the WRREC instruction to transfer the parameters to the module by means of data records, see section Parameter assignment and structure of parameter data record (Page 53). The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfig-uration in RUN	Scope with configuration software e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: Missing supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Reference junction	• Disable • Enable	Disable	Yes	Channel	Module
Diagnostics: Overflow	• Disable • Enable	Disable	Yes	Channel	Module
Diagnostics: Underflow	• Disable • Enable	Disable	Yes	Channel	
Wire break check	• Disable • Enable	Enable	Yes	Channel	Module
Diagnostics: Wire break	• Disable • Enable	Disable	Yes	Channel	Channel

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	**GSD file PROFIBUS DP**
Type/range of measurement	• Deactivated • Voltage – ±50 mV – ±80 mV – ±250 mV – ± 1 V • Thermocouple – Type B (PtRh-PtRh) – Type N (NiCrSi-NiSi) – Type E (NiCr-CuNi) – Type R (PtRh-Pt) – Type S (PtRh-Pt) – Type J (Fe-CuNi) – Type L (Fe-CuNi) – Type T (Cu-CuNi) – Type K (NiCr-NiAl) – Type U (Cu-CuNi) – Type C (WRe-WRe) – Type TXK	Type K (NiCr-NiAl)	Yes	Channel	Channel
Outlier suppression [1]	• Disable • Enable	Enable	Yes	Channel	Cannot be changed
Temperature unit	• Degrees Celsius • Degrees Fahrenheit • Kelvin	Degrees Celsius	Yes	Channel	Module
Reference junction [2]	• Internal reference junction • Reference channel of group 0 • Reference channel of group 1 • Reference channel of group 2 • Reference channel of group 3 • Fixed reference temperature	Fixed reference temperature	Yes	Channel	Channel
Fixed reference temperature	Temperature	0 °C	Yes	Channel	-
Smoothing	• None • Weak • Medium • Strong	None	Yes	Channel	Channel

Parameter	Value range	Default	Reconfig-uration in RUN	Scope with configuration software e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Interference frequency suppression [1]	• 60 Hz • 50 Hz [3] • 16.6 Hz • None	50 Hz	Yes	Channel	Module
Scalable measuring range [1]	• Disable • Enable	Disable	Yes	Channel	-
Measuring range resolution [1]	• 2 decimal places • 3 decimal places	2 decimal places	Yes	Channel	-
Measuring range center [1]	• Value within the nominal range of the measuring range	0	Yes	Channel	-
Hardware interrupt high limit 1 [1]	• Disable • Enable	Disable	Yes	Channel	-
High limit 1 [1]	• Value (INT) • Value (REAL) [4]	• 13720 • 1372.0 [4]	Yes	Channel	-
Hardware interrupt low limit 1 [1]	• Disable • Enable	Disable	Yes	Channel	-
Low limit 1 [1]	• Value (INT) • Value (REAL) [4]	• -2699 • -269.9 [4]	Yes	Channel	-
Hardware interrupt high limit 2 [1]	• Disable • Enable	Disable	Yes	Channel	-
High limit 2 [1]	• Value (INT) • Value (REAL) [4]	• 13720 • 1372.0 [4]	Yes	Channel	-
Hardware interrupt low limit 2 [1]	• Disable • Enable	Disable	Yes	Channel	-

Parameter	Value range	Default	Reconfig-uration in RUN	Scope with configuration software e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Low limit 2 [1]	• Value (INT) • Value (REAL) [4]	• -2699 • -269.9 [4]	Yes	Channel	-
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. If required, you can still assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 13 bytes.

[2] Only for configuration with PROFIBUS GSD file: The set reference junction is used with the additional parameter "Kx Reference junction activated" in the case of "Enable". In the case of "Disable", no "fixed reference temperature" is used for TC.

[3] Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

[4] Only for REAL representation.

Note

Unused channels

"Deactivate" unused channels in the parameter assignment to improve the cycle time of the module.

A disabled channel always returns the value $7FFF_H$ (REAL representation: $7F800000_H$).

4.3 Explanation of parameters

Diagnostics: Missing supply voltage L+

Enabling of the diagnostics for missing or insufficient supply voltage L+.

Diagnostics: Reference junction

Enabling of the reference junction diagnostics if the reference temperature of the reference junction needs to be determined for the TC channel being operated.

Reference junction using the PROFINET GSD file

As reference junction for the TC measurement, a BaseUnit with internal temperature sensor (BU..T) or the reference channel of the group 0, 1, 2, 3 can be used.

A possible parameter assignment is represented below:

Table 4- 3 TC channel

Setting	Description
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Diagnostics: Reference junction is triggered if there is an incorrect BaseUnit type.
Reference channel of group 0, 1, 2, 3	The channel acts as a **receiver** for the reference junction temperature of a group.
Fixed reference temperature	The reference temperature of the thermocouple is set to 0 °C. As a result, no temperature compensation is performed.

Note

Shared Device and "Reference channel of group 0, 1, 2, 3"

If the transmitter and receiver for the reference junction temperature of a group are assigned to different IO controllers, then both IO controllers must be performing data exchange with the IO device to ensure error-free operation of the temperature compensation.

Reference junction using the PROFIBUS GSD file

As reference junction for the TC measurement, a BaseUnit with internal temperature sensor (BU..T) or the reference channel of the group 0, 1, 2, 3 can be used.

Table 4- 4 **TC channel**

Setting	Description
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Diagnostics: Reference junction is triggered if there is an incorrect BaseUnit type.
Reference channel of group 0, 1, 2, 3	The channel acts as a **receiver** for the reference junction temperature of a group.
Fixed reference temperature	The reference temperature of the thermocouple is set to 0 °C. As a result, no temperature compensation is performed.

Setting	Description
Channel x Reference junction activated	• Disable: Channel x is configured with the setting "Fixed reference temperature". • Enable: Channel x is configured with the setting selected above.

Diagnostics: Overflow

Enabling of the diagnostics when the measured value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics if the measured value falls below the underrange.

Wire break check

Enable for wire break check. The module only detects an interruption at the input when the wire break check is activated.

Diagnostics: Wire break

Enabling of the diagnostics, if the module detects interruption at the corresponding configured input.

Type/range of measurement

See section Measurement types and measuring ranges (Page 16).

Outlier suppression

Suppresses interference pulses in analog input modules that can be caused, for example, by switching processes in the system.
The last measured values are statistically analyzed (box plot).
Limits within which a new measured value is expected are derived from the distribution (scatter) of the measured values. These limits are dynamically adjusted when the distribution of the measured values changes. New measured values that lie outside the determined limits are suppressed, i.e. the last value is kept.
Faults are suppressed up to a length of three module cycles. On the other hand, actual jumps in the input signal are delayed by the same time.

Temperature unit

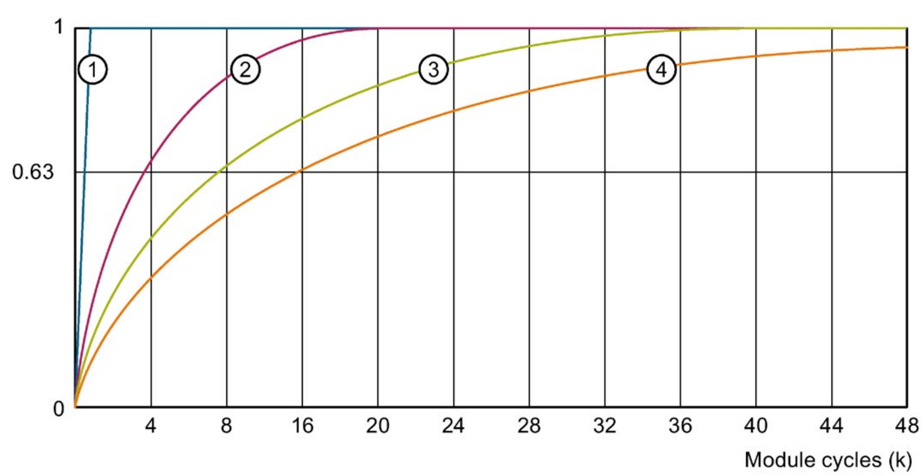
Selection between Degrees Celsius, Fahrenheit and Kelvin as the temperature unit for the selected measuring range.

Smoothing

The individual measured values are smoothed using filtering. The smoothing can be set in 4 levels.

Smoothing time = number of module cycles (k) x cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This specification is valid for all signal changes at the analog input.



① No smoothing (k = 1)
② Weak (k = 4)
③ Medium (k = 8)
④ Strong (k = 16)

Figure 4-1 Smoothing with AI 4×TC HS

Interference frequency suppression

Suppresses the interferences affecting analog input modules that are caused by the frequency of the AC voltage network used.

The frequency of the AC voltage network is likely to have a negative effect on measured values particularly with measurement in the low voltage range and on thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

Measuring range resolution

Parameters for the thermocouple measurement type.

Allows you to increase the resolution to 2 or 3 decimal places for a configurable section of the measuring range. See section Scalable measuring range (Page 25).

Measuring range center

Determines the temperature over which the scalable measuring range is symmetrically spanned. The value must be within the nominal range of the underlying measuring range. It is specified in integers.

Maximum / Minimum

Corresponds to overflow / underflow for the scalable measuring range.

Hardware interrupt enable

Enabling of a hardware interrupt if the high limit 1/2 or the low limit 1/2 is violated.

Low limit 1/2

Specify a threshold which triggers a hardware interrupt when violated.

High limit 1/2

Specify a threshold which triggers a hardware interrupt when violated.

Potential group

Specifies that a BaseUnit with incoming voltage supply is located on this slot (see system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

4.4 Scalable measuring range

Introduction

The scalable measuring range is available for the temperature measuring ranges of thermocouples. The measuring ranges for voltage are not supported.

The scalable measuring range is valid for the following ranges:

- Nominal range
- Underrange
- Overrange

Function

The scalable measuring range is a limited section of a measuring range supported by the module.

It allows you to increase the resolution for a configurable section.

- The "Measuring range resolution" parameter determines the resolution to 2 or 3 decimal places.
- The "Measuring range center" parameter determines the temperature over which the scalable measuring range is symmetrically spanned.

Value ranges

Table 4- 5 Value ranges

Scalable measuring range	Measuring range resolution		Values hex.
	2 decimal places	3 decimal places	
Overflow	> 325.11	> 32.511	$7FFF_H$
High limit	325.11	32.511	$7EFF_H$
Measuring range center	0	0	0_H
Low limit	-325.12	-32.512	8100_H
Underflow	<-325.12	<-32.512	8000_H

To obtain an absolute temperature, the measuring range center in the application program (as offset) must be calculated with the value of the user data of the scalable measuring range.

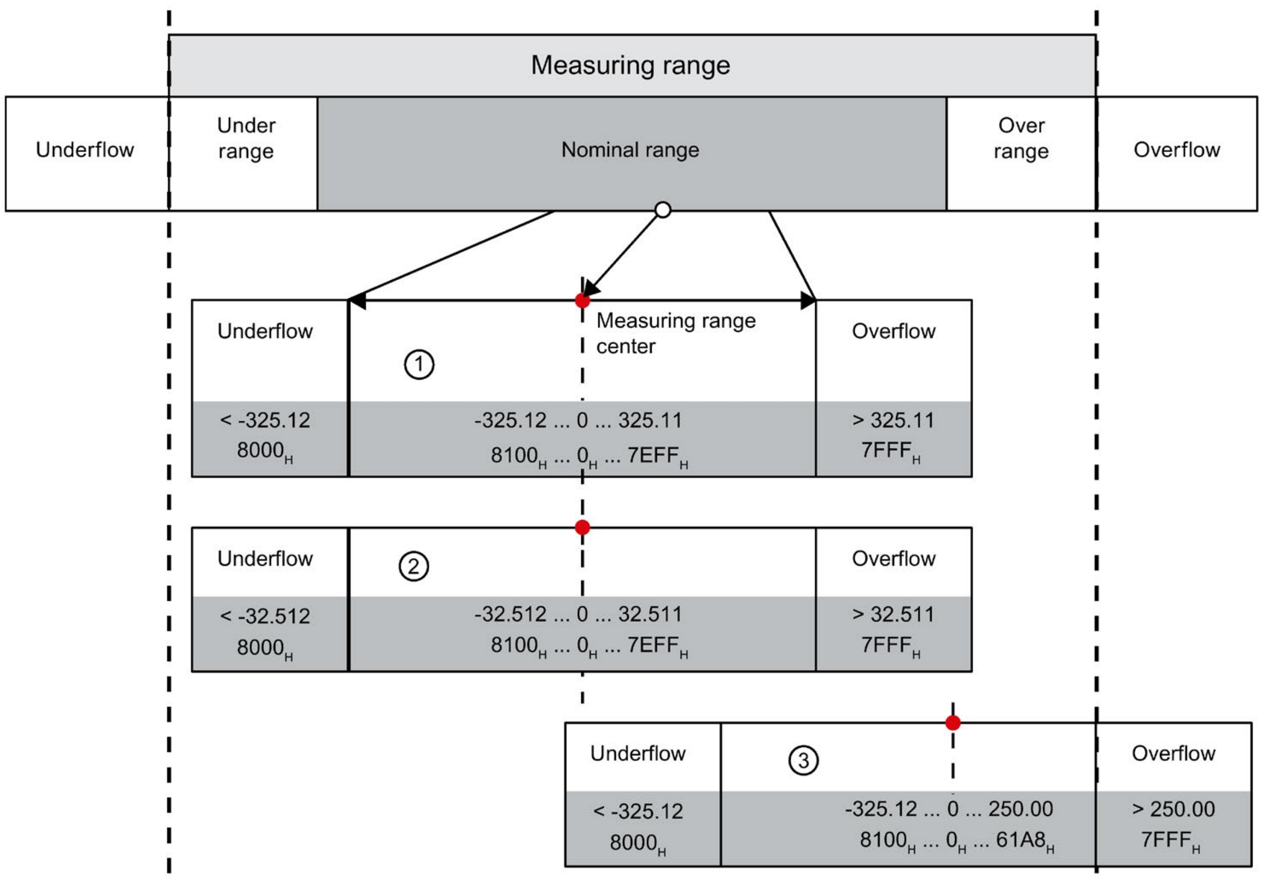
The measuring range center is always output in the user data as the value "0". The user data are correspondingly mapped to the bipolar input ranges in S7 format. Underflow / overflow is also formed in accordance with the limits of S7.

Rules

- The measuring range center must be within the nominal range of the underlying measuring range. It is specified in integers.
- The scalable measuring range is spanned symmetrically over the measuring range center. Depending on the resolution, various value ranges result (①, ②).
- The scalable measuring range is limited by underflow and overflow of the underlying measuring range:
  – It is clipped at the underflow when it falls below the limit.
  – It is clipped at the overflow when it exceeds the limit (③).

Example

The following example illustrates the effect of scalable measuring ranges:



① Scalable measuring range with 2 decimal places in hexadecimal S7 format
② Scalable measuring range with 3 decimal places in hexadecimal S7 format
③ Scalable measuring range which is cut off at the overflow of the underlying measuring range (clipping)

Figure 4-2 Examples of scalable measuring ranges

4.4.1 Configuration

Requirement

You must select a valid temperature measuring range for configuration.

Configuration

The function is activated using the "Scalable measuring range" parameter.

The following figure shows an example of a configuration in STEP 7:

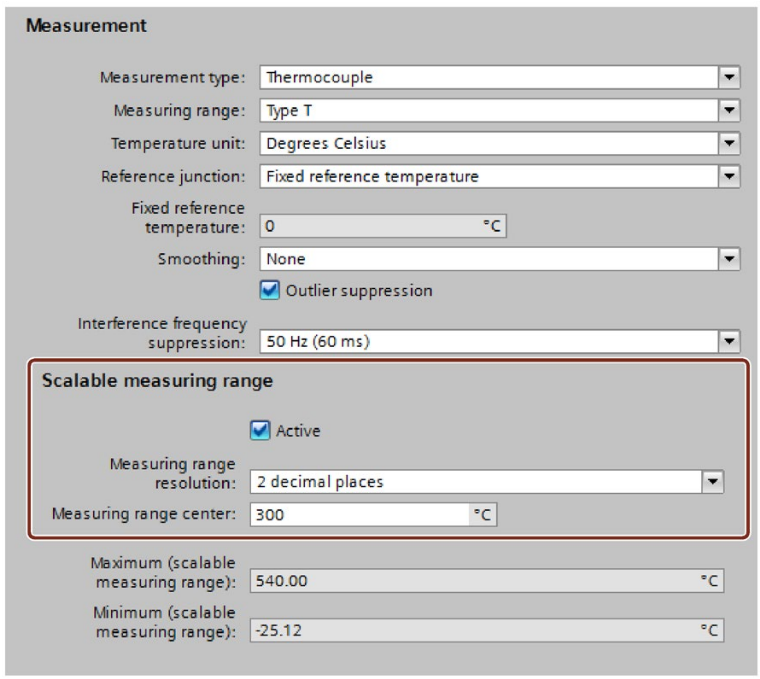


Figure 4-3 Configuration for the scalable measuring range

Reference

You will find more information on the configuration in the STEP 7 online help.

4.4.2 Evaluate status and limits of scalable measuring range

Evaluation in the user program

In the user program, you can evaluate the status and the limits of the scalable measuring range with data record 235, which may result by reaching underflow/overflow.

Structure of data record 235

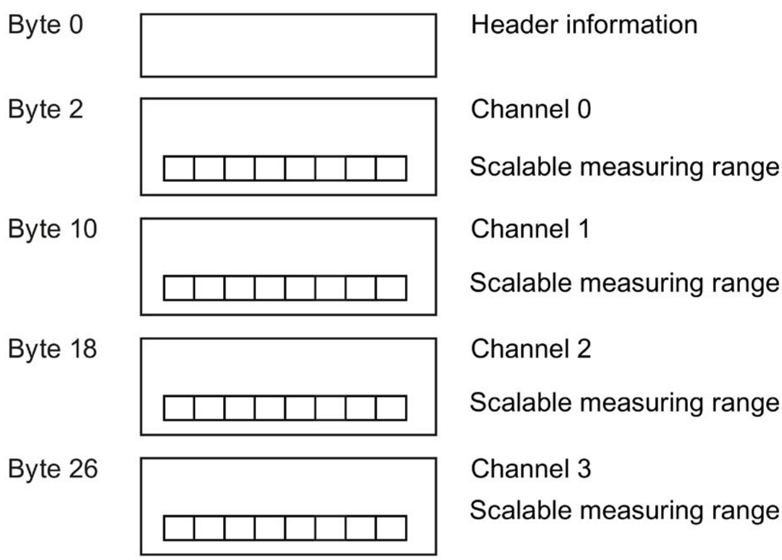

Figure 4-4 Structure of data record 235

Header information

The figure below shows the structure of the header information.

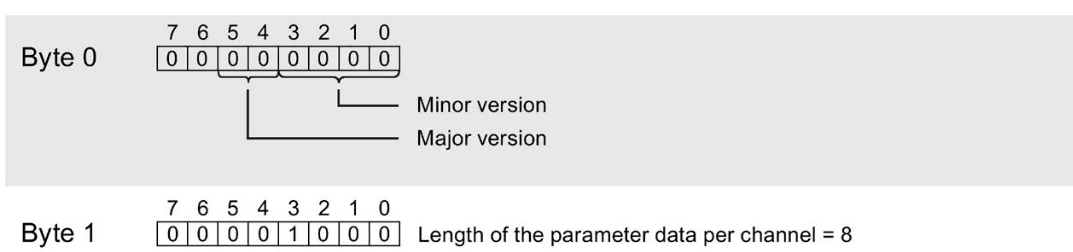

Figure 4-5 Header information of data record 235

Parameters

The figure below shows the structure of the parameter.

If the corresponding bit is set to "1", the parameter is activated.

* x = 2 + (channel number x 8)

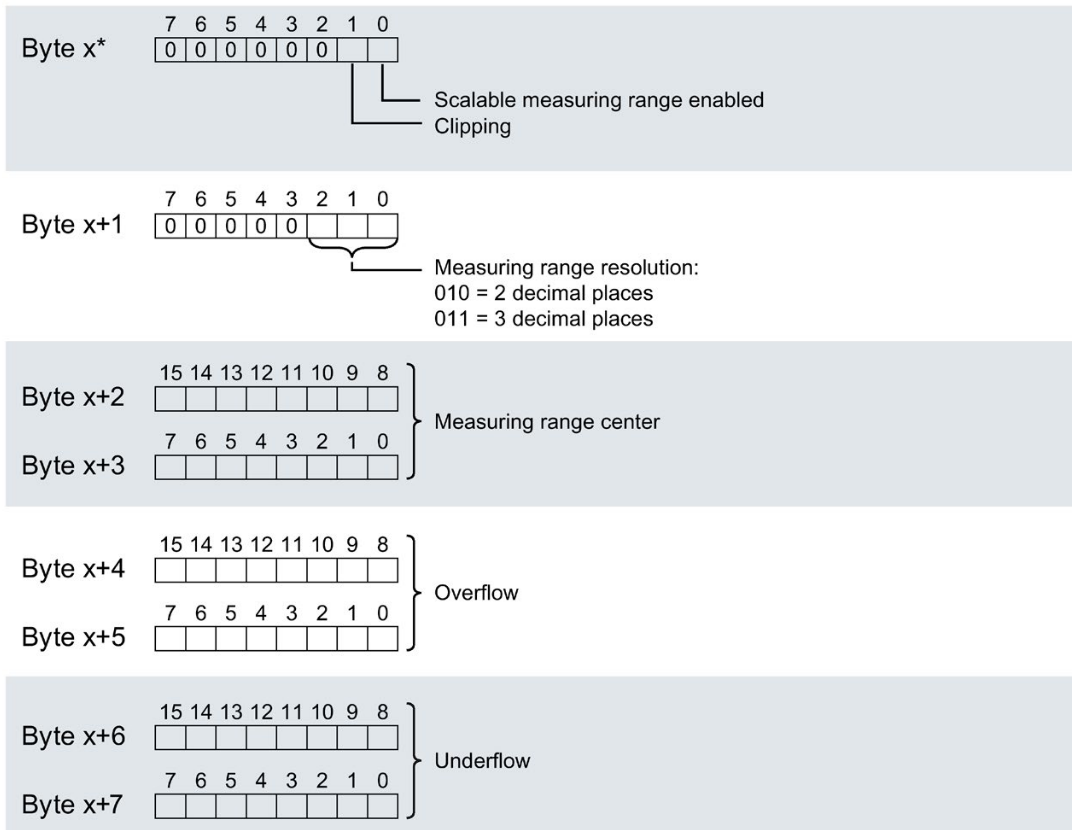

Figure 4-6 Structure of data record 235 - channel parameter byte x to x+7

Description of the parameters

Table 4- 6 Description **of the parameters from data record 235**

Parameter	Description
Scalable measuring range enabled	1 = Function is active for this channel.
Clipping	1 = Scalable measuring range cut off at the overflow / underflow of the underlying measuring range (see Figure (Page 26)).
Resolution	2 or 3 decimal places
Measuring range center	Temperature in whole °C / °F / K ("working point" for the scaling)
Overflow/underflow	Limits of the scalable measuring range

Example

The following example shows the values for a thermocouple type T:

Table 4- 7 Example of thermocouple type T

Hex. value	Dec. value	Evaluation of data record 235
00_H	0	V0.0
08_H	8	8 bytes
03_H	3	Scalable measuring range active and clipped (clipping)
02_H	2	Resolution: 2 decimal places
$012C_H$	300	Measuring range center: 300 °C
$5DC0_H$	24000	Overflow (Maximum): 240.**00** + 300 = 540.00 °C Scalable measuring range is clipped at the overflow.
8100_H	-32512	Underflow (Minimum): -325.**12** + 300 = -25.12 °C

4.5 REAL representation

Special features of REAL representation

If you have configured the module with REAL representation, the user data and hardware interrupt limits are displayed in REAL data format (32-bit floating point number) instead of S7 format.

The representation of the measured values in the REAL representation is always related to a physical unit, unlike in S7 representation.
This physical unit results from the measuring range you have set. For temperature ranges, the physical unit is determined by the "Temperature unit" parameter.

REAL representation has no influence on the overranges or underranges, the overflow or underflow diagnostics, or the QI characteristics.

Note

Substitute value for REAL representation

With REAL representation, the overflow of the substitute value $7F800000_H$ is output, for underflow it is substitute value $FF800000_H$.

Examples

The following examples show value ranges of different measuring ranges in REAL representation:

Table 4- 8 Value range in REAL representation

Measuring range	Value range	Unit
Voltage ±1 V	- 1.0 V to + 1.0 V	V
Voltage ± 50 mV	- 50.0 mV to + 50.0 mV	mV
Thermocouple type K	- 270.00 °C to +1372.00 °C	Configured temperature unit (°C, °F, K)

4.6 Address space

The module can be configured differently in STEP 7; see following table. Depending on the configuration, additional/different addresses are assigned in the process image input.

Configuration options of AI 4xTC HS

You can configure the module with STEP 7 (TIA Portal) or with a GSD file. If you configure the module by means of a GSD file, the configurations are available under various short designations/module names; see the table below. The following configurations are possible:

Table 4- 9 Configuration options with GSD file

Configuration	Short designation/module name in the GSD file	Configuration software, e.g. with STEP 7 (TIA Portal)		
		Integrated in the hardware catalog STEP 7, as of V15 with HSP0265	GSD file PROFINET IO	GSD file PROFIBUS DP
1 x 4-channel without value status	AI 4xTC HS V1.0	X	X	X
1 x 4-channel with value status	AI 4xTC HS V1.0, QI	X	X	---
1 x 4-channel with value status for module-internal Shared Input with up to 4 submodules	AI 4xTC HS V1.0, MSI [1]	X	X	---
1 x 4-channel with REAL representation	AI 4xTC HS V1.0, REAL	X	X	---
1 x 4-channel with REAL representation and value status	AI 4xTC HS V1.0, REAL, QI	X	X	---
1 x 4-channel with REAL representation, value status for module-internal Shared Input up to 4 submodules	AI 4xTC HS V1.0, REAL, MSI [1]	X	X	---

[1] When using the module in a shared device, ensure that you only configure associated MSI submodules for a basic submodule.

Value status (Quality Information, QI)

The value status is always activated for the following module versions:

- AI 4xTC HS V1.0, QI
- AI 4xTC HS V1.0, MSI
- AI 4xTC HS V1.0, REAL, QI
- AI 4xTC HS V1.0, REAL, MSI

Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the analog module. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit =1: No fault is present on the channel.

Bit = 0: The channel is disabled or the wiring, the value created on the channel, etc. is incorrect.

Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, QI

The following figure shows the assignment of the address space with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

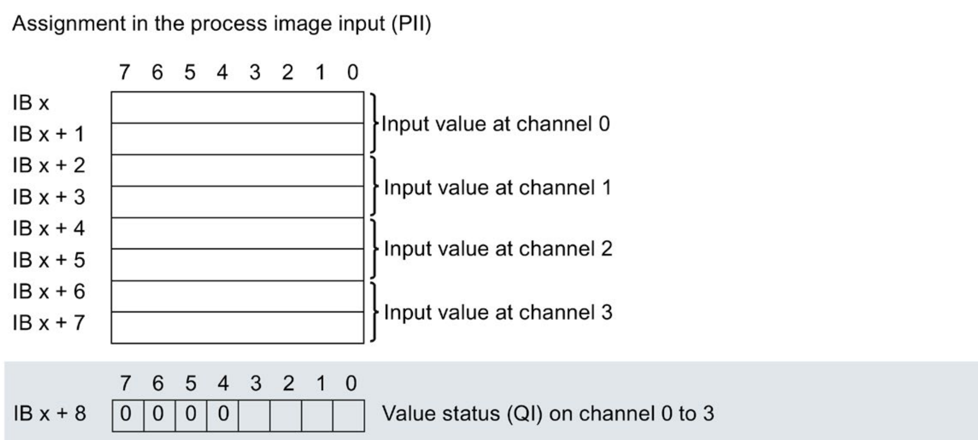

Figure 4-7 Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, QI with value status

Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, MSI

The channels 0 to 3 of the module are copied in up to 4 submodules with configuration 1 x 4-channel module (Module-internal shared input, MSI). Channels 0 to 3 are then available with identical input values in different submodules. These submodules can be assigned to up to four IO controllers when the module is used in a shared device. Each IO controller has read access to the same channels.

The number of available submodules depends on the used interface module. Please observe the information in the manual for the particular interface module.

Value status (Quality Information, QI)

The meaning of the value status depends on the submodule on which it occurs.

For the first submodule (=basic submodule), the value status 0 indicates that the value is incorrect.

For the 2nd to 4th submodule (=MSI submodule), the value status 0 indicates that the value is incorrect or the basic submodule has not yet been configured (not ready).

The figure below shows the assignment of the address space with submodules 1 and 2.

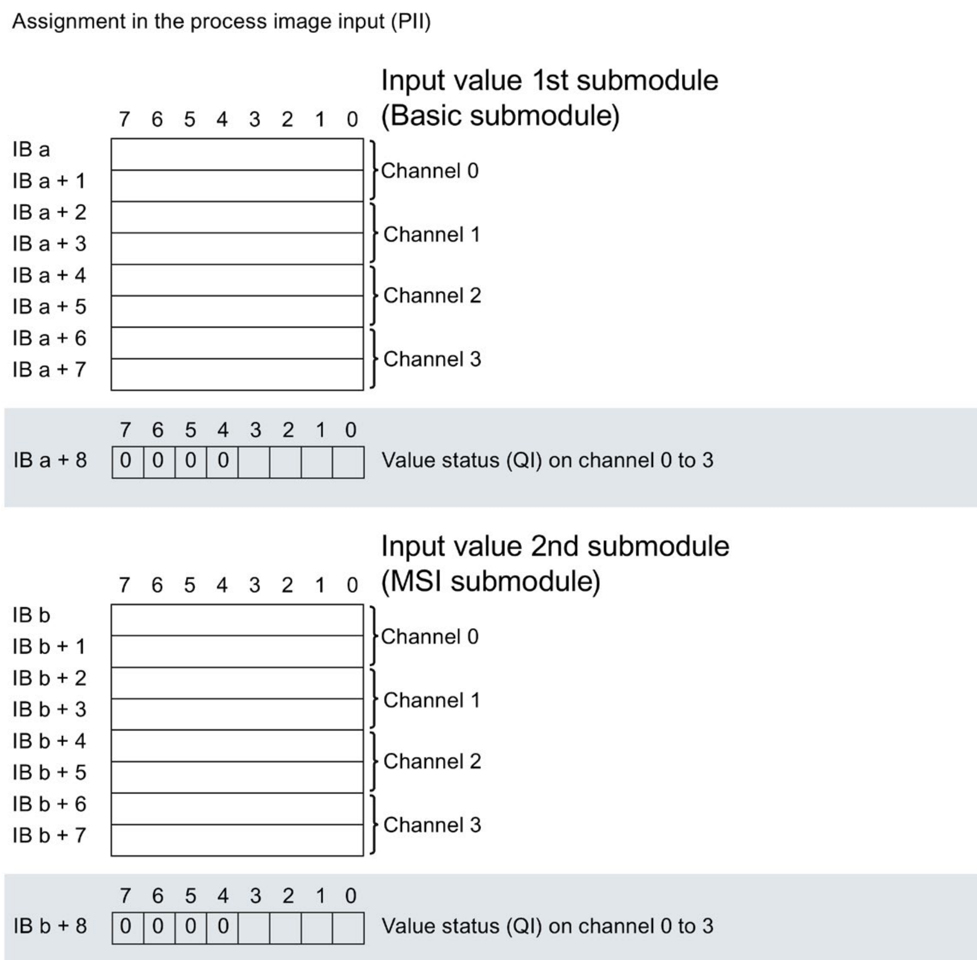

Figure 4-8 Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, MSI with value status, submodule 1 and 2

The figure below shows the assignment of the address space with submodules 3 and 4.

Assignment in the process image input (PII)

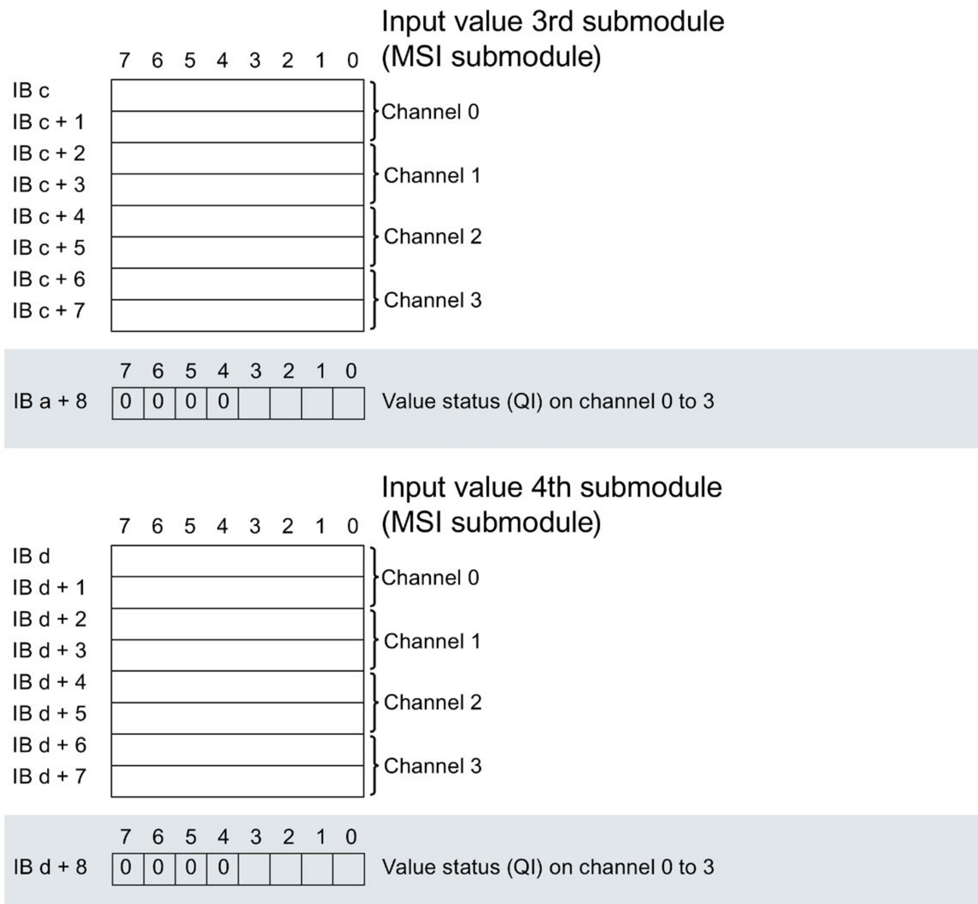

Figure 4-9 Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, MSI with value status, submodule 3 and 4

Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, REAL, QI

The following figure shows the assignment of the address space in REAL representation with value status (Quality Information (QI)). In REAL representation, each channel occupies 4 bytes in the process image of the inputs.
The addresses for the value status are only available if the value status is enabled.

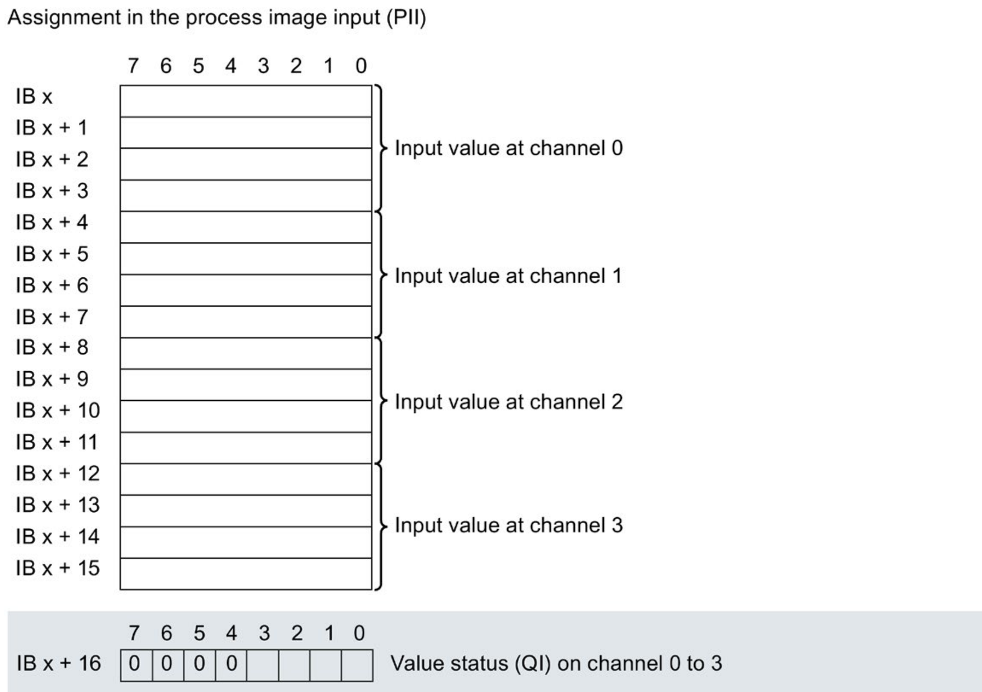

Figure 4-10 Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, REAL, QI with value status

Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, REAL, MSI

For the configuration as a 1 x 4-channel module REAL MSI, the channels react as in the 1 x 4-channel AI 4xTC HS V1.0, MSI configuration.
In REAL representation, each channel occupies 4 bytes in the process image of the inputs.

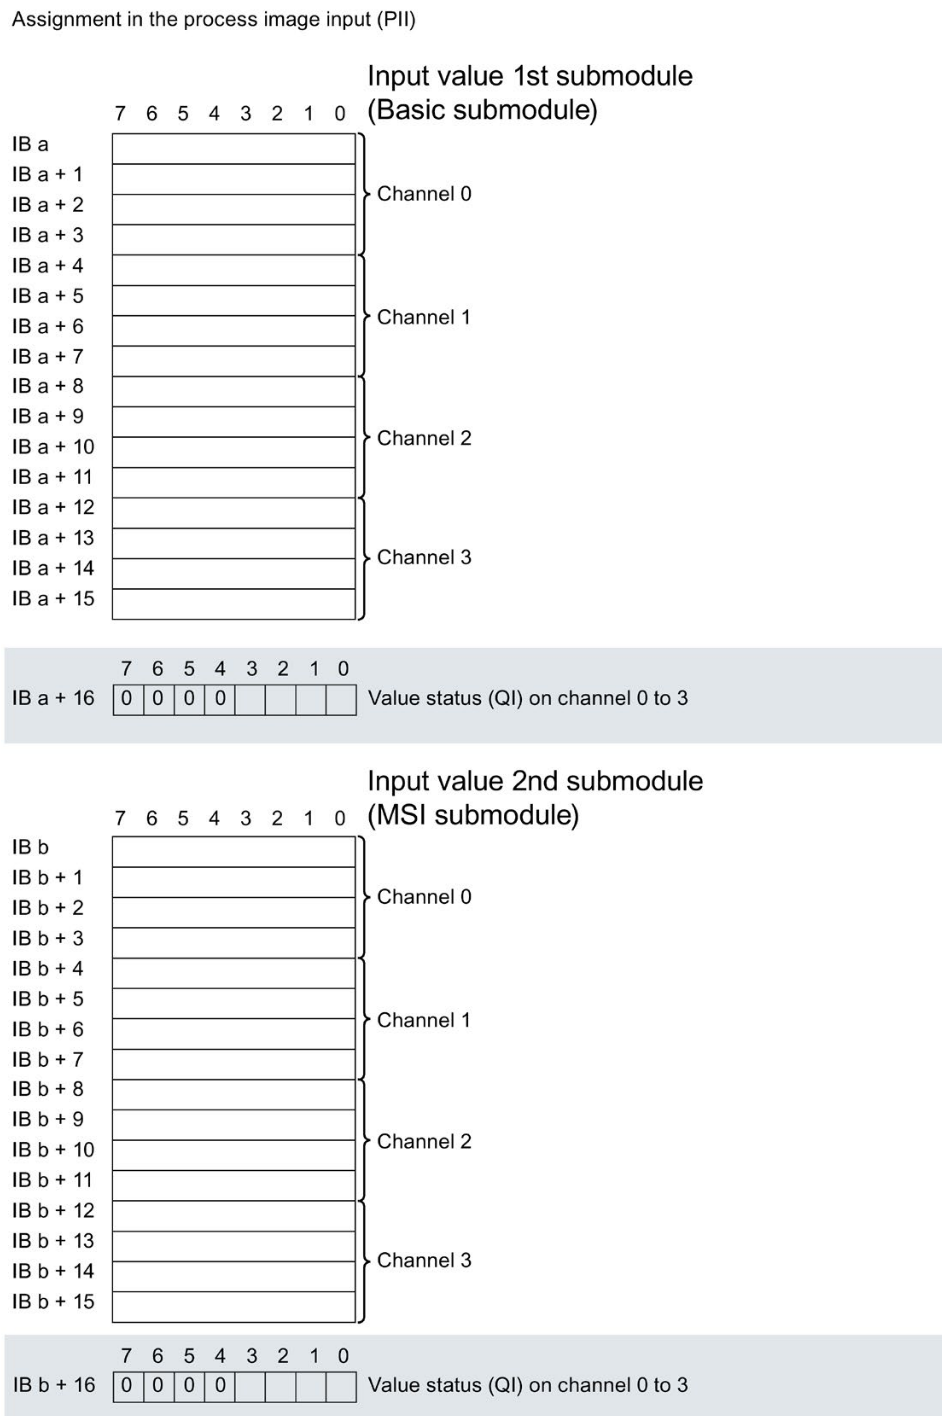

Figure 4-11 Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, REAL, MSI with value status, submodule 1 and 2

The figure below shows the assignment of the address space with submodules 3 and 4.

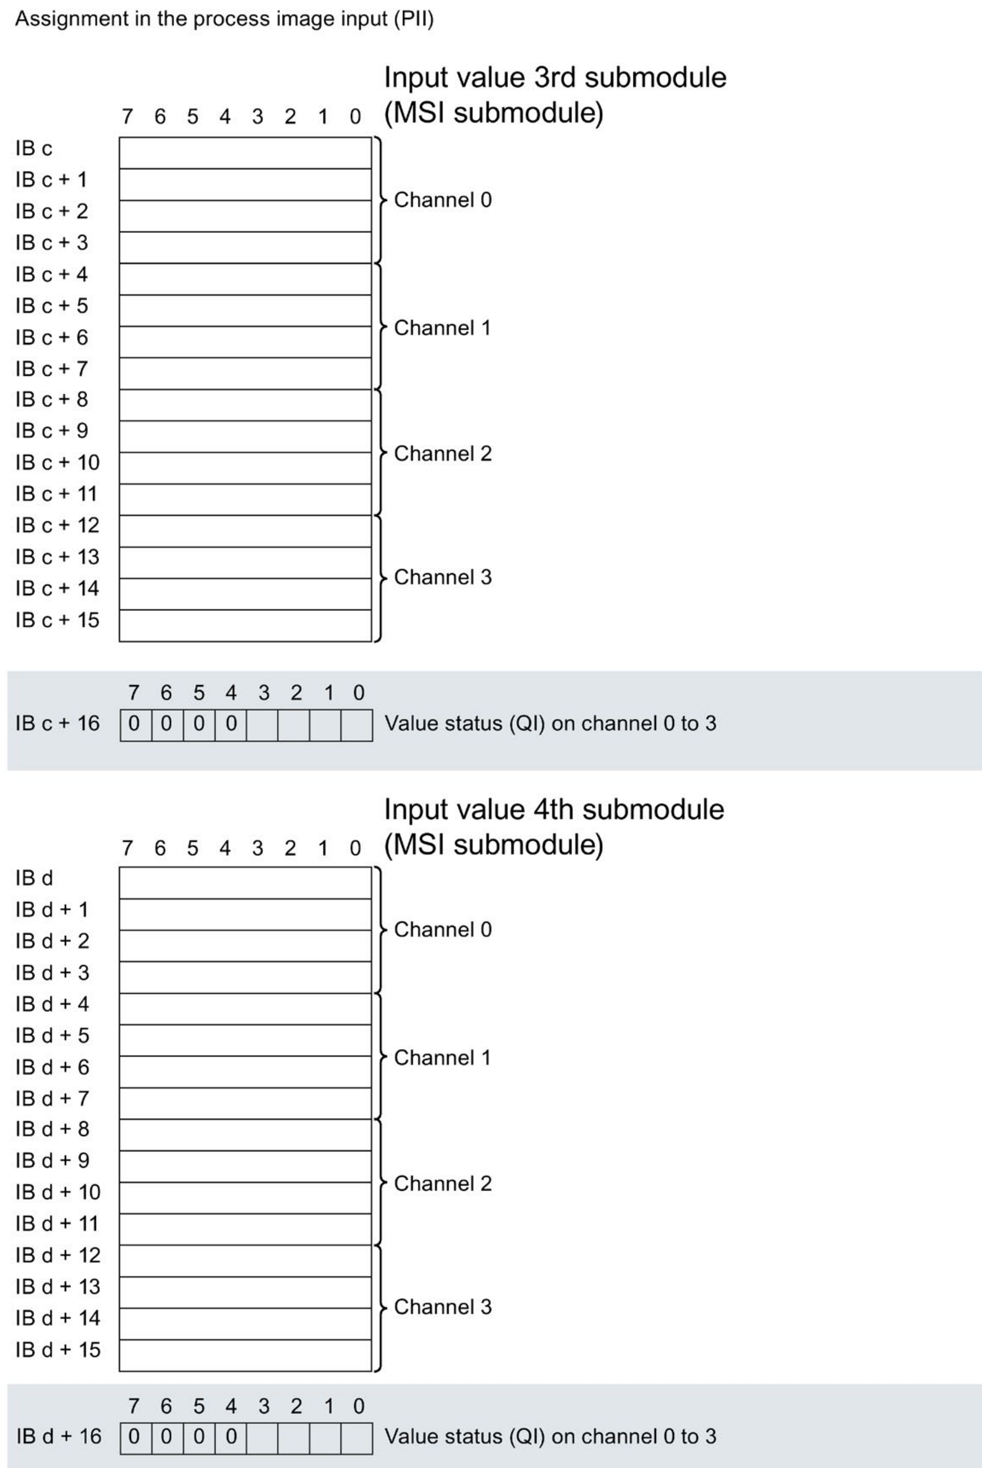

Figure 4-12 Address space for configuration as 1 x 4-channel AI 4xTC HS V1.0, REAL, MSI with value status, submodule 3 and 4

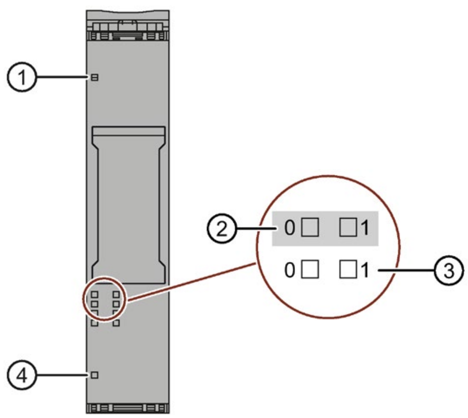
5 Interrupts/diagnostics alarms

5.1 Status and error display

LED display

The following figure shows you the LED display of the AI 4xTC HS:



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables contain the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostics alarms (Page 43).

LED DIAG

Table 5- 1 LED DIAG fault display

LED DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status/channel error LED

Table 5- 2 Status and error display of the LED channel status / channel error

LEDs		Meaning
Channel status	Channel error	
Off	Off	Channel deactivated
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
On	On	Not permitted (error)

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ present

5.2 Interrupts

Evaluating hardware interrupts with IO controller

The module generates a hardware interrupt at the following events:

- Violation of low limit 1
- Violation of high limit 1
- Violation of low limit 2
- Violation of high limit 2

You can obtain detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of double word 8 in local data.

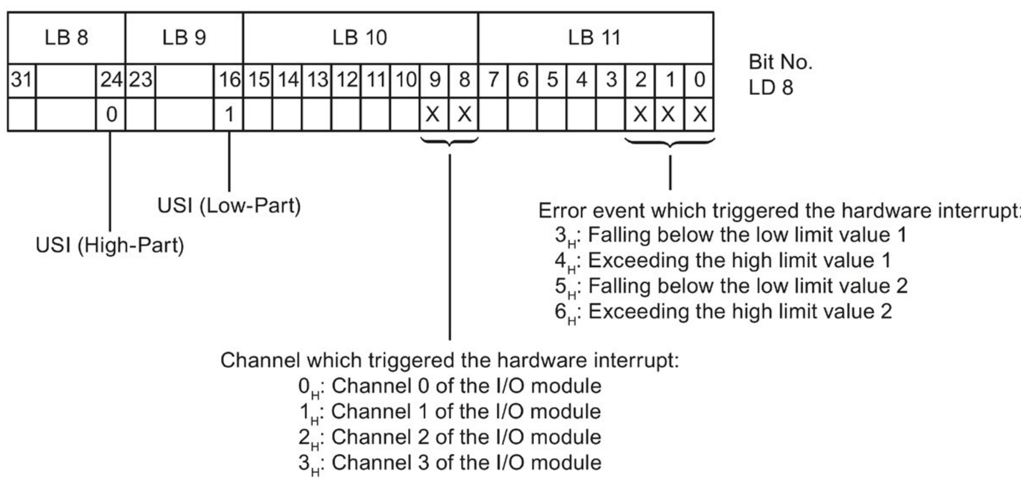


Figure 5-2 OB start information

Structure of the additional interrupt information

Table 5- 4 Structure of the additional interrupt information

Data block name		Content	Comment	Bytes
USI (User Structure Identifier)		W#16#0001	additional interrupt information for hardware interrupts of the I/O module	2
Channel that triggered the hardware interrupt.				
	Channel	B#16#00 to B#16#03	Channel 0 to 3 of the I/O module	1
Event that triggered the hardware interrupt.				
	Event	B#16#03	Violation of low limit 1	1
		B#16#04	Violation of high limit 1	
		B#16#05	Violation of low limit 2	
		B#16#06	Violation of high limit 2	

Diagnostic error interrupt

The module generates a diagnostic error interrupt at the following events:

- Channel temporarily unavailable
- Hardware interrupt lost
- Reference channel error
- Error
- Violation of low limit
- Violation of high limit
- Wire break
- Supply voltage missing
- Parameter assignment error

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Diagnostics alarms, their meaning and remedies

Diagnostics alarms	Error code	Meaning	Solution
Wire break	6_H	Resistance of sensor circuit too high	Use a different sensor type or modify the wiring, for example, using cables with larger cross-section
		Wire break between the module and sensor	Connect the cable
		Channel not connected (open)	• Deactivate diagnostics • Connect or deactivate the channel
Violation of high limit[1]	7_H	Value lies above the overrange.	Correct module/sensor interplay
Violation of low limit[1]	8_H	Value lies below the underrange.	Correct module/sensor interplay
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies to the entire module).	Replace module
Parameter assignment error	10_H	The module cannot evaluate parameters for the channel. Incorrect parameter assignment.	Correct the parameter assignment (wire break diagnostics only allowed with the permitted measuring ranges).
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Reference channel error (reference junction)	15_H	Reference temperature of the reference junction for the TC channel being operated with compensation is invalid.	• Check BaseUnit type • Select correct reference junction through parameter assignment[2] • Check whether the reference junction (reference channel of the group 0, 1, 2, 3) is only assigned once as the sender in the entire setup.
Hardware interrupt lost	16_H	At least one hardware interrupt could not be signaled because too many hardware interrupts are pending.	Correct the program or the process
Channel temporarily unavailable	$1F_H$	• Firmware update is currently in progress or has been canceled. The module does not read in process values in this state. • The channel is currently being calibrated.	• Wait for firmware update. • Restart the firmware update. • Complete calibration.

[1] The alarm refers to the diagnostics and depends on the configured measuring range.

[2] Shared device and "Reference temperature" diagnostics: If the sender and receiver of the reference junction temperature of a group are assigned to different IO controllers, you may need to download both configurations again in the case of diagnostics. First download the configuration containing the receiver.

6 Technical specifications

Technical specifications of the AI 4×TC HS

Article number	6ES7134-6JD00-0DA1
General information	
Product type designation	AI 4xTC HS
Firmware version	V1.0
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
• Measuring range scalable	Yes
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15 with HSP 265/integrated as of V15.1
• STEP 7 configurable/integrated as of version	Configurable via GSD file
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
• Oversampling	No
• MSI	Yes
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	Yes
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	37 mA
Current consumption, max.	50 mA

Article number	6ES7134-6JD00-0DA1
Power loss	
Power loss, typ.	0.9 W
Address area	
Address space per module	
• Address space per module, max.	16 byte; + 1 byte for QI information
Hardware configuration	
Automatic encoding	
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 2-wire connection	BU type A0, A1
Analog inputs	
Number of analog inputs	4
permissible input voltage for voltage input (destruction limit), max.	30 V
Cycle time (all channels), min.	Sum of the basic conversion times and additional processing times (depending on the parameterization of the active channels)
Technical unit for temperature measurement adjustable	Yes; °C/°F/K
Input ranges (rated values), voltages	
• -1 V to +1 V	Yes; 16 bit incl. sign
• Input resistance (-1 V to +1 V)	1 MΩ
• -250 mV to +250 mV	Yes; 16 bit incl. sign
• Input resistance (-250 mV to +250 mV)	1 MΩ
• -50 mV to +50 mV	Yes; 16 bit incl. sign
• Input resistance (-50 mV to +50 mV)	1 MΩ
• -80 mV to +80 mV	Yes; 16 bit incl. sign
• Input resistance (-80 mV to +80 mV)	1 MΩ

Article number	6ES7134-6JD00-0DA1
Input ranges (rated values), thermocouples	
• Type B	Yes; 16 bit incl. sign
• Input resistance (Type B)	1 MΩ
• Type C	Yes; 16 bit incl. sign
• Input resistance (Type C)	1 MΩ
• Type E	Yes; 16 bit incl. sign
• Input resistance (Type E)	1 MΩ
• Type J	Yes; 16 bit incl. sign
• Input resistance (type J)	1 MΩ
• Type K	Yes; 16 bit incl. sign
• Input resistance (Type K)	1 MΩ
• Type L	Yes; 16 bit incl. sign
• Input resistance (Type L)	1 MΩ
• Type N	Yes; 16 bit incl. sign
• Input resistance (Type N)	1 MΩ
• Type R	Yes; 16 bit incl. sign
• Input resistance (Type R)	1 MΩ
• Type S	Yes; 16 bit incl. sign
• Input resistance (Type S)	1 MΩ
• Type T	Yes; 16 bit incl. sign
• Input resistance (Type T)	1 MΩ
• Type U	Yes; 16 bit incl. sign
• Input resistance (Type U)	1 MΩ
• Type TXK/TXK(L) to GOST	Yes; 16 bit incl. sign
• Input resistance (Type TXK/TXK(L) to GOST)	1 MΩ
Thermocouple (TC)	
Temperature compensation	
– parameterizable	Yes
– Reference channel of the module	No
– internal comparison point	Yes; with BaseUnit type A1
– Reference channel of the group	Yes
– Number of reference channel groups	4; Group 0 to 3
– fixed reference temperature	Yes

Article number	6ES7134-6JD00-0DA1
Cable length	
• shielded, max.	200 m; 100 m for thermocouples
Analog value generation for the inputs	
Measurement principle	integrating (Sigma-Delta)
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Basic conversion time, including integration time (ms)	
– additional processing time for wire-break check	1 ms
• Interference voltage suppression for interference frequency f1 in Hz	16.6 / 50 / 60 Hz / off
• Conversion time (per channel)	180/60/50/1.25 ms
Smoothing of measured values	
• Number of smoothing levels	4
• parameterizable	Yes
• Step: None	Yes
• Step: low	Yes
• Step: Medium	Yes
• Step: High	Yes
Encoder	
Connection of signal encoders	
• for voltage measurement	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.01 %
Temperature error (relative to input range), (+/-)	0.005 %/K
Crosstalk between the inputs, min.	-70 dB
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.03 %
Operational error limit in overall temperature range	
• Voltage, relative to input range, (+/-)	0.1 %; 0.3 % when SFU OFF
Basic error limit (operational limit at 25 °C)	
• Voltage, relative to input range, (+/-)	0.05 %; 0.2 % when SFU OFF

Article number	6ES7134-6JD00-0DA1
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	70 dB
• Common mode voltage, max.	60 V; DC
• Common mode interference, min.	90 dB
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes; two upper and two lower limit values in each case
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; channel by channel
• Group error	Yes
• Overflow/underflow	Yes; channel by channel
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; Green/red LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	60 V DC
Isolation	
Isolation tested with	707 V DC (type test)

Article number	6ES7134-6JD00-0DA1
Standards, approvals, certificates	
Suitable for applications according to AMS 2750	Yes; Declaration of Conformity, see online support entry 109757262
Suitable for applications according to CQI-9	Yes; Based on AMS 2750 E
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	33 g

Operational and basic error limits for thermocouples

Error limits for thermocouples[1] (Interference frequency suppression: 16.6 Hz / 50 Hz / 60 Hz)	
Operational limit for thermocouples (in the entire temperature range)	±1.5 K
Basic error limit for thermocouples (operational limit at 25 °C)	±1 K
Overall error limits when using internal compensation	
• Operational limit (in the entire temperature range at static thermal state, ambient temperature change < 0.3 K/min)	± 2.5 K
• Basic error limit (operational limit at 25 °C at static thermal state, ambient temperature change < 0.3 K/min)	±1.5 K

[1] The indicated error limits apply as of the following temperatures:
Thermocouple type T: -200 °C
Thermocouple type K: -100 °C
Thermocouple type B: +700 °C
Thermocouple type N: -150 °C
Thermocouple type E: -150 °C
Thermocouple type R: +200 °C
Thermocouple type S: +100 °C

Error limits for thermocouples[1] (Interference frequency suppression: None)	
Operational limit for thermocouples (in the entire temperature range)	±3.75 K
Operational limit for thermocouples type B, C, E, R, S (in the entire temperature range)[1]	±7.5 K
Basic error limit for thermocouples (operational limit at 25 °C)	± 2.5 K
Basic error limit for thermocouples type B, C, E, R, S (operational limit at 25 °C)	±5 K
Overall error limits when using internal compensation	
• Operational limit (in the entire temperature range at static thermal state, ambient temperature change < 0.3 K/min)[2]	±5.25 K
• Basic error limit (operational limit at 25 °C at static thermal state, ambient temperature change < 0.3 K/min)[3]	±3 K

1 The indicated error limits apply as of the following temperatures:
Thermocouple type T: -200 °C
Thermocouple type K: -100 °C
Thermocouple type B: +700 °C
Thermocouple type N: -150 °C
Thermocouple type E: -150 °C
Thermocouple type R: +200 °C
Thermocouple type S: +100 °C

2 For thermocouple type B, C, E, R, S: ±9 K

3 For thermocouple type B, C, E, R, S: ±5.5 K

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data records

A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Table A- 1 Dependencies of the measurement type / measuring range

Measurement type	Measuring range	Reference junction	Temperature unit
Deactivated	*	*	*
Voltage	±50 mV, ±80 mV, ±250 mV, ±1 V	*	*
Thermocouple	Type B, N, E, R, S, J, L, T, K, U, C, TXK	Internal reference junction Reference channel of group 0, 1, 2, 3[1]	Degrees Celsius Degrees Fahrenheit Kelvin
		Fixed reference temperature	

x = property is allowed, – = property is **not allowed**, * = property is not relevant.

1 Use of "Reference channel of group 0, 1, 2, 3":
For each TC channel in the IO device that is intended to use this reference, "Reference junction" must be set to "Reference channel of group 0, 1, 2, 3".

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type for PROFINET.

Table A- 2 Dependencies on the measurement type

Measurement type	Scalable measuring range	Measuring range resolution	Wire break check	Diagnostics				
				Underflow	Overflow	Wire break	Missing supply voltage L+	Reference junction
Deactivated	*	*	*	*	*	*	*	*
Voltage	–	*	-	x	x	–	x	–
Thermocouple	x	2 and 3 decimal places	x	x	x	x[1]	x	x[2]

x = property is allowed, – = property is **not allowed**, * = property is not relevant.

1 Property is only permitted if the "Wire break check" parameter is enabled.

2 Property is not relevant when "Fixed reference temperature" is used.

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Table A- 3 Dependencies of the measurement type / measuring range

Measurement type	**Measuring range**	**Slot reference junction**	**Temperature unit**	**Wire break check**	**Diagnostics**			
					Underflow / overflow	**Wire break**	**Missing supply voltage L+**	**Reference junction**
Deactivated	*	*	*	*	*	*	*	*
Voltage	±50 mV, ±80 mV, ±250 mV, ±1 V	*	*	-	x	–	x	–
Thermocouple	Type B, N, E, R, S, J, L, T, K, U, C, TXK	Internal reference junction Reference channel of group 0, 1, 2, 3[1]	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x[2]	x	x
		Fixed reference temperature	Degrees Celsius Degrees Fahrenheit Kelvin	x	x	x[2]	x	*

x = property is allowed, – = property is **not allowed**, * = property is not relevant.

[1] Use of "Reference channel of group 0, 1, 2, 3":
For each TC channel in the IO device that is intended to use this reference, "Reference junction" must be set to "Reference channel of group 0, 1, 2, 3".

[2] Property is only allowed if the "Wire break check" is enabled.

A.2 Parameter assignment and structure of the parameter data record (S7 representation)

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, the measuring range of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 will not be changed on the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

-2699	-4539	33	-1999	-3279	733	Low limit

Error transmitting the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Table A- 11 Error messages, their meaning and corrective measures

Error code in the STATUS parameter (hexadecimal)				**Meaning**	**Solution**
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF_H	80_H	$B0_H$	00_H	Number of the data record unknown	Enter a valid number for the data record.
DF_H	80_H	$B1_H$	01_H	Length of the data record incorrect	Enter a valid value for the data record length.
DF_H	80_H	$B2_H$	00_H	Module not accessible	• Check station. • Module not correctly plugged in. • Check parameters of the WRREC block.
DF_H	80_H	$E0_H$	01_H	Incorrect version in header	Correct version number of the parameter block, see Figure A-2 Header information - S7 representation (Page 54).
DF_H	80_H	$E0_H$	02_H	Error in the header, length or number of parameter blocks	Correct the length and number of the parameter blocks, see Figure A-2 Header information - S7 representation (Page 54).
DF_H	80_H	$E1_H$	01_H	Reserved bit set	Write 0 to all reserved bits.
DF_H	80_H	$E1_H$	02_H	Invalid diagnostics enable bit set	Correct diagnostics enables. (Dependence on measurement type, measuring range, wire break check)
DF_H	80_H	$E1_H$	04_H	Value for hardware interrupt limit invalid	Use valid hardware interrupt limits, see Parameter assignment and structure of the parameter data record (S7 representation) (Page 53), "Limits for hardware interrupts" section.
DF_H	80_H	$E1_H$	08_H	Code for interference frequency suppression invalid	Use valid code for interference frequency suppression, see Figure A-3 Structure of byte x to x+21 for channel 0 to 3 - S7 representation (Page 57), byte x+3.
DF_H	80_H	$E1_H$	09_H	Code for smoothing invalid	Use valid code for smoothing.
DF_H	80_H	$E1_H$	$0F_H$	Code for reference junction invalid or not permissible	Use valid code for reference junction.
DF_H	80_H	$E1_H$	10_H	Code for the measurement type invalid	Use valid code for measurement type, see Table A-4 Codes for measurement type (Page 57).

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$E1_H$	11_H	Code for the measuring range invalid	Use valid code for measuring range, see Table A-5 Codes for measuring range (Page 58).
DF_H	80_H	$E1_H$	12_H	Value for fixed reference temperature invalid	Use valid reference temperature, see Figure A-3 Structure of byte x to x+21 for channel 0 to 3 - S7 representation (Page 57), byte x+8.
DF_H	80_H	$E1_H$	21_H	Code for temperature unit invalid	Use valid code for temperature unit Figure A-3 Structure of byte x to x+21 for channel 0 to 3 - S7 representation (Page 57), byte x+4.
DF_H	80_H	$E1_H$	22_H	Code for measuring range resolution invalid or scalable measuring range not permissible	• Use valid code for measuring range resolution. • Disable scalable measuring range.

A.3 Parameter assignment and structure of channel parameter (REAL representation)

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming. This means that you can use all the functions of the module even if you configured it via PROFIBUS-GSD.

Parameter assignment in the user program

You can reassign the parameters of the module in RUN. For example, the measuring range of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 will not be changed on the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

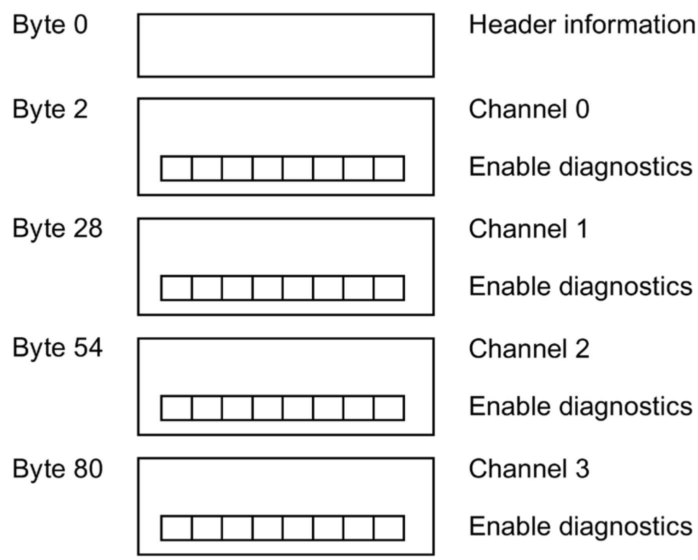

Figure A-4 Structure of data record 128

Header information

The figure below shows the structure of the header information in REAL representation.

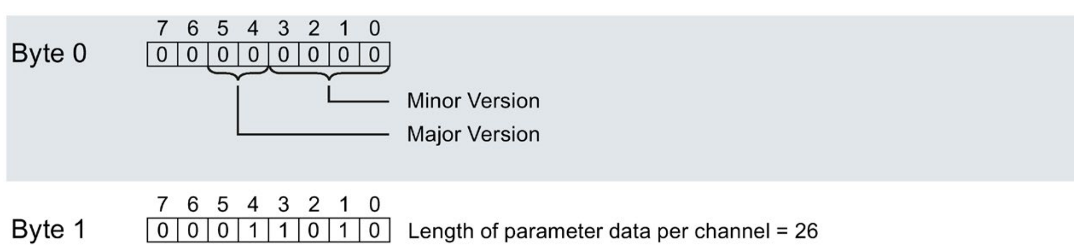

Figure A-5 Header information - REAL representation

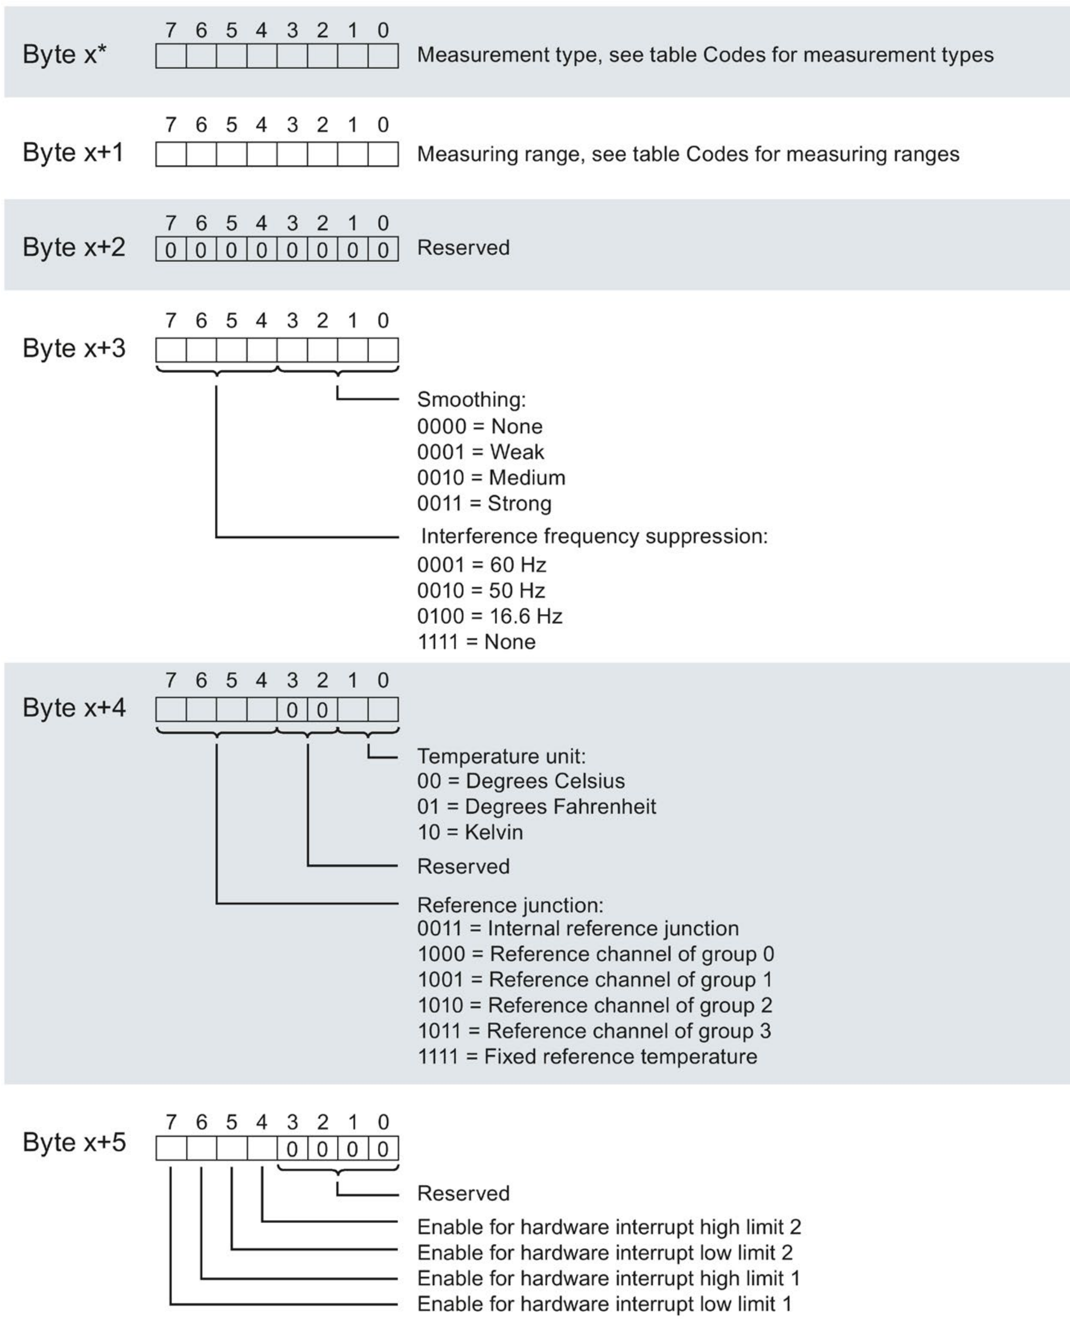
Channel parameter block

The figure below shows the structure of the parameters for channels 0 to 3.

You can activate a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number * 26); channel number = 0 to 3



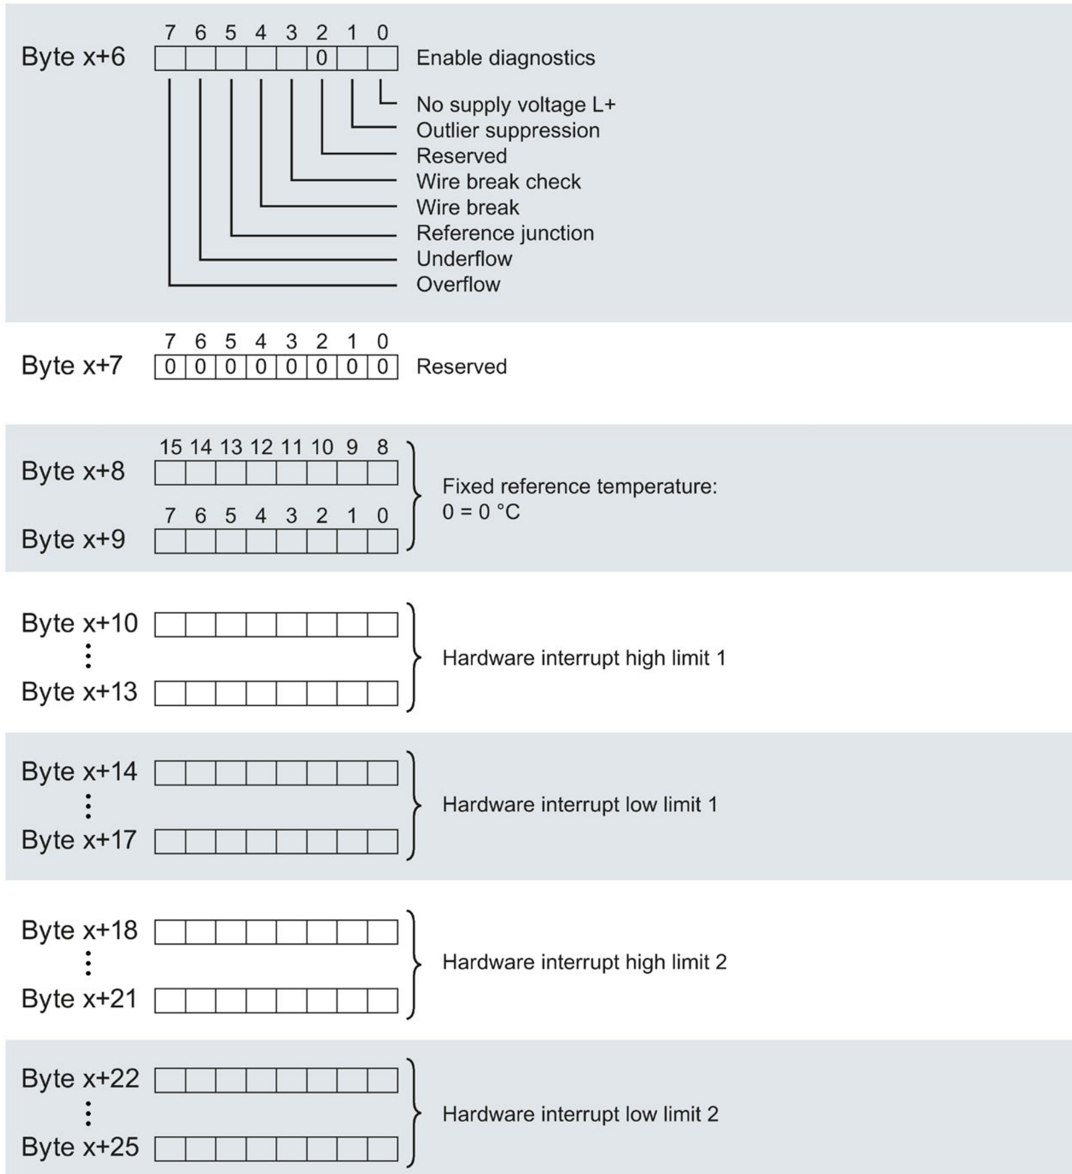


Figure A-6 Structure of byte x to x+25 for channel 0 to 3 - REAL representation

Codes for measurement type

The following table contains the codes for the measurement types of the analog input module. You need to enter these codes in the relevant byte x.

Table A- 12 Codes for measurement type

Measurement type	Code
Deactivated	0000 0000
Voltage	0000 0001
Thermocouple	0000 1010

Codes for measuring range

The following table contains the codes for the measuring ranges of the analog input module. You need to enter these codes in the relevant x+1.

Table A- 13 Codes for measuring range

Type TXK	0000 1011

Limits for hardware interrupts

The following tables contain the permitted limits for hardware interrupts (in each case, the usable value is given). The limits depend on the selected measurement type and the selected measuring range. The value for the high limit must be greater than the value for the low limit.

Table A- 14 Voltage limits

Voltage				
±50 mV	±80 mV	±250 mV	± 1 V	
58.7927 mV	94.0683 mV	293.963 mV	1.17585 V	High limit
-58.7945 mV	-94.0712 mV	-293.972 mV	-1.17589 V	Low limit

Table A- 15 Limits for thermocouple types B, C, and E

Thermocouple									
Type B			Type C			Type E			
°C	°F	K	°C	°F	K	°C	°F	K	
2069.9	3276.5	2343.1	2499.9	3276.5	2773.1	1199.9	2191.9	1473.1	High limit
-119.9	-183.9	153.3	-119.9	-183.9	153.3	-269.9	-453.9	3.3	Low limit

Table A- 16 Limits for thermocouple types R, S, J, and L

Thermocouple									
Types R, S			Type J			Type L			
°C	°F	K	°C	°F	K	°C	°F	K	
2018.9	3276.5	2292.1	1449.9	2641.9	1723.1	1149.9	2101.9	1423.1	High limit
-169.9	-273.9	103.3	-209.9	-345.9	63.3	-199.9	-327.9	73.3	Low limit

Table A- 17 Limits for thermocouple types T, K, and U

Thermocouple									
Type T			Type K			Type U			
°C	°F	K	°C	°F	K	°C	°F	K	
539.9	1003.9	813.1	1621.9	2951.5	1895.1	849.9	1561.9	1123.1	High limit
-269.9	-453.9	3.3	-269.9	-453.9	3.3	-199.9	-327.9	73.3	Low limit

Table A- 18 Limits for thermocouple types N and TXK

Thermocouple						
Type N			Type TXK			
°C	°F	K	°C	°F	K	
1549.9	2821.9	1823.1	1049.9	1921.9	1323.1	High limit
-269.9	-453.9	3.3	-199.9	-327.9	73.3	Low limit

Error transmitting the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns the appropriate error code if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Table A- 19 Error messages, their meaning and corrective measures

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$B0_H$	00_H	Number of the data record unknown	Enter a valid number for the data record.
DF_H	80_H	$B1_H$	01_H	Length of the data record incorrect	Enter a valid value for the data record length.
DF_H	80_H	$B2_H$	00_H	Module not accessible	• Check station. • Module not correctly plugged in. • Check parameters of the WRREC block.
DF_H	80_H	$E0_H$	01_H	Incorrect version in header	Correct version number of the parameter block, see Figure A-5 Header information - REAL representation (Page 63).
DF_H	80_H	$E0_H$	02_H	Error in the header, length or number of parameter blocks	Correct the length and number of the parameter blocks, see Figure A-5 Header information - REAL representation (Page 63).
DF_H	80_H	$E1_H$	01_H	Reserved bit set	Write 0 to all reserved bits.
DF_H	80_H	$E1_H$	02_H	Invalid diagnostics enable bit set	Correct diagnostics enables. (Dependence on measurement type, measuring range, wire break check)
DF_H	80_H	$E1_H$	04_H	Value for hardware interrupt limit invalid	Use valid hardware interrupt limits, see Parameter assignment and structure of channel parameter (REAL representation) (Page 62), "Limits for hardware interrupts" section.
DF_H	80_H	$E1_H$	08_H	Code for interference frequency suppression invalid	Use valid code for interference frequency suppression, see Figure A-6 Structure of byte x to x+25 for channel 0 to 3 - REAL representation (Page 65), byte x+3.
DF_H	80_H	$E1_H$	09_H	Code for smoothing invalid	Use valid code for smoothingFigure A-6 Structure of byte x to x+25 for channel 0 to 3 - REAL representation (Page 65).
DF_H	80_H	$E1_H$	$0F_H$	Code for reference junction invalid or not permissible	Use valid code for reference junctionFigure A-6 Structure of byte x to x+25 for channel 0 to 3 - REAL representation (Page 65).

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF_H	80_H	$E1_H$	10_H	Code for the measurement type invalid	Use valid code for measurement type, see Table A-12 Codes for measurement type (Page 65).
DF_H	80_H	$E1_H$	11_H	Code for the measuring range invalid	Use valid code for measuring range, see Table A-13 Codes for measuring range (Page 66).
DF_H	80_H	$E1_H$	12_H	Value for fixed reference temperature invalid	Use valid reference temperature, see Figure A-6 Structure of byte x to x+25 for channel 0 to 3 - REAL representation (Page 65), byte x+8.
DF_H	80_H	$E1_H$	21_H	Code for temperature unit invalid	Use valid code for temperature unit Figure A-6 Structure of byte x to x+25 for channel 0 to 3 - REAL representation (Page 65), byte x+4.

Representation of analog values

B

This appendix shows the analog values for all measuring ranges that you can use with the analog module AI 4xTC HS.

Measured value resolution

The resolution of the analog values differs depending on the analog module and its parameter assignment.

Each analog value is written left aligned to the tags. The bits marked with "x" are set to "0".

Note

Temperature values

The digitized temperature values are the result of a conversion in the analog module. The following resolution therefore does not apply to temperature values.

Table B- 1 Resolution of the analog values

Resolution in bits including sign	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of input ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar input ranges. The resolution is 16 bits.

Table B- 2 Bipolar input ranges

Dec. value	Measured value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
32767	>117.589	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Overflow
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
-32768	<-117.593	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Underflow

B.2 Representation of analog values in voltage measuring ranges

The following tables list the decimal and hexadecimal values (codes) of the possible voltage measuring ranges.

Table B- 3 Voltage measuring range ±1 V

Values		Voltage measuring range	Range
Dec.	Hex.	±1 V	
32767	7FFF	> 1.176 V	Overflow
32511	7EFF	1.176 V	Overrange
27649	6C01		
27648	6C00	1 V	Nominal range
20736	5100	0.75 V	
1	1	36.17 µV	
0	0	0 V	
-1	FFFF		
-20736	AF00	-0.75 V	
-27648	9400	-1 V	
-27649	93FF		Underrange
-32512	8100	-1.176 V	
-32768	8000	<-1.176 V	Underflow

Table B- 4 Voltage measuring range ±500 mV to ±50 mV

Values		Voltage measuring range			Range
Dec.	Hex.	±250 mV	±80 mV	±50 mV	
32767	7FFF	> 294.0 mV	> 94.1 mV	> 58.8 mV	Overflow
32511	7EFF	294.0 mV	94.1 mV	58.8 mV	Overrange
27649	6C01				
27648	6C00	250 mV	80 mV	50 mV	Nominal range
20736	5100	187.5 mV	60 mV	37.5 mA	
1	1	9.04 µV	2.89 µV	1.81 µV	
0	0	0 mV	0 mV	0 mV	
-1	FFFF				
-20736	AF00	-187.5 mV	-60 mV	-37.5 mV	
-27648	9400	-250 mV	-80 mV	-50 mV	
-27649	93FF				Underrange
-32512	8100	-294.0 mV	-94.1 mV	-58.8 mV	
-32768	8000	<-294.0 mV	<-94.1 mV	<-58.8 mV	Underflow

B.3 Representation of analog values for thermocouples

Note

A higher resolution can be configured for thermocouples, see section Scalable measuring range (Page 25).

The tables below list the decimal and hexadecimal values (codes) of the thermocouples.

Table B- 5 Thermocouple type B

Type B in °C	Values		Type B in °F	Values		Type B in K	Values		Range
	Dec.	Hex.		Dec.	Hex.		Dec.	Hex.	
> 2070.0	32767	7FFF	> 3276.6	32767	7FFF	> 2343.2	32767	7FFF	Overflow

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Changes/enhancements described in this manual, compared to the previous version:

- User data variant: Basic variables phase-specific measurement (ID 159 or $9F_H$) added
- Notes on the previous version of this manual have been taken into account in the current edition.

Conventions

CPU: When the term "CPU" is used in this manual, it applies both to the CPUs of the S7-1500 automation system and to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

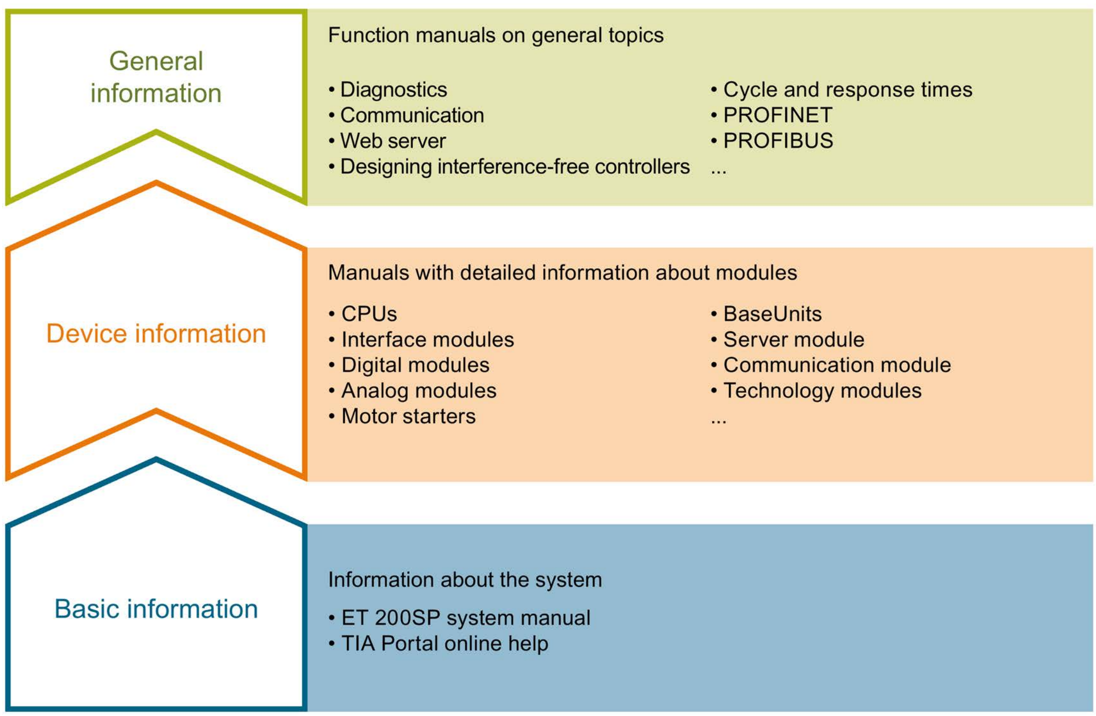
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

2 Product overview

2.1 Area of application

Introduction

Energy efficiency is playing an increasingly important role in industry. Rising energy prices, increasing pressure to improve profitability and the growing awareness of climate protection are important factors for reducing energy costs and for introducing an energy data management system.

Where can you use the AI Energy Meter 400VAC ST?

AI Energy Meter 400VAC ST is designed for machine-level deployment in an ET 200SP distributed I/O system. AI Energy Meter 400VAC ST records over 200 different electrical measurement and energy values. It lets you create transparency about the energy requirements of individual components of a production plant even down to the machine level.

Using the measured values provided by the AI Energy Meter 400VAC ST, you can determine energy consumption and power consumption. You can determine consumption forecasts and efficiency from the measured values. Power consumption measurements are relevant for load management and maintenance. In addition, you can use the measurements for energy reporting and for determining the CO_2 footprint.

Note

Measuring dangerous electrical quantities

The AI Energy Meter 400VAC ST is not tested according to DIN EN 61010-2-030 and may therefore not be used to verify, measure or monitor protective measures according to DIN EN 61557.

Qualified personnel must ensure through additional measures that no danger ensues for humans and the environment in case of an incorrect display.

TN and TT system

The AI Energy Meter 400VAC ST can be used in TN and TT systems.

Measuring with AI Energy Meter 400VAC ST

A typical supply network of a production plant is usually divided into three voltage ranges:

- The infeed of the entire plant
- The subdistribution, for example, to individual lines within the plant
- The end consumers such as the machines in the lines.

The following figure shows the measurement in an electricity supply network:

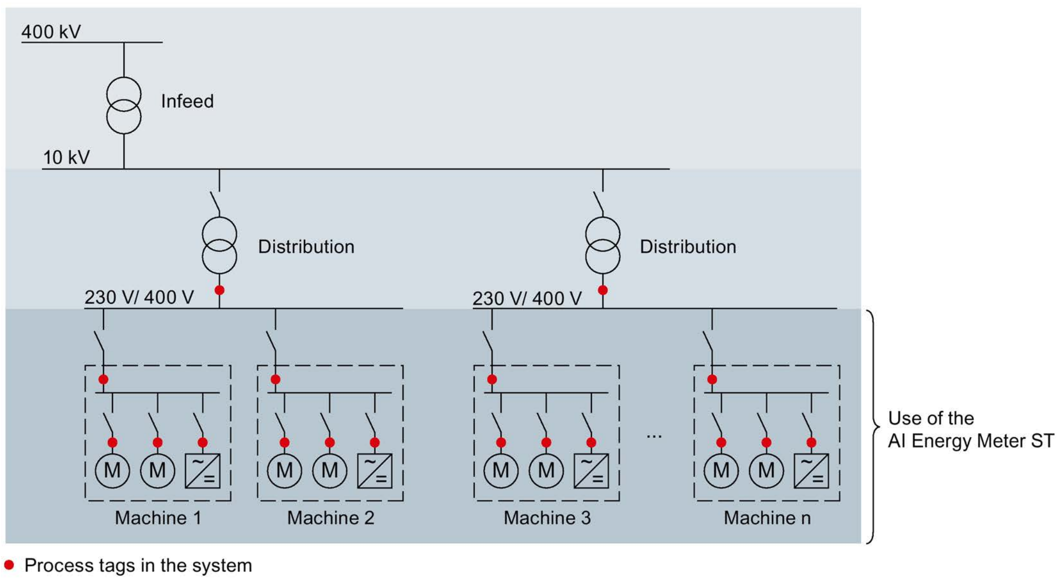


Figure 2-1 Use of the AI Energy Meter 400VAC ST

Advantages of the AI Energy Meter 400VAC ST

The AI Energy Meter 400VAC ST has the following advantages:

- Space-saving especially for use in control cabinet
- PROFINET IO or PROFIBUS DP (depending on the interface module in use)
- Multiple modules can be used with one interface module
- Extension of existing stations by components for energy recording

2.2 Properties of the AI Energy Meter 400VAC ST

⑥ LED for supply voltage
⑦ Function class
⑧ Color identification label module type
⑨ Function and firmware version
⑩ Article number

Figure 2-2 View of the module AI Energy Meter 400VAC ST

Properties

The module has the following technical properties:

- Measurement of electrical variables from single-phase and three-phase supply networks
- Max. nominal voltage between two outer conductors 400 VAC
- Recording of:
  – Voltages
  – Currents
  – Phase angles
  – Power
  – Energy / electrical work
  – Frequencies
  – Power factors

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V3.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	---
Identification data I&M0 to I&M3	FS01	V3.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	X
Reconfiguration in RUN	FS01	V3.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	X
Diagnostic error interrupts	FS01	V3.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	X

Accessories

The following accessories must be ordered separately:

- BaseUnit Type D0
- Labeling strips
- Reference identification label

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/es/58649293) system manual.

3 Wiring

3.1 Terminal and block diagram

In an ET 200SP station, the AI Energy Meter 400VAC ST forms its own potential group together with its dark BaseUnit.

General safety instructions

WARNING
Danger to life due to electric shock
Touching live parts can lead to death or severe injuries.
Before beginning any work deenergize the system and the Energy Meter and short-circuit installed transformers.

WARNING
Danger to life, dangerous system conditions and material damage possible
Removing and inserting the Energy Meter under live voltage is prohibited! For this reason the symbol "Do not Hot Swap" is located on the Energy Meter.
If you remove and insert the Energy Meter under live voltage during operation, the transformers used can produce dangerous induction voltages and electric arcs and dangerous system conditions can arise.
The Energy Meter may only be removed and inserted during operation if the measuring voltages supplied to the BaseUnit at terminals U_{L1} , U_{L2}, U_{L3} are disconnected at all poles **and** special current transformer terminals are used that short-circuit the transformer on the secondary side on removal.

CAUTION
Use only in three-phase and AC networks
Operation with direct voltage/direct current will destroy the Energy Meter.
Use the Energy Meter solely to measure electrical variables in three-phase and AC networks.

Supplying the module

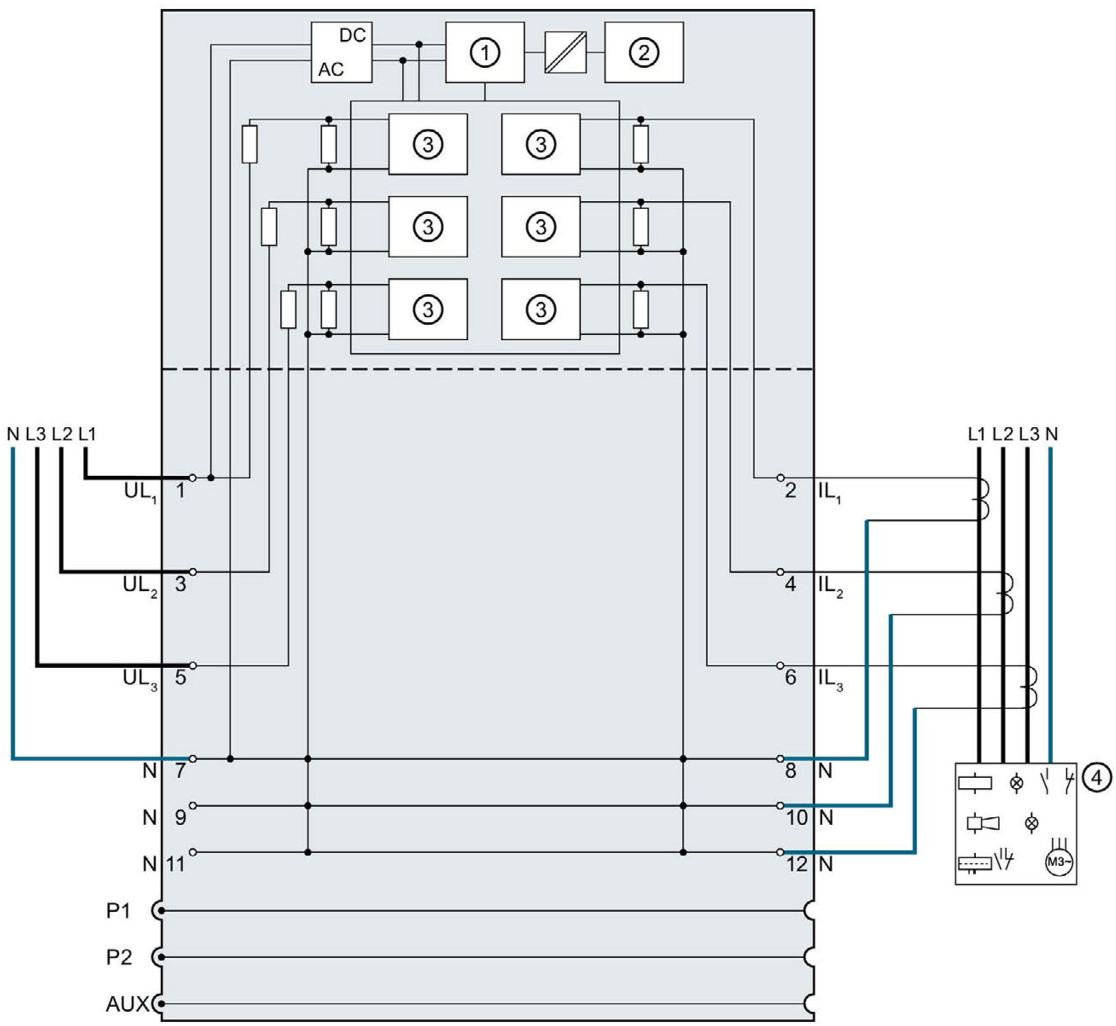
The Energy Meter is supplied through the terminals U_{L1} and N. The required minimum voltage amounts to 85 VAC.

Protecting the connection cables

To protect the connection cables at U_{L1}, U_{L2} and U_{L3}, make sure there is adequate cable protection, especially after cross-section transitions.

If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter 400VAC ST.

Terminal and block diagram



①	Microcontroller	UL_n	Voltage connection
②	Backplane bus interface	IL_n	Current connection
③	Analog-to-digital converter (ADC)	N	Neutral
④	Power measurement		

Figure 3-1 Block diagram of the AI Energy Meter 400VAC ST

Usable BaseUnit

The ET 200SP Distributed I/O System manual explains that a potential group always starts with a light BaseUnit. The AI Energy Meter 400VAC ST makes an exception in this case and only uses the dark BaseUnits type D0, 6ES7193-6BP00-0B**D0**.

The BaseUnit is not in contact with the power bus and passes the potential through from the left to the right slot.

When using some older CPUs / interface modules, note that the first permissible place for AI Energy Meter 400VAC ST is slot 2.

Connection types

The AI Energy Meter 400VAC ST supports the following connection types:

- 3P4W, 3 phases, 4 conductors
- 1P2W, 1 phase, 2 conductors

The input circuit of the module must correspond to one of the listed connection types. Select the appropriate connection type for the intended use.

You will find examples of connections in the section Connection examples (Page 19).

Information on the selection of a current transformer is available in the section Current transformer selection data (Page 20).

3.2 Connection examples

The following figures show the connection of the Energy Meter for three-phase and single-phase measurements. Note that the Energy Meter must always be connected via a current transformer.

Connection type	Wiring diagram	Comment
3P4W Three-phase measurement, 4 wires		Any load Connection with three current transformers
1P2W Single-phase measurement, 2 conductors		Measurement in an AC network with a current transformer Energy Meter supplies the value "0" for all measured values of Phases 2 and 3 as well as for some cross-phase measured values.

If short-circuit resistance is ensured by conformity to IEC 61439-1:2009, there is no need for separate line protection for the AI Energy Meter 400VAC ST.

Current transformer connection requirements

DIN VDE 0100-557 and IEC 60364-5-55 require the following for the connection of current transformers:

- The secondary circuits of current transformers must not be grounded.
- Guards must not be used in the secondary circuits of current transformers.
- Transformer secondary cable insulation must be designed for the highest voltage of all active components, or the secondary cables must be laid in such a way that their insulation cannot touch any active components, such as busbars.
- Connection points must be provided for temporary measurements.

3.3 Current transformer selection data

Introduction

Connection via a current transformer is always required for the current measurement. Use toroids with an accuracy class of 0.5, 1 or 3.

Dimensioning of the current transformer

The correct dimensioning of the current transformer is important for the following reasons:

- You achieve correct results from the measurements and
- You do not overload or damage the current transformers.

Selecting a current transformer

Use current transformers with a burden capacity 1.5 to 2 times greater than the power dissipation in the terminal circuit (consisting of resistance of the connection cables and burden of the Energy Meter). 1.5 times the power loss is required in order to prevent the transformer from overloading. 2 times the power dissipation is important to ensure the current limiting in case of a short-circuit.

Maximum length of the connection cable

To avoid overloading or damaging the current transformer, the burden Z_n specified on the data sheet of the current transformer (in VA) must not be exceeded. To prevent this being exceeded, the entire burden resistance (consisting of the resistance of the connection cable and the internal resistance of the AI Energy Meter 400VAC ST (see figure below) must be below a certain resistance value (depending on Z_n and I_{max}).

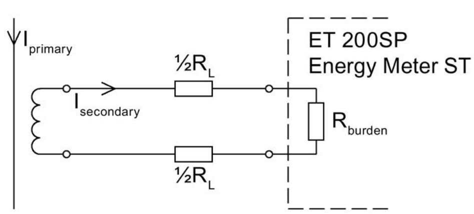


Figure 3-2 Maximum length of the connection cable

The maximum value of the resistance of the connection cable is obtained with the following formula:

$$R_{L,\,max} = \frac{Z_n}{I_{max}^{\,2}} - R_{burden}$$

R_L	Cable resistance in ohms	I_{max}	Secondary current of the current transformer
Z_n	Rated burden current transformer in VA	R_{burden}	Resistance of the Energy Meter (25 mΩ)

Figure 3-3 Maximum value for the resistance of the connection cable

Based on the maximum cable resistance in ohms, you then calculate the maximum length of the connection cable. To do this, check the data sheet of the connection cable you are using.

Note

The length of the connection cable (outwards and return) must not exceed the value of 200 meters.

Example

Current transformer 500/5 A

You use a current transformer with a transmission ration of 500/5 A that has a rated burden Z_n of 5 VA according to the data sheet.

The maximum primary current in the application is 400 A. This means that the maximum secondary current $I_{max.}$ is 4 A. The burden of the AI Energy Meter including connection resistance amounts to R_{Burden} = 25 mΩ.

The maximum value of the resistance of the connection cable (outgoing and incoming line) is obtained using the following formula:

$$R_{L,\,max} = \frac{Z_n}{I_{max}^{\,2}} - R_{Burden} = \frac{5\ \mathrm{AV}}{16\ \mathrm{A}^2} - 25\ \mathrm{m\Omega} = 312.5\ \mathrm{m\Omega} - 25\ \mathrm{m\Omega} = 287.5\ \mathrm{m\Omega}$$

The maximum cable resistance between the transformer and the terminals of the Energy Meter may not exceed 287.5 mΩ in this case. The corresponding cable length (outgoing and incoming line) depends on the cross-section used of the copper line and can be determined by using the following table.

The following table shows the resistance values of copper cables for typical cross-sections with ρ = 0.017857 Ω x mm²/m

Estimating the length for a connection cable

The value in the table must be less than the calculated terminal resistance $R_{L\ max}$ of the cable. For the resistance R_{Lmax} of 287.5 mΩ used in the above example it is possible to use a connection cable (outgoing and incoming line) with a length of 10 m from a cross-section of 0.75 mm² upward.

Cross-section	AWG	Cable overview for copper				
		0.5 m	1 m	5 m	10 m	50 m
0.25 mm²	24	35.7 mΩ	71.4 mΩ	357.1 mΩ	714.3 mΩ	3571.4 mΩ
0.34 mm²	22	26.3 mΩ	52.5 mΩ	262.6 mΩ	525.2 mΩ	2626.0 mΩ
0.5 mm²	21	17.9 mΩ	35.7 mΩ	178.6 mΩ	357.1 mΩ	1785.7 mΩ
0.75 mm²	19/20	11.9 mΩ	23.8 mΩ	119.0 mΩ	238.1 mΩ	1190.5 mΩ
1.0 mm²	18	8.9 mΩ	17.9 mΩ	89.3 mΩ	178.6 mΩ	892.9 mΩ
1.5 mm²	16	6.0 mΩ	11.9 mΩ	59.5 mΩ	119.0 mΩ	595.2 mΩ
2.5 mm²	14	3.6 mΩ	7.1 mΩ	35.7 mΩ	71.4 mΩ	357.1 mΩ

Checking the ratio of burden load and power loss

The rated burden of the transformer must be 1.5 to 2 times greater than the power loss in the connection circuit to ensure that the transformer is not overloaded and that the current limitation is ensured during a short-circuit.

At a maximum secondary current of 4 A the power loss in the connection circuit is calculated in accordance with the following formula for a connection cable (outgoing and incoming line) with a length of 10 m and a cross-section of 1.0 mm² and a burden resistance of the Energy Meter of 25 mΩ:

$$P_{\text{Connection circuit}} = (R_{\text{Connection cable}} + R_{\text{Burden}}) \times I^2_{\text{Max. secondary}}$$

$$P_{\text{Connection circuit}} = (178.6\ \text{m}\Omega + 25\ \text{m}\Omega) \times 4^2\ \text{A}^2\ 3.26\ \text{W}$$

The ratio of the rated burden and the power loss in the connection circuit thus amounts to:

$$\frac{Z_{\text{N rated burden}}}{P_{\text{Connection circuit}}} = \frac{5\ \text{VA}}{3.26\ \text{W}} = 1.54$$

The required ratio of rated burden and power loss in the connection circuit lies within the required range. The transformer is dimensioned sufficiently large.

Technical specifications (Page 66)

4 Configuration / address space

4.1 Configuring

Introduction

To configure the AI Energy Meter 400VAC ST after connecting it, use configuration software such as STEP 7. In addition, you can also change numerous parameters of the AI Energy Meter 400VAC ST in RUN via the user program.

Configuring

You configure the AI Energy Meter 400VAC ST with:

- STEP 7 (TIA Portal) V13 SP1 or higher with Update 4 and HSP
- STEP 7 V5.5 SP4 or higher and Hotfix 7
- GSD file for PROFIBUS or PROFINET

Note

Consistency check of the parameter assignment only with STEP 7

If you configure the AI Energy Meter 400VAC ST using STEP 7, STEP 7 already checks the various parameters for consistency while they are being entered.

If you configure the AI Energy Meter 400VAC ST using a GSD file, a consistency check is not carried out. The module does not recognize incorrect entries until after the parameter data record has been transferred. If the module recognizes an invalid parameter, the module rejects the complete data record.

Preferably use STEP 7 to configure the AI Energy Meter 400VAC ST.

The following instructions show the theoretical procedure for configuring the AI Energy Meter 400VAC ST with STEP 7 (TIA Portal) V13 SP1 or higher with Update 4 and HSP.

1. Select the ET 200SP distributed I/O system you are using in the hardware catalog.
2. Insert the module into your station.
3. Open the device view of the ET 200SP and insert the AI Energy Meter 400VAC ST.
4. Configure the AI Energy Meter 400VAC ST to suit your requirements.

   Once the configuration has been compiled without errors, you can download the configuration to the CPU and commission the ET 200SP station while the AI Energy Meter 400VAC ST is running.

4.2 Selecting the module versions

Introduction

The AI Energy Meter 400VAC ST has different module versions.

During the configuration you use the selection of the module version to specify which measured values can be read.

Each module version supplies quality information via the input user data.

At the module version "32 I / 12 Q" you can read the measured values as user data cyclically from the process image. At each module version you have the option to read measured value records from the AI Energy Meter 400VAC ST by using the RDREC instruction asynchronously.

Influence of the module version on the address space

Note

Influence of the AI Energy Meter 400 VAC ST on the maximum configuration of the ET 200SP

The available address space of the ET 200SP is influenced by the following factors:

- CPU or interface module
- Plugged I/O modules

The address space made **additionally** available by the AI Energy Meter 400 VAC ST is essentially influenced by the length of the user data supplied. The module version determines the length of the user data, which can be supplied by the AI Energy Meter 400VAC ST at maximum.

Module versions of the AI Energy Meter 400VAC Configuring with STEP 7

Module version	User data	Address space	Comment
2 I / 2 Q	No cyclic user data. Access to measured values through "Read data record".	2-byte inputs 2-byte outputs	Information about the structure of the 2 I / 2 Q module version is available in the appendix Module version "2 I / 2 Q" (Page 85).
32 I / 12 Q	User data selectable through defined user data variants	32 byte inputs / 12 byte outputs	You can change over the user data variant during operation. Information about the structure of the 32 I / 12 Q module version is available in the appendix Module version "32 I / 12 Q" (Page 88). Information about the user data variants at 32 I / 12 Q is available in the appendix User data variants with 32 bytes input data / 12 bytes output data (Page 92).

4.2.1 Changing over the user data variant during operation

Introduction

At the module version 32 I / 12 Q you switch over the user data variant in the output data in Byte 0.

Requirement

- User program has been created.
- AI Energy Meter 400VAC ST is configured as the module version 32 I / 12 Q.
- The start address of the module is known in the process image output.

Procedure

1. Create one constant with the data type BYTE per user data variant.
2. Enter the user data ID as a value in each case.
3. Write the constant to the start address of the module in the process image output.

Result

The user data variant is switched with the next cycle.

Note

Information about user data changeover

The parameterized user data variant is set in the following cases:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  - Coding of the user data variant not available

4.2.2 Recommendations for selecting the module version

The following table shows which module version is suitable for a given purpose.

Module version	Remarks on the field of application
2 I / 2 Q	• Solely acyclic reading of the measured values via the RDREC instruction from a measured value data record. • Use of many modules possible because little address space is used.
32 I / 12 Q	• Cyclic reading of the measured values from the user data. – Various measured variables can be read by switching over the user data variant. – One cycle elapses for each user data changeover. Measured values from the next user data variant are supplied with a slight time offset. – Depending on the user data variant, you must convert the measured values in the CPU to physical values using the supplied scaling factor. • Acyclic reading of the measured values via the RDREC instruction from a measured value data record. • Use of less modules possible because each module uses 32 bytes input and 12 bytes output.

4.3 Applicable modules

The following table shows with which controllers the different module versions can be configured.

Controller	Module version	
	2 I / 2Q	32 I / 12 Q
IM 155-6 PN ST	V1.0 or higher	
IM 155-6 PN HF	V2.0 or higher	
IM 155-6 PN BA	V3.2 or higher	
IM 155-6 PN HS	V4.0 or higher	
IM 155-6 DP HF	V1.0 or higher	
CPU 1510SP-1 PN	V1.6 or higher	
CPU 1510SP F-1 PN	V1.7 or higher	
CPU 1512SP-1 PN	V1.6 or higher	
CPU 1512SP F-1 PN	V1.7 or higher	
CPU 1515SP PC	V1.7 or higher	

5 Quick start

Introduction

This section shows you how to read and view your first measured values on the Energy Meter 400 VAC ST in a particularly quick and easy way.

Requirement

You have already connected the Energy Meter to your network with one of the connection types shown in the section Wiring (Page 16). The Energy Meter 400 VAC ST has already been integrated in your configuration tool (such as STEP 7), or the Energy Meter 400 VAC ST has been integrated in your hardware catalog with the GSD/GSDML file.

Procedure

1. Configure an ET 200SP station

   Configure an ET 200SP station with a CPU 151xSP or an IM 155-6.

2. Plug module in ET 200S station

   Plug the Energy Meter 400 VAC ST into the ET 200SP station and use the module version with 32 bytes inputs and 12 bytes outputs.

3. Set the module parameters

   Set the following parameters for the Energy Meter 400 VAC ST:

   – Connection type that you have used for the Energy Meter 400 VAC ST (e.g. 3P4W)

   – Measuring range, i.e. the phase voltage (UL1-N) of your network (for example 230 V AC)

   – Frequency of your network (for example 50 Hz)

   – Primary and secondary current of the used current transformer (e.g. 100 A and 1 A)

   Leave all other parameters at their default settings and do not change them.

4. Load configuration

   Switch on the ET 200SP station and download the configuration to the CPU.

Result

After being switched on, the Energy Meter supplies the measured values for the "Total power L1L2L3" user data variant "Basic measurements" with the ID 254 or FE_H.

Read and check the measured values provided by the Energy Meter in the output data.

The table below shows the structure of the user data variant, the measured variables and the data type of the measured values in STEP 7 (TIA Portal) that are stored in the 32 bytes of output data of the module. Each measured variable is referenced via the measured value ID. An overview of all the measured variables with their measured value IDs is provided in the section Measured variables (Page 80).

Table 5- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = $QQ_1\ I_3\ U_3\ I_2\ U_2\ I_1\ U_1$	BYTE	Bit string	qq xx xx xx	-
2 ... 3	Current L1	UINT	1 mA	0 … 65535	66007
4 ... 5	Current L2	UINT	1 mA	0 … 65535	66008
6 ... 7	Current L3	UINT	1 mA	0 … 65535	66009
8 ... 9	Total active power L1L2L3	INT	1 W	-27648 … 27648	66035
10 ... 11	Total reactive power L1L2L3	INT	1 var	-27648 … 27648	66036
12 ... 13	Total apparent power L1L2L3	INT	1 VA	-27648 … 27648	66034
14 ... 17	Total active energy L1L2L3	DINT	1 Wh	-2147483647 to +2147483647	225
18 ... 21	Total reactive energy L1L2L3	DINT	1 varh	-2147483647 to +2147483647	226
22	Reserved	BYTE	-	0	-
23	Total power factor L1L2L3	USINT	0.01	0 … 100	66037
24	Scaling current L1	USINT	-	0 ... 255	-
25	Scaling current L2	USINT	-	0 ... 255	-
26	Scaling current L3	USINT	-	0 ... 255	-
27	Scaling total active power L1L2L3	USINT	-	0 ... 255	-
28	Scaling total reactive power L1L2L3	USINT	-	0 ... 255	-
29	Scaling total apparent power L1L2L3	USINT	-	0 ... 255	-
30	Scaling total active energy L1L2L3	USINT	-	0 ... 255	-
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

Additional information

If you require further information about the evaluation and interpretation of the measured values, please refer to the section Reading and processing measured values (Page 30).

6 Reading and processing measured values

6.1 Basics for reading measured values

Introduction

The AI Energy Meter 400VAC ST provides the measured values and variables through the following methods:

- Cyclic: User data
- Acyclic: Measured value data records

User data

User data provide pre-defined measured values depending on the configured user data variant. The supplied measured values are cyclically written to the process image of the CPU. With some user data variants, the measured values are supplied as raw data, which you have to convert to the corresponding physical values using a supplied scaling factor.

Measured value data records

Each measured value data record supplies physical values that you can further process immediately. You read the values of a measured value data record acyclically with the RDREC instruction in a PLC tag of the STRUCT data type. You need a corresponding PLC tag for each measured value data record to be read.

You can display the read measured values in a watch table in STEP 7. Address the tag with the STRUCT data type directly.

Note

If you are using CPUs other than S7-1200 or S7-1500, convert 64-bit measured values to 32-bit measured values. Note the conversion can cause loss of accuracy.

For more information, read FAQ: Processing 64-bit-floating-point numbers in S7-300/400 (https://support.industry.siemens.com/cs/ww/en/view/56600676)

Validity of the measured values

After turning on the supply voltage UL1, the first measured values are available after approximately 2 seconds. In the input user data, the content of byte 0 is set to the selected user data variant. You can use this change in byte 0 as a trigger event.

As soon as the module has valid measured values, the value of this byte changes to a value within the value range.

Initial startup of the module

After the first startup or restart of the module, the parameters are transferred to the module. You can preset a user data variant in the parameters of the hardware configuration. This remains in effect until a different user data variant is selected in the output data (byte 0). This allows input user data to be modified dynamically according to the requirements of the process.

The user data variant defined in parameter data record 128 is used under the following conditions:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value: Coding of the user data variant not available

Current measured values become "0"

The current and all other measured values based on it are suppressed (or set "0") in the data records and in the user data in the following cases:

- The incoming current of the current transformer is less than the configured "Low limit for measuring current" parameter
- Incoming secondary current at the channel is higher than 12 A

The following measured values and derived measured variables of the phase involved become "0":

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A floating mean value is formed from the power values. These only become "0" after a corresponding time. The energy meter for active, reactive and apparent energy of the reset phase does not count any longer.

Substitute value behavior

The substitute values for input values of the AI Energy Meter 400VAC ST amount to "0".

Selecting the module versions (Page 24)

6.2 Quality information

Introduction

The AI Energy Meter 400VAC ST supplies quality information about the measurement in a status word. This information can be used to evaluate the status:

- Currents (I_{L1}, I_{L2}, I_{L3}) and voltages (U_1, U_2, U_3) lie within the valid measuring range
- Operating quadrants for Phase 1.

You can evaluate the quality information at every module version in Byte 1 of the output user data.

Structure of the quality information

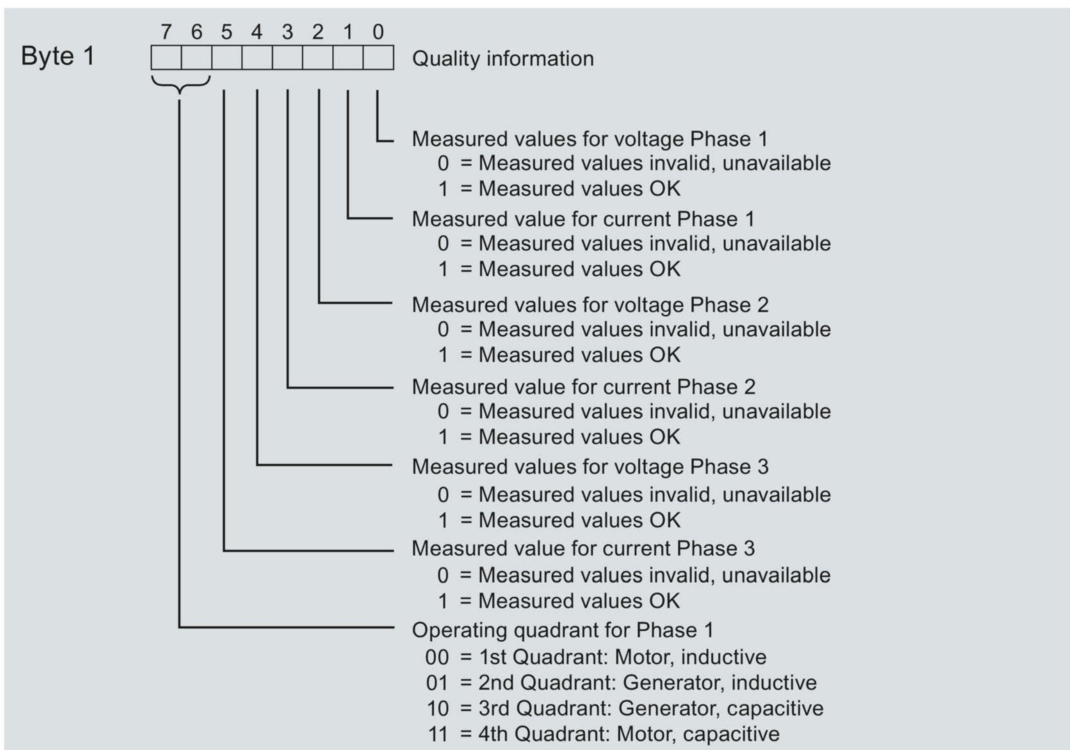

Figure 6-1 Quality information

Operating quadrant

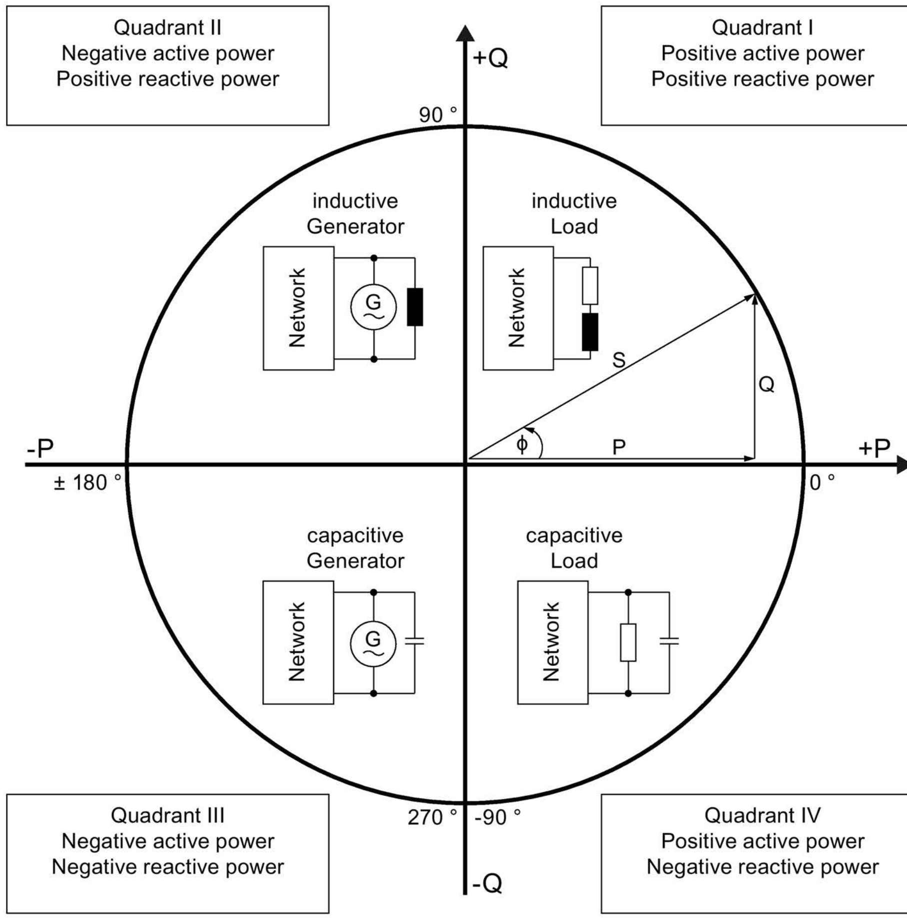

Figure 6-2 Quadrant in the quality bits

See also

Module version "32 I / 12 Q" (Page 88)

6.3 Reading measured values from user data cyclically

Requirement

- STEP 7 is open.
- AI Energy Meter 400VAC ST is configured.

Scaling of measured values in the user data

Since the value range of 16-bit values is often smaller than the value range of the physical value, a scaling factor is supplied together with the basic value in the user data for the respective measured or calculated values. You determine the actual value of the measured variable with the following formula:

Actual value of measured quantity = measured value in the user data x $10^{\text{scaling factor}}$

Procedure

To read measured values from the user data cyclically, proceed as follows:

1. Read the relevant measured value from the input data.
2. Observe the scaling factor at scaled measured values and convert the read measured value using the scaling factor.

Example

The user data variant 254 (FE_H) "Total power L1L2L3" is configured on the AI Energy Meter 400VAC ST. The measured value for "Current L1" should be read.

Table 6- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-
2 ... 3	Current L1	UINT	1 mA	0 … 65535	66007
4 ... 5	Current L2	UINT	1 mA	0 … 65535	66008
6 ... 7	Current L3	UINT	1 mA	0 … 65535	66009
:	:	:	:	:	:
24	Scaling current L1	USINT	-	0 ... 255	-
25	Scaling current L2	USINT	-	0 ... 255	-
26	Scaling current L3	USINT	-	0 ... 255	-
:	:	:	:	:	:
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

In the user data variant FE_H (254) the measured value for the current L1 is stored in Byte 2 + 3. The current is supplied by the module as a 16-bit-fixed-point number in the value range from 0 to 65535 in the unit 1 mA. In addition the scaling factor for the current L1 has to be considered additionally. The module supplies the related scaling factor in Byte 24.

The actual value for current L1 is calculated as follows:

Actual value for current L1 = Current L1 x $10^{\text{Scaling current L1}}$

Basics for reading measured values (Page 30)

6.4 Read measured value from a measured value data record

Introduction

To read measured values of a measured value data record, use the RDREC instruction. The read values are stored in a PLC variable with user-defined data type (UDT).

You can find more information on this in the STEP 7 documentation, under the keyword "RDREC".

Requirement

- STEP 7 is open.
- AI Energy Meter 400VAC ST is configured.

Procedure

1. Create a PLC tag of the STRUCT data type in STEP 7.
2. Insert the number of structural elements, which corresponds to the number of entries contained in the measured value data record.
3. Insert the RDREC instruction in the user program.
4. Configure the RDREC instruction as follows:
   – ID: Hardware identifier or start address of the Energy Meter (depending on the CPU used).
   – INDEX: Number of measured value data record whose entries are read.
   – MLEN: Length of the measured value data record in bytes. "0" if all the entries are to be read.
   – RECORD: Target range for the read data record Length depends on MLEN.
5. Call the RDREC instruction with REQ = 1.

Result

The values from the measured value data record were transferred into the target data area.

Basics for reading measured values (Page 30)

7 Energy counters

7.1 How the energy meter works

Introduction

The AI Energy Meter 400VAC ST provides 42 energy counters that detect both line-based and phase-based energy values.

- Active energy (total, outflow, inflow)
- Reactive energy (total, outflow, inflow)
- Apparent energy (total)

How energy recording works

Based on the measured currents and voltages and the calculation cycle the Energy Meter calculates the active, reactive and apparent energy. The active, reactive and apparent energies are updated in each calculation cycle.

Configuring

You configure the following settings for the energy counters:

- Activation of the gate for the energy counter

  The gate allows you to start and stop the counters via output data (DQ bit). If you deactivate the gate, the count starts immediately when the Energy Meter is switched on.
- Modes of the energy counters

  The energy counter count endlessly.

The settings apply to the energy counter of all phases.

Changing properties in RUN

You can change the following properties of energy counters in runtime:

- Enable / disable energy counter
- Reset energy counter
- Set initial values for the energy counter

Automatic reset of the energy counter

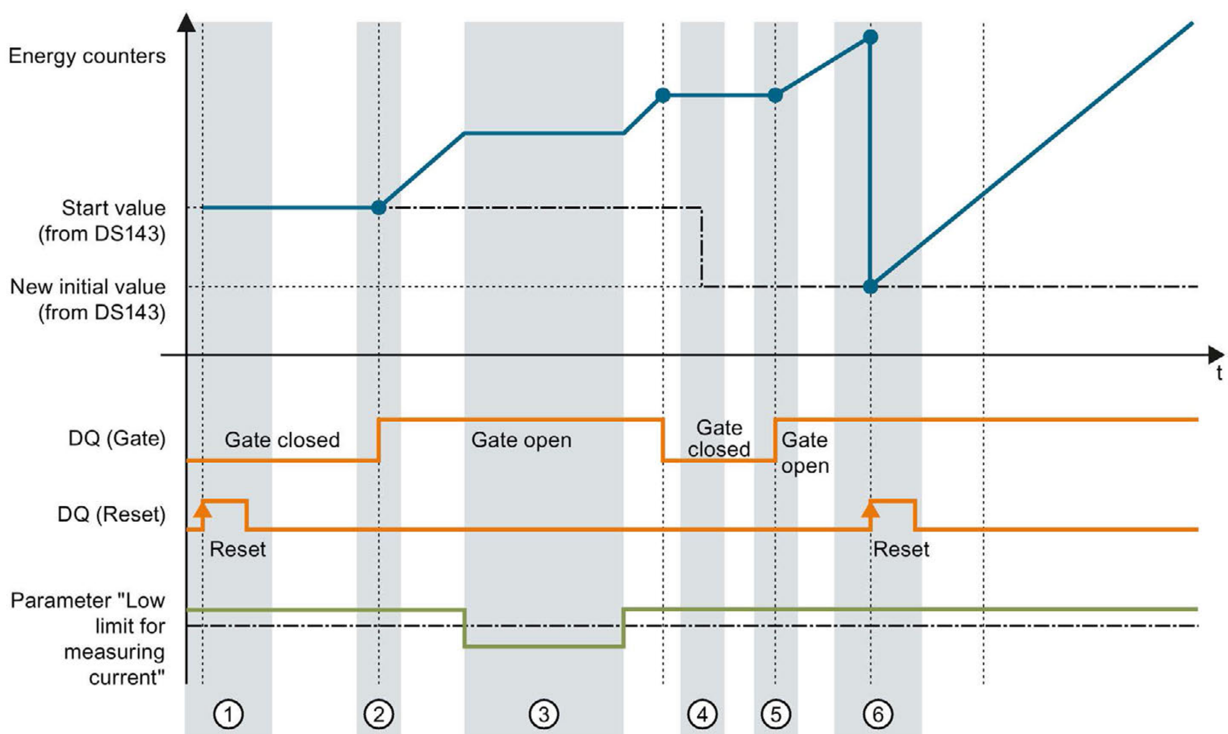
The energy counters are automatically reset to "0" when parameter settings relevant to the energy counter are changed. In the case of phase-specific changing of parameter settings relevant to the energy counter only the energy counters of the respective phases are reset.

Changing of the following parameters results in resetting of the energy counters:

- Measurement type or range
- Current transformer (primary current/secondary current)
- Direction of current

Example

The following figure shows the effect of initial value, reset and start/stop parameters with activated gating using the energy counter as an example:



① The counter is reset to the value specified in the configuration. The gate is closed. The counter does not count.
② The gate is opened via the control byte 1 in the output data of the user data variant. The counter counts.
③ The configured current low limit has been violated. The counter does not count.
④ The gate is closed. The counter does not count. A new start value is written to the measured value data record 143 with the WRREC instruction.
⑤ The gate is opened again via the control byte 1 in the output data of the user data variant. The counter counts with the new start value.
⑥ The counter is reset via the control byte 1 in the output data of the user data variant. The counter counts from the new start value that was transferred via the measured value data record 143.

Evaluating energy counters (Page 41)

7.2 Configuring counters

Overview

You can configure the energy counters of the AI Energy Meter 400VAC ST as follows:

- Activate / Deactivate
- Start / stop counters using gate
- Set and reset start value

Energy counter gate

You have the option of starting and stopping the energy counter using the gate. To this purpose you have to:

- Select the "Enable gate control for the energy counter" parameter in the configuration of the AI Energy Meter 400VAC ST.
- Set the DQ bit for the "counter gate" in the user data in Control byte 1 of the output data (Bit 6 in Control byte 1).

The "Enable gate control for the energy counter" parameter and the DQ bit for the "counter date" behave like the parallel connection of contacts.

Gate enabled: Gate "open" if DQ = "1"

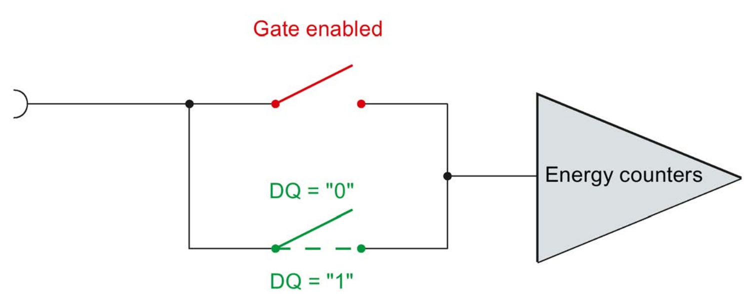

Figure 7-1 Gate enabled

If you deselect the "Enable gate control for the energy counter" parameter in the configuration of the AI Energy Meter 400VAC ST, the energy counters operate independently of the DQ bit as long as the current value lies above the configured "Low limit for measuring current".

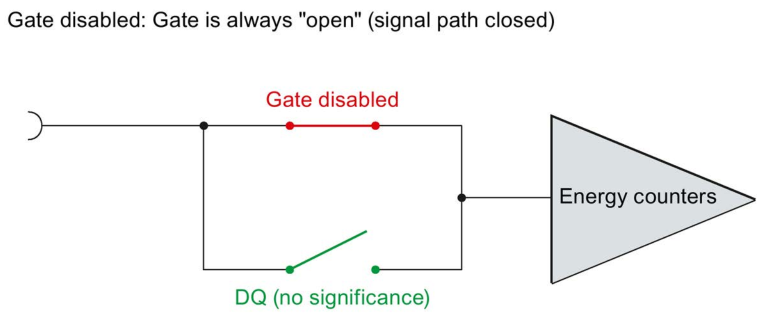

Figure 7-2 Gate disabled

Set and reset start value

The counters can be set to their start value via the output data of each user data variant. With energy counters, you have to reset the bit of the energy counter in control byte 2 of the data record 143.

You can reset each energy counter to the start value or also specify a new start value via the data record 143. You define the moment for updating of the start values in the data record 143 and in Control byte 1 in the user data. Start values are either applied immediately or after a reset bit has been set from 0 to 1.

You can find a detailed description for this in section Data record for energy counter (DS 143) (Page 49).

7.3 Evaluating energy counters

Evaluating energy counters

The energy counters are evaluated by

- Using the input data of the user data variants for energy
  - User data variant "Total energy L1 L2 L3" (ID 249 or $F9_H$)
  - User data variant "Energy L1" (ID 248 or $F8_H$)
  - User data variant "Energy L2" (ID 247 or $F7_H$)
  - User data variant "Energy L3" (ID 246 or $F6_H$)
- By reading data records
  - "Data record for basic measured values (DS 142)" for evaluation of the total energies L1 L2 L3
  - "Data record for energy counter (DS 143)" for evaluation of the phase-specific energies

Evaluate measured values

The evaluation of measured values via the input data of user data variants and reading of data records with the RDREC instruction is described in the section Reading and processing measured values (Page 30).

7.4 Reset energy counter

7.4.1 Introduction

Introduction

At the beginning of a new work order, it may be useful to reset the energy counter of the Energy Meter Reset here means that the energy counters are reset to their start value.

The following sections describe how you

- Reset energy counters via the outputs of the user data.
- Reset energy counters via data record 143.

7.4.2 Reset energy counters via user data

Introduction

Due to the differing lengths of the output data resetting of the energy counters depends on the configured module version.

If you use module versions with 12 bytes of output data, you can

- Reset energy counters for **all** phases separately by active, reactive and apparent energy.
- Reset energy counters for each **individual** phase separately by active, reactive and apparent energy.

If you use the module version with 2 bytes output data, you always reset **all** the energy counters simultaneously.

Procedure at module version with 12 bytes of output data

Resetting energy counters for all 3 phases

1. Select the categories of energy counter that you want to reset in byte 2.
   – Set bit 5 for active energy counters.
   – Set bit 6 for reactive energy counters.
   – Set bit 7 for apparent energy counters.

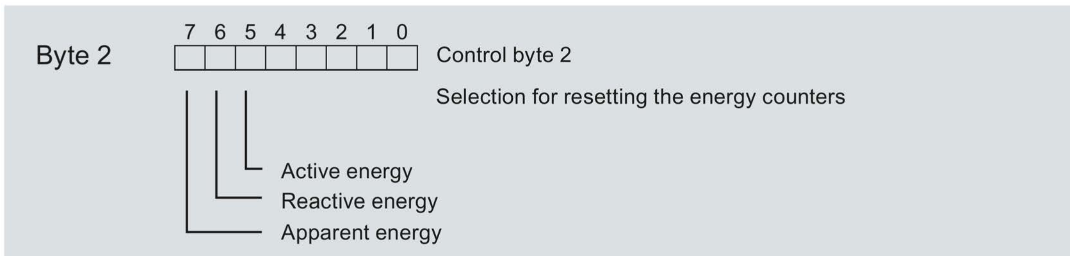

Figure 7-3 Selection of energy counters

2. Set the reset bit (bit 7) in byte 1.

   If there is an edge change of the reset bit for energy counters from 0 to 1, the module resets all energy counters that you previously selected in byte 2.

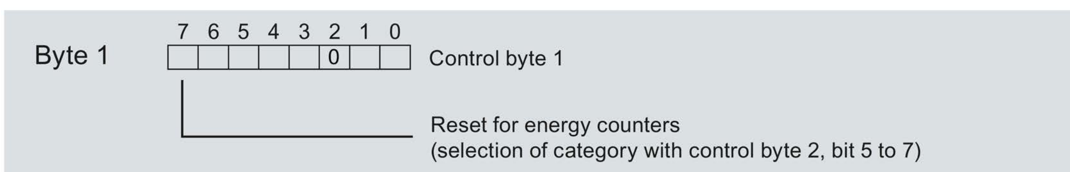

Figure 7-4 Reset bit for energy counters

Procedure at module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, you always reset all the energy counters simultaneously. Set the reset bit (Bit 7) in Control byte 1 from 0 to 1 through an edge change.

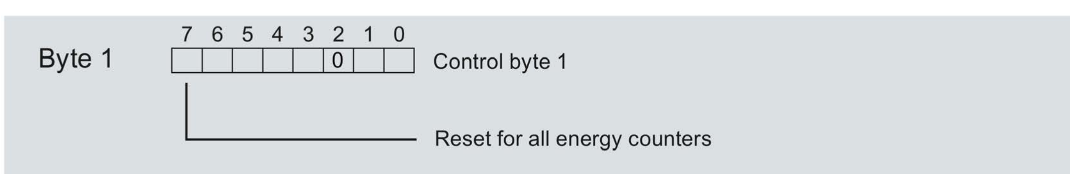

Figure 7-5 Resetting the energy counters at module version with 2 bytes of output data

Start values

After the reset the energy counters count with the specified start values (default = 0). You can change the start values for the energy counters via data record DS 143, see section Structure for energy counters (DS 143) (Page 49).

You can also reset the counters on a phase-specific basis by active, reactive and apparent energy using data record 143.

7.4.3 Resetting energy counters via data record DS 143

Introduction

At all the module versions you can reset the energy counters via the data record DS 143. Resetting is possible for:

- Energy counters for each **individual** phase separately by active, reactive and apparent energy.

Procedure at all module versions via data record DS 143

1. In Control byte 1 of the DS 143 set the reset bit (Bit 2) to 1 and Bit 0 to 1 for the overflow counter.
2. In Control byte 2 of the DS 143 set the category of the energy counters (active, reactive, apparent energy) to 1 via Bits 5 to 7.
3. In Control byte 1 of the DS 143 set Bit 7 for the moment of application of the start values:
   – Bit 7 to 0, if the start value are to be applied immediately after the transfer of the data record
   – Bit 7 to 1, if the start value are only to be applied after the reset bit has been set in the output data of the user data.

4. Transfer the data record with the WRREC instruction.

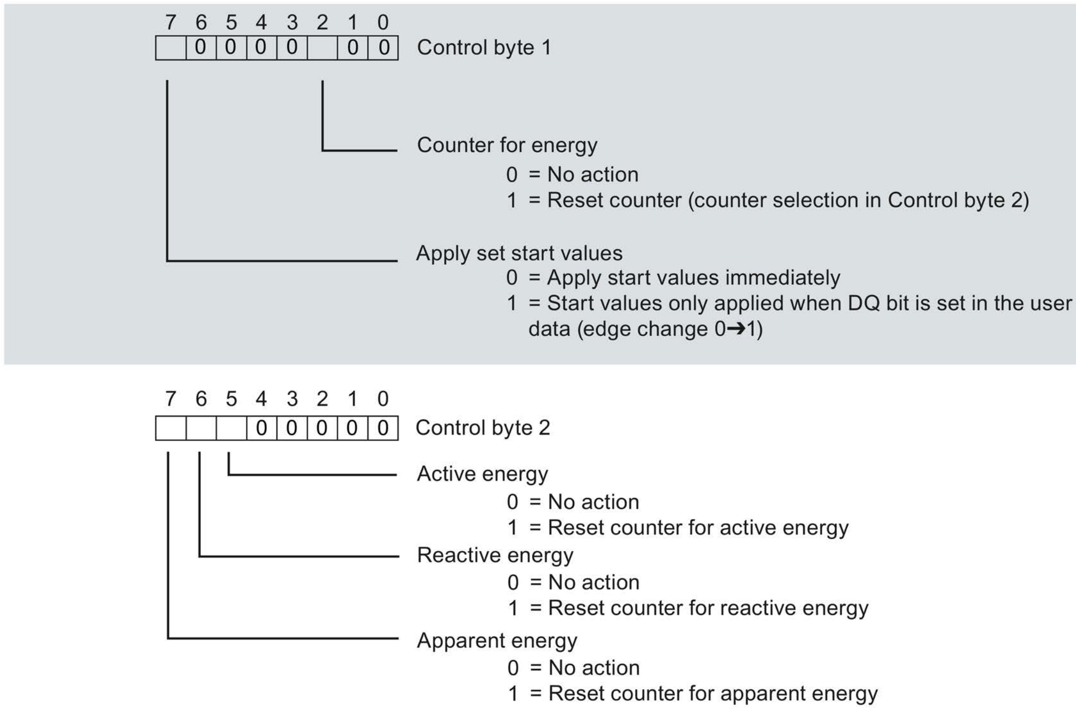

Figure 7-6 Energy counter control information DS 143

Start values

You specify the moment for the application of the start values in Control byte 1 via Bit 7. After the reset the energy counters count with the specified start values (default = 0). You can change the start values for the energy counters via data record DS 143.

7.4.4 Example for resetting energy counters via data record DS 143

Introduction

Before you can transfer the data record DS 143 to the CPU you have to create a PLC data type in your user program that has an identical structure to data record DS 143.

Procedure

1. Create a PLC data type that has an identical structure to data record DS 143.

   Detailed information on the structure of data record 143 is available in section Structure for energy counters (DS 143) (Page 49).

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-
3	Control byte 2 - L1	BYTE	Bit string		
4	Control byte 1 - L2	BYTE	Bit string		
5	Control byte 2 - L2	BYTE	Bit string		
6	Control byte 1 - L3	BYTE	Bit string		
7	Control byte 2 - L3	BYTE	Bit string		
8...15	Active energy inflow (initial value) L1	LREAL	Wh	See Section Structure for energy counters (DS 143) (Page 49)	61180
16...23	Active energy outflow (initial value) L1	LREAL	Wh		61181
:	:	:	:	:	:

2. Create a DB or instance DB and allocate the values of the data record

   Byte 0 and byte 1:

   Enter the value 01_H in Byte 0 and the value 00_H to Byte 1.

   Byte 2 ... byte 7: Control bytes for energy counters

   In the control bytes for the relevant phases, specify which energy counters you want to reset.

   The control bytes specify for each phase (L1, L2, L3) separately if and which energy meter values are to be reset.

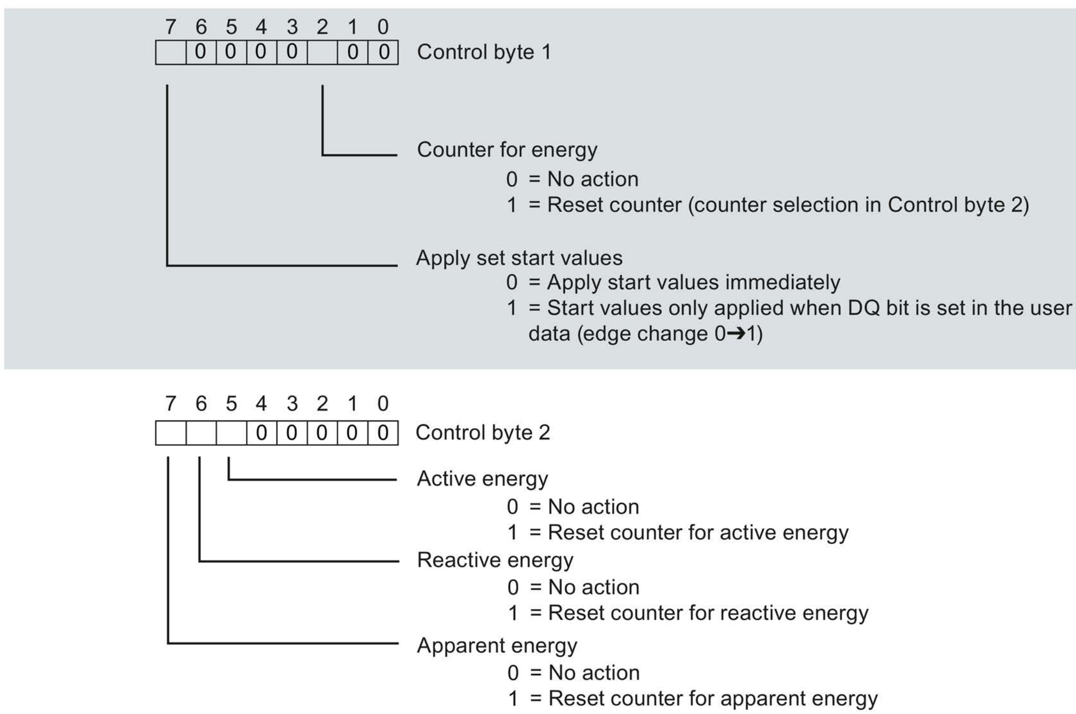

Figure 7-7 Control information DS 143 for energy counter

   Byte 8 ... byte 127: Start values for the individual energy meters

   The start values for energy counters in data record 143 are 64-bit floating point numbers. This corresponds to the data type LREAL in S7-1200 and in S7-1500.

3. Write the data record to the AI Energy Meter 400VAC ST module using the "WRREC" instruction.

   The input parameters must be allocated as follows:

   – REQ: A new write job is triggered if REQ = TRUE.
   – ID: Hardware identifier or start address of the Energy Meter (depending on the CPU used).
   – INDEX: The data record number: 143
   – LEN: The maximum length of the data record: 128
   – RECORD: A pointer to the data area in the CPU which includes data record 143.

Note

If you want to write or read several AI Energy Meter 400VAC ST at the same time, keep in mind the maximum number of active jobs in communication with SFB52/SFB53.

7.5 Data record for energy counter (DS 143)

7.5.1 Structure for energy counters (DS 143)

Energy meter data record 143 for different actions

The energy meter data record 143 includes all energy meters available on the module phase-by-phase. The data record can be used for different actions:

- Reset the energy counter to user-specific value (e.g. "0")
- Reading the current values of the energy counters

Energy meter data record 143

Table 7- 1 Energy meter data record 143

Byte	Measured variable	Data type	Unit	Value range	Mea-sured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-
3	Control byte 2 - L1	BYTE	Bit string		
4	Control byte 1 - L2	BYTE	Bit string		
5	Control byte 2 - L2	BYTE	Bit string		
6	Control byte 1 - L3	BYTE	Bit string		
7	Control byte 2 - L3	BYTE	Bit string		
8...15	Active energy inflow (initial value) L1	LREAL	Wh		61180

Byte	Measured variable	Data type	Unit	Value range	Mea-sured value ID

80...87	Apparent energy (initial value) L2	LREAL	VAh		61204
88...95	Active energy inflow (initial value) L3	LREAL	Wh		61220
96...103	Active energy outflow (initial value) L3	LREAL	Wh		61221
104...111	Reactive energy inflow (initial value) L3	LREAL	varh		61222
112...119	Reactive energy outflow (initial value) L3	LREAL	varh		61223
120...127	Apparent energy (initial value) L3	LREAL	VAh		61224

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the measured value data record 143:

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the modu-le is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E1	01	Reserved bits are not 0.	Check Byte 2...7 and set the reserved bits back to 0.
DF	80	E1	39	Incorrect version entered.	Check Byte 0. Enter a valid version.
DF	80	E1	3A	Incorrect data record length entered.	Check the parameters of the WRREC instruction. Enter a valid length.
DF	80	E1	3C	At least one start value is invalid.	Check Bytes 8...103 and Bytes 158...169. The start values may not be negative.
DF	80	E1	3D	At least one start value is too large	Check Bytes 8...103 and Bytes 158...169. Observe the ranges of values for start values.

7.5.2 Structure of the control and feedback interface for DS 143

Introduction

Bytes 2 to 7 of data record 143 form the phase-based control and feedback interface for the measured value data record of the energy counter.

- Bytes 2 and 3: Control and feedback interface for phase 1
- Bytes 4 and 5: Control and feedback interface for phase 2
- Bytes 6 and 7: Control and feedback interface for phase 3

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

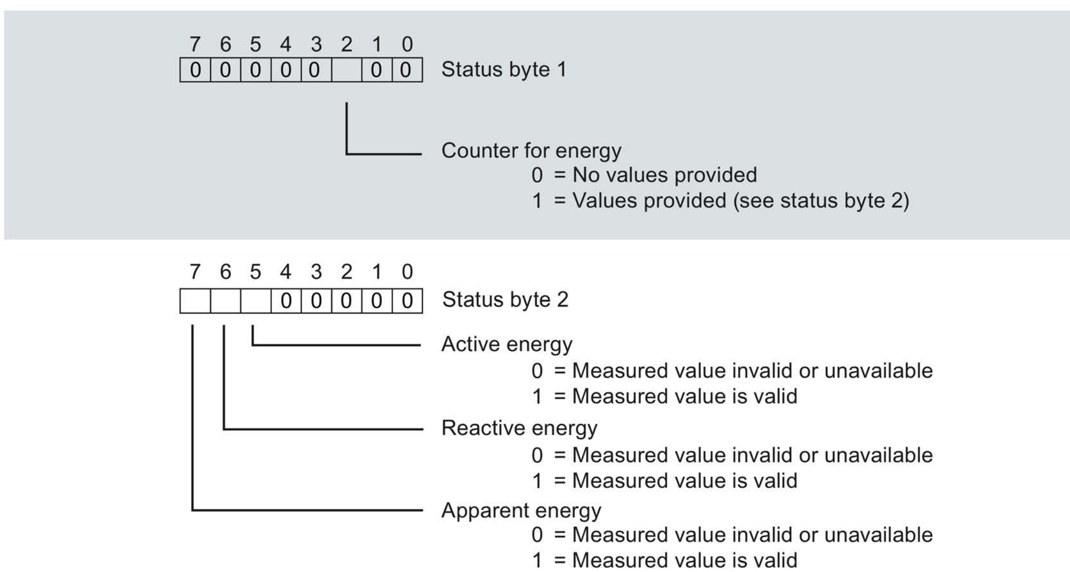

Figure 7-8 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy counters. The length of the control information amounts to 2 bytes for each phase:

- In Control byte 1 you determine how you reset the counter and the time at which the counter is reset.
- In Control byte 2 you determine which energy counter you want to reset.

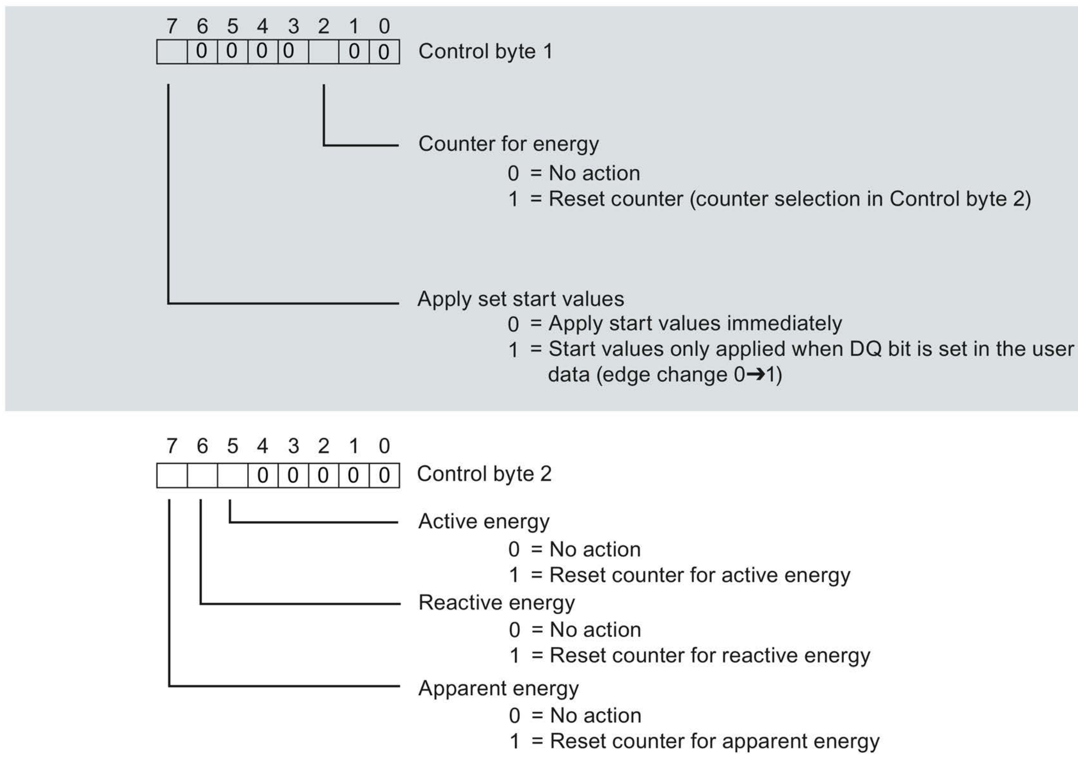

Figure 7-9 Control information DS 143 (write access)

Parameters 8

8.1 Parameters

Parameters of the AI Energy Meter 400VAC ST (DS 128)

As a rule the AI Energy Meter 400VAC ST is already integrated in the hardware catalog of STEP 7 (TIA Portal) or STEP 7 V5.5 or higher. In this case STEP 7 (TIA Portal) or STEP 7 V5.5 or higher checks the parameterized properties for plausibility during designing.

However, you can also assign parameters to the module by means of the GSD file and the configuration software of any provider. The module checks the validity of the configured properties only after the configuration has been downloaded. Note that some parameters depend on the selected connection type of the Energy Meter. For example in the connection type 1P2W for measurements in single-phase AC network it does not make sense to enter parameters for Phases 2 and 3 and they are also not checked by the system in this case.

The effective range of the parameters that can be set using a GSD file depends on the type of bus system used:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

In addition you can change the parameterized properties via the user program in RUN mode. When you assign parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records (see appendix Configuration via parameter data records (Page 72)). The following table summarizes all the configurable parameters.

Table 8- 1 AI Energy Meter 400VAC ST parameters

Parameters	Value range	Default setting	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics line voltage	• Disable • Enable	Disable	Yes	Module	Module
Connection type	• Disabled • 1P2W - 1-phase alternating current • 3P4W - 3 phases, 4 conductors	3P4W - 3 phases, 4 conductors	Yes	Module	Module (only 1P2W, 3P4W and deactivated)
Voltage measuring range	• 100 V • 110 V • 115 V • 120 V • 127 V • 190 V • 200 V • 208 V • 220 V • 230 V	230 V	Yes	Module	Module
Line voltage tolerance [%]	• 1 ... 50 %	10 %	Yes	Module	Module
Line frequency	• 50 Hz • 60 Hz	50 Hz	Yes	Module	Module
Enable gate energy counter	• No • Yes	No	Yes	Module	-
User data variant	See the table Overview of the user data variants (Page 92)	Total energy L1 L2 L3 (ID 254 or FE_H)	Yes	Module	Module (only user data variant)
Diagnostics overflow current	• Disable • Enable	Disable	Yes	Channel/phase	Module
Diagnostics overflow voltage	• Disable • Enable	Disable	Yes	Channel/phase	Module

Parameters	Value range	Default setting	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics underflow voltage	• Disable • Enable	Disable	Yes	Channel/phase	Module
Diagnostics low limit voltage	• Disable • Enable	Disable	Yes	Channel/phase	- (blocking is preset)
Diagnostics overflow cumulative values	• Disable • Enable	Disable	Yes	Channel/phase	Module
Overcurrent tolerance value [0.1 A]	• 10 ... 100 [0.1 A]	100 [0.1 A]	Yes	Channel/phase	Module
Overcurrent tolerance time [ms]	• 1 ... 60000 ms	40000 ms	Yes	Channel/phase	Module
Low limit for current measurement [mA]	• 20 ... 250 mA	50 mA	Yes	Module	- (Default setting: 20 mA)
Current transformer primary current [A]	• 1 ... 10000 A	1 A	Yes	Channel/phase	Module (Value range: 1...65535)
Current transformer secondary current	• 1 A • 5 A	1 A	Yes	Channel/phase	Module
Reverse current direction	• Disable • Enable	Disable	Yes	Channel/phase	Module

8.2 Description of parameters

Diagnostics line voltage

Activate the diagnostics line voltage here. If there is no voltage or too little voltage at L1, the message "No supply voltage at L1" is output and a diagnostic interrupt is triggered.

Connection type

Specify the connection type you used for the Energy Meter here.

For more detailed information, refer to "Connection examples (Page 19)".

Voltage measuring range

Here you can set the voltage measuring range of the power supply system.

Line voltage tolerance

Monitoring the supply voltage based on this tolerance band is a positive or negative value.

Line frequency

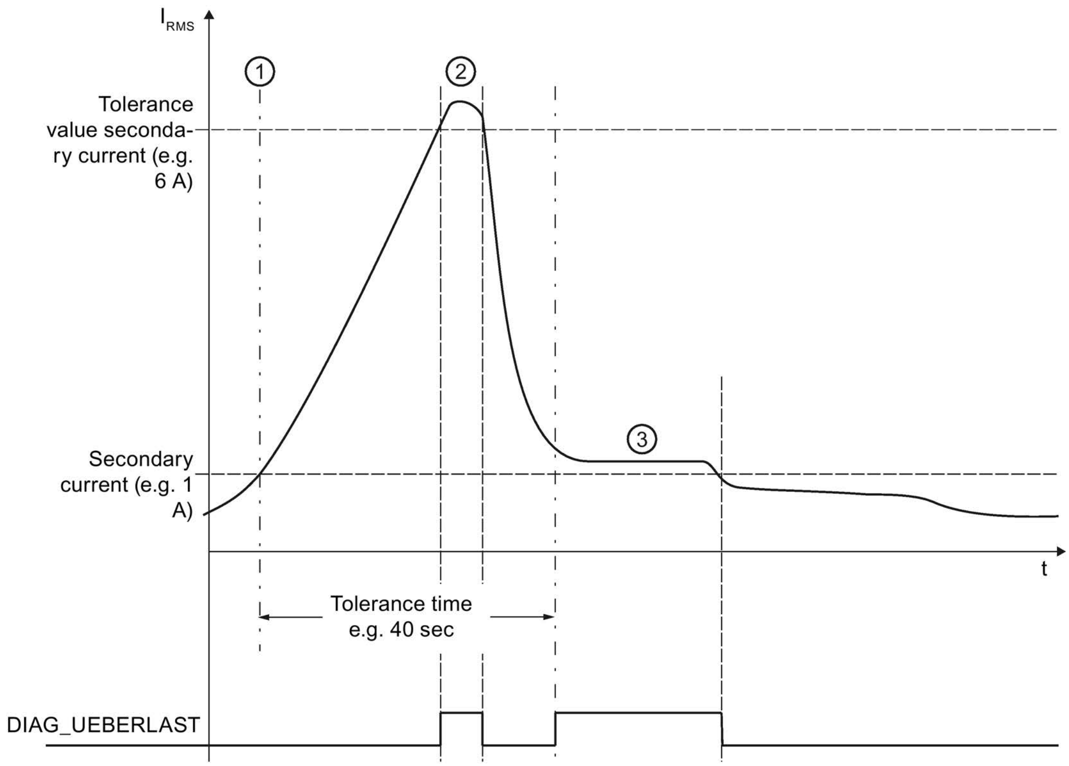
Here you can set the line frequency of the power supply system.

Enable gate energy counter

Enable the gate for the energy counter here. When the gate is enabled, the energy counter only counts when the corresponding output data bit (DQ bit) is set to "1".

Diagnostics overflow current

The measured current is monitored after expiry of the "Tolerance time" for "Overcurrent [0.1 A] tolerance value". Exceeding this results in overflow current.



① The tolerance time starts as soon as the secondary current value (1 A, 5 A) is exceeded.

② DIAG_UEBERLAST diagnoses the affected phase if the tolerance value of the secondary current has been exceeded within the assigned tolerance time (or the maximum value of the secondary current (12 A) is exceeded).

③ After the set tolerance time has elapsed, the secondary current value (1 A, 5 A) is monitored. A violation of the secondary current value also returns DIAG_UEBERLAST.

Figure 8-1 Diagnostics response in the event of a current overload

Diagnostics overflow voltage

Line voltage (measuring range) is monitored for tolerance. A violation of the overflow triggers a diagnostic interrupt.

Diagnostics underflow voltage

Line voltage (measuring range) is monitored for tolerance. A violation of the underflow triggers a diagnostic interrupt.

Diagnostics low limit voltage

Low limit for voltage is monitored. A violation of the low limit triggers a diagnostic interrupt.

Diagnostics overflow cumulative values

A cumulative overflow in the calculated variables is displayed. The values stop at the high or low limit. A violation triggers a diagnostic interrupt.

Overcurrent tolerance value [0.1 A]

The tolerance factor secondary overcurrent parameter (10 to 100) indicates the tolerable value of the secondary current in 0.1 A increments (10 = 1 A to 100 = 10 A). Always take note of the current class of the current transformer being used (1 A, 5 A).

Overcurrent tolerance time

Monitoring time in ms in which the overcurrent is tolerated. 0 means that the monitoring time has been disabled.

Low limit for measuring current

The configurable low limit for measuring current refers to the secondary currents and is used to avoid incorrect calculations in the case of very low currents. Incorrect measurements of very low currents in particular are a cause of inaccuracies in the current transformer used. Set the low limit for the current measurement to the required value depending on your process.

Tip: If you want to find the low limit for the current measurement experimentally, set it to a lower value. Then, feed in a very precise low current and determine the measurement error that can no longer be tolerated. Afterwards, set the low limit for the current measurement to the limit value you have determined.

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy of the reset phase do not measure any longer.

Current transformer primary current

Enter here the nominal value for the primary current of the current transformer used. The transformer ratio is calculated from the primary and secondary current.

Current transformer secondary current

Enter here the nominal value for the secondary current (1 A or 5 A) of the current transformer used. The transformer ratio is calculated from the primary and secondary current.

Reverse current direction

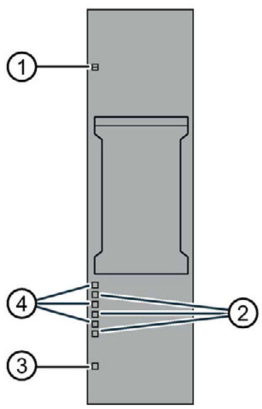
Setting to determine whether or not to reverse the direction of current.

In the event of inadvertent incorrect connection, this parameter can be used to correct the measured values, thus saving the hassle of rewiring. The direction of the current is only evident from the power measurement values. The current measurement value is an rms value.

Interrupts/diagnostic alarms 9

9.1 Status and error display

LED display



① DIAG (green/red)
② Error (red)
③ PWR (green)
④ Status (green)

Figure 9-1 LED display

Meaning of the LED displays

The following table explains the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostic alarms (Page 64).

DIAG LED

Table 9- 1 Meaning of the DIAG LED

DIAG	Meaning
Off	Supply voltage of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Status LED

Table 9- 2 Meaning of the Status LED

Status	Meaning
Off	Channel deactivated or error
On	Channel activated and no error

Error LED

Table 9- 3 Meaning of the Error LED

Status	Meaning
Off	Channel is OK
On	Channel is faulty

PWR LED

Table 9- 4 Meaning of the PWR LED

PWR	Meaning
Off	Line voltage missing
On	Line voltage available

9.2 Interrupts

The AI Energy Meter 400VAC ST analog input module supports diagnostic alarms.

9.2.1 Diagnostics interrupt

Diagnostic interrupt

The module generates a diagnostic error interrupt at the following events:

- Channel is temporarily unavailable
- Error
- Supply voltage missing
- Parameter assignment error
- Low limit voltage violated (measuring voltage < 80 V)
- High limit value voltage exceeded
- Underflow voltage (tolerance for supply voltage) violated
- Overflow voltage (tolerance for supply voltage) exceeded
- Overload (current measurement > 12 A or tolerance overcurrent exceeded after expiry of the tolerance time)
- Overflow of the calculated values (measured or calculated values screen exceed the representable range of values)

Diagnostic alarms (Page 64)

9.3 Diagnostic alarms

Diagnostic alarms

Note

Assignment channel in diagnostics alarm ⇔ Phase

Channels are counted in the diagnostic messages starting from channel "0" and in the AI Energy Meter 400VAC ST starting from phase "1".

Note the following assignment:

- Channel "0" ⇔ Phase "1"
- Channel "1" ⇔ Phase "2"
- Channel "2" ⇔ Phase "3"

Table 9- 5 Error types

Diagnostic message	Error code	Meaning	Solution
Undervoltage[1]	2_H	Line voltage (measuring range) is monitored for tolerance. Violation leads to voltage overflow/underflow	Observe the line voltage range
Overvoltage	3_H		
Overload	4_H	The measured current is monitored after expiry of the "Tolerance time" for "Tolerance value overcurrent [0.1 A]". Exceeding this results in overflow current. The maximum value of the secondary current (12 A) has been exceeded.	Observe the current range
High limit	7_H	Cumulative overflow in the calculated values	-
Low limit[1]	8_H	Violation of the low limit for voltage measurement. The message occurs when the configured minimum current or voltage is below 80 V.	Observe the voltage range
Error	9_H	Internal module error (diagnostic alarm on channel 0 applies to the entire module).	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Load voltage missing	11_H	Missing or insufficient line voltage on phase L1	Check supply
Channel is temporarily unavailable	$1F_H$	Firmware upgrade is being performed. Channel 0 applies to the entire module. The module is currently not performing any measurements.	--
		A user calibration is being executed at the channel.	Complete the user calibration

[1] If the "Undervoltage" and "Low limit" diagnostics are active at the same time, the "Low limit" diagnostics has higher priority and deletes the "Undervoltage" diagnostics.

9.4 Diagnostics response

Diagnostics response

This section describes the response of the AI Energy Meter 400VAC ST when diagnostics information is reported.

Measured values in the case of diagnostics

Even in the case of diagnostics, measured values continue to be displayed as long as they can still be acquired. If measured values cannot be measured or calculated, "0" is displayed.

Zero suppression

If the supplied current is less than the configured "Low limit for measuring current" parameter, the current measurement and all dependent variables are suppressed or set to "0".

Overload limitation

If the secondary current fed in at the channel is higher than 12 A, the module changes to limitation and the measured value of the current and all dependent variables are set to "0".

Value falls below "Low limit current measurement"

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy of the reset phase do not measure any longer.

Loss of the supply voltage

At a loss of supply voltage at U_{L1} (phase 1), all measurements are interrupted.

After the supply voltage is restored, the AI Energy Meter 400VAC ST operates again with the configuration / parameter assignment stored in the CPU. The energy counter is used for retentively stored values.

Input data to "0"

Note

If the AI Energy Meter 400VAC ST is no longer recognized by the interface module (for example, because it is defective or not plugged in), all input data are set to "0".

10 Technical specifications

10.1 Technical specifications

Technical specifications of the AI Energy Meter 400VAC ST

Article number	6ES7134-6PA01-0BD0
General information	
Product type designation	ET 200SP, AI Energy Meter 400 V AC ST, PU 1
Firmware version	V3.0
usable BaseUnits	BU type D0, BU20-P12+A0+0B
Product function	
• Voltage measurement	Yes
• Voltage measurement with voltage transformers	No
• Current measurement	Yes
• Phase current measurement without current transformers	No
• Phase current measurement with current transformers	Yes
• Energy measurement	Yes
• Frequency measurement	Yes
• Power measurement	Yes
• Active power measurement	Yes
• Reactive power measurement	Yes
• I&M data	Yes; I&M0 to I&M3
• Isochronous mode	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
• STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	V2.3

Article number	6ES7134-6PA01-0BD0
Operating mode	
• cyclic measurement	Yes
• acyclic measurement	Yes
• Acyclic measured value access	Yes
• Fixed measured value sets	Yes
• Freely definable measured value sets	No
Configuration control	
via dataset	Yes
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	No
Installation type/mounting	
Mounting position	Any
Supply voltage	
Design of the power supply	Supply via voltage measurement channel L1
Type of supply voltage	100 - 240 V AC
permissible range, lower limit (AC)	90 V
permissible range, upper limit (AC)	264 V
Line frequency	
• permissible range, lower limit	47 Hz
• permissible range, upper limit	63 Hz
Power loss	
Power loss, typ.	0.6 W
Address area	
Address space per module	
• Address space per module, max.	44 byte; 32 byte input / 12 byte output
Hardware configuration	
Automatic encoding	
• Mechanical coding element	Yes
Time of day	
Operating hours counter	
• present	No
Analog inputs	
Cycle time (all channels), typ.	50 ms; Time for consistent update of all measured and calculated values (cyclic und acyclic data)

Article number	6ES7134-6PA01-0BD0
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	No
• Hardware interrupt	No
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; red Fn LED
• for module diagnostics	Yes; green/red DIAG LED
Integrated Functions	
Measuring functions	
• Measuring procedure for voltage measurement	TRMS
• Measuring procedure for current measurement	TRMS
• Type of measured value acquisition	seamless
• Curve shape of voltage	Sinusoidal or distorted
• Buffering of measured variables	No
• Parameter length	38 byte
• Bandwidth of measured value acquisition	2 kHz; Harmonics: 39 / 50 Hz, 32 / 60 Hz
Operating mode for measured value acquisition	
– automatic detection of line frequency	No; Parameterizable
Measuring range	
– Frequency measurement, min.	45 Hz
– Frequency measurement, max.	65 Hz

Article number	6ES7134-6PA01-0BD0
Measuring inputs for voltage	
– Measurable line voltage between phase and neutral conductor	230 V
– Measurable line voltage between the line conductors	400 V
– Measurable line voltage between phase and neutral conductor, min.	90 V
– Measurable line voltage between phase and neutral conductor, max.	264 V
– Measurable line voltage between the line conductors, min.	155 V
– Measurable line voltage between the line conductors, max.	460 V
– Measurement category for voltage measurement in accordance with IEC 61010-2-030	CAT II; CAT III in case of guaranteed protection level of 1.5 kV
– Internal resistance line conductor and neutral conductor	3.4 MΩ
– Power consumption per phase	20 mW
– Impulse voltage resistance 1,2/50µs	1 kV
Measuring inputs for current	
– measurable relative current (AC), min.	5 %; Relative to the secondary rated current; 1 A, 5 A
– measurable relative current (AC), max.	100 %; Relative to the secondary rated current; 1 A, 5 A
– Continuous current with AC, maximum permissible	5 A
– Apparent power consumption per phase for measuring range 5 A	0.6 V·A
– Rated value short-time withstand current restricted to 1 s	100 A
– Input resistance measuring range 0 to 5 A	25 mΩ; At the terminal
– Zero point suppression	Parameterizable: 20 ... 250 mA, default 50 mA
– Surge strength	10 A; for 1 minute

Article number	6ES7134-6PA01-0BD0
Accuracy class according to IEC 61557-12	
– Measured variable voltage	0.5
– Measured variable current	0.5
– Measured variable apparent power	1
– Measured variable active power	1
– Measured variable reactive power	1
– Measured variable power factor	0.5
– Measured variable active energy	1
– Measured variable reactive energy	2
– Measured variable phase angle	±1 °; not covered by IEC 61557-12
– Measured variable frequency	0.05
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes; 3 700V AC (type test) CAT III
Isolation	
Isolation tested with	2 300V AC for 1 min. (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm
Weights	
Weight (without packaging)	45 g
Data for selecting a current transformer	
• Burden power current transformer x/1A, min.	As a function of cable length and cross section, see device manual
• Burden power current transformer x/5A, min.	As a function of cable length and cross section, see device manual

ATEX approval

Parameter data records A

A.1 Configuration via parameter data records

The parameter data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Parameter assignment in the user program

You can reassign the module parameters in RUN mode, for example change the diagnostics behavior.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module via the respective data record. The parameters set in STEP 7 do not change in the CPU, which means the parameters set in STEP 7 are still valid after a restart.

If you reconfigure a module (so that the user data size changes) and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing".

STATUS output parameter

If errors occur during the transfer of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help.

A.2 Structure of the parameter data record 128 for the entire module

Structure of data record 128

You can find the user data variant in the section Overview of the user data variants (Page 92).

Channel header information

The following figure shows the structure of the header information for a channel.

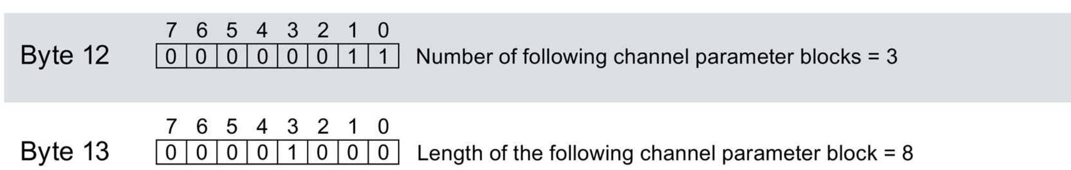

Figure A-5 Channel header information

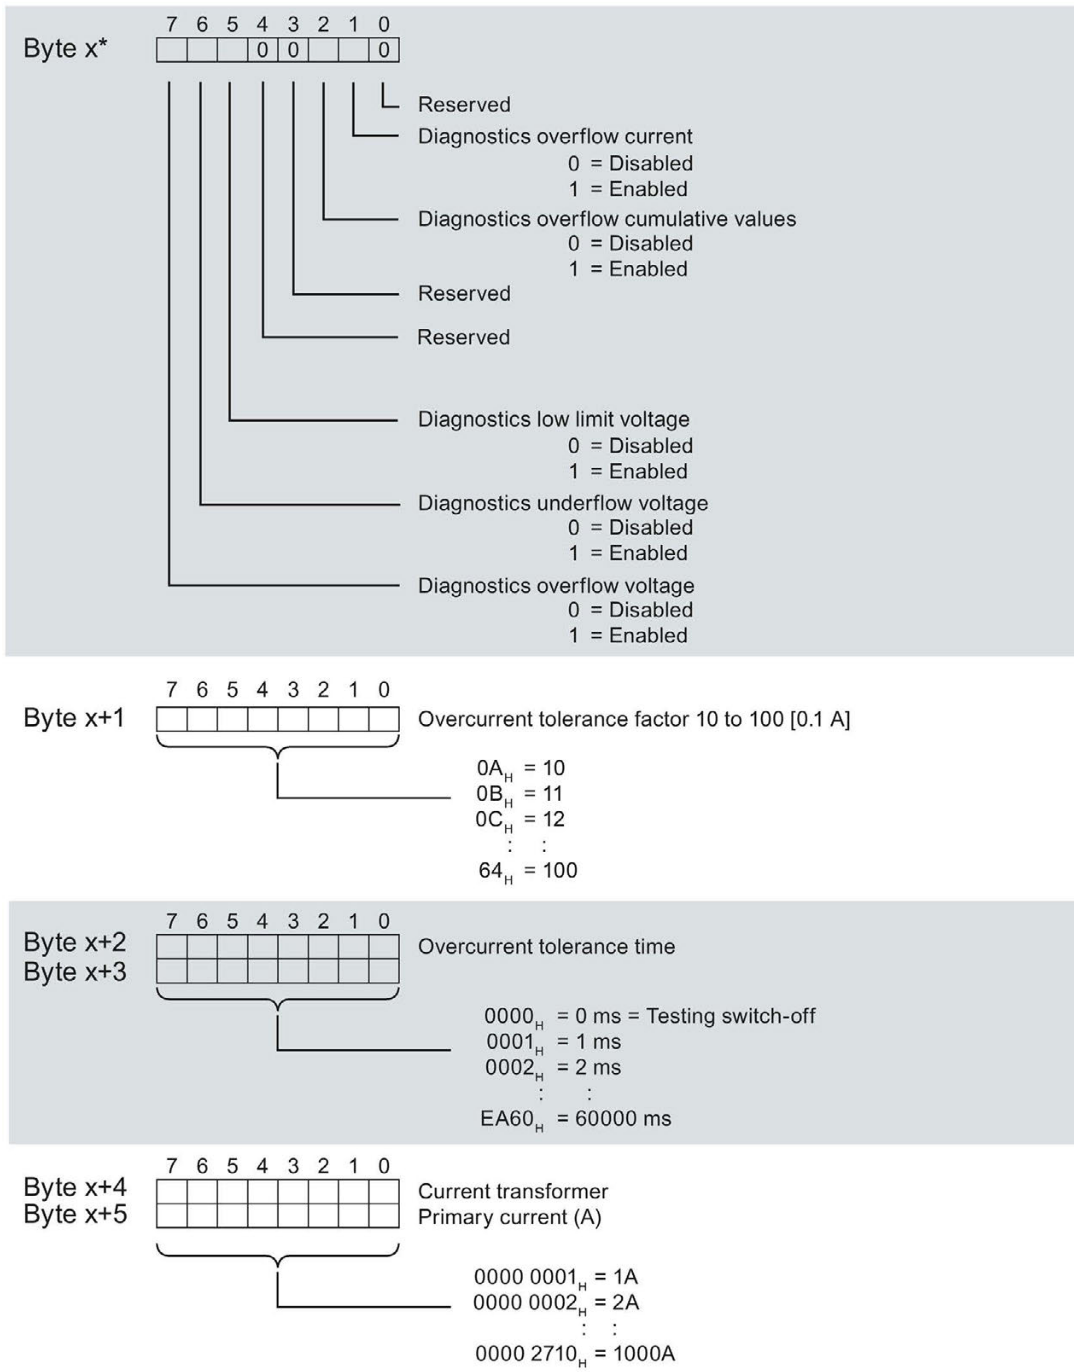
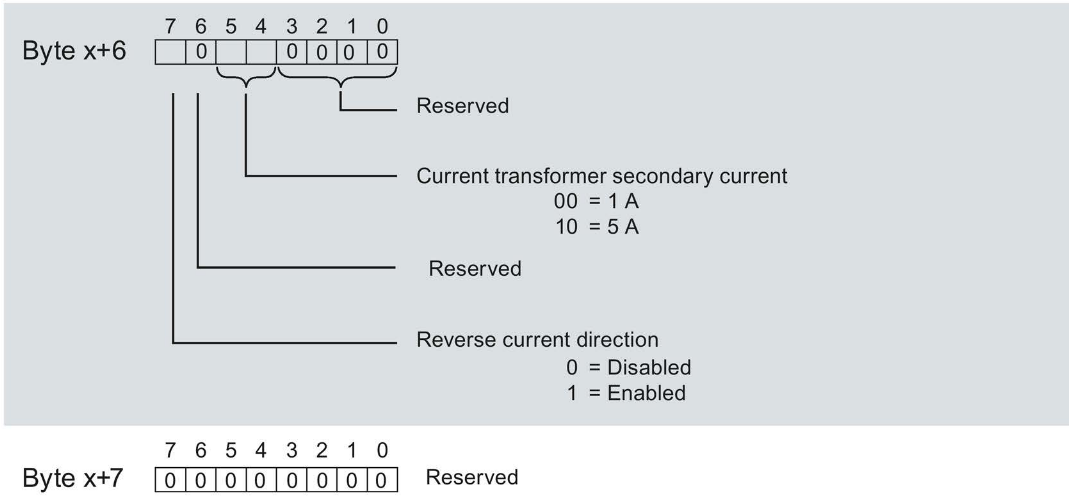
Channel parameter block

The figure below shows the structure of the channel parameter block.

Enable a parameter by setting the corresponding bit to "1".





* x = 14 for Channel 0 (Phase 1); 22 for Channel 1 (Phase 2); 30 for Channel 2 (Phase 3)

Figure A-6 Channel parameter block

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check Bytes 6, 10, 14, 20...22, 28...30, 36 and 37, and set reserved bits back to 0.
DF	80	E1	02	Reserved bits are not 0.	Check Byte 8 and set reserved bits back to 0.
DF	80	E1	05	Measuring range for voltage invalid.	Check Byte 5. Permitted values: 01_H to $0C_H$
DF	80	E1	20	Connection type invalid.	Check Byte 4. Permitted values: 00_H, $0B_H$ ... 01_H
DF	80	E1	21	Parameter for user data variant in DS 128 not possible or input data configuration not large enough.	Check Byte 11. Select a different user data variant or change the configuration.
DF	80	E1	22	Parameter for user data variant is invalid.	Check Byte 11. Select a valid code for the user data variant.
DF	80	E1	23	Parameter for frequency is invalid.	Check Byte 6. Enter valid values.
DF	80	E1	24	Parameter for tolerance line voltage is invalid.	Check Byte 7. Enter valid values.
DF	80	E1	25	Parameter for current transformer secondary current is invalid.	Check Bit 4...5 in Byte 20, 28, 36. Enter valid values.
DF	80	E1	26	Reserved parameter bits for current transformer on secondary side are not zero.	Enter 0 in Bytes 20, 28 and 36 and in Bits 0...3 and Bit 6.
DF	80	E1	29	Parameter for tolerance value overcurrent invalid.	Check Byte 15, 23, 31. Enter valid values.
DF	80	E1	30	Parameter for tolerance time overcurrent invalid.	Check Bytes 16...17, 24...25, 32...33. Enter valid values.
DF	80	E1	2B	Parameter for low limit measuring current invalid	Check Byte 9. Enter valid values.
DF	80	E1	2C	Parameter for current transformer primary current is invalid.	Check Bytes 18...19, 26...27, 34...35. Enter valid values.
DF	80	E1	30	Invalid data record number.	Check the data record number. Enter a valid data record number.

Measured variables B

Measured variables for data records and user data

The following table provides an overview of all measured variables that are used in the data records and user data.

Note that the format and unit differ in the evaluation of records and user data.

Table B- 1 Measured variables for data records and user data

Measured value ID	Measured variables	Data type	Unit	Value range	Connection type	
					1P2W	3P4W

1 Effective value

2 IEC 61557-12

3 Arithmetical mean value over 200 ms as floating mean

4 Arithmetical mean value over 10 s as floating mean

5 Simple summation

6 Calculation from the start/restart (inflow and outflow values are positive numbers)

7 Determined from ratio of active and apparent power

Format

Table B- 2 Format and its length in bytes

Format in STEP 7 (TIA Portal)	Format to IEEE	Length in bytes	Comment
BYTE	BYTE	1 byte	Bit field with 8 bit
WORD	WORD	2 bytes	Bit field with 16 bit
USINT	INT8 (unsigned)	1 byte	Fixed-point number 8 bits without sign
INT	INT16 (signed)	2 bytes	Fixed-point number 16 bits with sign
UINT	INT16 (unsigned)	2 bytes	Fixed-point number 16 bits without sign
UDINT	INT32 (unsigned)	4 bytes	Fixed-point number 32 bits without sign
DINT	INT32 (signed)	4 bytes	Fixed-point number, 32 bits with sign
REAL	Float32	4 bytes	Floating-point number 32 bits with sign
LREAL	Float64	8 bytes	Floating-point number 64 bits with sign

Module versions

C

C.1 Module version "2 I / 2 Q"

User data of the module

The module has 2 bytes of input user data and 2 bytes of output user data for status and control information. At this module version measured variables can be read solely via measured value data records (no measured variables can be evaluated via user data).

Structure of input user data

The structure of the input user data is fixed.

Table C- 1 Structure of input user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Constant = 0x80
1	Module	Quality information	Quality bits to describe the quality of the basic measured values

Allocation of the input user data

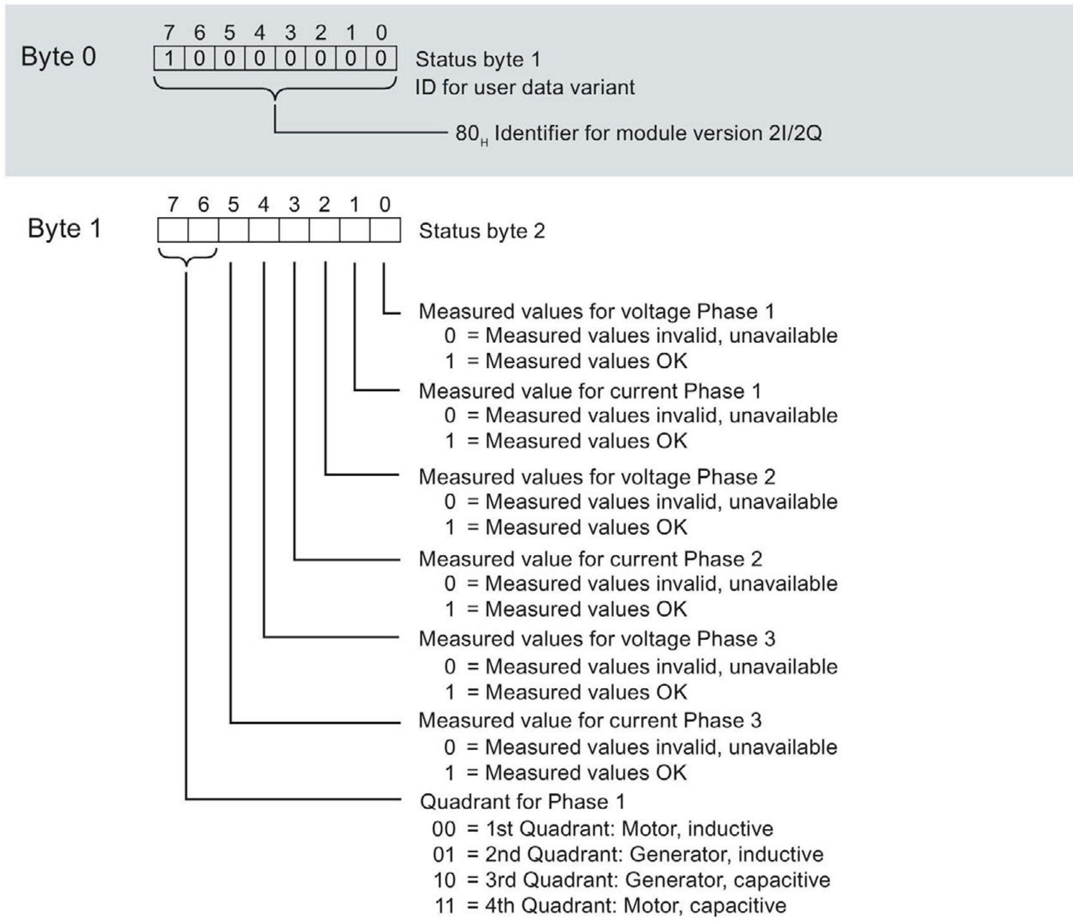

Figure C-1 Allocation of the status bytes in the input user data (2 bytes)

Structure of output user data

The structure of the output user data is fixed.

Table C- 2 Structure of output user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	Reserved	Reserved
1	Module	Control outputs	Reset of values and counters, gate

Assignment of the output user data

You control the counter gate for the energy counter via the output user data.

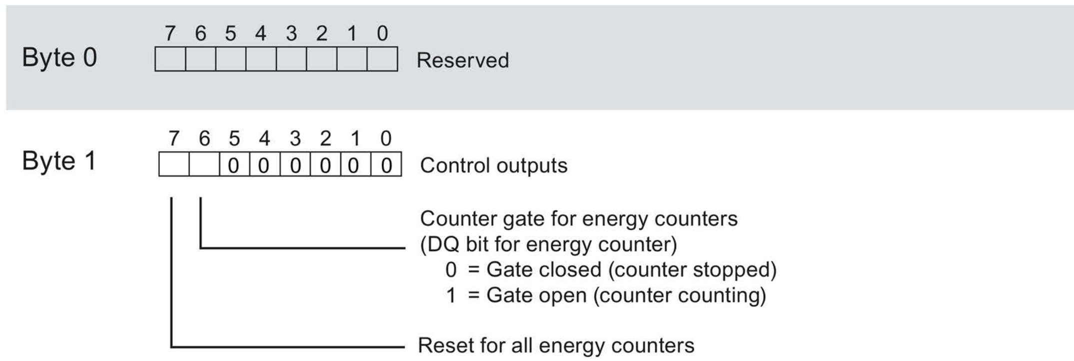

Figure C-2 Allocation of the control byte in the output user data (1 byte)

Note

For module version 2 I / 2 Q, a reset always acts on **all** energy counters of the three phases.

C.2 Module version "32 I / 12 Q"

User data of the module

The module occupies 32 bytes of input user data and 12 bytes of output user data. Of these the module uses 2 bytes input data for status information and 12 bytes output data for control information. Measured variables can be read cyclically via user data (Bytes 2 to 31) or acyclically via measured value data records

Structure of input user data

You can set the contents of the input user data dynamically. You can choose between different user data variants.

Table C- 3 Structure of input user data (32 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Display of the utilized user data variant
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 31	Module or phase	Data	2 or 4 bytes of measured values or calculated values according to user data variant

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

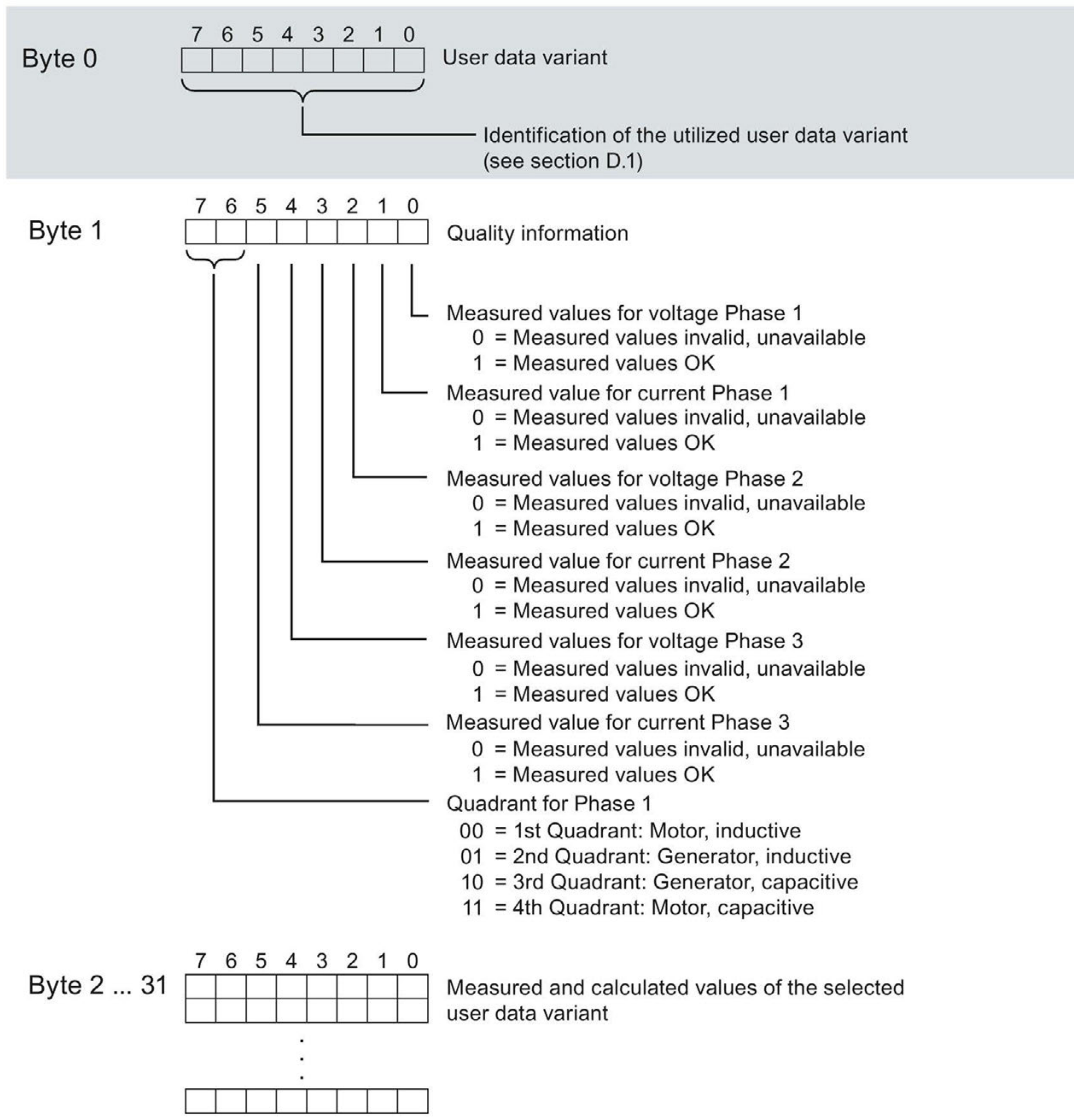

Figure C-3 Assignment of the input user data (32 bytes)

Structure of output user data

The structure of the output user data is fixed and is the same at all the selectable user data variants.

Via the output user data you globally control

- Resetting for energy counter (reset via Byte 1 and selection via Byte 2)
- The counter gate for the energy counter.

Table C- 4 Structure of output user data (12 bytes)

Byte	Validity	Designation	Comment
0	Module	User data vari-ant	Switching the user data variant
1	Module	Control byte 1	Reset of values and counters, gate
2	Module	Control byte 2	Selection for resetting the energy counters
3 ... 11	Reserved		

Control byte for user data variant

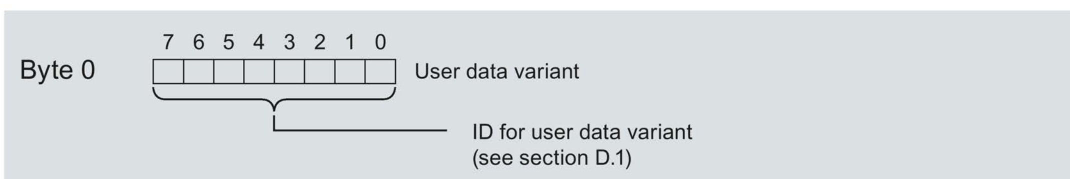

Figure C-4 Allocation of the control bytes for user data variant (Byte 0)

Control bytes for all three phases

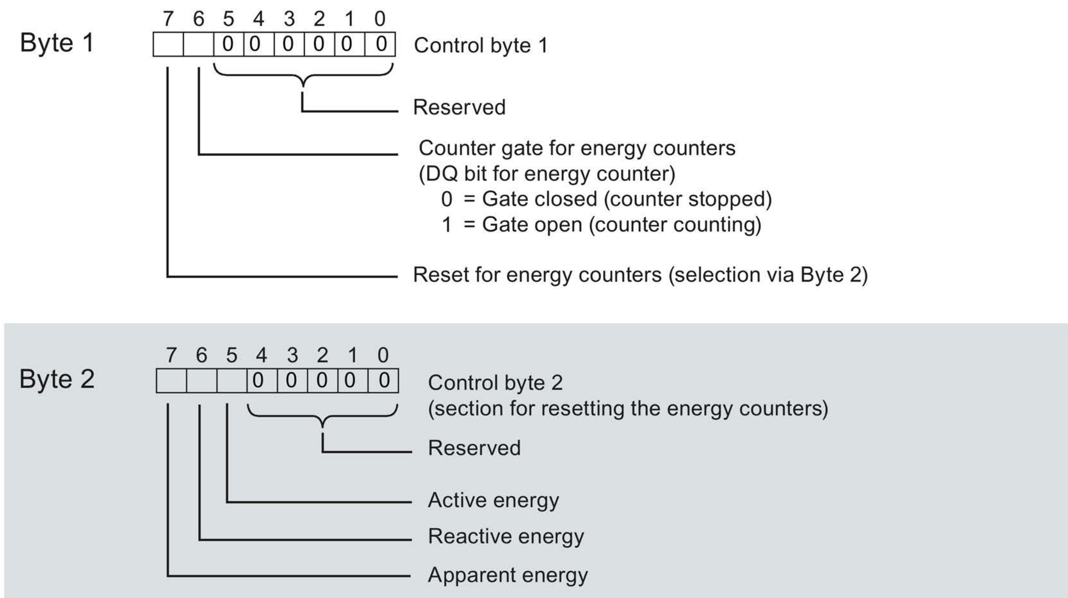

Figure C-5 Allocation of the control bytes for all three phases (bytes 1 and 2)

User data variants D

D.1 User data variants with 32 bytes input data / 12 bytes output data

User data

30 bytes are available for transferring the measured values in a cycle at the module version 32 I / 12 Q. This module variant therefore supports dynamic switching between 11 preconfigured user data variants that contain a specific selection of measured values.

For more detailed information, refer to "Selecting the module versions (Page 24)".

Measured value data records

E

E.1 Overview of all measured value data records

Energy Meter 400VAC ST writes the measured values in several data records that you can read acyclically using the RDREC instruction in the user program.

The following tables show the structure of the individual data records:

- Data record DS 142 for basic measured values (read only).
- Data record DS 143 for energy counters (read and write).

Note

- The cumulative value of the energy counters in 3-phase operation is obtained from the sums of the respective individual values of the phases.
- Inflow and outflow energy meters are always positive values.

E.2 Measured value data record for base measurements (DS 142)

Measured variables of the module

The following table provides an overview of all the measured variables that data record 142 supplies. Please note that, depending on the connection type used the display of some measured variables does not make sense and that the module deletes measured values that are not relevant.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables (Page 80)).

Table E- 1 Data record 142

202...209	Total active energy outflow L1L2L3	LREAL	Wh	0.0 ... 1.8×10^{308}	211

Procedure

Data record 142 is located on the AI Energy Meter 400VAC ST. Use SFB "RDREC" to read out the data record from the module. This system function block is stored in the STEP 7 library.

Measured values in STEP 7 as of V5.5

Measured values are represented as negative values in STEP 7 as of V5.5 if the value range of the integer format (32767 dec) is exceeded. This is not an error in the measured value. Solution: Select hexadecimal representation.

Conversion of 64-bit floating-point numbers

If you cannot process 64-bit floating-point numbers in your automation system, we recommend conversion to 32-bit floating-point numbers. Note the conversion can cause loss of accuracy. For a description of the conversion of the 64-bit floating-point numbers (data type LREAL) into 32-bit floating-point numbers (data type REAL) please refer to the Internet (http://support.automation.siemens.com/WW/view/en/56600676).

E.3 Structure for energy counters (DS 143)

Energy meter data record 143 for different actions

The energy meter data record 143 includes all energy meters available on the module phase-by-phase. The data record can be used for different actions:

- Reset the energy counter to user-specific value (e.g. "0")
- Reading the current values of the energy counters

Energy meter data record 143

Table E- 2 Energy meter data record 143

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-

120...127	Apparent energy (initial value) L3	LREAL	VAh		61224

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the measured value data record 143:

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the modu-le is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E1	01	Reserved bits are not 0.	Check Byte 2...7 and set the reserved bits back to 0.
DF	80	E1	39	Incorrect version entered.	Check Byte 0. Enter a valid version.
DF	80	E1	3A	Incorrect data record length entered.	Check the parameters of the WRREC instruction. Enter a valid length.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	3C	At least one start value is invalid.	Check Bytes 8...103 and Bytes 158...169. The start values may not be negative.
DF	80	E1	3D	At least one start value is too large	Check Bytes 8...103 and Bytes 158...169. Observe the ranges of values for start values.

F.1 Tips and tricks

FAQ and application examples

Several FAQs and application examples are available to help you at work with the AI Energy Meter .

Measuring and visualizing energy data

You can find these application example at Internet (http://support.automation.siemens.com/WW/view/en/86299299)

IT network

You must create an artificial N-conductor (for example, by means of a 1:1 voltage transformer) in IT networks due to the missing neutral conductor. You can then use the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Changes/enhancements described in this manual, compared to the previous version:

- "Quality information" section rearranged.
- "Measured variables for limit monitoring" section supplemented.
- Notes on the previous version of this manual have been taken into account in the current edition.

Conventions

CPU: When the term "CPU" is used in this manual, it applies both to the CPUs of the S7-1500 automation system and to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

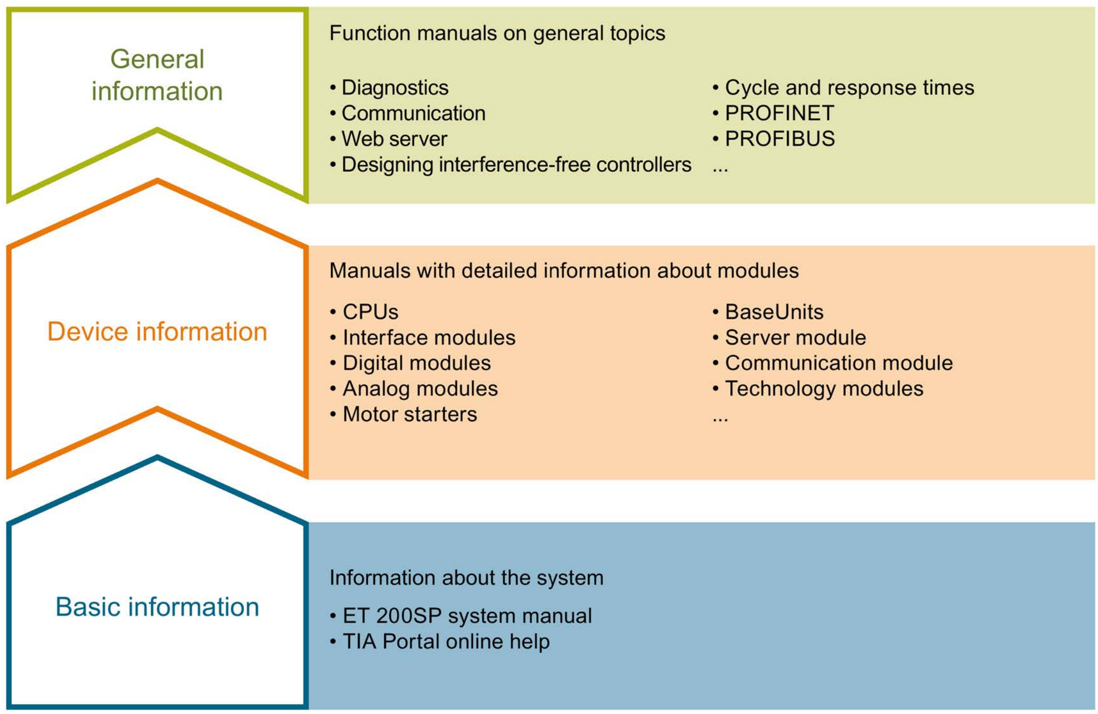
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Product overview 2

2.1 Area of application

Introduction

Energy efficiency is playing an increasingly important role in industry. Rising energy prices, increasing pressure to improve profitability and the growing awareness of climate protection are important factors for reducing energy costs and for introducing an energy data management system.

Where can you use the AI Energy Meter 480VAC ST?

AI Energy Meter 480VAC ST is designed for machine-level deployment in an ET 200SP distributed I/O system. AI Energy Meter 480VAC ST records over 200 different electrical measurement and energy values. It lets you create transparency about the energy requirements of individual components of a production plant even down to the machine level.

Using the measured values provided by the AI Energy Meter 480VAC ST, you can determine energy consumption and power consumption. You can determine consumption forecasts and efficiency from the measured values. Power consumption measurements are relevant for load management and maintenance. In addition, you can use the measurements for energy reporting and for determining the CO_2 footprint.

Note

Measuring dangerous electrical quantities

The AI Energy Meter 480VAC ST is not tested according to DIN EN 61010-2-030 and may therefore not be used to verify, measure or monitor protective measures according to DIN EN 61557.

Qualified personnel must ensure through additional measures that no danger ensues for humans and the environment in case of an incorrect display.

TN and TT system

The AI Energy Meter 480VAC ST can be used in TN and TT systems.

Measuring with AI Energy Meter 480VAC ST

A typical supply network of a production plant is usually divided into three voltage ranges:

- The infeed of the entire plant
- The subdistribution, for example, to individual lines within the plant
- The end consumers such as the machines in the lines.

The following figure shows the measurement in an electricity supply network:

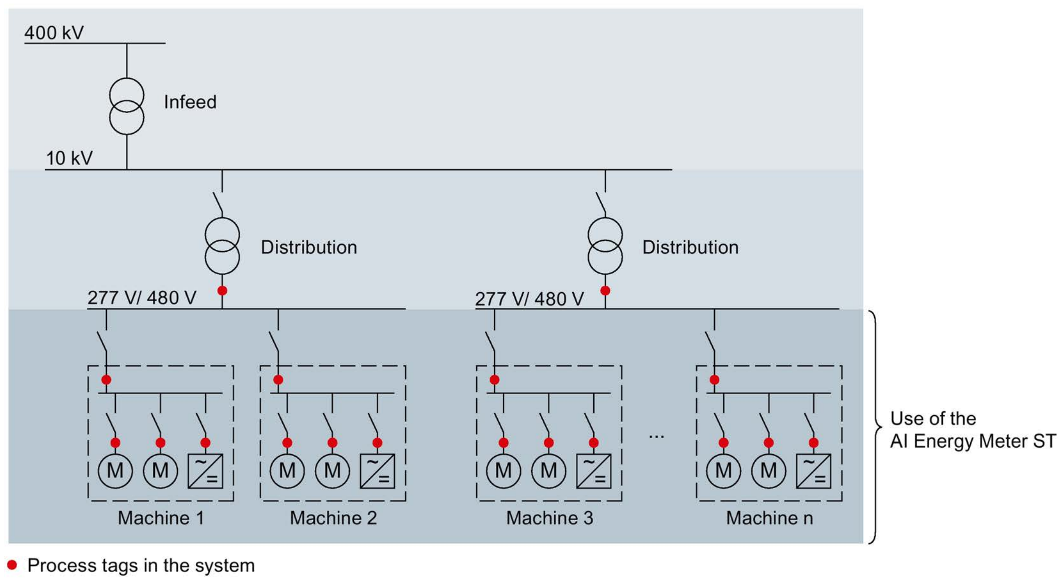


Figure 2-1 Use of the AI Energy Meter 480VAC ST

Advantages of the AI Energy Meter 480VAC ST

The AI Energy Meter 480VAC ST has the following advantages:

- Space-saving especially for use in control cabinet
- PROFINET IO or PROFIBUS DP (depending on the interface module in use)
- Multiple modules can be used with one interface module
- Extension of existing stations by components for energy recording

2.2 Properties of the AI Energy Meter 480VAC ST

Figure 2-2 View of the module AI Energy Meter 480VAC ST

Properties

The module has the following technical properties:

- Measurement of electrical variables from single-phase, two-phase and three-phase supply networks
- Max. nominal voltage between two outer conductors 480 VAC
- Retentive storage of the counter values
- Recording of:
  - Voltages
  - Currents
  - Phase angles
  - Power
  - Energy / electrical work
  - Frequencies
  - Minimum and maximum values
  - Power factors
  - Operating hours
  - Limits

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7		GSD file	
			TIA Portal	V5.x	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V4.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	---
Calibration in runtime	FS01	V4.0.0 or higher	V13 SP1 with update 4 and HSP or higher	---	---	---
Identification data I&M0 to I&M3	FS01	V4.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	X
Reconfiguration in RUN	FS01	V4.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	X
Diagnostic interrupts	FS01	V4.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	X
Hardware interrupts	FS01	V4.0.0 or higher	V13 SP1 with update 4 and HSP or higher	V5.5 SP4 and hotfix 7 or higher	X	---

Accessories

The following accessories must be ordered separately:

- BaseUnit Type D0
- Labeling strips
- Reference identification label

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/es/58649293) system manual.

Wiring 3

3.1 Terminal and block diagram

In an ET 200SP station, the AI Energy Meter 480VAC ST forms its own potential group together with its dark BaseUnit.

General safety instructions

WARNING

Danger to life due to electric shock

Touching live parts can lead to death or severe injuries.

Before beginning any work deenergize the system and the Energy Meter and short-circuit installed transformers.

WARNING

Danger to life, dangerous system conditions and material damage possible

Removing and inserting the Energy Meter under live voltage is prohibited! For this reason the symbol "Do not Hot Swap" is located on the Energy Meter.

If you remove and insert the Energy Meter under live voltage during operation, the transformers used can produce dangerous induction voltages and electric arcs and dangerous system conditions can arise.

The Energy Meter may only be removed and inserted during operation if the measuring voltages supplied to the BaseUnit at terminals U_{L1} , U_{L2}, U_{L3} are disconnected at all poles **and** special current transformer terminals are used that short-circuit the transformer on the secondary side on removal.

CAUTION

Use only in three-phase and AC networks

Operation with direct voltage/direct current will destroy the Energy Meter.

Use the Energy Meter solely to measure electrical variables in three-phase and AC networks.

Supplying the module

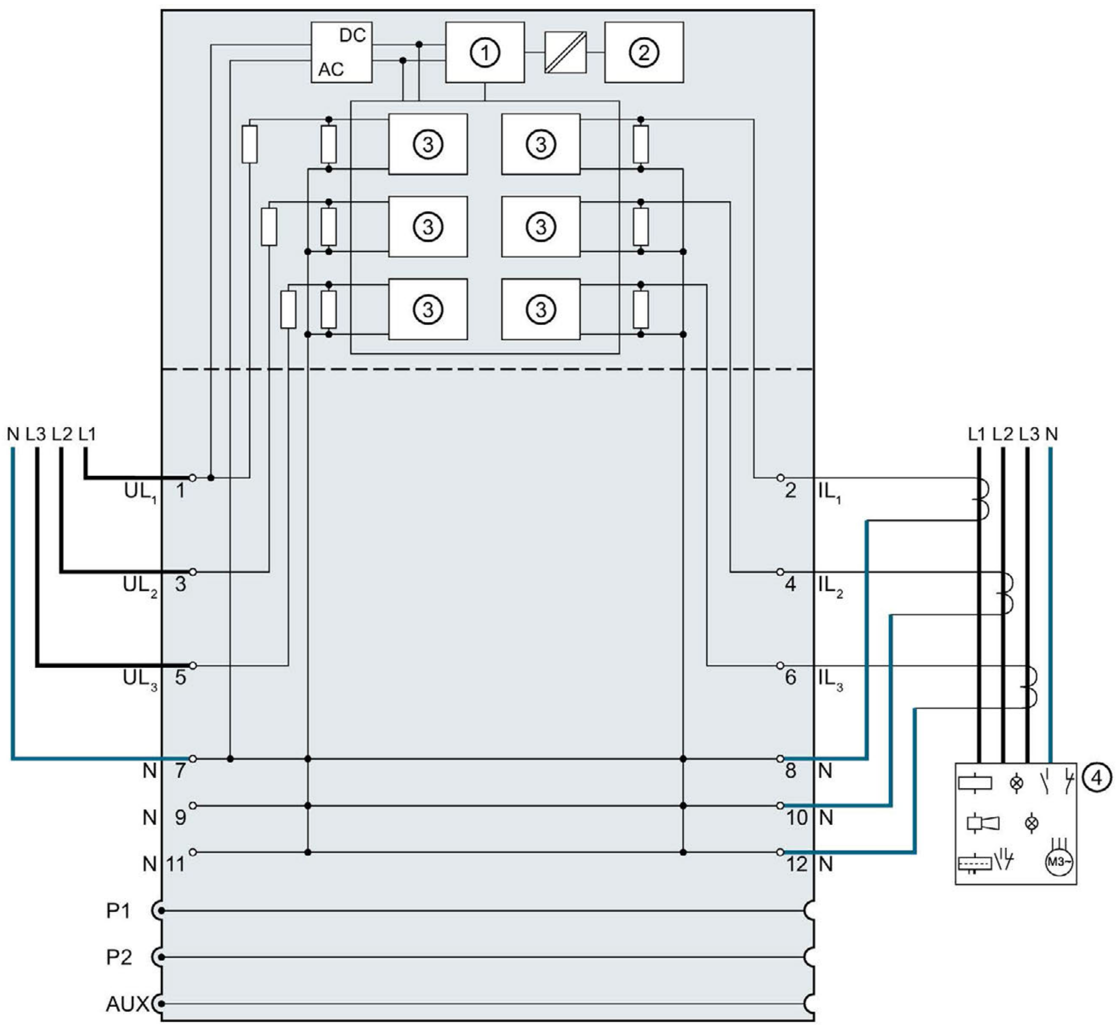
The Energy Meter is supplied through the terminals U_{L1} and N. The required minimum voltage amounts to 85 VAC.

Protecting the connection cables

To protect the connection cables at U_{L1}, U_{L2} and U_{L3}, make sure there is adequate cable protection, especially after cross-section transitions.

If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter 480VAC ST.

Terminal and block diagram



①	Microcontroller	UL_n	Voltage connection
②	Backplane bus interface	IL_n	Current connection
③	Analog-to-digital converter (ADC)	N	Neutral
④	Power measurement		

Figure 3-1 Block diagram of the AI Energy Meter 480VAC ST

Usable BaseUnit

The ET 200SP Distributed I/O System manual explains that a potential group always starts with a light BaseUnit. The AI Energy Meter 480VAC ST makes an exception in this case and only uses the dark BaseUnits type D0, 6ES7193-6BP00-0B**D0**.

The BaseUnit is not in contact with the power bus and passes the potential through from the left to the right slot.

When using some older CPUs / interface modules, note that the first permissible place for AI Energy Meter 480VAC ST is slot 2.

Connection types

The AI Energy Meter 480VAC ST supports the following connection types:

- 3P4W1, 3 phases, 4 conductors, balanced load
- 3P4W, 3 phases, 4 conductors
- 2P3W, 2 phases, 3 conductors
- 1P2W, 1 phase, 2 conductors
- 3 x 1P2W, 3 x 1 phase, 2 conductors

The input circuit of the module must correspond to one of the listed connection types. Select the appropriate connection type for the intended use.

You will find examples of connections in the section Connection examples (Page 21).

Information on the selection of a current transformer is available in the section Current transformer selection data (Page 24).

3.2 Connection examples

The following figures show the connection of the Energy Meter for three-phase, two-phase and single-phase measurements. Note that the Energy Meter must always be connected via a current transformer. The use of voltage transformers is optional.

Connection type	Wiring diagram	Comment
3P4W Three-phase measurement, 4 wires		Any load Connection with three current transformers
3P4W Three-phase measurement, 4 wires		Any load Connection with three current and three voltage transformers
3P4W1 Three-phase measurement, 4 wires		Balanced load Connection with one current transformer

Connection type	Wiring diagram	Comment
3P4W1 Three-phase measurement, 4 wires		Balanced load Connection with one current and one voltage transformer
2P3W Two-phase measurement, 3 conductors		Any load Connection with two current transformers Energy Meter supplies the value "0" for all measured values of Phase 3 as well as for some cross-phase measured values.
2P3W Two-phase measurement, 3 conductors		Any load Connection with two current and two voltage transformers Energy Meter supplies the value "0" for all measured values of Phase 3 as well as for some cross-phase measured values.
1P2W Single-phase measurement, 2 conductors		Measurement in an AC network with a current transformer Energy Meter supplies the value "0" for all measured values of Phases 2 and 3 as well as for some cross-phase measured values.

Connection type	Wiring diagram	Comment
1P2W Single-phase measurement, 2 conductors		Measuring the load in an AC network with a current and a voltage converter Energy Meter supplies the value "0" for all measured values of Phases 2 and 3 as well as for some cross-phase measured values.
3 x 1P2W 3 x single-phase measurement		Measurement with three current transformers for any three loads that are each connected to one of the three phases Max. permissible secondary current of the current transformer is 1 A
3 x 1P2W 3 x single-phase measurement		Measurement with three current transformers and three voltage transformers for any three loads that are each connected to one of the three phases Max. permissible secondary current of the current transformer is 1 A

* If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter 480VAC ST.

Current transformer connection requirements

DIN VDE 0100-557 and IEC 60364-5-55 require the following for the connection of current transformers:

- The secondary circuits of current transformers must not be grounded.
- Guards must not be used in the secondary circuits of current transformers.
- The insulation of the secondary cables of transformers must be designed for the highest voltage of all active components, or the secondary cables must be installed in such a way that their insulation cannot touch any active components, such as busbars.
- Connection points must be provided for temporary measurements.

3.3 Current transformer selection data

Introduction

Connection via a current transformer is always required for the current measurement. Use toroids with an accuracy class of 0.5, 1 or 3.

Dimensioning of the current transformer

The correct dimensioning of the current transformer is important for the following reasons:

- You achieve correct results from the measurements and
- You do not overload or damage the current transformers.

Selecting a current transformer

Use current transformers with a burden capacity 1.5 to 2 times greater than the power dissipation in the terminal circuit (consisting of resistance of the connection cables and burden of energy meter). 1.5 times the power loss is required in order to prevent the transformer from overloading. 2 times the power dissipation is important to ensure the current limiting in case of a short-circuit.

Maximum length of the connection cable

To avoid overloading or damaging the current transformer, the burden Z_n specified on the data sheet of the current transformer (in VA) must not be exceeded. To prevent this being exceeded, the entire burden resistance (consisting of the resistance of the connection cable and the internal resistance of the AI Energy Meter 480VAC ST (see figure below) must be below a certain resistance value (depending on Z_n and I_{max}).

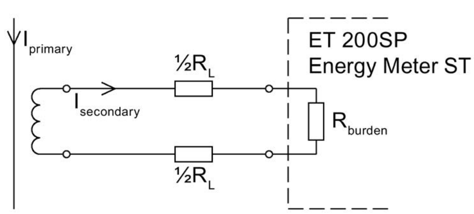


Figure 3-2 Maximum length of the connection cable

The maximum value of the resistance of the connection cable is obtained with the following formula:

$$R_{L,\,max} = \frac{Z_n}{I_{max}^2} - R_{burden}$$

R_L	Cable resistance in ohms	I_{max}	Secondary current of the current transformer
Z_n	Rated burden current transformer in VA	R_{burden}	Resistance of the Energy Meter (25 mΩ)

Figure 3-3 Maximum value for the resistance of the connection cable

Based on the maximum cable resistance in ohms, you then calculate the maximum length of the connection cable. To do this, check the data sheet of the connection cable you are using.

Note

The length of the connection cable (outwards and return) must not exceed the value of 200 meters.

Example: Usage of a current transformer 500/5 A

You use a current transformer with a transmission ration of 500/5 A that has a rated burden Z_n of 5 VA according to the data sheet.

The maximum primary current in the application amounts to 400 A. This means that the maximum secondary current $I_{max.}$ amounts to 4 A. The burden of the AI Energy Meter including connection resistance amounts to R_{Burden} = 25 mΩ.

The maximum value of the resistance of the connection cable (outgoing and incoming line) is obtained using the following formula:

$$R_{L,\,max} = \frac{Z_n}{I_{max}^2} - R_{Burden} = \frac{5\ \text{AV}}{16\ \text{A}^2} - 25\ \text{m}\Omega = 312.5\ \text{m}\Omega - 25\ \text{m}\Omega = 287.5\ \text{m}\Omega$$

The maximum cable resistance between the transformer and the terminals of the Energy Meter may not exceed 287.5 mΩ in this case. The corresponding cable length (outgoing and incoming line) depends on the cross-section used of the copper line and can be determined by using the following table.

The following table shows the resistance values of copper cables for typical cross-sections with ρ = 0.017857 Ω x mm²/m

Estimating the length for a connection cable

The value in the table must be less than the calculated terminal resistance $R_{L\ max}$ of the cable. For the resistance R_{Lmax} of 287.5 mΩ used in the above example it is possible to use a connection cable (outgoing and incoming line) with a length of 10 m from a cross-section of 0.75 mm² upward.

Cross-section	AWG	Cable overview for copper				
		0.5 m	1 m	5 m	10 m	50 m
0.25 mm²	24	35.7 mΩ	71.4 mΩ	357.1 mΩ	714.3 mΩ	3571.4 mΩ
0.34 mm²	22	26.3 mΩ	52.5 mΩ	262.6 mΩ	525.2 mΩ	2626.0 mΩ
0.5 mm²	21	17.9 mΩ	35.7 mΩ	178.6 mΩ	357.1 mΩ	1785.7 mΩ
0.75 mm²	19/20	11.9 mΩ	23.8 mΩ	119.0 mΩ	238.1 mΩ	1190.5 mΩ
1.0 mm²	18	8.9 mΩ	17.9 mΩ	89.3 mΩ	178.6 mΩ	892.9 mΩ
1.5 mm²	16	6.0 mΩ	11.9 mΩ	59.5 mΩ	119.0 mΩ	595.2 mΩ
2.5 mm²	14	3.6 mΩ	7.1 mΩ	35.7 mΩ	71.4 mΩ	357.1 mΩ

Checking the ratio of burden load and power loss

The rated burden of the transformer must be 1.5 to 2 times greater than the power loss in the connection circuit to ensure that the transformer is not overloaded and that the current limitation is ensured during a short-circuit.

At a maximum secondary current of 4 A the power loss in the connection circuit is calculated in accordance with the following formula for a connection cable (outgoing and incoming line) with a length of 10 m and a cross-section of 1.0 mm² and a burden resistance of the Energy Meter of 25 mΩ:

$$P_{\text{Connection circuit}} = (R_{\text{Connection cable}} + R_{\text{Burden}}) \times I^2_{\text{Max. secondary}}$$

$$P_{\text{Connection circuit}} = (178.6\ \text{m}\Omega + 25\ \text{m}\Omega) \times 4^2\ \text{A}^2\ 3.26\ \text{W}$$

The ratio of the rated burden and the power loss in the connection circuit thus amounts to:

$$\frac{Z_{\text{N rated burden}}}{P_{\text{Connection circuit}}} = \frac{5\ \text{VA}}{3.26\ \text{W}} = 1.54$$

The required ratio of rated burden and power loss in the connection circuit lies within the required range. The transformer is dimensioned sufficiently large.

4 Configuration / address space

4.1 Configuring

Introduction

To configure the AI Energy Meter 480VAC ST after connecting it, use configuration software such as STEP 7. In addition, you can also change numerous parameters of the AI Energy Meter 480VAC ST in RUN via the user program.

Configuring

You configure the AI Energy Meter 480VAC ST with:

- STEP 7 (TIA Portal) V13 SP1 or higher with Update 4 and HSP
- STEP 7 V5.5 SP4 or higher and Hotfix 7
- GSD file for PROFIBUS or PROFINET

Note

Consistency check of the parameter assignment only with STEP 7

If you configure the AI Energy Meter 480VAC ST using STEP 7, STEP 7 already checks the various parameters for consistency while they are being entered.

If you configure the AI Energy Meter 480VAC ST using a GSD file, a consistency check is not carried out. The module does not recognize incorrect entries until after the parameter data record has been transferred. If the module recognizes an invalid parameter, the module rejects the complete data record.

Preferably use STEP 7 to configure the AI Energy Meter 480VAC ST.

The following instructions show the theoretical procedure for configuring the AI Energy Meter 480VAC ST with STEP 7 (TIA Portal) V13 SP1 or higher with Update 4 and HSP.

1. Select the ET 200SP distributed I/O system you are using in the hardware catalog.
2. Insert the module into your station.
3. Open the device view of the ET 200SP and insert the AI Energy Meter 480VAC ST.
4. Configure the AI Energy Meter 480VAC ST to suit your requirements.

   Once the configuration has been compiled without errors, you can download the configuration to the CPU and commission the ET 200SP station while the AI Energy Meter 480VAC ST is running.

4.2 Selecting the module versions

Introduction

The AI Energy Meter 480VAC ST has different module versions.

During the configuration you use the selection of the module version to specify which measured values can be read.

Each module version supplies quality information via the input user data.

With the exception of the module version "2 I / 2 Q" you can read the measured values as user data cyclically from the process image. At each module version you have the option to read measured value records from the AI Energy Meter 480VAC ST by using the RDREC instruction asynchronously.

Influence of the module version on the address space

Note

Influence of the AI Energy Meter 480 VAC ST on the maximum configuration of the ET 200SP

The available address space of the ET 200SP is influenced by the following factors:

- CPU or interface module
- Plugged I/O modules

The address space made **additionally** available by the AI Energy Meter 480 VAC ST is essentially influenced by the length of the user data supplied. The module version determines the length of the user data, which can be supplied by the AI Energy Meter 480VAC ST at maximum.

4.2.1 Module versions at configuration with STEP 7

Module versions with fixed user data assignment

Module version	User data	Address space	Comment
2 I / 2 Q	No cyclic user data. Access to measured values through "Read data record".	2-byte inputs 2-byte outputs	Information about the structure of the 2 I / 2 Q module version is available in the appendix Module version "2 I / 2 Q" (Page 142).
EE@Industry E0	User data in accordance with EE@Industry measurement data profiles	12 byte inputs / 12 byte outputs	Information about the structure of the EE@Industry measured data profiles is available in the appendix Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3" (Page 153).
EE@Industry E1		4 byte inputs / 12 byte outputs

Module versions with selectable user data variants

Module version	User data	Address space	Comment
32 I / 12 Q	User data selectable through user data variants or through user-specific user data*	32 byte inputs / 12 byte outputs	You can change over the user data variant during operation. If you use user-specific user data, you write your measured value profile into the AI Energy Meter 480VAC ST with the data record 130. To do this use the WRREC instruction. Information about the structure of data record 130 is available in appendix Structure of the parameter data record 130 for user-data mapping (Page 125).
64 I / 12 Q		64 byte inputs / 12 byte outputs	
128 I / 12 Q		128 byte inputs / 12 byte outputs	
256 I / 12 Q		256 byte inputs / 12 byte outputs	

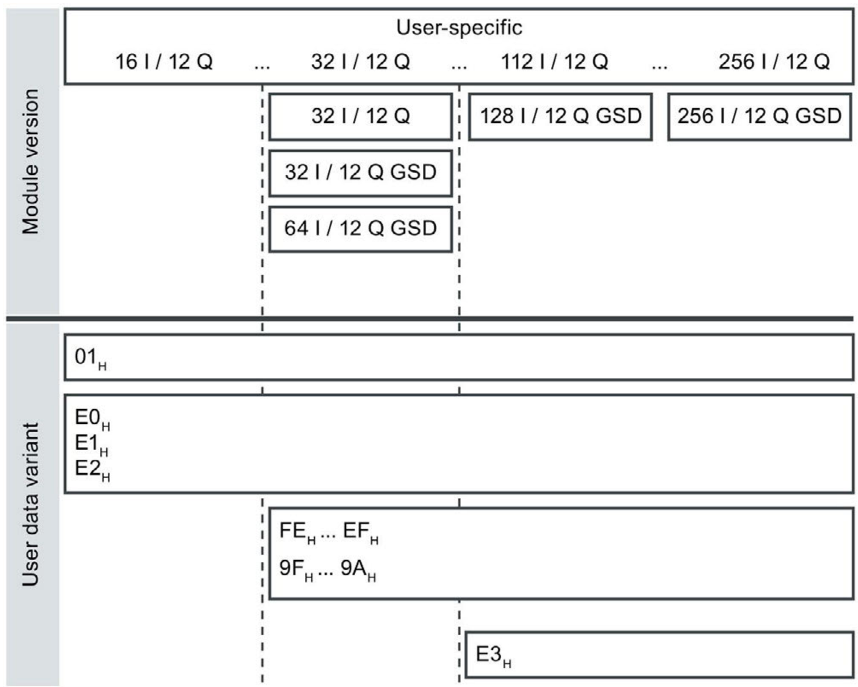
*Ensure that the user data do not exceed the size of the address space of the module version. If necessary, use a module version with a larger address space

4.2.3 Changing over the user data variant during operation

Introduction

You change the user data variant in the output data of each user data variant in Byte 0.

The following figure shows to which user data you can change over at various module versions during operation.



Requirement

- User program has been created.
- AI Energy Meter 480VAC ST is configured as one of the module versions mentioned in the illustration above.
- The start address of the module is known in the process image output.

Procedure

1. Create one constant with the data type BYTE per user data variant.
2. Enter the user data ID as a value in each case.
3. Write the constant to the start address of the module in the process image output.

Result

The user data variant is switched with the next cycle.

Note

Information about user data changeover

The parameterized user data variant is set in the following cases:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  - Coding of the user data variant not available

    or
  - Available address space is not sufficient for the selected user data variant.

4.2.4 Recommendations for selecting the module version

The following table shows which module version is suitable for a given purpose.

Module version	Application	Note
2 I / 2 Q	• Use of many AI Energy Meter 480VAC ST in an ET 200SP or little address space is available	• Read the measured values solely via the RDREC instruction from a measured value data record. • Quality information about the measured values is always available.
EE@Industry measurement data profile E0 / E1 / E2 / E3	• Cyclic measurement per phase • Supplied measured values in accordance with the EE@Industry measured data profile	• Available measured values depend on the configured measurement data profile. • The user data are fixed and cannot be changed dynamically. Alternatively, read the measured values acyclically from a measured value data record via the RDREC instruction. • No quality information
32 I / 12 Q	• Cyclic measurement per phase • Flexibility by switching predefined user data variants	• Quality information about the measured values is always available. • Depending on the user data variant, you must convert the measured values in the CPU to physical values using the supplied scaling factor. • One cycle elapses for each user data changeover. Measured values from the next user data variant are thus supplied with a slight time offset. Alternatively, read the measured values acyclically from a measured value data record via the RDREC instruction. Consistent measured values of a measuring cycle are supplied.
User-specific With GSD configuration • 32 I / 12 Q • 64 I / 12 Q • 128 I / 12 Q • 256 I / 12 Q	• Cyclic measurement of up to 64 measured values configurable • Flexibility by switching predefined user data variants	

4.3 Applicable modules

Configuring with STEP 7

The following table shows with which controllers the different module versions can be configured with STEP 7.

Table 4- 1 Module versions configured with STEP 7

Controller	Module version						
	2 I / 2Q	32 I / 12 Q	User-specific	EE@Industry measurement data profile

Quick start 5

Introduction

This section shows you how to read and view your first measured values on the Energy Meter 480 VAC ST in a particularly quick and easy way.

Requirement

You have already connected the Energy Meter to your network with one of the connection types shown in the section Wiring (Page 18). The Energy Meter 480 VAC ST has already been integrated in your configuration tool (such as STEP 7), or the Energy Meter 480 VAC ST has been integrated in your hardware catalog with the GSD/GSDML file.

Procedure

1. Configure an ET 200SP station

   Configure an ET 200SP station with a CPU 151xSP or an IM 155-6.
2. Plug module in ET 200S station

   Plug the Energy Meter 480 VAC ST into the ET 200SP station and use the module version with 32 bytes inputs and 12 bytes outputs.
3. Set the module parameters

   Set the following parameters for the Energy Meter 480 VAC ST:

   – Connection type that you have used for the Energy Meter 480 VAC ST (e.g. 3P4W)

   – Measuring range, i.e. the phase voltage (UL1-N) of your network (for example 230 V AC)

   – Frequency of your network (for example 50 Hz)

   – Primary and secondary current of the used current transformer (e.g. 100 A and 1 A)

   – Primary and secondary voltages of the used voltage transformer (e.g. 230 V and 230 V)

   Leave all other parameters at their default settings and do not change them.
4. Load configuration

   Switch on the ET 200SP station and download the configuration to the CPU.

Result

After being switched on, the Energy Meter supplies the measured values for the "Total power L1L2L3" user data variant "Basic measurements" with the ID 254 or FE_H.

Read and check the measured values provided by the Energy Meter in the output data.

The table below shows the structure of the user data variant, the measured variables and the data type of the measured values in STEP 7 (TIA Portal) that are stored in the 32 bytes of output data of the module. Each measured variable is referenced via the measured value ID. An overview of all the measured variables with their measured value IDs is provided in the section Measured variables (Page 131).

Table 5- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Meas-ured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-

26	Scaling current L3	USINT	-	0 ... 255	-
27	Scaling total active power L1L2L3	USINT	-	0 ... 255	-
28	Scaling total reactive power L1L2L3	USINT	-	0 ... 255	-
29	Scaling total apparent power L1L2L3	USINT	-	0 ... 255	-
30	Scaling total active energy L1L2L3	USINT	-	0 ... 255	-
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

Additional information

If you require further information about the evaluation and interpretation of the measured values, please refer to the section Reading and processing measured values (Page 37).

Reading and processing measured values 6

6.1 Basics for reading measured values

Introduction

The AI Energy Meter 480VAC ST provides the measured values and variables through the following methods:

- Cyclic: User data
- Acyclic: Measured value data records

User data

User data provide pre-defined measured values depending on the configured user data variant. The supplied measured values are cyclically written to the process image of the CPU. With some user data variants, the measured values are supplied as raw data, which you have to convert to the corresponding physical values using a supplied scaling factor.

Measured value data records

Each measured value data record supplies physical values that you can further process immediately. You read the values of a measured value data record acyclically with the RDREC instruction in a PLC tag. You need a corresponding PLC tag for each measured value data record to be read.

You can display the read measured values in a watch table in STEP 7.

Note

If you are using CPUs other than S7-1200 or S7-1500, convert 64-bit measured values to 32-bit measured values. Note the conversion can cause loss of accuracy.

For more information, read FAQ: Processing 64-bit-floating-point numbers in S7-300/400 (https://support.industry.siemens.com/cs/ww/en/view/56600676)

Validity of the measured values

After turning on the supply voltage UL1, the first measured values are available after approximately 2 seconds. In the input user data, the content of byte 0 is set to the selected user data variant. You can use this change in byte 0 as a trigger event.

As soon as the module has valid measured values, the value of this byte changes to a value within the value range.

Initial module startup

After the first startup or restart of the module, the parameters are transferred to the module. You can preset a user data variant in the parameters of the hardware configuration. This remains in effect until a different user data variant is selected in the output data (byte 0). This allows input user data to be modified dynamically according to the requirements of the process.

The user data variant defined in parameter data record 128 is used under the following conditions:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  - Coding of the user data variant not available, or
  - Available address space is not sufficient for the selected user data variant.

    See "Selecting the module versions (Page 28)".

Current measured values become "0"

The current and all other measured values based on it are suppressed (or set to "0") in the data records and in the user data in the following cases:

- The incoming current of the current transformer is less than the configured "Low limit for measuring current" parameter
- Incoming secondary current at the channel is higher than 12 A

The following measured values and derived measured variables of the phase involved become "0":

- Effective current value
- Active power
- Reactive power
- Apparent power
- Neutral current
- Phase angle
- Power factor

A floating mean value is formed from the power values. These only become "0" after a corresponding time. The operating hours counter and the energy counter for active, reactive and apparent energy of the reset phase stops counting.

Substitute value behavior

The substitute values for input values of the AI Energy Meter 480VAC ST amount to "0".

Reading measured values from user data cyclically (Page 45)

Read measured value from a measured value data record (Page 47)

6.2 Quality information

Use the quality information to evaluate the status for currents, voltage, operating quadrants and the rotating field.

The AI Energy Meter 480VAC ST provides quality information:

- In byte 1 of the user data
- In measured value IDs 65500 to 65503

See also

Module version "32 I / 12 Q" (Page 145)

6.2.1 Quality information in byte 1 of the user data

For all user data variants, the module provides brief quality information in an 8-bit field in byte 1 for:

- Currents (I_{L1}, I_{L2}, I_{L3})
- Voltages (U_1, U_2, U_3)
- Operating quadrant for a phase

Please note that quality information assignment with user data variants for phase-specific measurement (ID 154 to ID 159) is different from user data variant assignment for 3-phase measurement (ID 244 to ID 254).

Quality information in byte 1 of the user data for 3-phase measurement

The quality information for 3-phase measurement is provided by the module in user data variants ID 244 to ID 254.

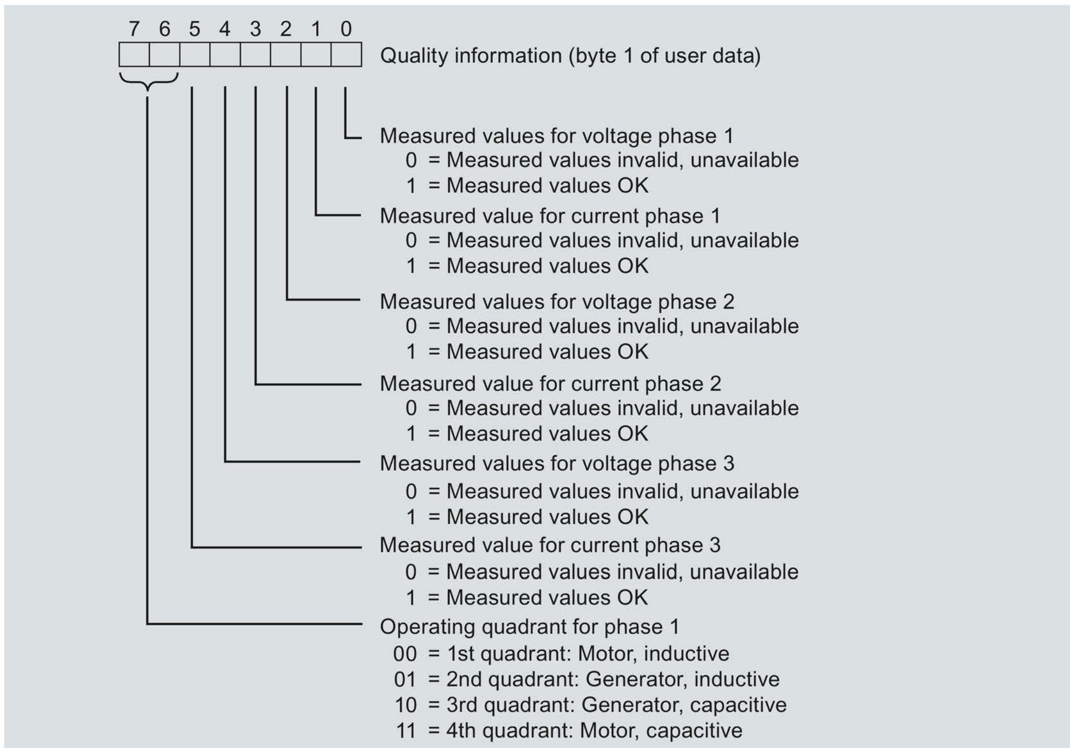

Figure 6-1 Assignment of byte 1 for user data variants ID 224 to ID 254

Quality information in byte 1 for phase-specific measurement

The quality information for phase-specific measurement is provided by the module in user data variants ID 154 to ID 159.

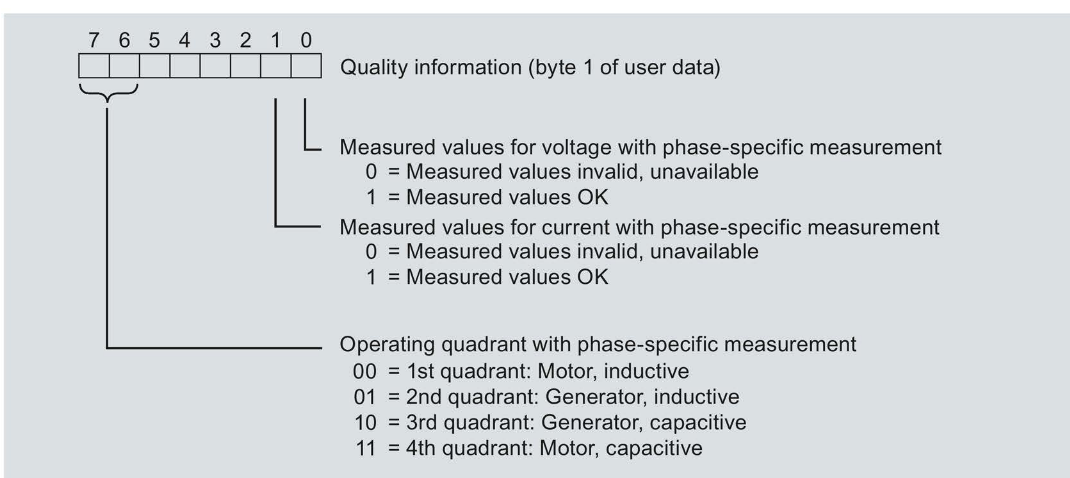

Figure 6-2 Byte 1 assignment for user data variants ID 154 to ID 159

6.2.2 Quality information with measured value IDs

Complete quality information is provided by the module in a 16-bit field with measured value IDs 65500 to 65503.

- Measured value ID 65503 for 3-phase measurement
- Measured value ID 65500, 65501 or 65502 for phase-specific measurement in phase 1, phase 2 or phase 3

Quality information with measured value ID 65503 for 3-phase measurement

The quality information for 3-phase measurement is provided by the module with:

- User data variant "Basic variables quality values three-phase measurement (ID 240 or $F0_H$)
- User data (measured value ID 66503)
- Measured value data record 150

The measured value IDs 65503 provide information on:

- Currents (I_{L1}, I_{L2}, I_{L3})
- Voltages (U_1, U_2, U_3)
- Operating quadrants for all 3 phases
- Rotating field for the 3-phase system

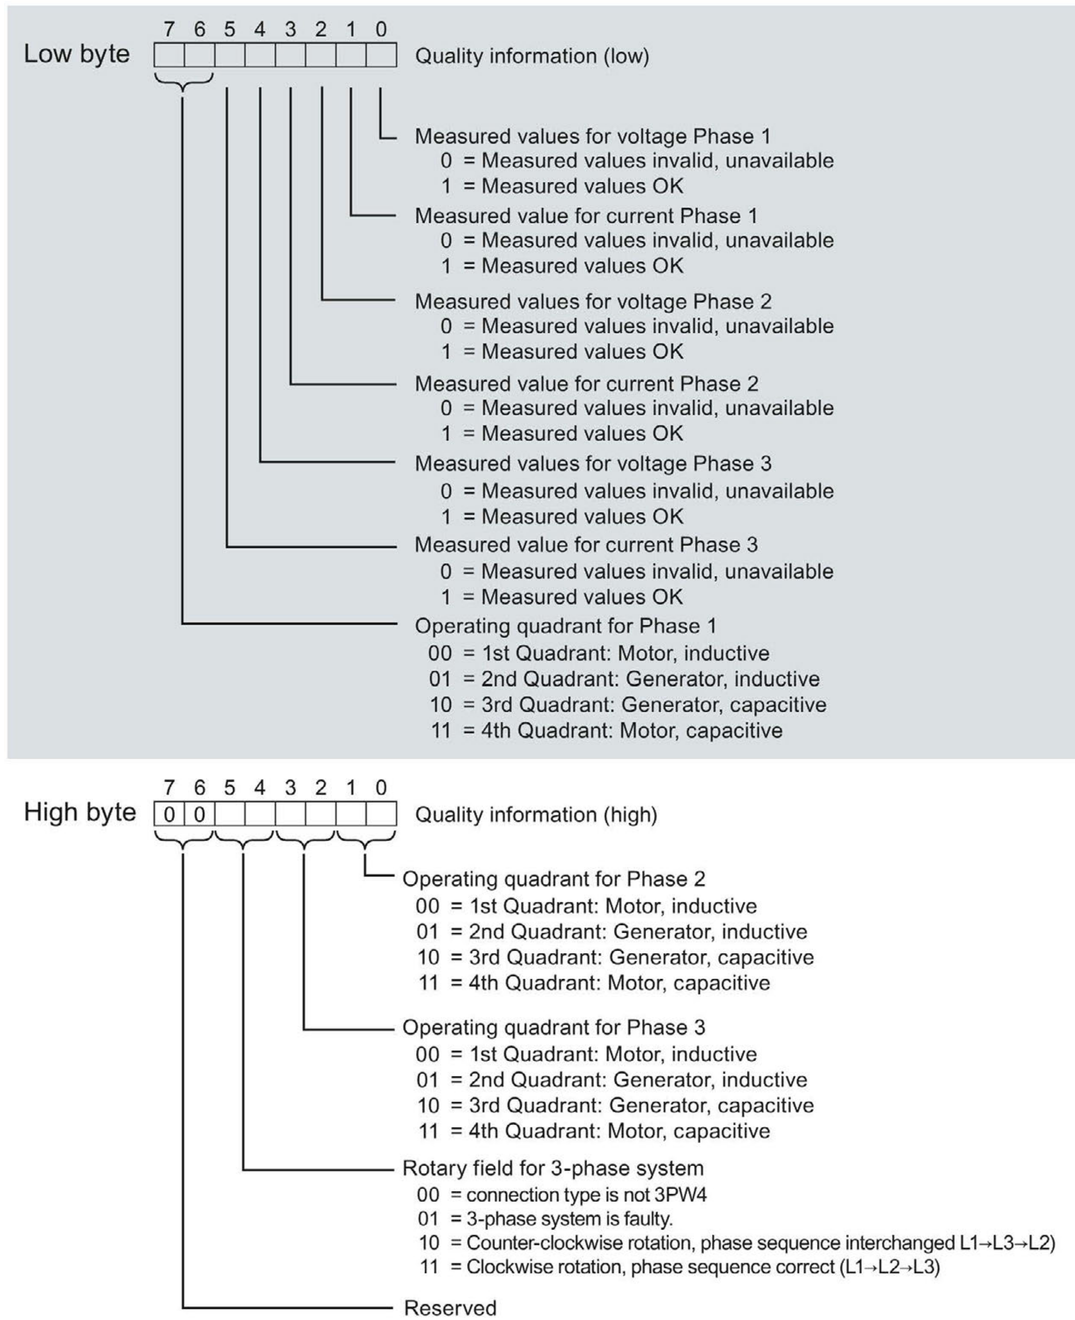

Figure 6-3 Quality information for low and high byte of the measured value ID 65503

Quality information with measured value ID 65500, 65501 or 65502 for phase-specific measurement

The module provides quality information for phase-specific measurement in phase 1, phase 2 or phase 3 with:

- User data (with measured value ID 65500, 65501 or 65502)
- Measured value data record DS 147, 148 or 149

Measured value IDs 65500, 65501 and 65502 provide information on:

- Current of the phase in question
- Voltage of the phase in question
- Operating quadrant of the phase in question

In contrast to the assignment for measured value ID 65503 (figure above), measured value IDs 65500, 65501 and 65502 only contain the phase-specific information for current, voltage and operating quadrant. The information about the other phases and the rotating field have the value 0.

6.2.3 Operating quadrant

The figure below shows the quality information of the operating quadrants.

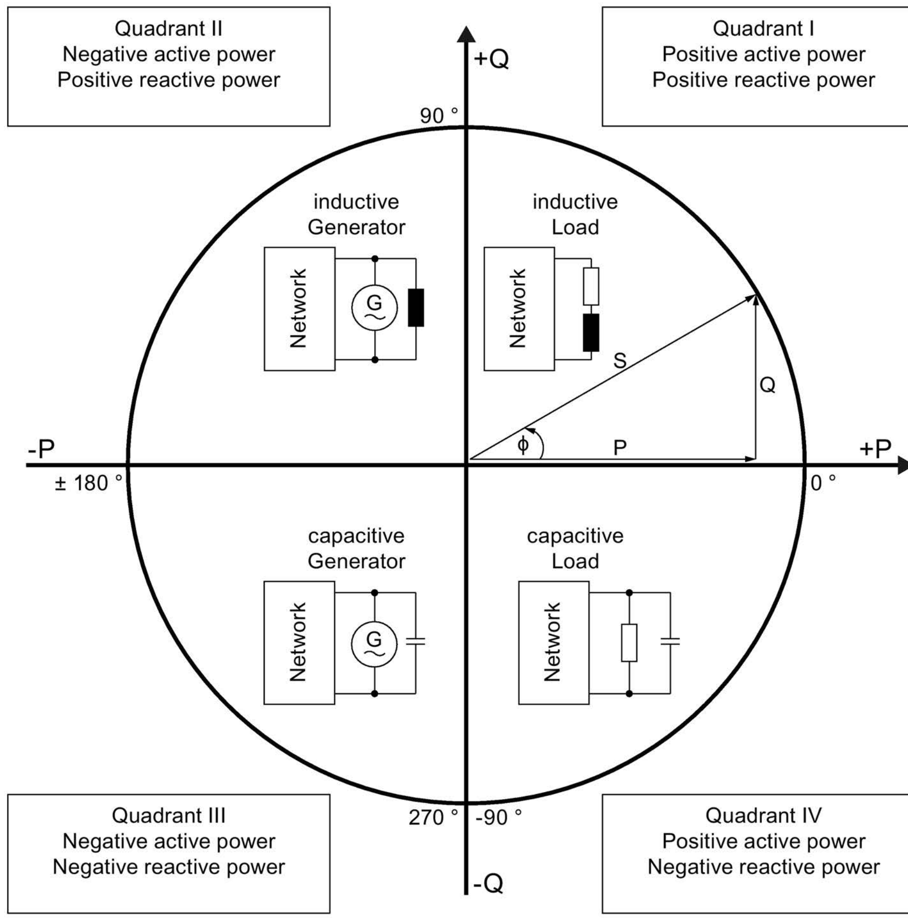

Figure 6-4 Quadrant in the quality bits

6.3 Reading measured values from user data cyclically

Requirement

- STEP 7 is open.
- AI Energy Meter 480VAC ST is configured.

Scaling of measured values in the user data

Since the value range of 16-bit values is often smaller than the value range of the physical value, a scaling factor is supplied together with the basic value in the user data for the respective measured or calculated values. You determine the actual value of the measured variable with the following formula:

Actual value of measured quantity = measured value in the user data x $10^{\text{scaling factor}}$

Procedure

To read measured values from the user data cyclically, proceed as follows:

1. Read the relevant measured value from the input data.
2. Observe the scaling factor at scaled measured values and convert the read measured value using the scaling factor.

Example

The user data variant 254 (FE_H) "Total power L1L2L3" is configured on the AI Energy Meter 480VAC ST. The measured value for "Current L1" should be read.

Table 6- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-
2 ... 3	Current L1	UINT	1 mA	0 … 65535	66007
4 ... 5	Current L2	UINT	1 mA	0 … 65535	66008
6 ... 7	Current L3	UINT	1 mA	0 … 65535	66009
:	:	:	:	:	:
24	Scaling current L1	USINT	-	0 ... 255	-
25	Scaling current L2	USINT	-	0 ... 255	-
26	Scaling current L3	USINT	-	0 ... 255	-
:	:	:	:	:	:
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

In the user data variant FE_H (254) the measured value for the current L1 is stored in Byte 2 + 3. The current is supplied by the module as a 16-bit-fixed-point number in the value range from 0 to 65535 in the unit 1 mA. In addition the scaling factor for the current L1 has to be considered additionally. The module supplies the related scaling factor in Byte 24.

The actual value for current L1 is calculated as follows:

Actual value for current L1 = Current L1 x $10^{\text{Scaling current L1}}$

Basics for reading measured values (Page 37)

6.4 Read measured value from a measured value data record

Introduction

To read measured values of a measured value data record, use the RDREC instruction. The read values are stored in a PLC variable with user-defined data type (UDT).

You can find more information on this in the STEP 7 documentation, under the keyword "RDREC".

Requirement

- STEP 7 is open.
- AI Energy Meter 480VAC ST is configured.

Procedure

1. In STEP 7 create a user-defined data type with the structure of the data record to be read.
2. Insert the number of structural elements, which corresponds to the number of entries contained in the measured value data record.
3. Insert the RDREC instruction in the user program.
4. Configure the RDREC instruction as follows:
   - ID: Hardware identifier or start address of the Energy Meter (depending on the CPU used).
   - INDEX: Number of measured value data record whose entries are read.
   - MLEN: Length of the measured value data record in bytes. "0" if all the entries are to be read.
   - RECORD: Target range for the read data record Length depends on MLEN.
5. Call the RDREC instruction with REQ = 1.

Result

The values from the measured value data record were transferred into the target data area.

Basics for reading measured values (Page 37)

Energy counters 7

7.1 How the energy meter works

Introduction

The AI Energy Meter 480VAC ST provides 42 energy counters that detect both line-based and phase-based energy values.

- Active energy (total, outflow, inflow)
- Reactive energy (total, outflow, inflow)
- Apparent energy (total)

How energy recording works

Based on the measured currents and voltages and the calculation cycle the Energy Meter calculates the active, reactive and apparent energy. The active, reactive and apparent energies are updated in each calculation cycle.

Retentivity

All the counter states of the module are stored retentively in the Energy Meter. After an interruption (e.g. Power System Off → Power System On), the energy counting resumes with the retentively stored values.

Configuring

You configure the following settings for the energy counters:

- Activation of the gate for the energy counter

  The gate allows you to start and stop the counters via output data (DQ bit). If you deactivate the gate, the count starts immediately when the Energy Meter is switched on.

- Modes of the energy counters

  The energy counters count either infinitely or periodically. For periodic counting, the adjustable full-scale values are 10^3, 10^6, 10^{12} and 10^{15}. When the full-scale value is exceeded, the energy counter begins again at 0. At the same time the overflow counter is increased by 1 (see Resetting energy counters and overflow counters (Page 54)).

The settings apply to the energy counter of all phases.

Changing properties in RUN

You can change the following properties of energy counters in runtime:

- Enable / disable energy counter
- Reset energy counter
- Set initial values for the energy counter
- Change the mode of the energy counter

Automatic reset of the energy counter

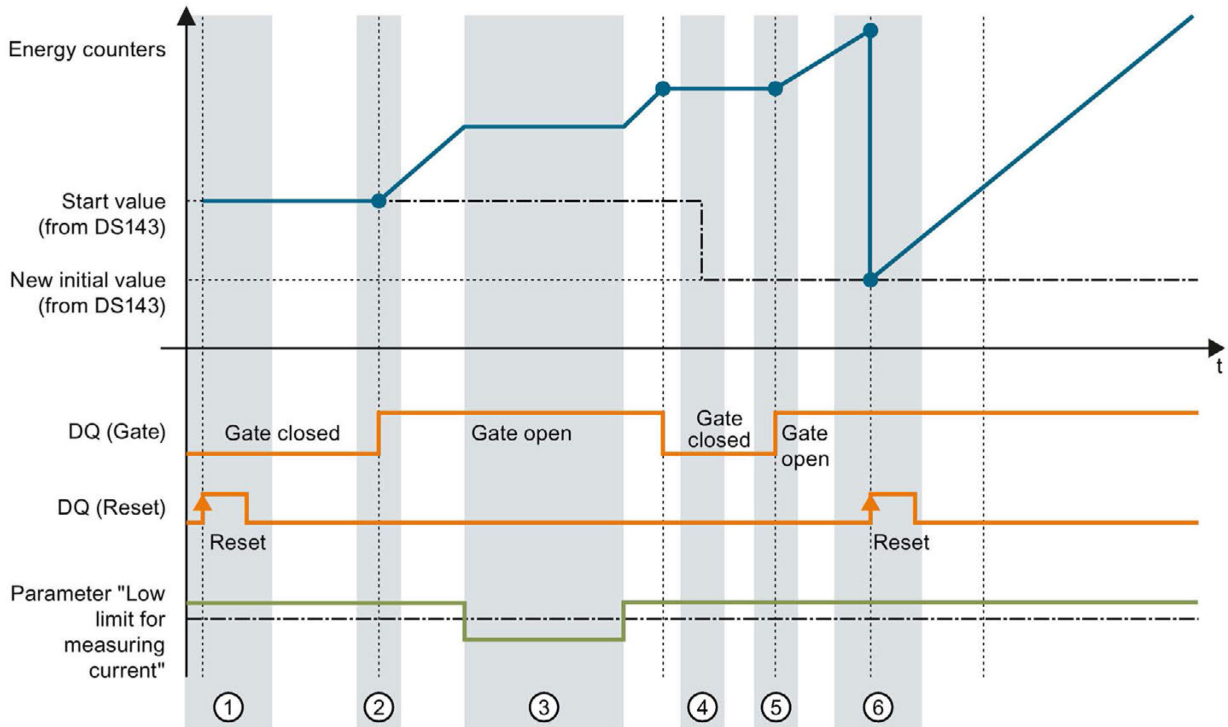
The energy counters are automatically reset to "0" when parameter settings relevant to the energy counter are changed. In the case of phase-specific changing of parameter settings relevant to the energy counter only the energy counters of the respective phases are reset.

Changing of the following parameters results in resetting of the energy counters:

- Measurement type or range
- Current transformer (primary current/secondary current)
- Voltage transformer (primary voltage/secondary voltage)
- Direction of current
- Full-scale value for energy counter
- Mode of the energy counter (infinite / periodic)

Example

The following figure shows the effect of initial value, reset and start/stop parameters with activated gating using the energy counter as an example:



① The counter is reset to the value specified in the configuration. The gate is closed. The counter does not count.

② The gate is opened via the control byte 1 in the output data of the user data variant. The counter counts.

③ The configured current low limit has been violated. The counter does not count.

④ The gate is closed. The counter does not count. A new start value is written to the measured value data record 143 with the WRREC instruction.

⑤ The gate is opened again via the control byte 1 in the output data of the user data variant. The counter counts with the new start value.

⑥ The counter is reset via the control byte 1 in the output data of the user data variant. The counter counts from the new start value that was transferred via the measured value data record 143.

See also

Evaluate energy counter and overflow counter (Page 53)

7.2 Configuring counters

Overview

You can configure the energy counters of the AI Energy Meter 480VAC ST as follows:

- Activate / Deactivate
- Start / stop counters using gate
- Set and reset start value

Energy counter gate

You have the option of starting and stopping the energy counter using the gate. To this purpose you have to:

- Select the "Enable gate control for the energy counter" parameter in the configuration of the AI Energy Meter 480VAC ST.
- Set the DQ bit for the "counter gate" in the user data in Control byte 1 of the output data (Bit 6 in Control byte 1).

The "Enable gate control for the energy counter" parameter and the DQ bit for the "counter date" behave like the parallel connection of contacts.

Gate enabled: Gate "open" if DQ = "1"

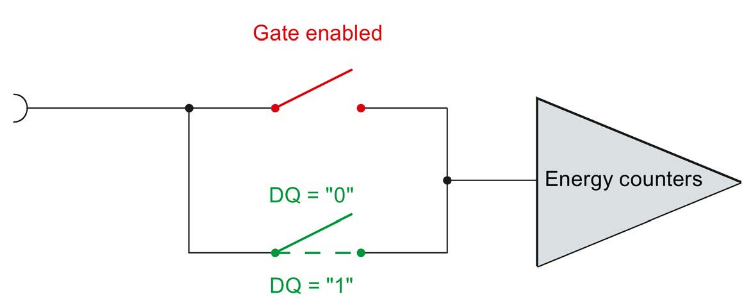


Figure 7-1 Gate enabled

If you deselect the "Enable gate control for the energy counter" parameter in the configuration of the AI Energy Meter 480VAC ST, the energy counters operate independently of the DQ bit as long as the current value lies above the configured "Low limit for measuring current".

Gate disabled: Gate is always "open" (signal path closed)

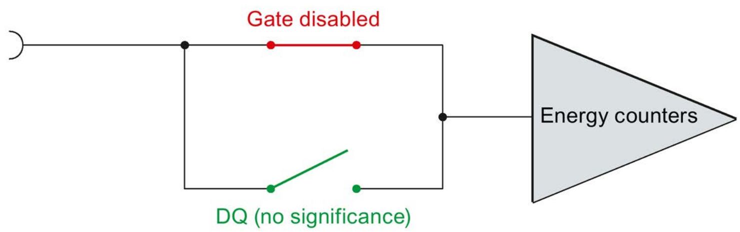

Figure 7-2 Gate disabled

Set and reset start value

The counters can be set to their start value via the output data of each user data variant. With energy counters, you have to reset the bit of the energy counter in control byte 2 of the data record 143.

You can reset each energy counter to the start value or also specify a new start value via the data record 143. You define the moment for updating of the start values in the data record 143 and in Control byte 1 in the user data. Start values are either applied immediately or after a reset bit has been set from 0 to 1.

You can find a detailed description for this in section Resetting energy counters and overflow counters (Page 54).

7.3 Evaluate energy counter and overflow counter

Evaluate energy counter and overflow counter

The energy counters are evaluated by

- Using the input data of the user data variants for energy
  - User data variant "Total energy L1 L2 L3" (ID 249 or $F9_H$)
  - User data variant "Energy L1" (ID 248 or $F8_H$)
  - User data variant "Energy L2" (ID 247 or $F7_H$)
  - User data variant "Energy L3" (ID 246 or $F6_H$)
- Using the input data of the user-defined user data variant with the use of the respective measuring value IDs for energy counters
- By reading data records
  - "Data record for basic measured values (DS 142)" for evaluation of the total energies L1 L2 L3.
  - "Data record for energy counter (DS 143)" for evaluation of the phase-specific energy.
  - "Data record for phase-specific measured values L1 - L3 (DS 147 - 149) for evaluation of the phase-specific energies.

The overflow counters are evaluated by:

- Using the input data of the user-defined user data variant with the use of the respective measuring value IDs for overflow counters
- Reading the "Data record for energy counter (DS 143)".

Evaluate measured values

The evaluation of measured values via the input data of user data variants and reading of data records with the RDREC instruction is described in the section Reading and processing measured values (Page 37).

7.4 Resetting energy counters and overflow counters

Introduction

At the beginning of a new work order, it may be useful to reset the energy and overflow counter of the Energy Meters Resetting here means setting the energy counters to their start values and resetting the overflow counters to 0.

The following sections describe how you

- Reset energy counters via the outputs of the user data.
- Reset energy counters and overflow counters via data record 143.

See also

Structure for energy counters (DS 143) (Page 61)

7.4.1 Reset energy counters via user data

Introduction

Due to the differing lengths of the output data resetting of the energy counters depends on the configured module version.

If you use module versions with 12 bytes of output data, you can

- Reset energy counters for **all** phases separately by active, reactive and apparent energy.
- Reset energy counters for each **individual** phase separately by active, reactive and apparent energy.

If you use the module version with 2 bytes output data, you always reset **all** the energy counters simultaneously.

Procedure at module version with 12 bytes of output data

Resetting energy counters for all 3 phases

1. Select the categories of energy counter that you want to reset in byte 2.
   - Set bit 5 for active energy counters.
   - Set bit 6 for reactive energy counters.
   - Set bit 7 for apparent energy counters.

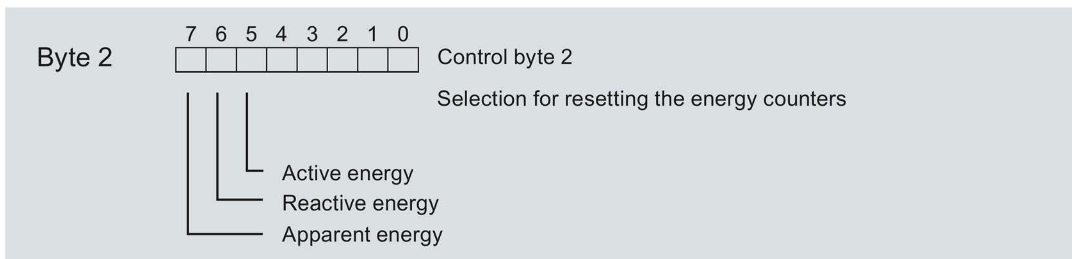

Figure 7-3 Selection of energy counters

2. Set the reset bit (bit 7) in byte 1.

   If there is an edge change of the reset bit for energy counters from 0 to 1, the module resets all energy counters that you previously selected in byte 2.

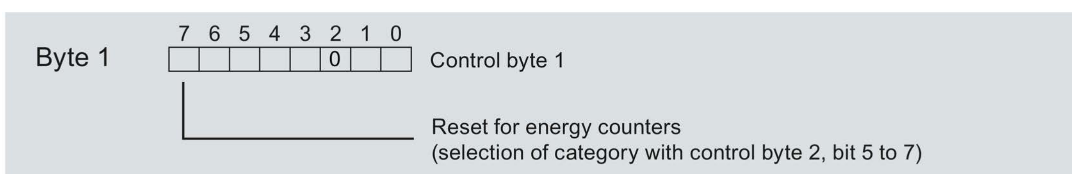

Figure 7-4 Reset bit for energy counters

Resetting energy counters for phase-specific measurement

You can also reset the energy counters on a phase-specific basis using the output data.

Follow the procedure for "Resetting energy counters for all 3 phases" as applicable.

1. Select the categories of energy counter that you want to reset on a phase-specific basis.
   - Set the bits for the phase 1 energy counters in byte 7.
   - Set the bits for the phase 2 energy counters in byte 9.
   - Set the bits for the phase 3 energy counters in byte 11.
2. Set the reset bit (bit 7)
   - in byte 6 for phase 1
   - in byte 8 for phase 2
   - in byte 10 for phase 3

If there is an edge change of the phase-specific reset bit for energy counters from 0 to 1, the module resets the energy counters for the given phase:

Procedure at module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, you always reset **all** the energy counters simultaneously.

Set the reset bit (Bit 7) in Control byte 1 from 0 to 1 through an edge change.

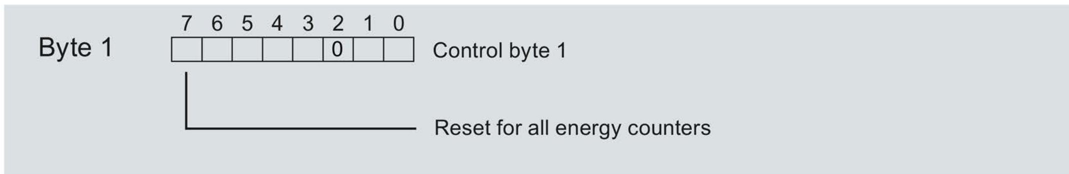

Figure 7-5 Resetting the energy counters at module version with 2 bytes of output data

Start values

After the reset the energy counters count with the specified start values (default = 0). You can change the start values for the energy counters via data record DS 143, see section Resetting energy counters and overflow counters via data record DS 143 (Page 56).

You can also reset the counters on a phase-specific basis by active, reactive and apparent energy using data record 143.

7.4.2 Resetting energy counters and overflow counters via data record DS 143

Introduction

At all the module versions you can reset the energy counters and their overflow counters via the data record DS 143. Resetting is possible for:

- Energy counters and overflow counters for each **individual** phase separately by active, reactive and apparent energy.

Procedure for all module versions using data record DS 143

1. In Control byte 1 of the DS 143 set the reset bit (Bit 2) to 1 and Bit 0 to 1 for the overflow counter.
2. In Control byte 2 of the DS 143 set the category of the energy counters (active, reactive, apparent energy) to 1 via Bits 5 to 7.
3. In Control byte 1 of the DS 143 set Bit 7 for the moment of application of the start values of the desired energy counters:
   – Bit 7 to 0, if the start value are to be applied immediately after the transfer of the data record
   – Bit 7 to 1, if the start value are only to be applied after the reset bit has been set in the output data of the user data.

In Control byte 1 of the DS 143 set the reset bit (Bit 2) to 1 and Bit 0 to 1 for the overflow counter.

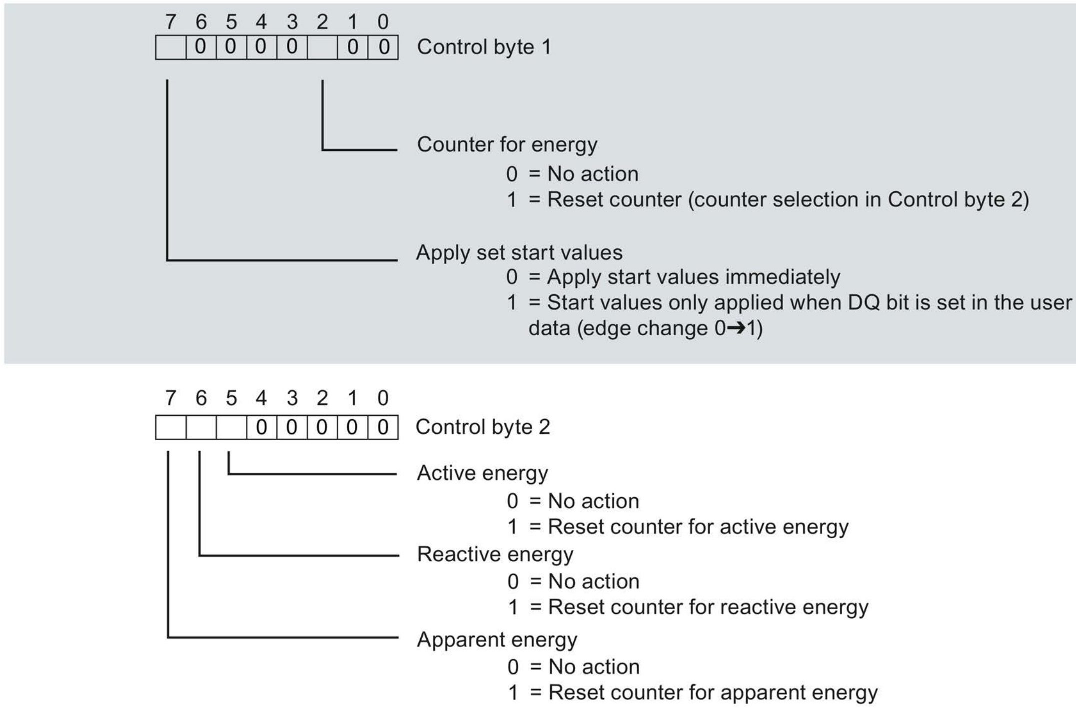

Figure 7-6 Energy counter control information DS 143

4. Transfer the data record with the WRREC instruction.

Start values

You specify the moment for the application of the start values in Control byte 1 via Bit 7. After the reset the energy counters count with the specified start values (default = 0) and the overflow counters begin again with 0. You can change the start values for the energy counters via data record DS 143.

7.4.3 Example for energy counters and overflow counters via data record DS 143

Introduction

Before you can transfer the data record DS 143 to the CPU you have to create a user-defined PLC data type in your user program that has an identical structure to data record DS 143.

Procedure

1. Create a PLC data type that has an identical structure to data record DS 143.

   Detailed information on the structure of data record 143 is available in section Structure for energy counters (DS 143) (Page 179).

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-
3	Control byte 2 - L1	BYTE	Bit string		
4	Control byte 1 - L2	BYTE	Bit string		
5	Control byte 2 - L2	BYTE	Bit string		
6	Control byte 1 - L3	BYTE	Bit string		
7	Control byte 2 - L3	BYTE	Bit string		
8...15	Active energy inflow (initial value) L1	LREAL	Wh	See Section Structure for energy counters (DS 143) (Page 179)	61180
16...23	Active energy outflow (initial value) L1	LREAL	Wh		61181
:	:	:	:	:	:
162...165	Operating hours counter L2 (initial value)	REAL	h	See Section Structure for energy counters (DS 143) (Page 179)	65506
166...169	Operating hours counter L3 (initial value)	REAL	h		65507

2. Create a user-defined PLC data type and allocate the values of the data record in a DB or instance DB.

   Byte 0 and byte 1:

   Enter the value 01_H in Byte 0 and the value 00_H to Byte 1.

   Byte 2 ... byte 7: Control bytes for energy and overflow counter

   In the control byte for the respective phases, specify which energy and overflow counters you want to reset.

   The control bytes specify for each phase (L1, L2, L3) separately if and which energy meter values are to be reset.

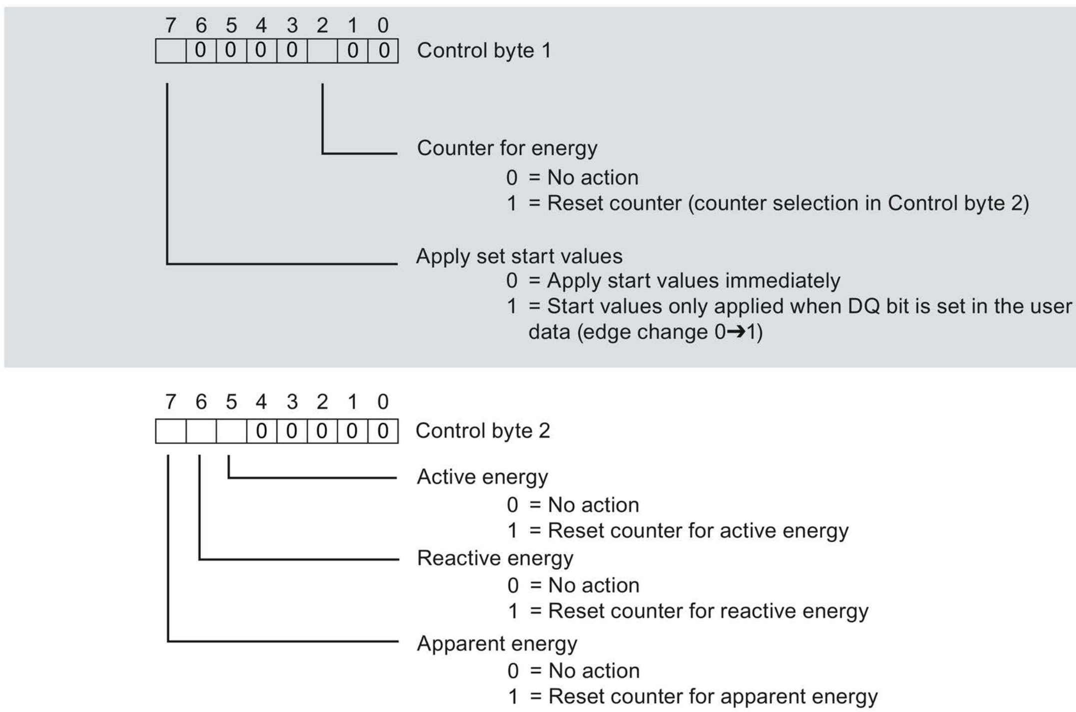

Figure 7-7 Control information DS 143 for energy and overflow counter

Byte 8 ... byte 127: Start values for the individual energy meters

The start values for energy counters in data record 143 are 64-bit floating point numbers. This corresponds to the data type LREAL in S7-1200 and in S7-1500.

Byte 128 ... byte 157: Initial values for overflow counters

The initial values for overflow counters in data record 143 are 16-bit integers. This corresponds to the data type UINT in S7-1200 and in S7-1500.

3. Write the data record to the AI Energy Meter 480VAC ST module using the "WRREC" instruction.

   The input parameters must be allocated as follows:

   – REQ: A new write job is triggered if REQ = TRUE.
   – ID: Hardware identifier or start address of the Energy Meter (depending on the CPU used).
   – INDEX: The data record number: 143
   – LEN: The maximum length of the data record: 170
   – RECORD: A pointer to the data area in the CPU which includes data record 143.

Note

If you want to write or read several AI Energy Meter 480VAC ST at the same time, keep in mind the maximum number of active jobs in communication with SFB52/SFB53.

7.5.1 Structure for energy counters (DS 143)

Energy meter data record 143 for different actions

The energy meter data record 143 includes all energy meters available on the module phase-by-phase. The data record can be used for different actions:

- Reset the energy counter to user-specific value (e.g. "0")
- Reading the current values of the energy counters
- Reading the overflow counters
- Reading the operating hours

158...161	Operating hours counter L1 (initial value)	REAL	h	During reading: 0...3.4x10^{38} During writing: 0...10^{9}	65505
162...165	Operating hours counter L2 (initial value)	REAL	h		65506
166...169	Operating hours counter L3 (initial value)	REAL	h		65507

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

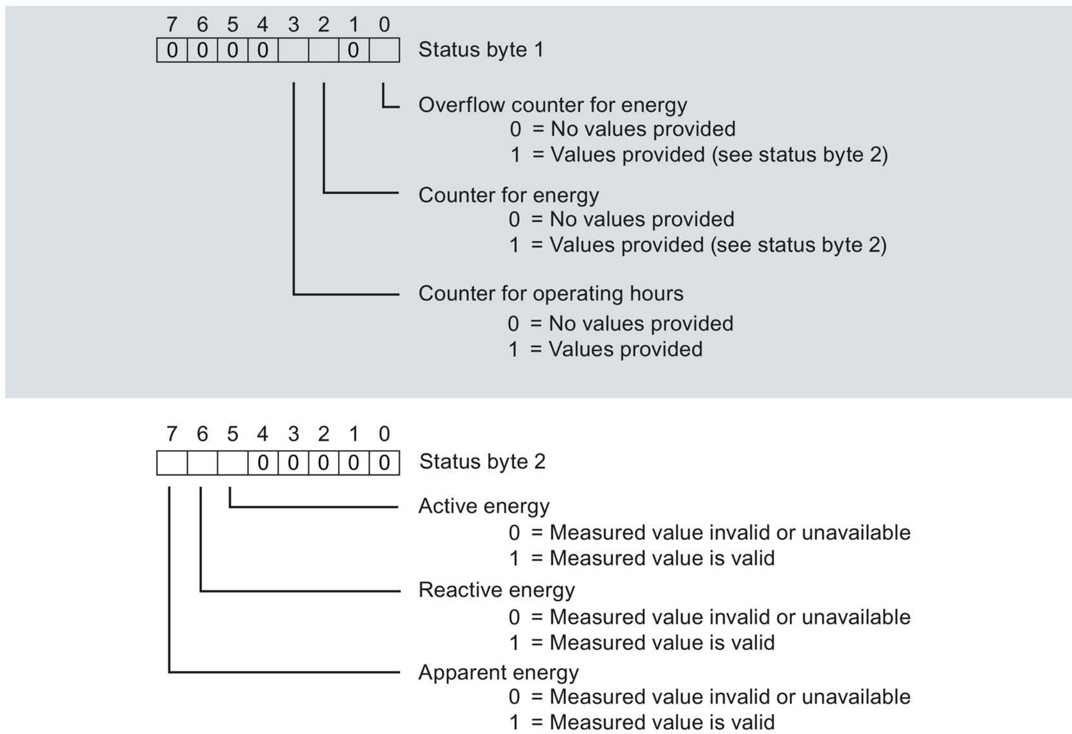

Figure 7-8 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy counters, overflow counters and operating hours counter. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to reset and the time at which counters are reset.
- In Control byte 2 you determine which energy counters and which overflow counters you want to reset.

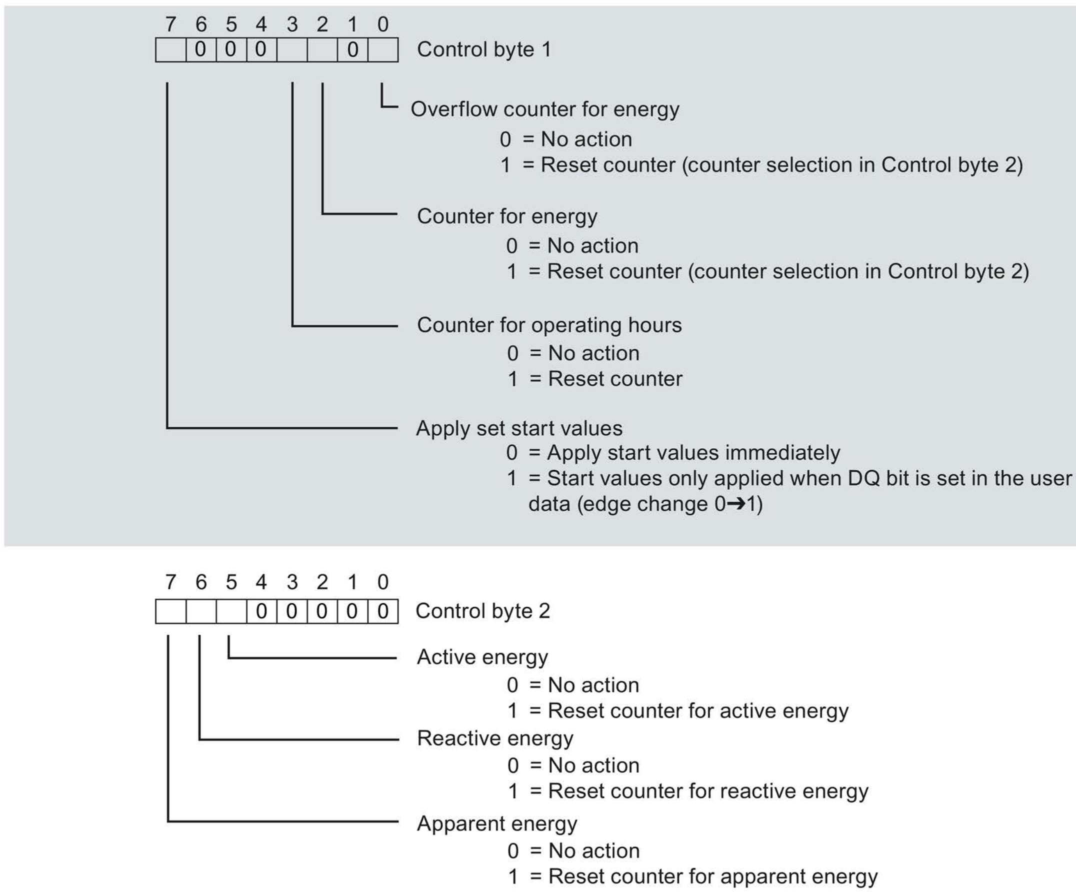

Figure 7-9 Control information DS 143 (write access)

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the measured value data record 143:

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E1	01	Reserved bits are not 0.	Check Byte 2...7 and set the reserved bits back to 0.
DF	80	E1	39	Incorrect version entered.	Check Byte 0. Enter a valid version.
DF	80	E1	3A	Incorrect data record length entered.	Check the parameters of the WRREC instruction. Enter a valid length.
DF	80	E1	3C	At least one start value is invalid.	Check Bytes 8...103 and Bytes 158...169. The start values may not be negative.
DF	80	E1	3D	At least one start value is too large	Check Bytes 8...103 and Bytes 158...169. Observe the ranges of values for start values.

7.5.2 Structure of the control and feedback interface for DS 143

Introduction

Bytes 2 to 7 of data record 143 form the phase-based control and feedback interface for the measured value data record of the energy counter.

- Bytes 2 and 3: Control and feedback interface for phase 1
- Bytes 4 and 5: Control and feedback interface for phase 2
- Bytes 6 and 7: Control and feedback interface for phase 3

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

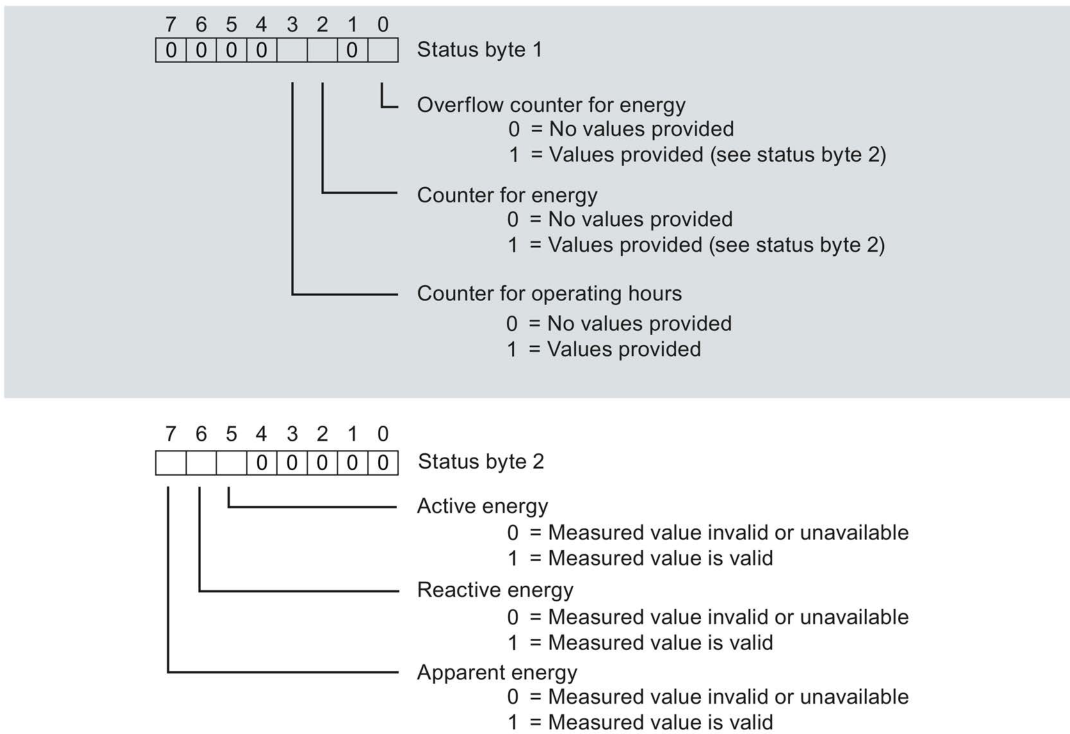

Figure 7-10 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy counters, overflow counters and operating hours counter. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to reset and the time at which counters are reset.
- In Control byte 2 you determine which energy counters and which overflow counters you want to reset.

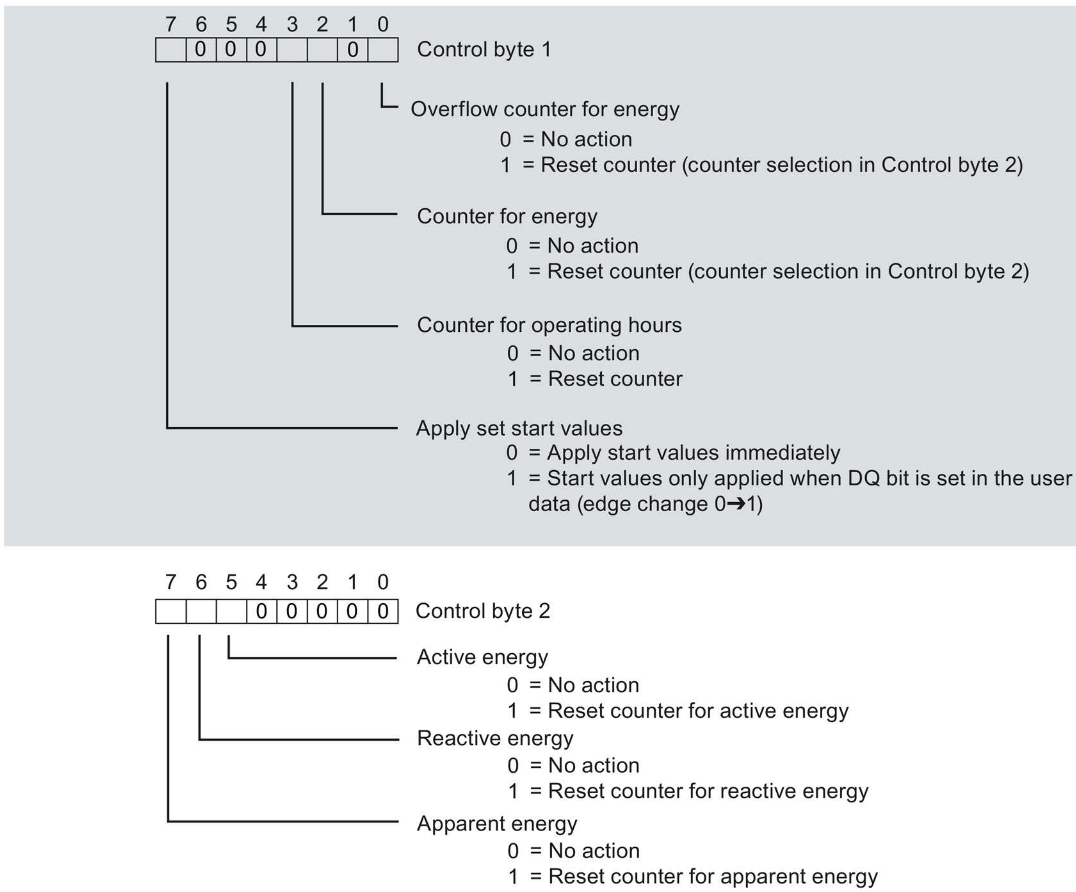

Figure 7-11 Control information DS 143 (write access)

Operating hours counter 8

8.1 How the operating hours counter works

Introduction

The AI Energy Meter 480VAC ST provides one operating hours counter for each phase, which counts the operating hours of the load connected to a phase when there is current greater than the configurable "Low limit for measuring current". The operating hours counter for the entire module is calculated from the sum of the operating hours of the individual phases. The operating hours counter has a value range from 0 to 3.4×10^{38}. The values are stored retentively in the module and can be read via the data record 143 (energy counter data record) and data record 150 (measured value for extended measuring and status values).

Configuring

You configure the following operating hours counter settings in STEP 7:

- Activation of the gate for the operating hours counter

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Open / close operating hours counter [1]	Closed	Module version starting at 2 bytes of output data
Set initial value	0	Data record 143
Reset operating hours counter	0	Module version starting at 2 bytes of output data [2]

[1] Effective only with enabled gate

[2] Only module-wide resetting is supported in module version "2 I / 2 Q".

Measured value data record for advanced measurement and status values (DS 150) (Page 194)

8.2 Reset operating hours counters

Introduction

At the beginning of a new work order, it may be useful to reset the operating hours counters of the Energy Meter. Resetting here means that the operating hours counters are reset to their start value.

The following section describes how you

- Reset operating hours counters via the outputs of the user data.
- Reset operating hours counters via data record 143.

8.2.1 Reset operating hours counters via user data

Introduction

Due to the differing lengths of the output data resetting of the operating hours counters depends on the configured module version.

If you use module versions with 12 bytes output data, you can

- Reset operating hours counters for **all** phases.
- Reset operating hours counters for each **individual** phase.

If you use the module version with 2 bytes of output data, you always reset **all** the operating hours counters simultaneously. Differentiated resetting of the counters by phases is only possible via data set DS 143 for this module version, see section Structure for energy counters (DS 143) (Page 179).

Procedure for module version with 12 bytes and 2 bytes of output data

Set the reset bit (Bit 5) in Control byte 1 from 0 to 1 through an edge change.

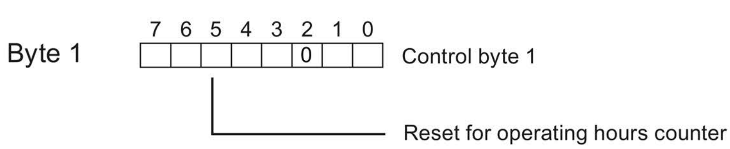

Figure 8-1 Resetting the operating hours counters for module version with 12 bytes and 2 bytes of output data

Resetting operating hours counters on a phase-specific basis

You can also reset the operating hours counters on a phase-specific basis using the output data. Follow the procedure for "Resetting operating hours counters for all 3 phases" as applicable.

Set the reset bit (bit 5):

- in byte 6 for phase 1
- in byte 8 for phase 2
- in byte 10 for phase 3

Start values

After the reset the operating hours counters count with the specified start values (default = 0). You can change the start values for the operating hours counters via data record DS 143, see section Structure for energy counters (DS 143) (Page 179).

8.2.2 Resetting operating hours counters via data record DS 143

Introduction

At all the module versions you can reset the operating hours counters via the data record DS 143. Resetting is possible for:

- Operating hours counters for each **individual** phase.

Procedure at all module versions via data record DS 143

1. Set the reset bit (Bit 3) in Control byte 1 to 1.

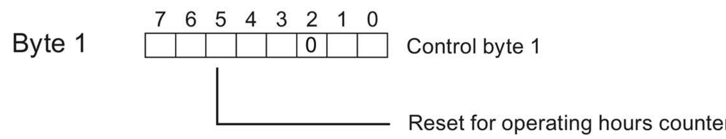

Figure 8-2 Resetting operating hours counters with data record 143

2. In Control byte 1 set Bit 7 for the moment of application of the start values:
   - Bit 7 to 0, if the start value are to be applied immediately after the transfer of the data record
   - Bit 7 to 1, if the start value are only to be applied after the reset bit has been set in the output data of the user data.

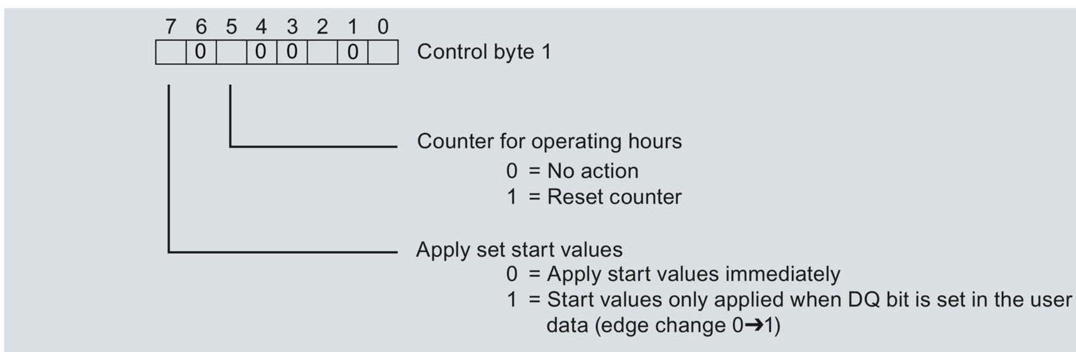

Figure 8-3 Operating hours counter control information DS 143

Start values

You specify the moment for the application of the start values in Control byte 1 via Bit 7. After the reset the operating hours counters count with the specified start values (default = 0). You can change the start values for the operating hours counters via data record DS 143.

Limit monitoring 9

9.1 How limit monitoring works

Introduction

The AI Energy Meter 480VAC ST supports monitoring of parameterizable low **or** high limits for up to 16 analog measured or calculated variables.

You can also define multiple limits for each measured or calculated variable, in order to define a high or low value range.

The measured value data record 150 returns the current status limit violations and per limit one counter that displays the number of limit violations. In addition, a hardware interrupt may be generated for each limit violation.

The status of the limit violations can also be evaluated in the user data variant 240 ($F0_H$) or via the user-defined user data variant via the measured value ID 65509.

Benefits

With activated limit monitoring you can already detect any irregularities in the measured value acquisition already in field level.

Retentivity

All the counter states of the module are stored retentively in the Energy Meter. After an interruption (e.g. Power System Off → Power System On), the counting resumes with the retentively stored values.

Configuring

You configure the following limit monitoring settings in STEP 7:

- Measured variable that is to be monitored.
- Activate / Deactivate limit monitoring.
- High or low limit values.
- Delay time and hysteresis for each limit.
- Activate / Deactivate hardware interrupts at limit violation.
- Measured value that is subject to limit monitoring.

Hardware interrupt at a limit violation

The hardware interrupt provides the following information:

- Measured value ID of the monitored measured or calculated variable
- Number of the limit (0 = Limit 1. 15 = Limit 16)
- Information on whether limit was exceeded or fallen below

For more detailed information, refer to section Hardware interrupts (Page 101).

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Enable/disable monitoring per limit[1]	Disabled	Module version with 12 bytes of output data
Reset number of total limit violations	0	Module version starting at 2 bytes of output data

[1] Effective only with enabled gate

9.2 Influence of hysteresis and delay time on limit monitoring

Delay time and hysteresis

In order to prevent the triggering of limit violations with small fluctuations, you have the following configuration options in STEP 7:

- Delay time in seconds (0 to 10 s)

  With the delay time, you filter faults and thereby prevent limit value monitoring from triggering too frequently. The limit violation is counted only when the limit violation is present for longer than the configured delay time. The deceleration time is also taken into consideration during outgoing of the limit violation.

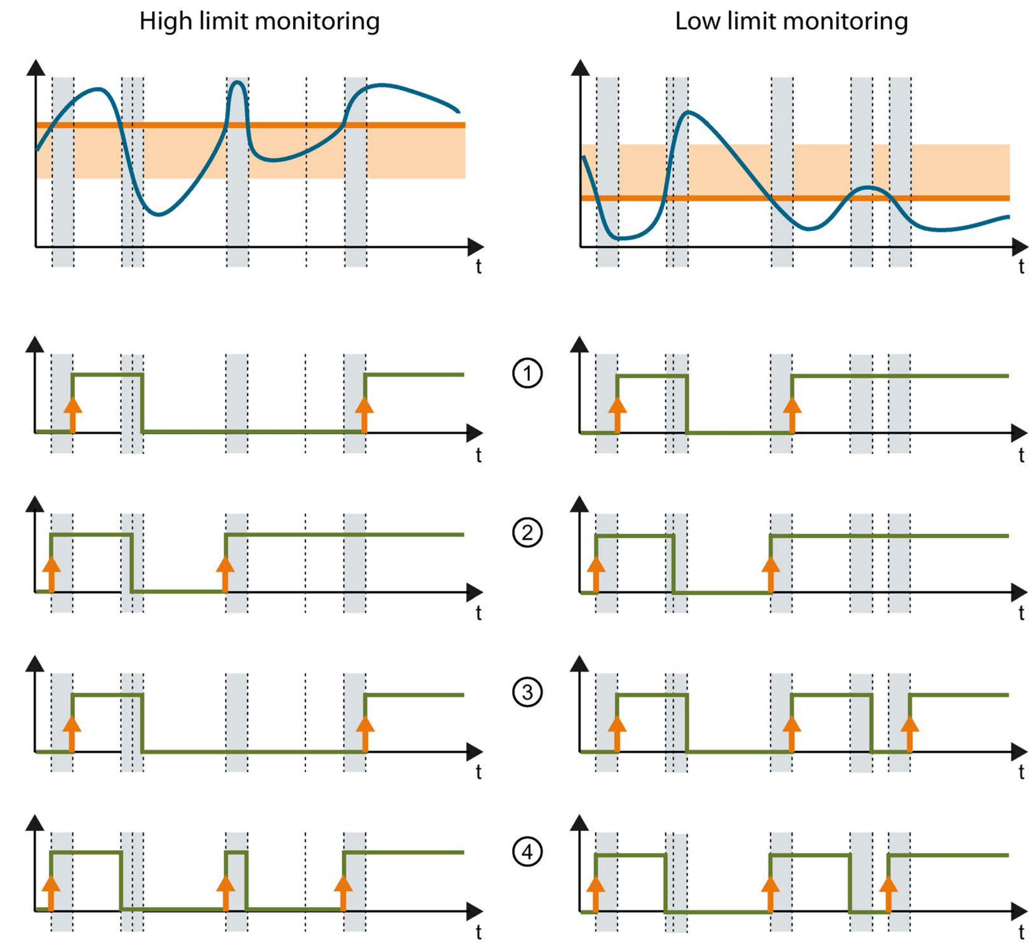
- Hysteresis as a percentage (0 to 20%)

  With the hysteresis, you suppress fluctuations around the limit. The hysteresis is a tolerance range that you define as a percentage deviation of the configured limit. The limit violation is considered to be corrected only when the monitored value leaves the tolerance range.

Note

You can get information about transient underflow and overflow from the calculation of minimum (Page 186) and maximum values (Page 184) of selected measured variables.

The following figure shows the value-over-time for two measured values using the example of a high and low limit as well as the influence of hysteresis and delay time on the counting of the limit violations.



- Configured limit.
- Configured delay time. Is taken into consideration during coming and going.
- Hysteresis range. Only considered for outgoing.
- Value-over-time for which the limit is monitored.
- Edge change. Counter for limit violations is incremented by 1. If parameterized, a hardware interrupt is triggered.
- Signal wave
- ① Limit monitoring with hysteresis and delay time
- ② Limit monitoring with hysteresis, but without delay time
- ③ Limit monitoring without hysteresis, but with delay time
- ④ Limit monitoring without hysteresis and delay time

Figure 9-1 Influence of hysteresis and delay time on the limit

How limit monitoring works (Page 72)

Minimum and maximum values (Page 82)

9.3 Reset, activate and deactivate counters for limit violation

Introduction

At the beginning of a new work order, it can be useful to reset or indeed also enable/disable the counters for limit violations of the Energy Meter.

Resetting here means that the counters for limit violations are reset to 0.

Due to the differing lengths of the output data resetting of the counters for limit violations depends on the configured module version.

Resetting at module version with 12 bytes of output data

1. Select the counters for limit violations that you want to reset in control bytes 3 and 4; see "Enabling/disabling the counters for limit violations".
2. In control byte 1, set the rest bit (bit 3) with an edge change from 0 to 1; see "Resetting the counters for limit violations".

Resetting at module version with 2 bytes of output data

Set the reset bit (Bit 3) in Control byte 1 from 0 to 1 through an edge change. Resetting acts globally on all the configured counters for limit violation.

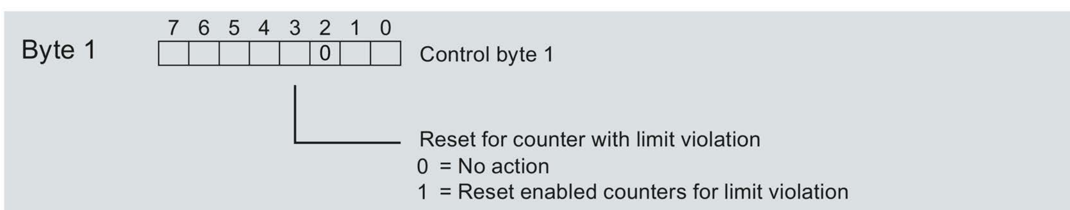

Figure 9-2 Resetting of the counters for limit violations

Activating / Deactivating counters for limit violations

Activating / Deactivating of the counters for limit violations is only possible for module versions with 12 bytes of output data.

Requirements: "Gate for limit value monitoring" was parameterized during configuration of the module using STEP 7 or by writing the data record DS 128.

Select the counters for limit violations that you want to activate / deactivate in Control bytes 3 and 4.

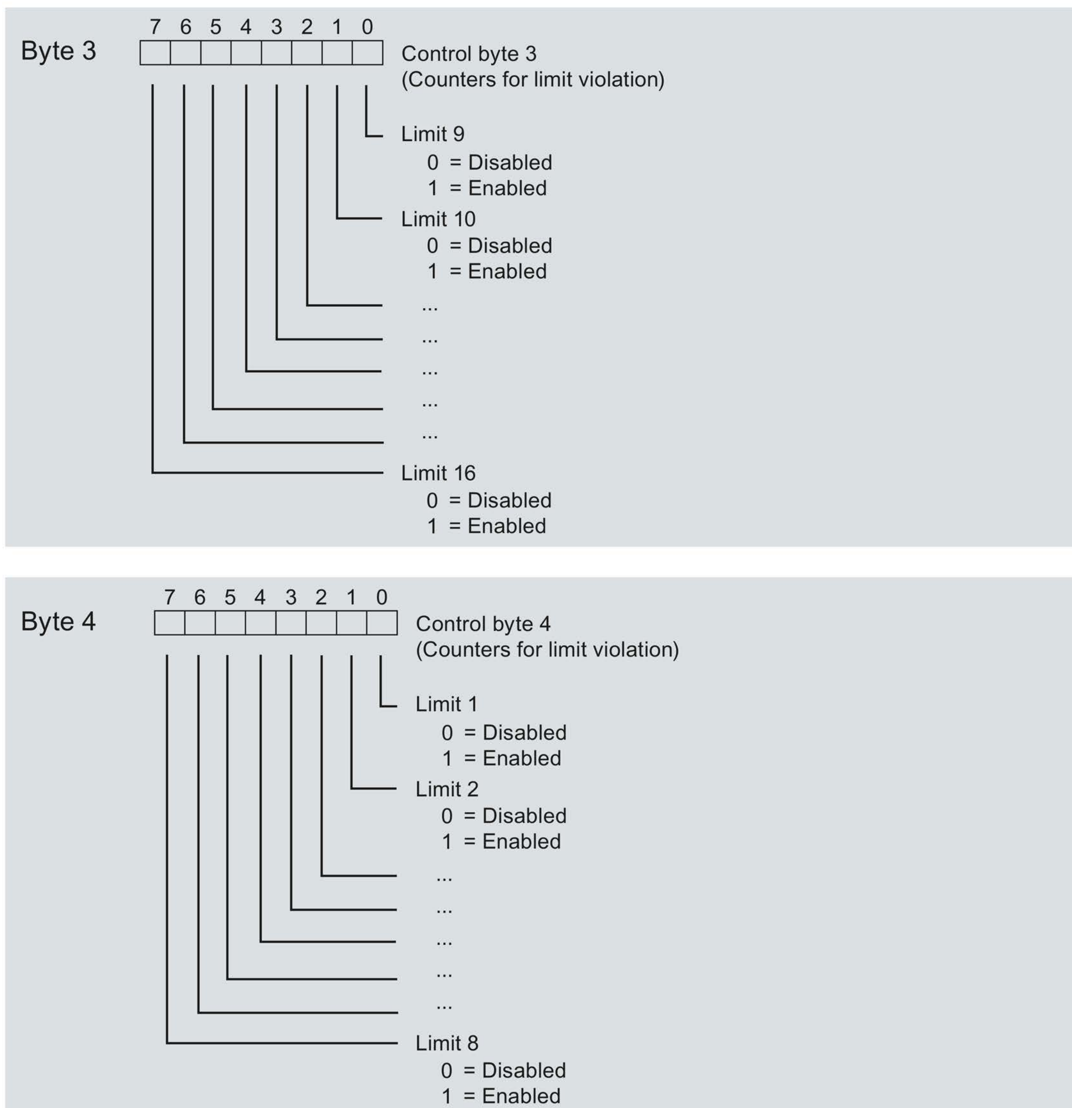

Figure 9-3 Activating / deactivating of the counters for limit violations

9.4 Measured variables for limit monitoring

The table below shows which measured variables are available for limit monitoring.

Measured value ID	Measured variables	Use for limit monitoring
1	Voltage UL1-N	Yes
2	Voltage UL2-N	Yes
3	Voltage UL3-N	Yes
4	Voltage UL1- L2	Yes
5	Voltage UL2- L3	Yes

Minimum and maximum values 10

10.1 Minimum and maximum values

Introduction

The AI Energy Meter 480VAC ST determines the respective highest and lowest measured or calculated value for a series of measured and calculated values. The values are stored retentively in the module and can be read using measured value data records 144 and 145.

Benefits

Using the stored minimum and maximum values, for example, you can detect further irregularities in addition to limit monitoring.

Calculation of minimum and maximum values

Minimum and maximum values are only calculated for the phases in accordance with the configured connection type. Existing minimum and maximum values that have not been calculated are initialized with 0. If faults such as under or overcurrent occur during operation, new minimum and maximum values are calculated.

The measured and calculated values are initialized as follows during commissioning of the AI Energy Meter 480VAC ST so that the first calculation of minimum and maximum values supplies a plausible result:

- Maximum values for measured and calculated values: Minimum values
- Minimum values for measured and calculated values: Maximum values

Configuring

You configure the following settings in STEP 7:

- Enable calculation of minimum and maximum values

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Reset saved maximum values	0	Module version starting at 2 bytes of output data
Reset saved minimum values	0	Module version starting at 2 bytes of output data

Note

Automatic reset

If you change the parameters for current or voltage transformers, the minimum and maximum values are reset automatically to their initial values.

10.2 Resetting minimum and maximum values

Description

At the beginning of a new work order, it may be useful to reset the minimum and maximum values of the Energy Meter. Resetting means that the minimum and maximum values are reset to their initial values. Initial values are described, see section Measured value data record for maximum values (DS 144) (Page 184) and section Measured value data record for minimum values (DS 145) (Page 186).

As the output data differs in length, resetting the minimum and maximum values depends on the configured module version. If you use module versions with 12 bytes output data, you can

- Reset the minimum and maximum values for **all** phases.
- Reset minimum and maximum values for each **individual** phase.

If you use the module version with 2 bytes of output data, you always reset **all** the minimum and maximum values simultaneously.

Procedure at module version with 12 bytes of output data

Resetting the minimum and maximum values for all 3 phases.

1. Select the categories of minimum and maximum value that you want to reset in byte 2.
   - Set bit 0 for voltage and frequency.
   - Set bit 1 for current and power factor.
   - Set bit 2 for active power.
   - Set bit 3 for reactive power.
   - Set bit 4 for apparent power.

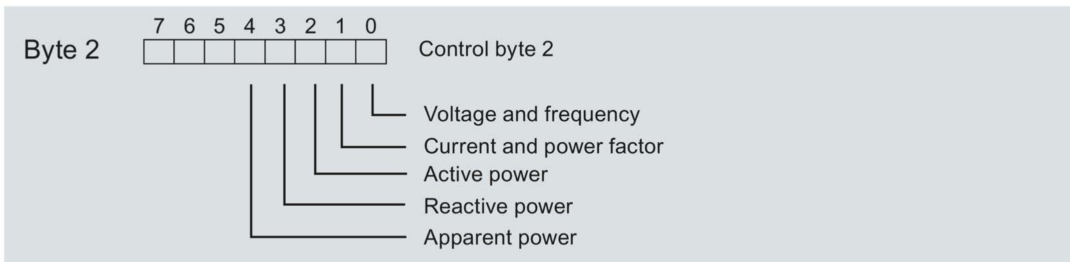

Figure 10-1 Selection of minimum and maximum value category

2. In byte 1, set reset bit 0 for minimum values or reset bit 1 for maximum values.
   If there is an edge change of the reset bits from 0 to 1, the module resets the selected minimum or maximum values for all 3 phases that you previously selected in byte 2.

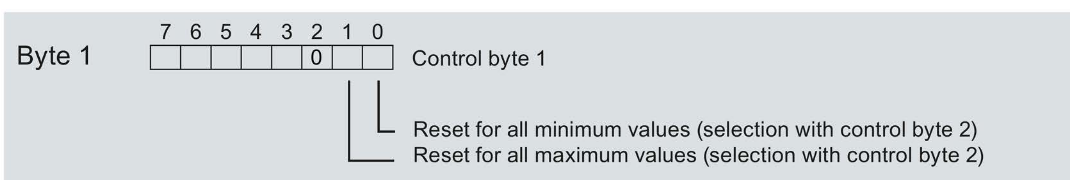

Figure 10-2 Reset bit for minimum and maximum values

Resetting minimum and maximum values for phase-specific measurement

You can also reset the minimum and maximum values on a phase-specific basis using the output data.

Follow the procedure for "Resetting minimum and maximum values for all 3 phases" as applicable.

1. Select the categories of minimum and maximum value that you want to reset on a phase-specific basis.
   – In byte 7, set the bits for the category of minimum and maximum values in phase 1.
   – In byte 9, set the bits for the category of minimum and maximum values in phase 2.
   – In byte 11, set the bits for the category of minimum and maximum values in phase 3.
2. Set the reset bit (bit 0 and bit 1) for minimum or maximum values.
   – in byte 6 for phase 1
   – in byte 8 for phase 2
   – in byte 10 for phase 3

If there is an edge change of the phase-specific reset bits from 0 to 1, the module resets the minimum or maximum values for the given phase.

Procedure at module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, you always reset **all** the minimum and maximum values simultaneously.

Set the reset bit (Bit 0 or Bit 1) in Control byte 1 from 0 to 1 through an edge change.

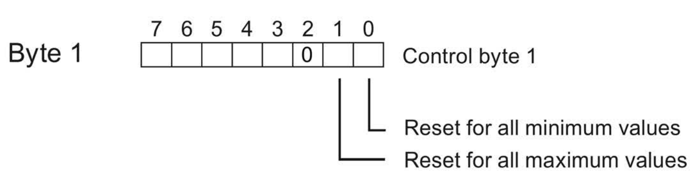

Figure 10-3 Resetting the minimum and maximum values at module version with 2 bytes of output data

Phase-based measured values 11

11.1 Phase-based measured values

Introduction

The AI Energy Meter 480VAC ST makes the measured values of individual phases available.

- Through the user data variants
  - Phase-specific measurement Phase L1 with user data variants 154 ($9A_H$) and 155 ($9B_H$)
  - Phase-specific measurement Phase L2 with user data variants 156 ($9C_H$) and 157 ($9D_H$)
  - Phase-specific measurement Phase L3 with user data variants 158 ($9E_H$) and 159 ($9F_H$)
- Via measured value data records
  - Phase-specific measurement for the phases L1, L2 and L3 with data record 142
  - Phase-specific measurement for phase L1 with data record 147
  - Phase-specific measurement for phase L2 with data record 148
  - Phase-specific measurement for phase L3 with data record 149

User data variants

Through the user data variants 154 ($9A_H$) to 159 ($9F_H$) you can evaluate the following measured values for each phase of an AC / three-phase network:

- Quality information
- Current and voltage
- Active, reactive and apparent power
- Active, reactive and apparent energy
- Power factor

You can find the structure of the user data variants in section Measured value data record for phase-based measured values L1 (DS 147) (Page 188).

Measured value data records

Through the measured value data records DS 142, DS 147, DS 148 and DS 149 you can evaluate the following measured values for each phase of an AC / three-phase network:

- Quality information
- Current and voltage
- Minimum current and minimum voltage
- Maximum current and maximum voltage
- Active, reactive and apparent power
- Minimum active, reactive and apparent power
- Maximum active, reactive and apparent power
- Active, reactive and apparent energy
- Minimum active, reactive and apparent energy
- Maximum active, reactive and apparent energy
- Power factor
- Minimum power factor
- Maximum power factor

You can find the structure of the measured value data records in section Measured value data record for phase-based measured values L1 (DS 147) (Page 188).

Parameters 12

12.1 Parameters

Parameters of the AI Energy Meter 480VAC ST (DS 128, DS 129, DS 130)

As a rule, the AI Energy Meter 480VAC ST is already integrated in the hardware catalog of STEP 7 (TIA Portal) or STEP 7 V5.5 or higher. In this case STEP 7 (TIA Portal) or STEP 7 V5.5 or higher checks the parameterized properties for plausibility during designing.

However, you can also assign parameters to the module using a GSD file and the configuration software of any provider. The module checks the validity of the configured properties only after the configuration has been downloaded. Note that some parameters depend on the selected connection type of the Energy Meter. For example in the connection type 1P2W for measurements in single-phase AC network it does not make sense to enter parameters for Phases 2 and 3 and they are also not checked by the system in this case.

The effective range of the parameters that can be set using a GSD file depends on the type of bus system used:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

In addition you can change the parameterized properties via the user program in RUN mode. When you assign parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records (see appendix Configuration via parameter data records (Page 112)). The following table summarizes all the configurable parameters.

Table 12- 1 AI Energy Meter 480VAC ST parameters

Parameters	Value range	Default setting	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Hardware interrupt	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics line voltage	• Disable • Enable	Disable	Yes	Module	Module
Connection type	• Disabled • 1P2W - 1-phase alternating current • 3x1P2W - 3x1 phase, 2 conductors each • 2P3W - 2 phases, 3 conductors • 3P4W - 3 phases, 4 conductors • 3P4W1 - 3 phases, 4 conductors, balanced load	3P4W - 3 phases, 4 conductors	Yes	Module	Module (only 1P2W, 3P4W, 3P4W1 and deactivated)
Voltage measuring range	• 100 V • 110 V • 115 V • 120 V • 127 V • 190 V • 200 V • 208 V • 220 V • 230 V • 240 V • 277 V	230 V	Yes	Module	Module
Line voltage tolerance [%]	• 1 ... 50 %	10 %	Yes	Module	Module
Line frequency	• 50 Hz • 60 Hz	50 Hz	Yes	Module	Module

Limit monitoring for limit	• Disable • Enable	Disable	Yes	Module	-
Measured variable for limit	• Measured value ID, see Table B-1	None	Yes	Limit	-
Gate for limit via DQ	• Disable • Enable	Disable	Yes	Channel/phase	-
Hardware interrupt for limit	• Disable • Enable	Disable	Yes	Channel/phase	-
Limit	• depending on the selected measured variable	0	Yes	Limit	-
Type of limit	• High limit • Low limit	High limit	Yes	Channel/phase	-

Parameters	Value range	Default setting	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Hysteresis for limit monitoring [%]	• 0 ... 200 [0.1%]	0%	Yes	Channel/phase	-
Delay time for limit monitoring [s]	• 0 ... 10 s	0 s	Yes	Channel/phase	-
Number of measured values for user data mapping	• 0 ... 64	0	Yes	Module	- (no user data mapping)
Measured variable	• Measured value ID, see Table B-1	None	Yes	Measured variable	- (no user data mapping)

12.2 Description of parameters

Hardware interrupt

Enable the hardware interrupt for the entire module here.

Diagnostics line voltage

Activate the diagnostics line voltage here. If there is no voltage or too little voltage at L1, the message "No supply voltage at L1" is output and a diagnostic interrupt is triggered.

Connection type

Specify the connection type you used for the Energy Meter here.

For more detailed information, refer to "Connection examples (Page 21)".

Voltage measuring range

Here you can set the voltage measuring range of the power supply system.

Line voltage tolerance

Monitoring the supply voltage based on this tolerance band is a positive or negative value.

Line frequency

Here you can set the line frequency of the power supply system.

Enable gate energy counter

Enable the gate for the energy counter here. When the gate is enabled, the energy counter only counts when the corresponding output data bit (DQ bit) is set to "1".

Full-scale value for energy counter

Select here the full-scale value for the periodic counting of the energy counter. You can also specify that the energy counter is to count without a full-scale value (infinite counting). The calculated energy counter values are stored retentively in the module.

User data variant

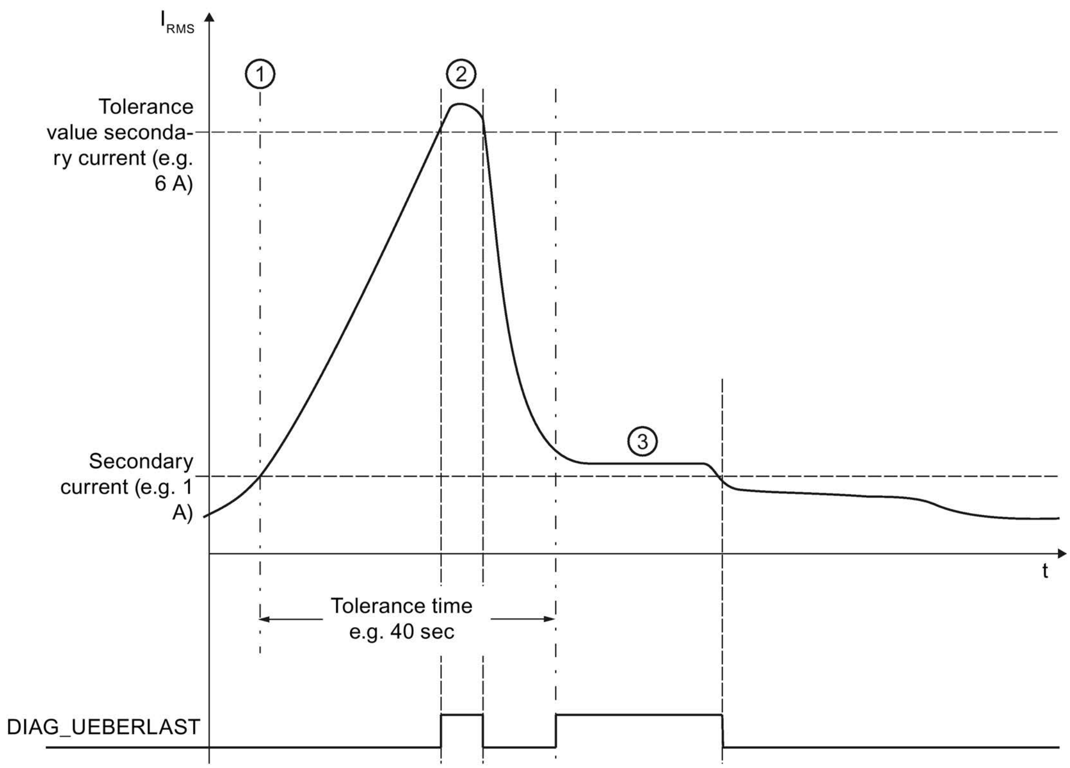
Select here the user data variant with which the module is to operate once it is switched on.

Minimum and maximum value calculation

Enable calculation of the minimum and maximum values here. The minimum and maximum value are calculated from the start of the measurement. The calculated values are stored retentively in the Energy Meter.

Diagnostics overflow current

The measured current is monitored after expiry of the "Tolerance time" for "Overcurrent [0.1 A] tolerance value". Exceeding this results in overflow current.



① The tolerance time starts as soon as the secondary current value (1 A, 5 A) is exceeded.

② DIAG_UEBERLAST diagnoses the affected phase if the tolerance value of the secondary current has been exceeded within the assigned tolerance time (or the maximum value of the secondary current (12 A) is exceeded).

③ After the set tolerance time has elapsed, the secondary current value (1 A, 5 A) is monitored. A violation of the secondary current value also returns DIAG_UEBERLAST.

Figure 12-1 Diagnostics response in the event of a current overload

Diagnostics overflow voltage

Line voltage (measuring range) is monitored for tolerance. A violation of the overflow triggers a diagnostic interrupt.

Diagnostics underflow voltage

Line voltage (measuring range) is monitored for tolerance. A violation of the underflow triggers a diagnostic interrupt.

Diagnostics low limit voltage

Low limit for voltage is monitored. A violation of the low limit triggers a diagnostic interrupt.

Diagnostics overflow cumulative values

A cumulative overflow in the calculated variables is displayed. The values stop at the high or low limit. A violation triggers a diagnostic interrupt.

Overcurrent tolerance value [0.1 A]

The tolerance factor secondary overcurrent parameter (10 to 100) indicates the tolerable value of the secondary current in 0.1 A increments (10 = 1 A to 100 = 10 A). Always take note of the current class of the current transformer being used (1 A, 5 A).

Overcurrent tolerance time

Monitoring time in ms in which the overcurrent is tolerated. 0 means that the monitoring time has been disabled.

Low limit for measuring current

The configurable low limit for measuring current refers to the secondary currents and is used to avoid incorrect calculations in the case of very low currents. Incorrect measurements of very low currents in particular are a cause of inaccuracies in the current transformer used. Set the low limit for the current measurement to the required value depending on your process.

Tip: If you want to find the low limit for the current measurement experimentally, set it to a lower value. Then, feed in a very precise low current and determine the measurement error that can no longer be tolerated. Afterwards, set the low limit for the current measurement to the limit value you have determined.

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Neutral current
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy of the reset phase do not measure any longer.

Operating hours counter

Enable the operating hours counter here. The counting starts from a programmable minimum current value. The counter can be reset or pre-defined using data record or output bit.

Enable gate of operating hours counter

Enable the gate for the operating hours counter here. When the gate is activated, the operating hours counter only counts when the corresponding output data bit (DQ bit) is set to "1".

Current transformer primary current

Enter here the nominal value for the primary current of the current transformer used. The transformer ratio is calculated from the primary and secondary current.

Current transformer secondary current

Enter here the nominal value for the secondary current (1 A or 5 A) of the current transformer used. The transformer ratio is calculated from the primary and secondary current.

Voltage transformer primary voltage

To determine the voltage transformer ratio, enter the primary voltage here. The transformer ratio is calculated from the primary and secondary voltage.

Voltage transformer secondary voltage

Enter the secondary voltage to determine the voltage transformer ratio here. The transformer ratio is calculated from the primary and secondary voltage.

Reverse current direction

Setting to determine whether or not to reverse the direction of current.

In the event of inadvertent incorrect connection, this parameter can be used to correct the measured values, thus saving the hassle of rewiring. The direction of the current is only evident from the power measurement values. The current measurement value is an rms value.

Number of limits

Enter the number of measured values that you want to monitor for limits.

Limit monitoring

Enable the monitoring of the limit for a freely definable measured value here. Limit violations are counted and the count values stored retentively.

Measured value ID for limit

Enter the ID of a measured value that you want to use for limit monitoring.

Gate enabled with limit monitoring

Enable the gate via limit monitoring here. When the gate is enabled, the limit monitoring is only started when the corresponding bit of the associated output user data is set to "1".

Hardware interrupt for limit

Enable the hardware interrupt here. The hardware interrupt is triggered if a high or low limit is violated. Without activation of a hardware interrupt, a limit violation is only displayed in the user data and in DS 150.

Limit

Enter the limit here that is to trigger a limit violation when exceeded or fallen below. Limit violations are displayed in the user data and in DS 150.

Type of limit

Select here, whether it is an high or low limit. Depending on this selection, the limit violation or hardware interrupt is triggered when a value exceeds (high limit) or falls below (low limit) the limit.

Hysteresis for limit monitoring

Enter the hysteresis for limit in percent here. The percentage refers to the numerical value of the limit when the limit violation occurs. A message is only canceled if the measured value is outside the limit and its hysteresis range. As long as the measured value is in the hysteresis range, no new message is output.

Delay time for limit monitoring

Here you can select the delay time for limit violation. The delay refers to the time that must elapse before an occurrence of a limit violation is reported. Faults can be filtered out by selection of the delay time. The deceleration time is also taken into consideration during outgoing of the limit violation.

Number of measured values for user data mapping

Specify the number of measured values/variables that you want to use for the user-specific user data mapping.

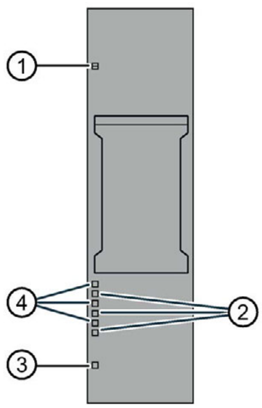
Measured variable

Select the measured variable (with the measured value ID) that you want to use for the user-specific user data mapping.

13 Interrupts/diagnostic alarms

13.1 Status and error display

LED display



① DIAG (green/red)
② Error (red)
③ PWR (green)
④ Status (green)

Figure 13-1 LED display

Meaning of the LED displays

The following table explains the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostic alarms (Page 103).

DIAG LED

Table 13- 1 Meaning of the DIAG LED

DIAG	Meaning
Off	Supply voltage of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Status LED

Table 13- 2 Meaning of the Status LED

Status	Meaning
Off	Channel deactivated or error
On	Channel activated and no error

Error LED

Table 13- 3 Meaning of the Error LED

Status	Meaning
Off	Channel is OK
On	Channel is faulty

PWR LED

Table 13- 4 Meaning of the PWR LED

PWR	Meaning
Off	Line voltage missing
On	Line voltage available

13.2 Interrupts

The analog input module Energy Meter 480VAC ST supports hardware and diagnostic interrupts.

13.2.1 Hardware interrupts

Hardware interrupts

The module generates a hardware interrupt at the following events:

- Violation of low limit 1 to 16
- Violation of high limit 1 to 16

You can find detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment of the local data double word 8 by the start information of the hardware interrupt organization block.

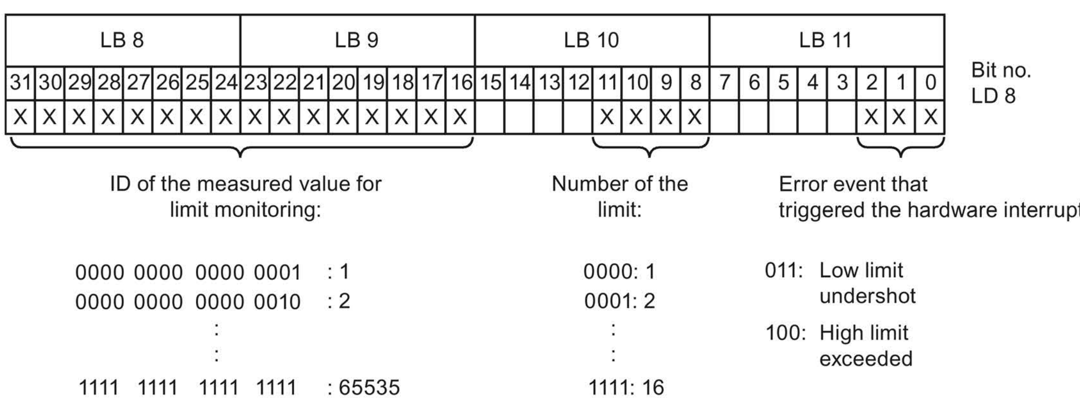


Figure 13-2 Start information of the organization block

Structure of the additional interrupt information

Table 13- 5 Structure of the additional interrupt information

Data block name		Contents	Comment	Bytes
Identifier		W#16#0001 to W#16#FFFF	ID of the measured value for limit monitoring	2
Number of the limit (1 to 16), which has triggered the hardware interrupt				
	Channel	B#16#00 to B#16#0F	Number of the limit	1
Event that triggered the hardware interrupt.				
	Event	B#16#03	Violation of low limit	1
		B#16#04	Violation of high limit	

13.2.2 Diagnostics interrupt

Diagnostic interrupt

The module generates a diagnostic error interrupt at the following events:

- Channel is temporarily unavailable
- Hardware interrupt lost
- Error
- Supply voltage missing
- Parameter assignment error
- Low limit voltage violated (measuring voltage < 80 V)
- High limit value voltage exceeded
- Underflow voltage (tolerance for supply voltage) violated
- Overflow voltage (tolerance for supply voltage) exceeded
- Overload (current measurement > 12 A or tolerance overcurrent exceeded after expiry of the tolerance time)
- Overflow of the calculated values (measured or calculated values screen exceed the representable range of values)

Diagnostic alarms (Page 103)

13.3 Diagnostic alarms

Diagnostic alarms

Note

Assignment channel in diagnostic message ⇔ Phase

In the diagnostic messages the channels are counted from "Channel "0" on, in the AI Energy Meter 480VAC ST from Phase "1" on.

Note the following assignment:

- Channel "0" ⇔ Phase "1"
- Channel "1" ⇔ Phase "2"
- Channel "2" ⇔ Phase "3"

Table 13- 6 Error types

Diagnostic message	Error code	Meaning	Solution
Undervoltage[1]	2_H	Line voltage (measuring range) is monitored for tolerance. Violation leads to voltage overflow/underflow	Observe the line voltage range
Overvoltage	3_H		
Overload	4_H	The measured current is monitored after expiry of the "Tolerance time" for "Tolerance value overcurrent [0.1 A]". Exceeding this results in overflow current. The maximum value of the secondary current (12 A) has been exceeded.	Observe the current range
High limit	7_H	Cumulative overflow in the calculated values	-
Low limit[1]	8_H	Violation of the low limit for voltage measurement. The message occurs when the configured minimum current or voltage is below 80 V.	Observe the voltage range
Error	9_H	Internal module error (diagnostic alarm on channel 0 applies to the entire module).	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Load voltage missing	11_H	Missing or insufficient line voltage on phase L1	Check supply
Channel is temporarily unavailable	$1F_H$	Firmware upgrade is being performed. Channel 0 applies to the entire module. The module is currently not performing any measurements.	--
		A user calibration is being executed at the channel.	Complete the user calibration

[1] If the "Undervoltage" and "Low limit" diagnostics are active at the same time, the "Low limit" diagnostics has higher priority and deletes the "Undervoltage" diagnostics.

13.4 Diagnostics response

Diagnostics response

This section describes the response of the AI Energy Meter 480VAC ST when diagnostics information is reported.

Measured values in the case of diagnostics

Even in the case of diagnostics, measured values continue to be displayed as long as they can still be acquired. If measured values cannot be measured or calculated, "0" is displayed.

Zero suppression

If the supplied current is less than the configured "Low limit for measuring current" parameter, the current measurement and all dependent variables are suppressed or set to "0".

Overload limitation

If the secondary current fed in at the channel is higher than 12 A, the module changes to limitation and the measured value of the current and all dependent variables are set to "0".

Value falls below "Low limit current measurement"

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Neutral current
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy of the reset phase do not measure any longer.

Loss of the supply voltage

At a loss of supply voltage at U_{L1} (phase 1), all measurements are interrupted.

After the supply voltage is restored, the AI Energy Meter 480VAC ST operates again with the configuration / parameter assignment stored in the CPU. The retentively stored values are used at the following counters and calculations:

- Energy and overflow counters
- Operating hours counters
- Counters for limit violation
- Minimum values
- Maximum values

Input data to "0"

Note

If the AI Energy Meter 480VAC ST is no longer recognized by the interface module (for example, because it is defective or not plugged in), all input data are set to "0".

---

14 Technical specifications

14.1 Technical specifications

Technical specifications of the AI Energy Meter 480VAC ST

Article number	6ES7134-6PA20-0BD0
General information	
Product type designation	ET 200SP, AI Energy Meter 480 V AC ST, PU 1
Firmware version	V4.0
usable BaseUnits	BU type D0, BU20-P12+A0+0B
Product function	
• Voltage measurement	Yes
• Voltage measurement with voltage transformers	Yes
• Current measurement	Yes
• Phase current measurement without current transformers	No
• Phase current measurement with current transformers	Yes
• Energy measurement	Yes
• Frequency measurement	Yes
• Power measurement	Yes
• Active power measurement	Yes
• Reactive power measurement	Yes
• I&M data	Yes; I&M0 to I&M3
• Isochronous mode	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
• STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	V2.3

Article number	6ES7134-6PA20-0BD0
Operating mode	
• cyclic measurement	Yes
• acyclic measurement	Yes
• Acyclic measured value access	Yes
• Fixed measured value sets	Yes
• Freely definable measured value sets	Yes
Configuration control	
via dataset	Yes
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	Yes
Installation type/mounting	
Mounting position	Any
Supply voltage	
Design of the power supply	Supply via voltage measurement channel L1
Type of supply voltage	AC 100 - 277 V
permissible range, lower limit (AC)	90 V
permissible range, upper limit (AC)	293 V
Line frequency	
• permissible range, lower limit	47 Hz
• permissible range, upper limit	63 Hz
Power loss	
Power loss, typ.	0.6 W
Address area	
Address space per module	
• Address space per module, max.	268 byte; 256 byte input / 12 byte output
Hardware configuration	
Automatic encoding	
• Mechanical coding element	Yes
Time of day	
Operating hours counter	
• present	Yes
Analog inputs	
Cycle time (all channels), typ.	50 ms; Time for consistent update of all measured and calculated values (cyclic und acyclic data)

Article number	6ES7134-6PA20-0BD0
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes
• Hardware interrupt	Yes; Monitoring of up to 16 freely selectable process values (exceeding or undershooting of value)
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; red Fn LED
• for module diagnostics	Yes; green/red DIAG LED
Integrated Functions	
Measuring functions	
• Measuring procedure for voltage measurement	TRMS
• Measuring procedure for current measurement	TRMS
• Type of measured value acquisition	seamless
• Curve shape of voltage	Sinusoidal or distorted
• Buffering of measured variables	Yes
• Parameter length	74 byte
• Bandwidth of measured value acquisition	2 kHz; Harmonics: 39 / 50 Hz, 32 / 60 Hz
Operating mode for measured value acquisition	
– automatic detection of line frequency	No; Parameterizable
Measuring range	
– Frequency measurement, min.	45 Hz
– Frequency measurement, max.	65 Hz

Article number	6ES7134-6PA20-0BD0
Measuring inputs for voltage	
– Measurable line voltage between phase and neutral conductor	277 V
– Measurable line voltage between the line conductors	480 V
– Measurable line voltage between phase and neutral conductor, min.	90 V
– Measurable line voltage between phase and neutral conductor, max.	293 V
– Measurable line voltage between the line conductors, min.	155 V
– Measurable line voltage between the line conductors, max.	508 V
– Measurement category for voltage measurement in accordance with IEC 61010-2-030	CAT II; CAT III in case of guaranteed protection level of 1.5 kV
– Internal resistance line conductor and neutral conductor	3.4 MΩ
– Power consumption per phase	20 mW
– Impulse voltage resistance 1,2/50µs	1 kV
Measuring inputs for current	
– measurable relative current (AC), min.	1 %; Relative to the secondary rated current 5 A
– measurable relative current (AC), max.	100 %; Relative to the secondary rated current 5 A
– Continuous current with AC, maximum permissible	5 A
– Apparent power consumption per phase for measuring range 5 A	0.6 V·A
– Rated value short-time withstand current restricted to 1 s	100 A
– Input resistance measuring range 0 to 5 A	25 mΩ; At the terminal
– Zero point suppression	Parameterizable: 2 ... 250 mA, default 50 mA
– Surge strength	10 A; for 1 minute

Article number	6ES7134-6PA20-0BD0
Accuracy class according to IEC 61557-12	
– Measured variable voltage	0,2
– Measured variable current	0,2
– Measured variable apparent power	0.5
– Measured variable active power	0.5
– Measured variable reactive power	1
– Measured variable power factor	0.5
– Measured variable active energy	0.5
– Measured variable reactive energy	1
– Measured variable neutral current	0.5; calculated
– Measured variable phase angle	±1 °; not covered by IEC 61557-12
– Measured variable frequency	0.05
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes; 3 700V AC (type test) CAT III
Isolation	
Isolation tested with	2 300V AC for 1 min. (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm
Weights	
Weight (without packaging)	45 g
Data for selecting a current transformer	
• Burden power current transformer x/1A, min.	As a function of cable length and cross section, see device manual
• Burden power current transformer x/5A, min.	As a function of cable length and cross section, see device manual

ATEX approval

In accordance with EN 60079-15 (Electrical apparatus for potentially explosive atmospheres; Type of protection "n") and EN 60079-0 (Electrical apparatus for potentially explosive gas atmospheres - Part 0: General Requirements)

Parameter data records A

A.1 Configuration via parameter data records

The parameter data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Parameter assignment in the user program

You can reassign the module parameters in RUN mode, for example change the diagnostics behavior, define new limits or configure a modified user data mapping.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module via the respective data record. The parameters set in STEP 7 do not change in the CPU, which means the parameters set in STEP 7 are still valid after a restart.

If you reconfigure a module (so that the user data size changes) and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing".

STATUS output parameter

If errors occur during the transfer of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help.

A.2 Structure of the parameter data record 128 for the entire module

Structure of data record 128

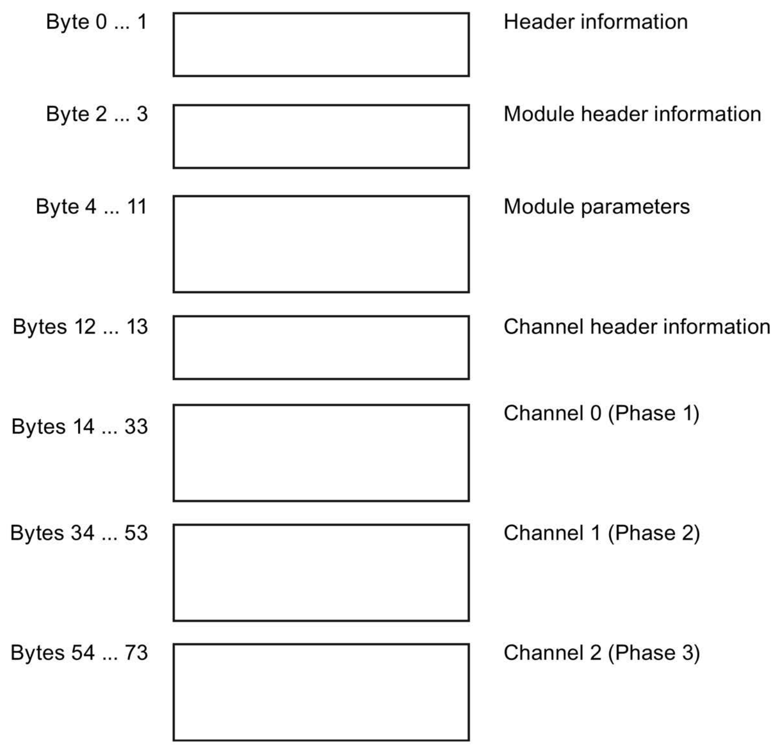

Figure A-1 Parameter data record 128

Header information

The figure below shows the structure of the header information.

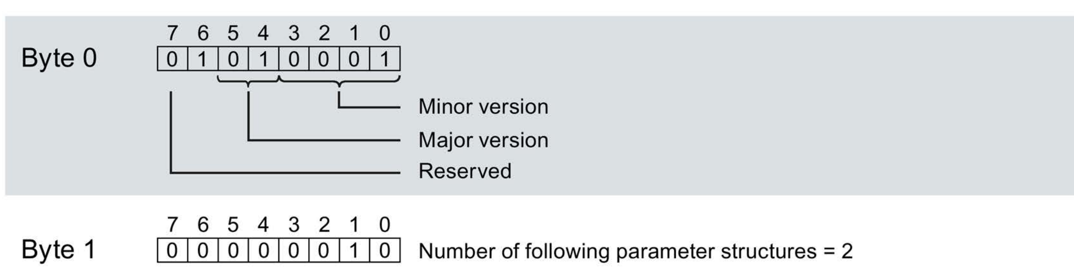

Figure A-2 Header information

Module header information

The figure below shows the structure of the header information for a module.

	7	6	5	4	3	2	1	0	
Byte 2	0	1	0	0	0	0	0	1	Number of the following module parameter blocks = 1
Byte 3	0	0	0	0	1	0	0	0	Length of the following module parameter block = 8

Figure A-3 Module header information

Module parameter block

The figure below shows the structure of the module parameter block.

Enable a parameter by setting the corresponding bit to "1".

Byte 4 (bits 7 6 5 4 3 2 1 0)

Connection type of the phases

- 00_H = Disabled
- $0B_H$ = 1P2W 1-phase alternating current
- $0C_H$ = 3P4W 3-phase, 4-wire
- $0E_H$ = 3P4W1, 3-phases, 4-wire, balanced Load
- $0F_H$ = 3x1P2W 3x1-phase alternating current, 2-wire,
- 10_H = 2P3W 2-phase, 3-wire, 2-current transformer

Byte 5 (bits 7 6 5 4 3 2 1 0)

Voltage measuring range of the power supply system (Supply voltage, nominal value of phase voltage)

- 01_H = 100 V
- 02_H = 110 V
- 03_H = 115 V
- 04_H = 120 V
- 05_H = 127 V
- 06_H = 190 V
- 07_H = 200 V
- 08_H = 208 V
- 09_H = 220 V
- $0A_H$ = 230 V
- $0B_H$ = 240 V
- $0C_H$ = 277 V

Byte 6 (bits 7 6 5 4 3 2 1 0)

Bits 0–3: Line frequency of the power supply system

- 0001 = 60 Hz
- 0010 = 50 Hz

Bits 4–6: Full-scale value for energy counter

- 000 = No full-scale value - infinite counting
- 001 = Count periodically to 10^3
- 010 = Count periodically to 10^6
- 011 = Count periodically to 10^9
- 100 = Count periodically to 10^{12}
- 101 = Count periodically to 10^{15}

Bit 7: Energy counter gate

- 0 = Energy counter always counting
- 1 = Energy counter gate

Byte 7 (bits 7 6 5 4 3 2 1 0)

Line voltage tolerance

- 01_H = 1%
- 02_H = 2%
- 03_H = 3%
- : :
- 32_H = 50%

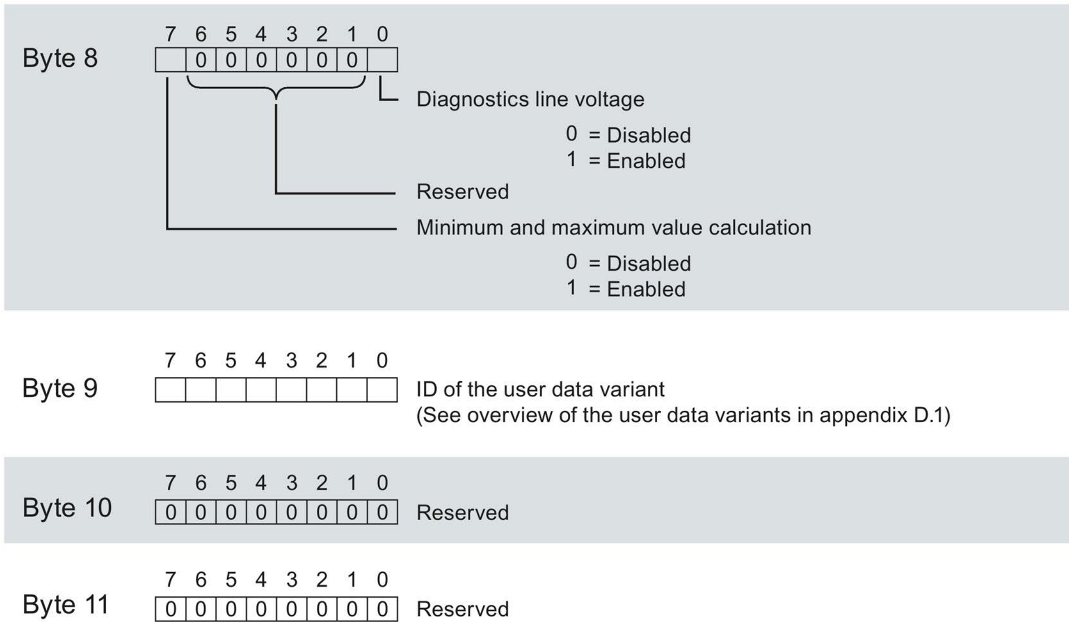

Figure A-4 Module parameter block

You can find the user data variant in the section Overview of the user data variants (Page 155).

Channel header information

The following figure shows the structure of the header information for a channel.

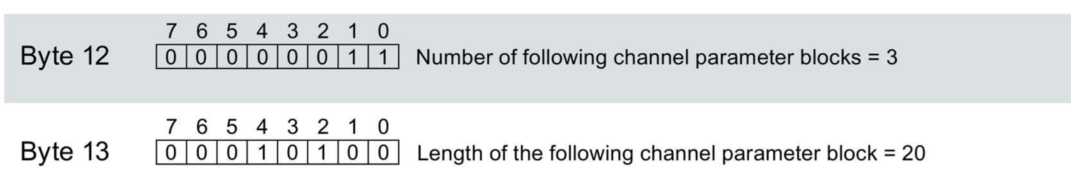

Figure A-5 Channel header information

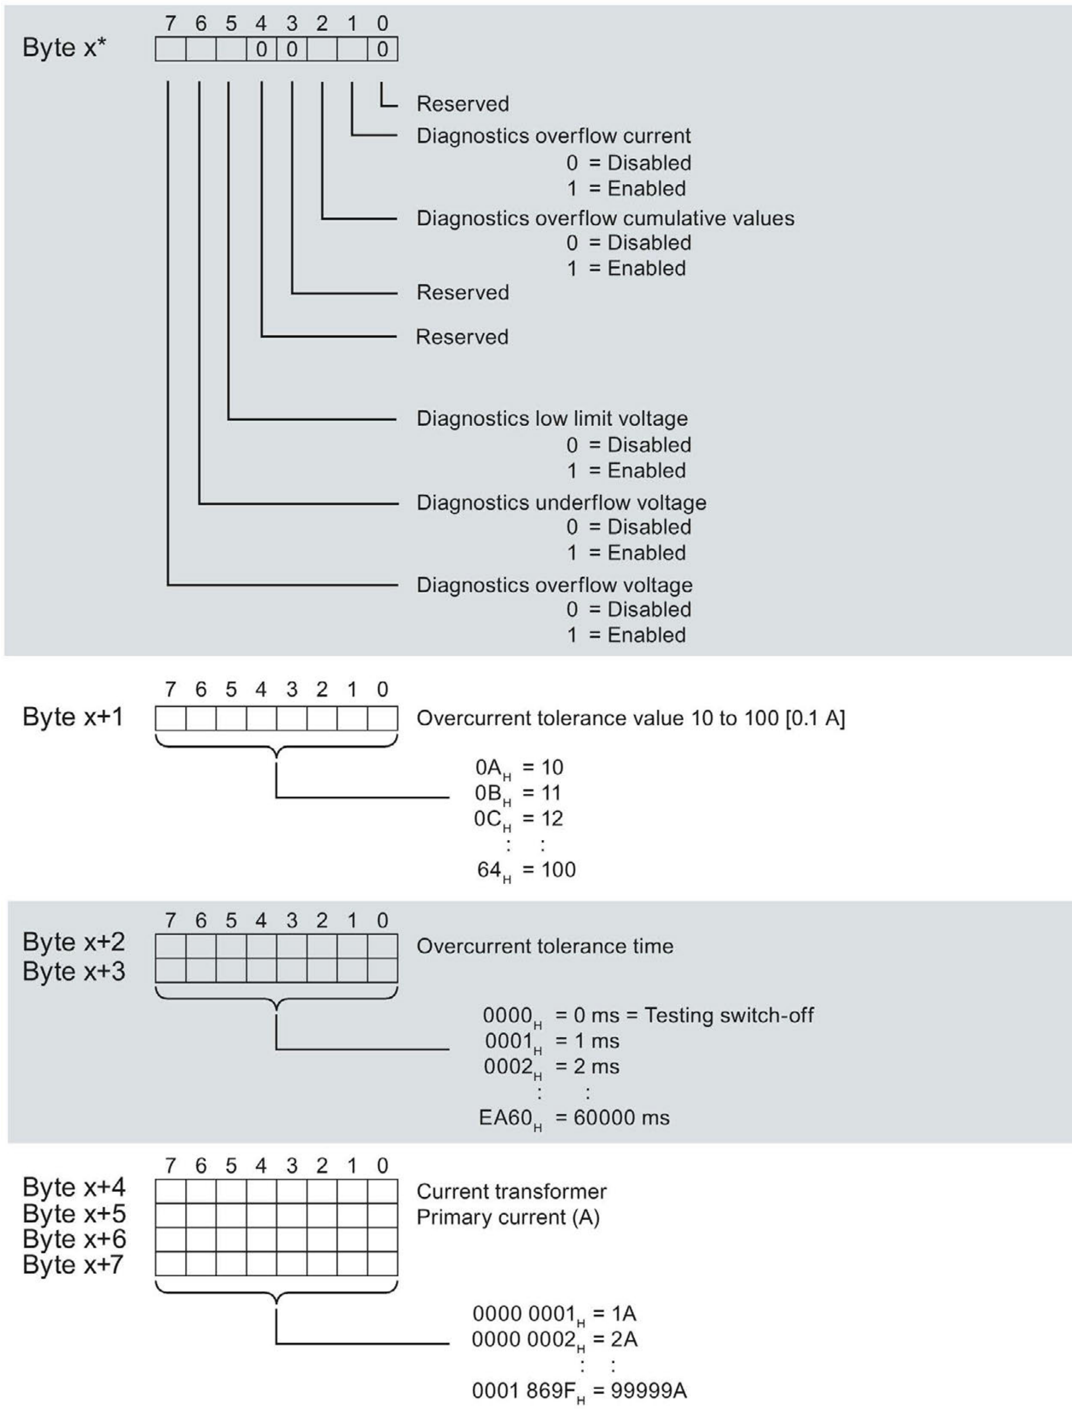
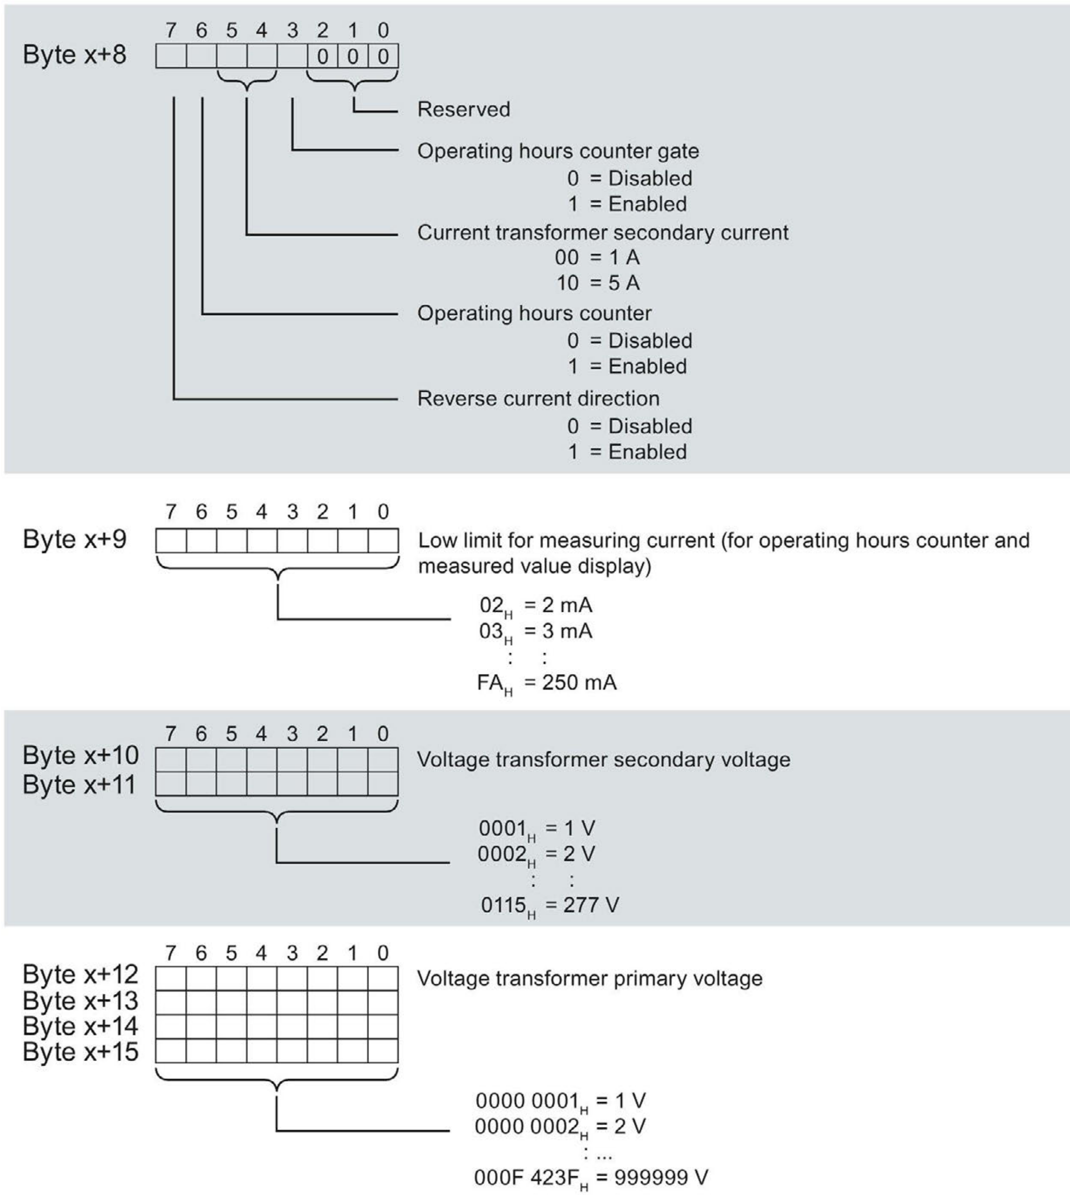
Channel parameter block

The figure below shows the structure of the channel parameter block.

Enable a parameter by setting the corresponding bit to "1".





Byte x+8

Voltage transformer primary voltage
$0000\ 0001_H$ = 1 V
$0000\ 0002_H$ = 2 V
: ...
$000F\ 423F_H$ = 999999 V

	7	6	5	4	3	2	1	0	
Byte x+16	0	0	0	0	0	0	0	0	Reserved
Byte x+17	0	0	0	0	0	0	0	0	Reserved
Byte x+18	0	0	0	0	0	0	0	0	Reserved
Byte x+19	0	0	0	0	0	0	0	0	Reserved

* x = 14 for channel/phase 1, 34 for channel/phase 2, 54 for channel/phase 3

Figure A-6 Channel parameter block

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check Byte 10, 11, 14, 22, 30...34, 42, 50...54, 70...74 and set the reserved bits back to 0.
DF	80	E1	02	Reserved bits are not 0.	Check Byte 8 and set the reserved bits back to 0.
DF	80	E1	05	Measuring range for voltage invalid.	Check Byte 5. Permitted values: 01_H to $0C_H$
DF	80	E1	20	Connection type invalid.	Check Byte 4. Permitted values: 00_H, $0B_H$ ... 01_H

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	21	Parameter for user data variant in DS 128 not possible or input data configuration not large enough.	Check Byte 9. Select a different user data variant in DS 128 or change the configuration.
DF	80	E1	22	Parameter for user data variant is invalid.	Check Byte 9. Select a valid code for the user data variant.
DF	80	E1	23	Parameter for frequency is invalid.	Check Byte 6. Enter valid values.
DF	80	E1	24	Parameter for tolerance line voltage is invalid.	Check Byte 7. Enter valid values.
DF	80	E1	25	Parameter for current transformer secondary is invalid.	Check Bit 4...5 in Byte 22, 42...62. Enter valid values.
DF	80	E1	29	Parameter for tolerance value overcurrent invalid.	Check Byte 15, 35...55. Enter valid values.
DF	80	E1	2A	Parameter for tolerance time overcurrent invalid.	Check Byte 16...17, 36...37, 56...57. Enter valid values.
DF	80	E1	2B	Parameter for low limit measuring current invalid	Check Byte 23, 43...63. Enter valid values.
DF	80	E1	2C	Parameter for current transformer primary current is invalid.	Check Byte 18...21, 38...41, 48...61. Enter valid values.
DF	80	E1	2D	Parameter for voltage converter primary voltage invalid.	Check Byte 26...29, 46...49, 66...69. Enter valid values.
DF	80	E1	2E	Parameter for voltage converter secondary voltage invalid.	Check Byte 24...25, 44...45, 64...65. Enter valid values.
DF	80	E1	2F	Parameter for full-scale value for energy counters invalid.	Check Bit 4...6 in Byte 6. Enter valid values.
DF	80	E1	30	Invalid data record number.	Check the data record number. Enter a valid data record number.
DF	80	E1	3E	Only for connection type 3P4W1. Parameters for the different phases are not identical.	Check Bytes 14...33, 34...53, 54...73. Enter identical values at all three phases.
DF	80	E1	3F	Full-scale value for energy counter too small or transmission ratio of current and voltage too high.	Increase the full-scale value or reduce the transmission ratio of the current and voltage transformer.

A.3 Structure of the parameter data record 129 for limit monitoring

Structure of data record 129

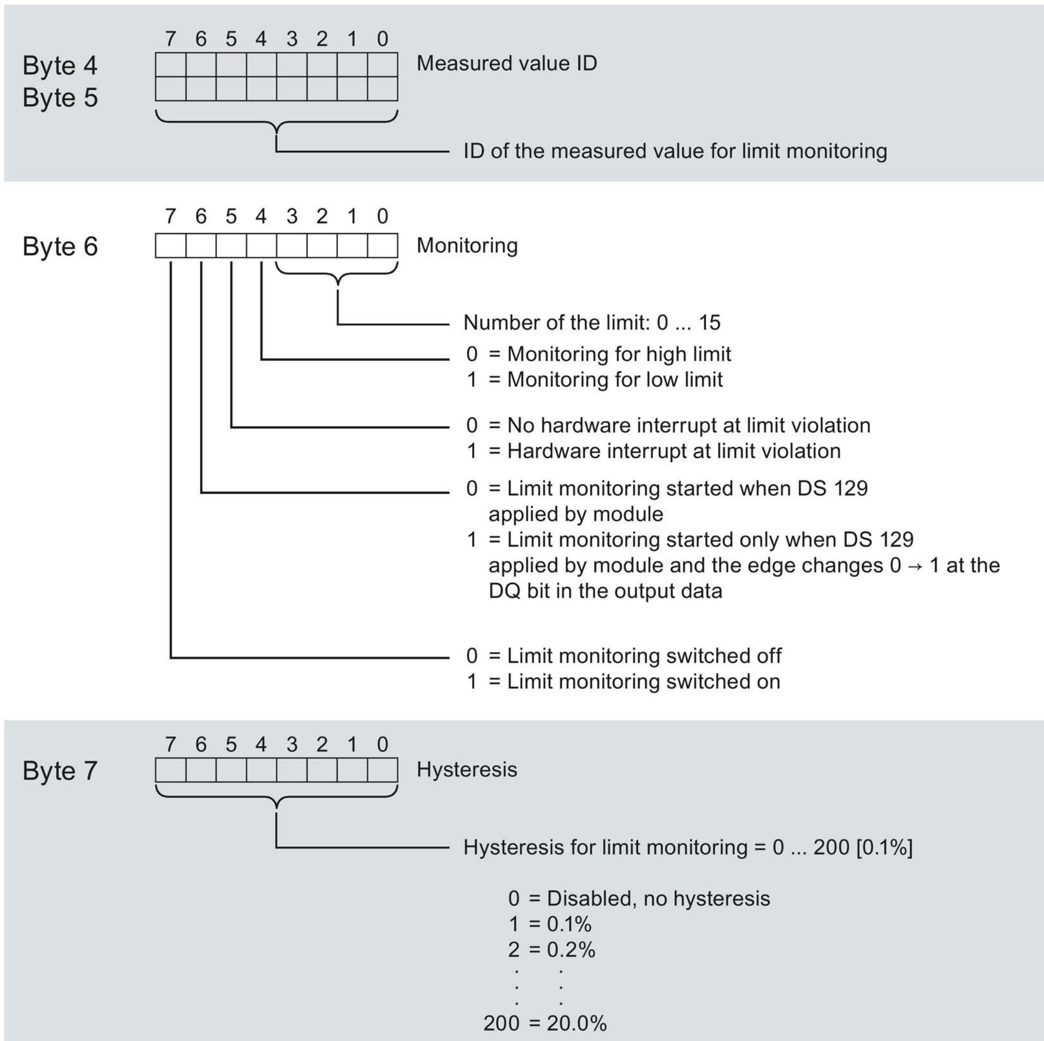
The following diagram shows the structure of the parameter blocks for limit monitoring.



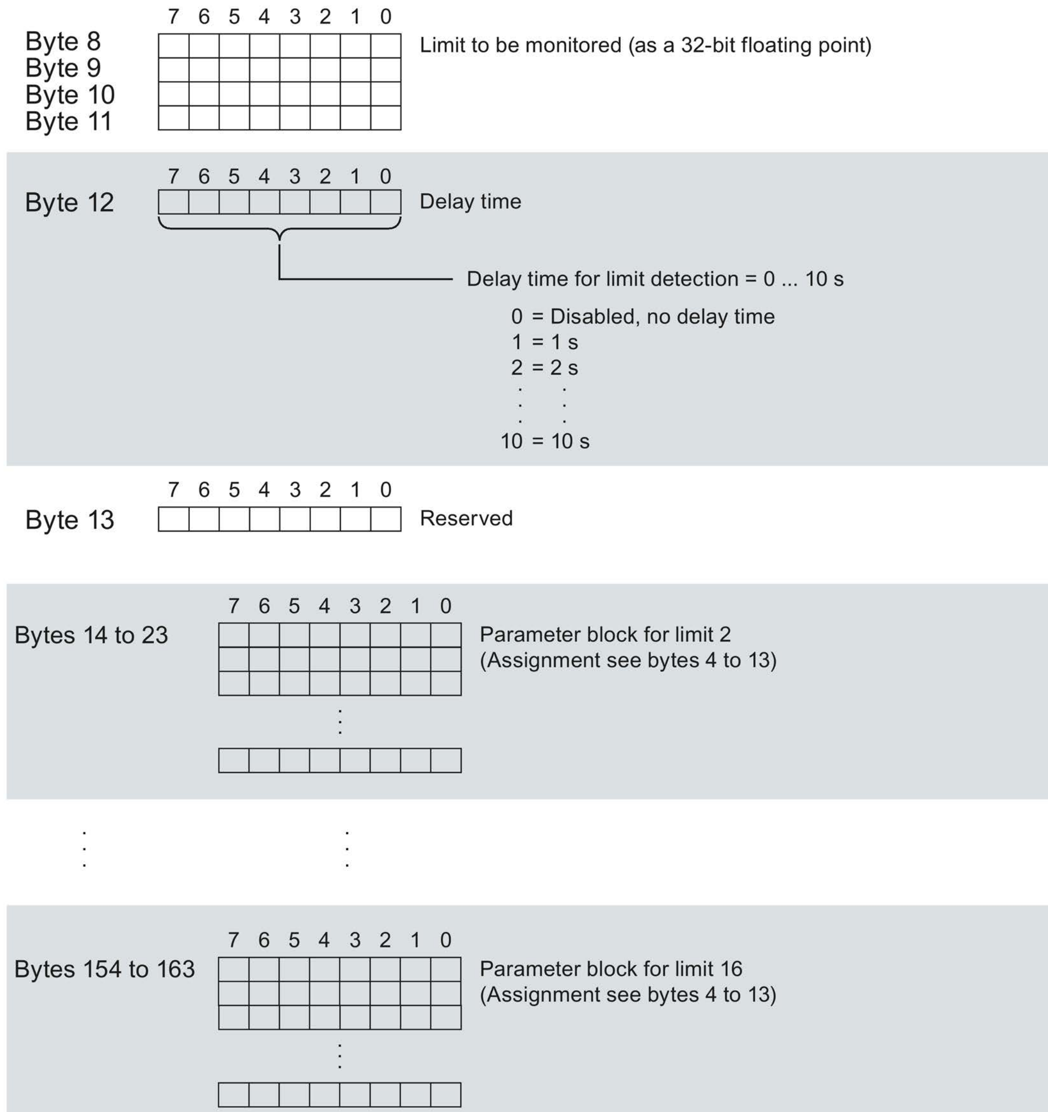


Figure A-9 Limit parameter data block

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 129.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check Byte 10, 11, 14, 22, 30...34, 42, 50...54, 70...74 and set the reserved bits back to 0.
DF	80	E1	31	Parameter for length of the parameter block invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	Parameters for number of parameter blocks invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	Parameter for measured value ID invalid.	Check Bytes 4 and 5. Enter valid values.
DF	80	E1	34	Parameters for monitoring the limits	Check Bit 0...3 in Byte 6. Enter valid values.
DF	80	E1	35	Number for limits in monitoring parameter assigned several times	Check Bit 0...3 in Byte 6. Do not use limit number several times.
DF	80	E1	36	Parameters for hysteresis invalid	Check Byte 7. Enter valid values.
DF	80	E1	37	Parameter for limit to be monitored invalid.	Check Byte 8...11. Enter valid values.
DF	80	E1	38	Delay time in Hysteresis parameter invalid.	Check Byte 12. Enter valid values.

Parameter block for user data mapping

The following diagram shows the structure of the parameter blocks for user data mapping.

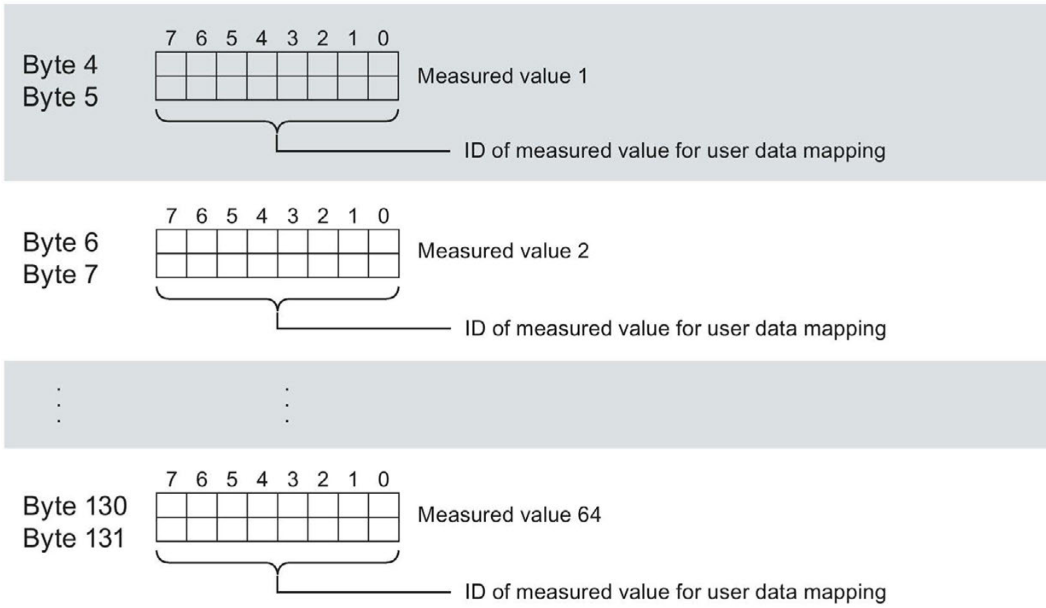

Figure A-12 Parameter block for user data mapping

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 130.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the mod-ule is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	01	Reserved bits are not 0.	Check Byte 10, 11, 14, 22, 30...34, 42, 50...54, 70...74 and set the reserved bits back to 0.
DF	80	E1	21	Parameter for user data variant in DS 128 not possible or input data configuration not large enough.	Check Byte 9. Select a different user data variant in DS 128 or change the configuration.
DF	80	E1	30	Invalid data record number.	Check the data record number. Enter a valid data record number.
DF	80	E1	31	Parameter for length of the parameter block invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	Parameters for number of parameter blocks invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	Parameter for measured value ID invalid.	Check Bytes 4 and 5. Enter valid values.
DF	80	E1	3B	Parameter for user data variant impermissible.	Check Byte 1. Number for user-specific user data variant has to be 01_H.

Measured variables for user data mapping

The table below shows which measured variables are available for user data mapping.

Measured value ID	Measured variables	Use for user data mapping
1	Voltage UL1-N	Yes
2	Voltage UL2-N	Yes
3	Voltage UL3-N	Yes
4	Voltage UL1- L2	Yes
5	Voltage UL2- L3	Yes
6	Voltage UL3- L1	Yes
7	Current L1	Yes
8	Current L2	Yes
9	Current L3	Yes
10	Apparent power L1	Yes
11	Apparent power L2	Yes
12	Apparent power L3	Yes
13	Active power L1	Yes
14	Active power L2	Yes
15	Active power L3	Yes
16	Reactive power L1	Yes
17	Reactive power L2	Yes
18	Reactive power L3	Yes
19	Power factor L1	Yes
20	Power factor L2	Yes
21	Power factor L3	Yes
30	Frequency	Yes

Measured value ID	Measured variables	Use for user data mapping
34	Total active power L1L2L3	Yes
35	Total reactive power L1L2L3	Yes
36	Total apparent power L1L2L3	Yes
37	Total power factor L1L2L3	Yes
38	Amplitude unbalance for voltage	Yes
39	Amplitude unbalance for current	Yes
40	Max. voltage UL1-N	Yes
41	Max. voltage UL2-N	Yes
42	Max. voltage UL3-N	Yes
43	Max. voltage UL1- L2	Yes
44	Max. voltage UL2- L3	Yes
45	Max. voltage UL3- L1	Yes
46	Max. current L1	Yes
47	Max. current L2	Yes
48	Max. current L3	Yes
49	Max. apparent power L1	Yes
50	Max. apparent power L2	Yes
51	Max. apparent power L3	Yes
52	Max. active power L1	Yes
53	Max. active power L2	Yes
54	Max. active power L3	Yes
55	Max. reactive power L1	Yes
56	Max. reactive power L2	Yes
57	Max. reactive power L3	Yes
58	Max. power factor L1	Yes
59	Max. power factor L2	Yes
60	Max. power factor L3	Yes
61	Max. frequency	Yes
65	Max. total active power	Yes
66	Max. total reactive power	Yes
67	Max. total apparent power	Yes
68	Max. total power factor	Yes
70	Min. voltage UL1-N	Yes
71	Min. voltage UL2-N	Yes
72	Min. voltage UL3-N	Yes

Measured variables

B

Measured variables for data records and user data

The following table provides an overview of all measured variables that are used in the data records and user data.

Note that the format and unit differ in the evaluation of records and user data.

Table B- 1 Measured variables for data records and user data

Measured value ID	Measured variables	Data type	Unit	Value range	Connection type				
					1P2W	3x1P2W	2P3W	3P4W	3P4W1
1	Voltage UL1-N [1]	REAL	V	0.0 ... 1000000.0	✓	✓	✓	✓	✓
2	Voltage UL2-N [1]	REAL	V	0.0 ... 1000000.0		✓	✓	✓	✓
3	Voltage UL3-N [1]	REAL	V	0.0 ... 1000000.0		✓		✓	✓
4	Voltage UL1-L2 [2]	REAL	V	0.0 ... 1000000.0				✓	✓
5	Voltage UL2-L3 [2]	REAL	V	0.0 ... 1000000.0				✓	✓
6	Voltage UL3-L1 [2]	REAL	V	0.0 ... 1000000.0				✓	✓
7	Current L1 [1]	REAL	A	0.0 … 100000.0	✓	✓	✓	✓	✓
8	Current L2 [1]	REAL	A	0.0 … 100000.0		✓	✓	✓	✓
9	Current L3 [1]	REAL	A	0.0 … 100000.0		✓		✓	✓
10	Apparent power L1 [3]	REAL	VA	-3.0 x 10^9 … +3.0 x 10^9	✓	✓	✓	✓	✓
11	Apparent power L2 [3]	REAL	VA	-3.0 x 10^9 … +3.0 x 10^9		✓	✓	✓	✓
12	Apparent power L3 [3]	REAL	VA	-3.0 x 10^9 … +3.0 x 10^9		✓		✓	✓
13	Active power L1 [3]	REAL	W	-3.0 x 10^9 … +3.0 x 10^9	✓	✓	✓	✓	✓
14	Active power L2 [3]	REAL	W	-3.0 x 10^9 … +3.0 x 10^9		✓			
15	Active power L3 [3]	REAL	W	-3.0 x 10^9 … +3.0 x 10^9		✓		✓	✓
16	Reactive power L1 [3, 10]	REAL	var	-3.0 x 10^9 … +3.0 x 10^9	✓	✓	✓	✓	✓
17	Reactive power L2 [3, 10]	REAL	var	-3.0 x 10^9 … +3.0 x 10^9		✓	✓	✓	✓
18	Reactive power L3 [3, 10]	REAL	var	-3.0 x 10^9 … +3.0 x 10^9		✓		✓	✓
19	Power factor L1 [3]	REAL	-	0.0 ... 1.0	✓	✓	✓	✓	✓
20	Power factor L2 [3]	REAL	-	0.0 ... 1.0		✓	✓	✓	✓

Measured value ID	Measured variables	Data type	Unit	Value range	Connection type				
					1P2W	3x1P2W	2P3W	3P4W	3P4W1
21	Power factor L3 [3]	REAL	-	0.0 ... 1.0		✓		✓	✓
30	Frequency [4]	REAL	Hz	45.0 ... 65.0	✓	✓	✓	✓	✓
34	Total active power L1L2L3 [5]	REAL	W	-3.0×10^9 … $+3.0 \times 10^9$	✓	✓	✓	✓	✓
35	Total reactive power L1L2L3 [5 11]	REAL	var	-3.0×10^9 … $+3.0 \times 10^9$	✓	✓	✓	✓	✓
36	Total apparent power L1L2L3 [5]	REAL	VA	-3.0×10^9 … $+3.0 \times 10^9$	✓	✓	✓	✓	✓
37	Total power factor L1L2L3 [6 7]	REAL	-	0.0 ... 1.0	✓	✓	✓	✓	✓
38	Amplitude balance for voltage [2]	REAL	%	0 ... 100				✓	✓
39	Amplitude symmetry for current [2]	REAL	%	0 ... 200				✓	✓
40	Max. voltage UL1-N [6]	REAL	V	0.0 ... 1000000.0	✓	✓	✓	✓	✓
41	Max. voltage UL2-N [6]	REAL	V	0.0 ... 1000000.0		✓	✓	✓	✓
42	Max. voltage UL3-N [6]	REAL	V	0.0 ... 1000000.0		✓		✓	✓
43	Max. voltage UL1-UL2 [6]	REAL	V	0.0 ... 1000000.0				✓	✓
44	Max. voltage UL2-UL3 [6]	REAL	V	0.0 ... 1000000.0				✓	✓
45	Max. voltage UL3-UL1 [6]	REAL	V	0.0 ... 1000000.0				✓	✓
46	Max. current L1 [6]	REAL	A	0.0 ... 100000.0	✓	✓	✓	✓	✓
47	Max. current L2 [6]	REAL	A	0.0 ... 100000.0		✓	✓	✓	✓
48	Max. current L3 [6]	REAL	A	0.0 ... 100000.0		✓		✓	✓
49	Max. apparent power L1 [6]	REAL	VA	-3.0×10^9 … $+3.0 \times 10^9$	✓	✓	✓	✓	✓
50	Max. apparent power L2 [6]	REAL	VA	-3.0×10^9 … $+3.0 \times 10^9$		✓	✓	✓	✓
51	Max. apparent power L3 [6]	REAL	VA	-3.0×10^9 … $+3.0 \times 10^9$		✓		✓	✓
52	Max. active power L1 [6]	REAL	W	-3.0×10^9 … $+3.0 \times 10^9$	✓	✓	✓	✓	✓
53	Max. active power L2 [6]	REAL	W	-3.0×10^9 … $+3.0 \times 10^9$		✓	✓	✓	✓
54	Max. active power L3 [6]	REAL	W	-3.0×10^9 … $+3.0 \times 10^9$		✓		✓	✓
55	Max. reactive power L1 [6]	REAL	var	-3.0×10^9 … $+3.0 \times 10^9$	✓	✓	✓	✓	✓
56	Max. reactive power L2 [6]	REAL	var	-3.0×10^9 … $+3.0 \times 10^9$		✓	✓	✓	✓
57	Max. reactive power L3 [6]	REAL	var	-3.0×10^9 … $+3.0 \times 10^9$		✓		✓	✓
58	Max. power factor L1 [6]	REAL	-	0.0 ... 1.0	✓	✓	✓	✓	✓
59	Max. power factor L2 [6]	REAL	-	0.0 ... 1.0		✓	✓	✓	✓

1 Effective value

2 IEC 61557-12

3 Arithmetical mean value over 200 ms as floating mean

4 Arithmetical mean value over 10 s as floating mean

5 Simple summation

6 Calculation from the start/restart (inflow and outflow values are positive numbers)

7 Determined from ratio of active and apparent power

8 For mapping both states as UINT (high: Energy counter overflow, low limit)

9 Corresponds to the maximum of the phase-specific operating hours counters

10 Measured value includes fundamental and harmonics, arithmetic mean over 200 ms as floating mean

11 Measured value includes fundamental and harmonics, simple summation

Format

Table B- 2 Format and its length in bytes

Format in STEP 7 (TIA Portal)	Format to IEEE	Length in bytes	Comment
BYTE	BYTE	1 byte	Bit field with 8 bit
WORD	WORD	2 bytes	Bit field with 16 bit
USINT	INT8 (unsigned)	1 byte	Fixed-point number 8 bits without sign
INT	INT16 (signed)	2 bytes	Fixed-point number 16 bits with sign
UINT	INT16 (unsigned)	2 bytes	Fixed-point number 16 bits without sign
UDINT	INT32 (unsigned)	4 bytes	Fixed-point number 32 bits without sign
DINT	INT32 (signed)	4 bytes	Fixed-point number, 32 bits with sign
REAL	Float32	4 bytes	Floating-point number 32 bits with sign
LREAL	Float64	8 bytes	Floating-point number 64 bits with sign

Module versions C

C.1 Module version "2 I / 2 Q"

User data of the module

The module has 2 bytes of input user data and 2 bytes of output user data for status and control information. At this module version measured variables can be read solely via measured value data records (no measured variables can be evaluated via user data).

Structure of input user data

The structure of the input user data is fixed.

Table C- 1 Structure of input user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Constant = 0x80
1	Module	Quality information	Quality bits to describe the quality of the basic measured values

Allocation of the input user data

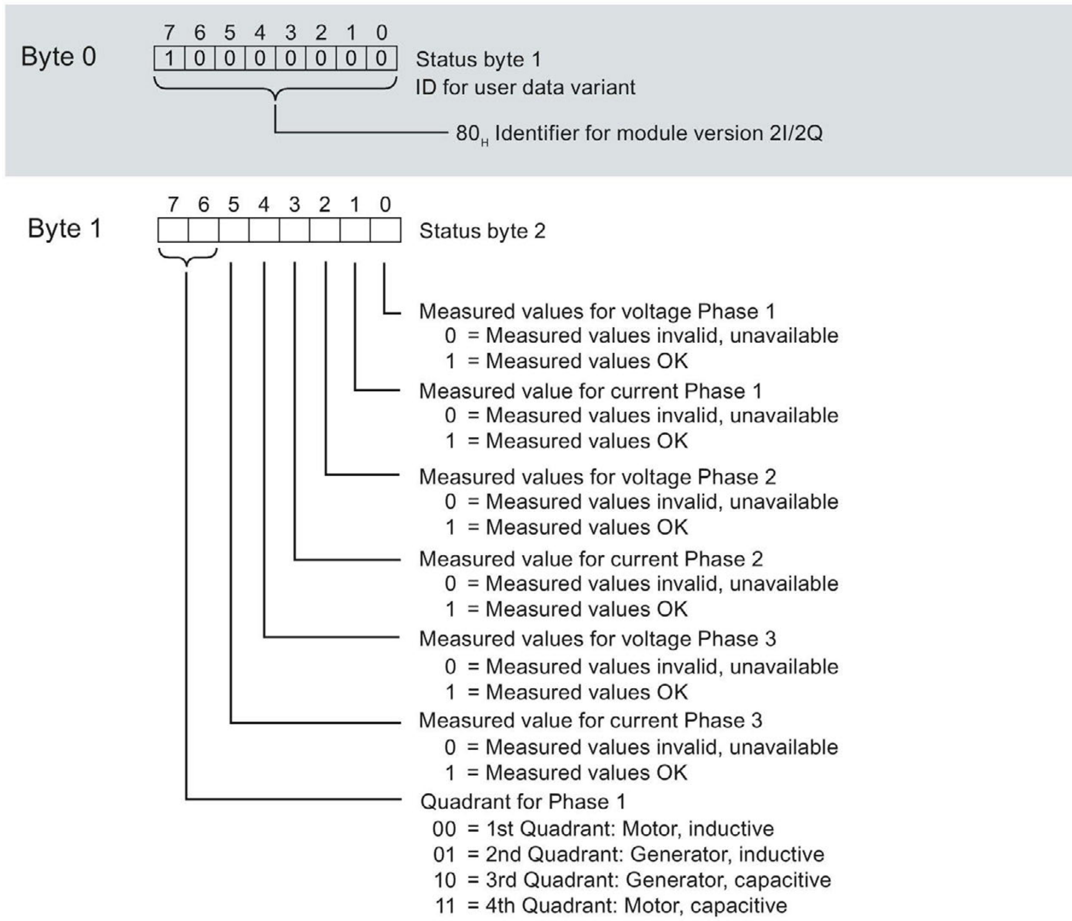

Figure C-1 Allocation of the status bytes in the input user data (2 bytes)

Structure of output user data

The structure of the output user data is fixed.

Table C- 2 Structure of output user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	Reserved	Reserved
1	Module	Control outputs	Reset of values and counters, gate

Assignment of the output user data

Via the output user data you control for all phases

- Resetting for all minimum values, maximum values, limits, operating hours counter and energy counters.
- The counter gates for operating hours counter and energy counters.

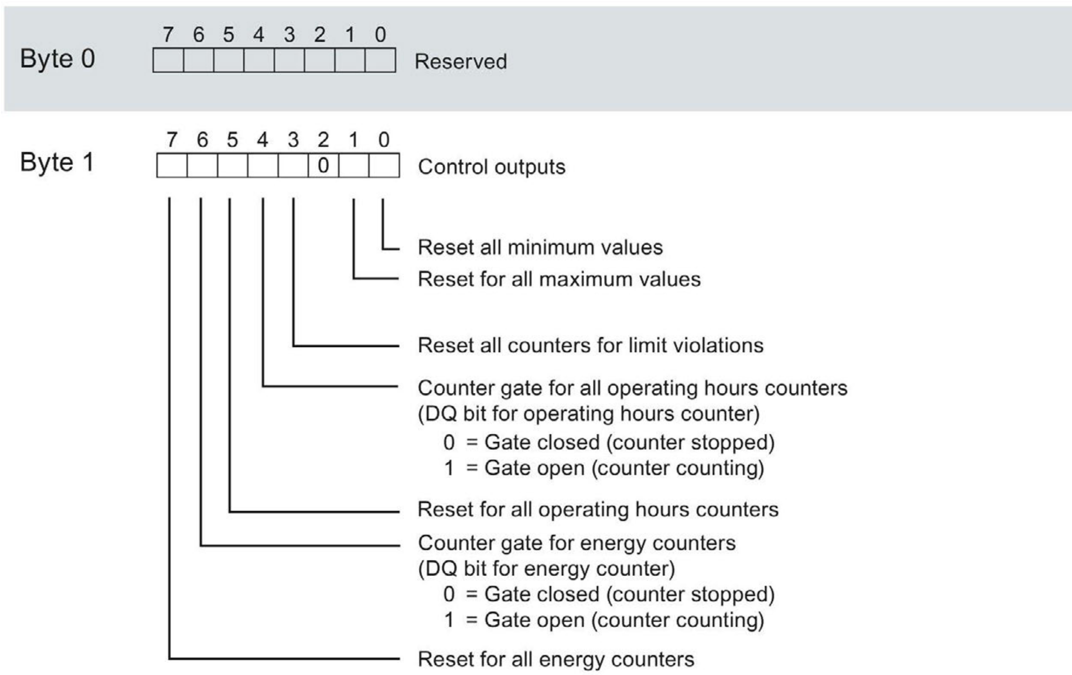

Figure C-2 Allocation of the control byte in the output user data (1 byte)

Note

For module version 2 **I** / 2 Q, a reset of the selected variables always acts on **all** measured values/counter levels of the three phases.

- Reset energy counter: Acts on all active, reactive and apparent energies of all phases
- Reset operating hours counter: Acts on the counters of Phases 1 to 3
- Reset minimum / maximum values: Acts on the minimum and maximum value calculations of Phases 1-3
- Reset all counters for limit violations: Acts on all 16 limit values.

C.2 Module version "32 I / 12 Q"

User data of the module

The module occupies 32 bytes of input user data and 12 bytes of output user data. Of these the module uses 2 bytes input data for status information and 12 bytes output data for control information. Measured variables can be read cyclically via user data (Bytes 2 to 31) or acyclically via measured value data records

Structure of input user data

You can set the contents of the input user data dynamically. You can choose between different user data variants.

Table C- 3 Structure of input user data (12 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	-
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 31	Module or phase	Data	2 or 4 bytes of measured values or calculated values according to user data variant

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

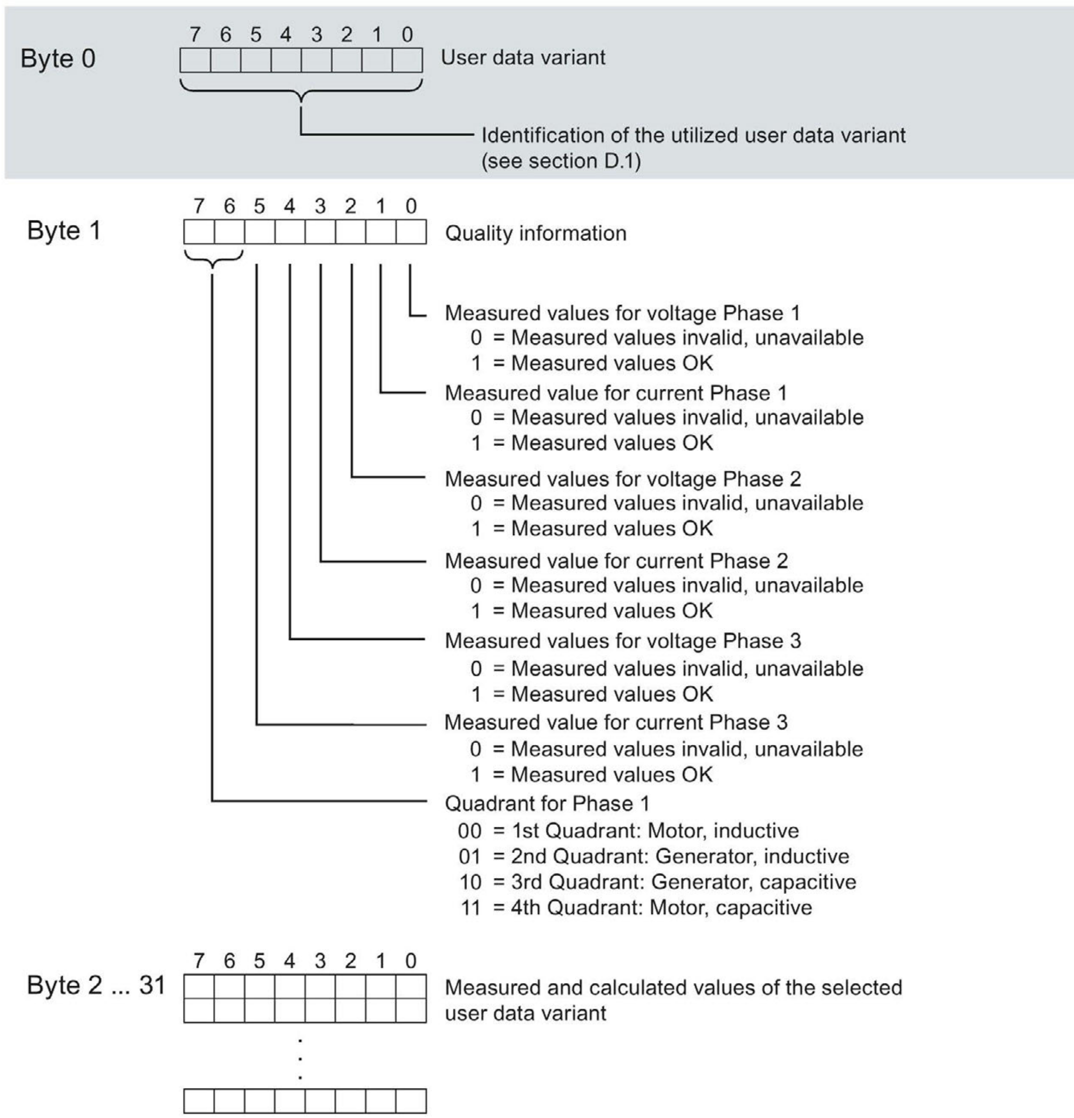

Figure C-3 Assignment of the input user data (32 bytes)

Structure of output user data

The structure of the output user data is fixed and is the same at all the selectable user data variants.

Via the output user data you control globally or phase-specifically

- Resetting for minimum values, maximum values, limits, operating hours counter and energy counters.
- The counter gates for operating hours counter and energy counters.

Table C- 4 Structure of output user data (12 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Control byte for switching the user data variant
1	Module	Control byte 1	Global resetting of values and counters, gate
2	Module	Control byte 2	Selection of the energy counter to be reset
3	Module	Control byte 3	Control of the limit monitoring of limit values 9 to 16
4	Module	Control byte 4	Control of the limit monitoring of limit values 1 to 8
5	Module	Reserved	-
6	Phase L1	Control byte 6	Phase-specific resetting of values and counters, gate for Phase 1
7	Phase L1	Control byte 7	
8	Phase L2	Control byte 8	Phase-specific resetting of values and counters, gate for Phase 2
9	Phase L2	Control byte 9	
10	Phase L3	Control byte 10	Phase-specific resetting of values and counters, gate for Phase 3
11	Phase L3	Control byte 11	

Control bytes for user data variant

Control bytes for all three phases

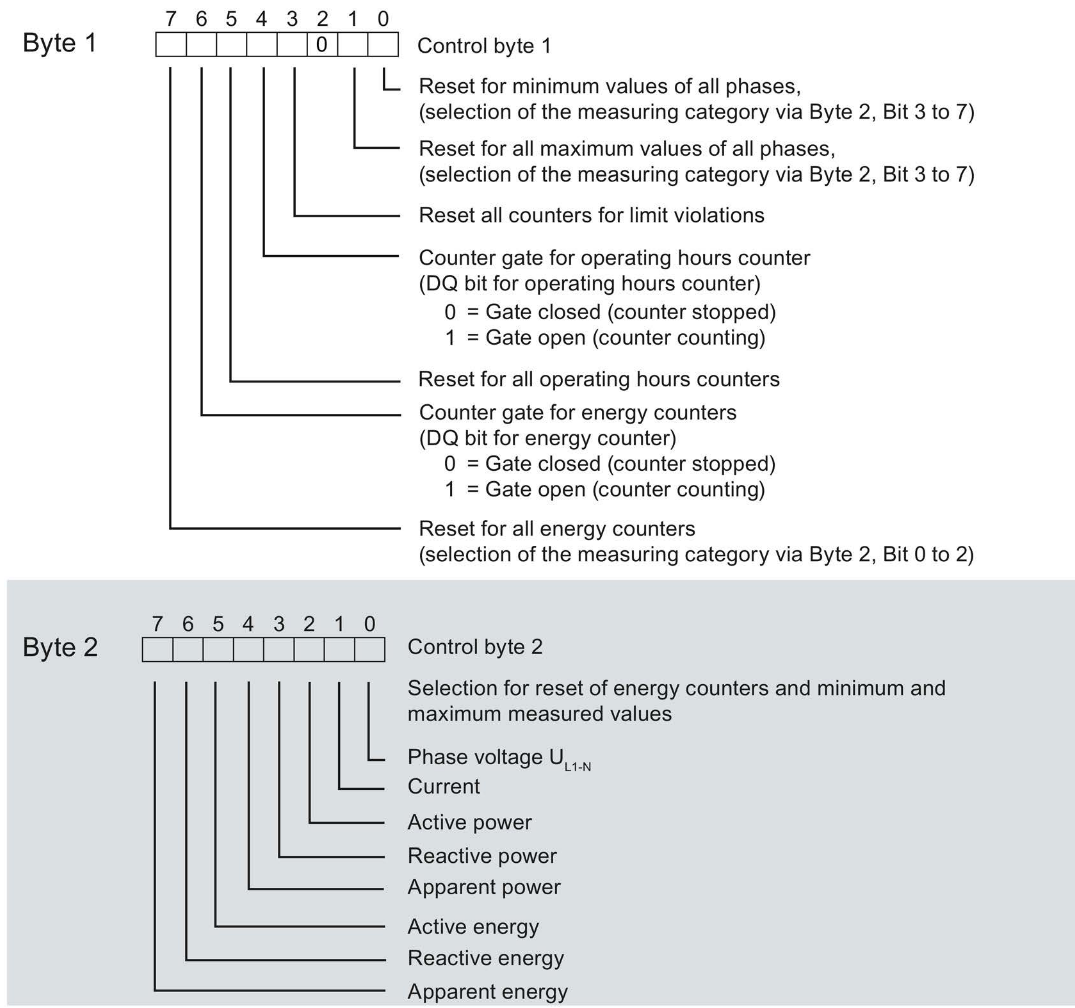

Figure C-5 Allocation of the control bytes for all three phases (bytes 1 and 2)

Control bytes for limit monitoring

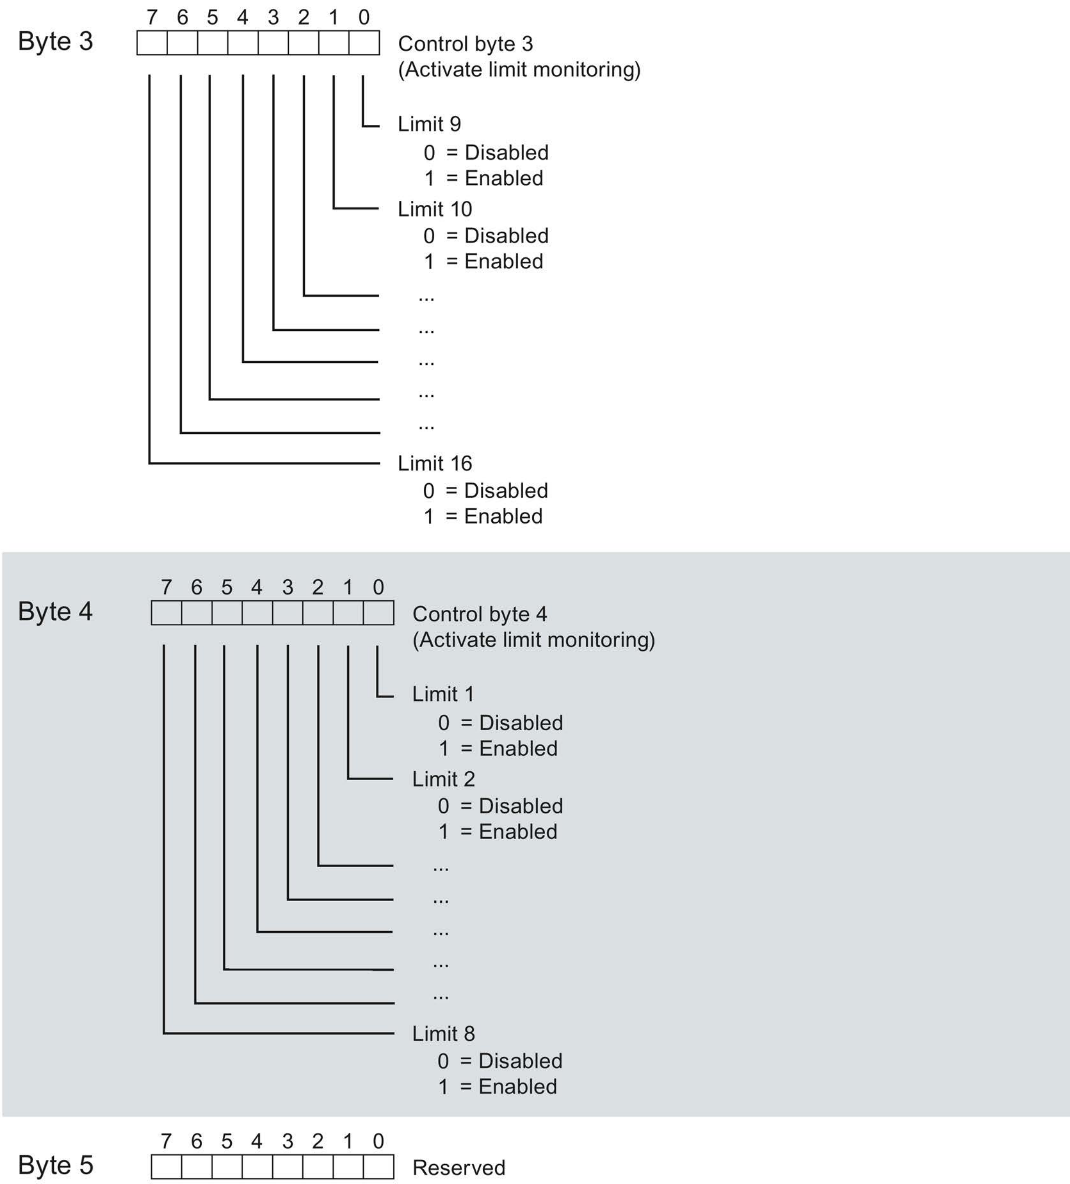

Figure C-6 Allocation of the control bytes for limit monitoring (bytes 3 to 5)

Control bytes for each individual phase

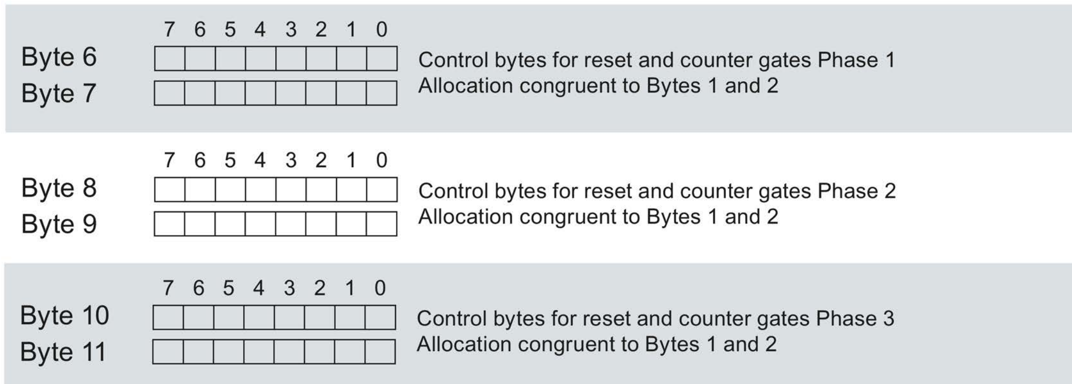

Figure C-7 Allocation of the control bytes for each individual phase (bytes 6 to 11)

C.3 "User-specific" module version

User data of the module

The module occupies between 16 and 256 bytes of input user data and 12 bytes of output user data. Of these the module uses 2 bytes input data for status information and 12 bytes output data for control information. Measured variables can be read cyclically via user data (as of Byte 2) or acyclically via measured value data records

Structure of input user data

You configure the structure of the input user data starting at Byte 2 at this module version itself. An input user data length of 32 bytes also allows you to set the input user data dynamically. You can choose between different user data variants.

Table C- 5 Structure of input user data (16 to 256 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	-
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 255	Module or phase	Data	Measured values or calculated values in accordance with their configuration: • At configuration in STEP 7 the size of the input user data is calculated automatically. • At configuration via the GSD file the size of the input user data amounts to 32, 64, 128 or 256 bytes. The memory area has to be sufficiently large for the measured variables defined in parameter data record 130.

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

The allocation of the status information in Byte 0 and 1 corresponds to the module version 32 I / 12 Q, see appendix Module version "32 I / 12 Q" (Page 145).

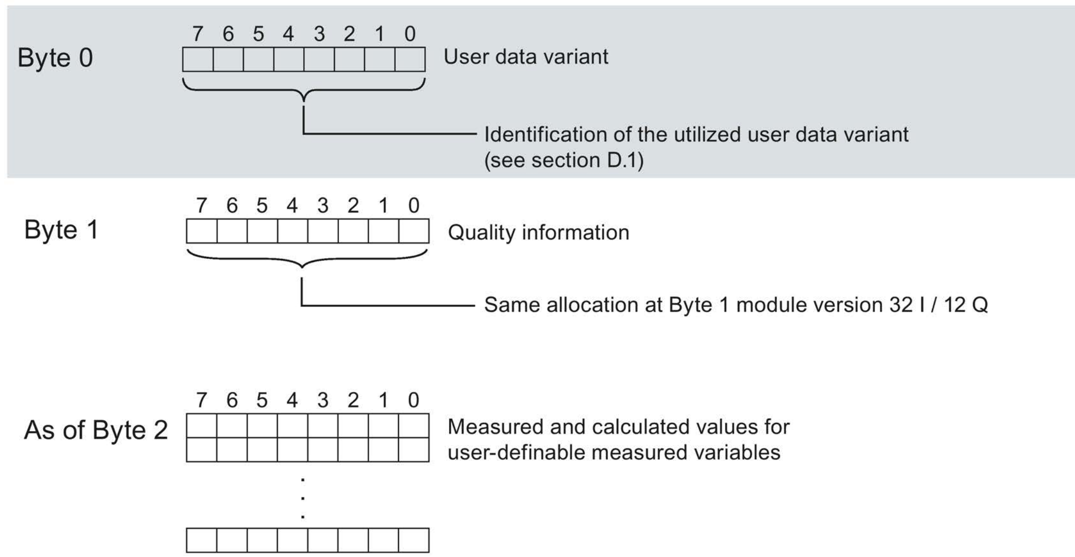

Figure C-8 Allocation of the input user data ("User-specific" module version"

Note

Behavior at switchover in case of the input user data being too small

If the configured size of the variable input user data is smaller than the sized of the fixed user data variant, the response depends on the type of switchover:

- Re-configuration via parameter data record 128 / 130: Output of a parameter assignment error (33). No switchover.
- Switchover using output byte 0 of a user data variant: No switchover and no error message.

Structure of output user data

The structure of the 12 output user data is fixed and is identical to the output user data (control bytes) of the Module version "32 I / 12 Q" (Page 145).

C.4 Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3"

User data of the module

The four versions according to EE@Industry use between 4 and 104 bytes of input user data and 12 bytes of output user data. A dynamic switchover of the input user data is not possible.

Structure of input user data

The structure of the input user data for the module versions according to the EE@Industry standard is fixed and depends on the selected measurement data profile.

Table C- 6 Measurement data profile E0

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0...3	Current L1	REAL	1 A	0.0 … 100000.0	7

100...103	Power factor L3	REAL	-	0.0 … 1.0	21

Structure of output user data

The structure of the 12 byte output user data is fixed and is identical to the output user data (control bytes) of the Module version "32 I / 12 Q" (Page 145).

User data variants

D

D.1 User data variants with 32 bytes input data / 12 bytes output data

User data

30 bytes are available for transferring the measured values in a cycle at the module version 32 I / 12 Q. Therefore this module version supports dynamic switching between 22 preconfigured user data variants that contain a specific selection of measured values.

For more detailed information, refer to "Selecting the module versions (Page 28)".

Table D- 1 Overview of the user data variants

User data	User data variant
Total power L1L2L3	254 (FE_H) - default setting
Active power L1L2L3	253 (FD_H)
Reactive power L1L2L3	252 (FC_H)

Measured value data records E

E.1 Overview of all measured value data records

Energy Meter 480VAC ST writes the measured values in several data records that you can read acyclically using the RDREC instruction in the user program.

The following tables show the structure of the individual data records:

- Data record DS 142 for basic measured values (read only).
- Data record DS 143 for energy counters (read and write).
- Data record DS 144 for maximum values (read only).
- Data record DS 145 for minimum values (read only).
- Data record DS 147 for phase-specific measured values L1 (read only).
- Data record DS 148 for phase-specific measured values L2 (read only).
- Data record DS 149 for phase-specific measured values L3 (read only).
- Data record DS 150 for advanced measurement and status values (read only).

Note

- The cumulative value of the energy counters in 3-phase operation is obtained from the sums of the respective individual values of the phases.
- Inflow and outflow energy meters are always positive values.
- The operating hours counter for the entire module is calculated from the maximum of the operating hours of the individual phases.

E.2 Measured value data record for base measurements (DS 142)

Measured variables of the module

The following table provides an overview of all the measured variables that data record 142 supplies. Please note that, depending on the connection type used the display of some measured variables does not make sense and that the module deletes measured values that are not relevant.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables (Page 131)).

Neutral current

If you operate the AI Energy Meter 480VAC ST with connection type 3P4W, the neutral current is also measured under the following conditions:

- Transmission factors of all phase currents (primary and secondary currents) are identical.
- Measured phase currents are greater than the value of the "Low limit for measuring current parameter.

  The neutral current is subject to a "Low limit for measuring current" like all other measured current values. The lowest value of all three configured low limits is used as the minimum value.

If one of the conditions is not met, 0 is entered as the value for the neutral current. You can read the neutral current calculated using measured value data record 142.

Procedure

Data record 142 is located on the AI Energy Meter 480VAC ST. Use SFB "RDREC" to read out the data record from the module. This system function block is stored in the STEP 7 library.

Measured values in STEP 7 as of V5.5

Measured values are represented as negative values in STEP 7 as of V5.5 if the value range of the integer format (32767 dec) is exceeded. This is not an error in the measured value. Solution: Select hexadecimal representation.

Conversion of 64-bit floating-point numbers

If you cannot process 64-bit floating-point numbers in your automation system, we recommend conversion to 32-bit floating-point numbers. Note the conversion can cause loss of accuracy. For a description of the conversion of the 64-bit floating-point numbers (data type LREAL) into 32-bit floating-point numbers (data type REAL) please refer to the Internet (http://support.automation.siemens.com/WW/view/en/56600676).

E.3 Structure for energy counters (DS 143)

Energy meter data record 143 for different actions

The energy meter data record 143 includes all energy meters available on the module phase-by-phase. The data record can be used for different actions:

- Reset the energy counter to user-specific value (e.g. "0")
- Reading the current values of the energy counters
- Reading the overflow counters
- Reading the operating hours

Energy meter data record 143

166...169	Operating hours counter L3 (initial value)	REAL	h		65507

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

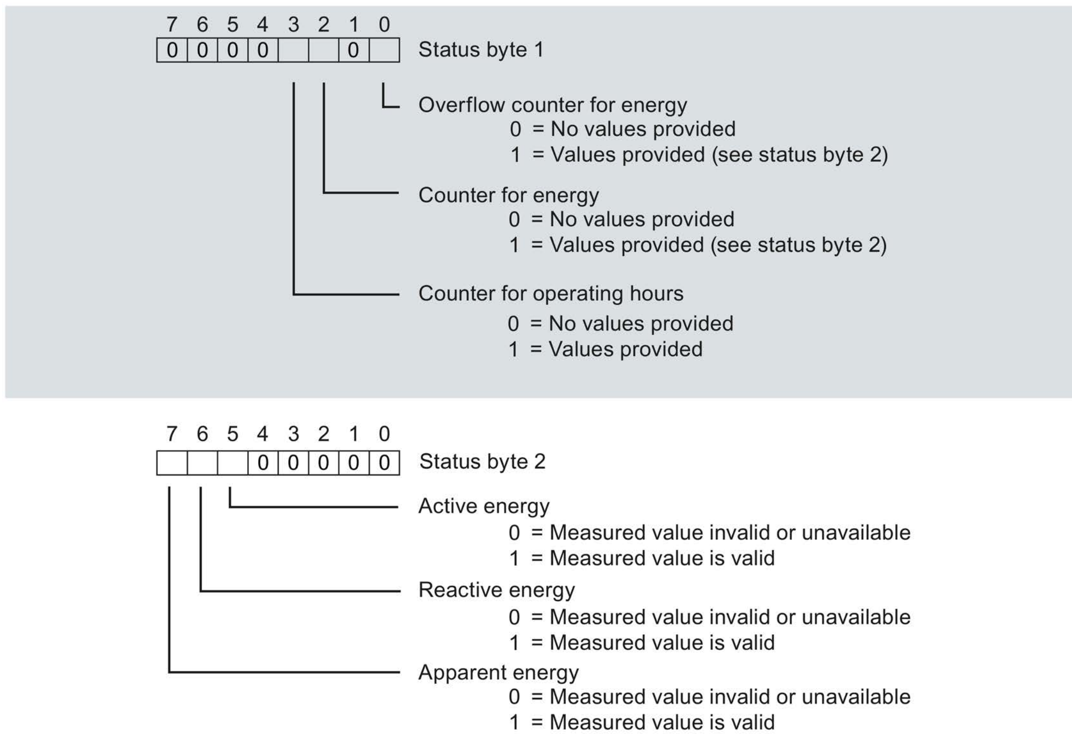

Figure E-1 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy counters, overflow counters and operating hours counter. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to reset and the time at which counters are reset.
- In Control byte 2 you determine which energy counters and which overflow counters you want to reset.

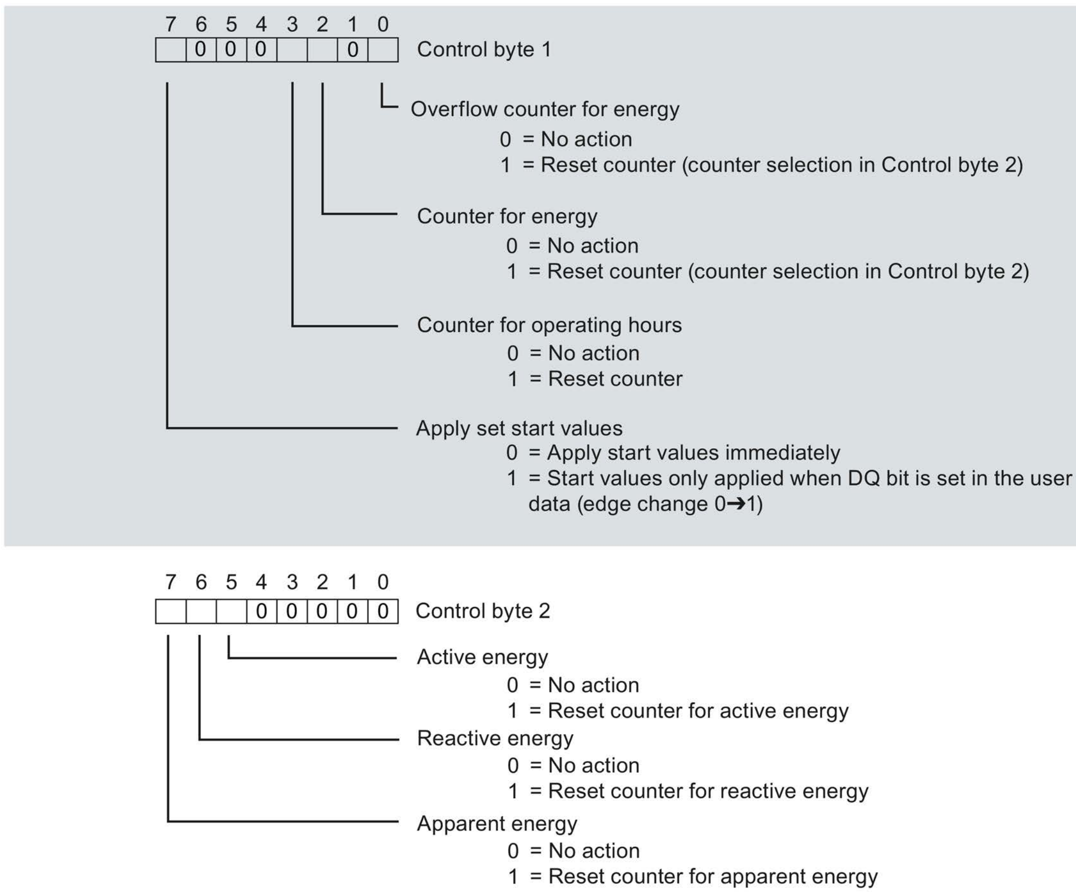

Figure E-2 Control information DS 143 (write access)

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the measured value data record 143:

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the mod-ule is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E1	01	Reserved bits are not 0.	Check Byte 2...7 and set the reserved bits back to 0.
DF	80	E1	39	Incorrect version entered.	Check Byte 0. Enter a valid version.
DF	80	E1	3A	Incorrect data record length entered.	Check the parameters of the WRREC instruction. Enter a valid length.
DF	80	E1	3C	At least one start value is invalid.	Check Bytes 8...103 and Bytes 158...169. The start values may not be negative.
DF	80	E1	3D	At least one start value is too large	Check Bytes 8...103 and Bytes 158...169. Observe the ranges of values for start values.

E.4 Measured value data record for maximum values (DS 144)

Measured variables of the module

The largest values ever measured or calculated from the time AI Energy Meter 480VAC ST was started are stored in this data record.

Tips and tricks

F

F.1 Tips and tricks

Processing and visualizing energy data

On the basis of an application example we show you how the measured values of the AI Energy Meter can be processed further and visualized.

You can find this application example on the Internet (http://support.automation.siemens.com/WW/view/en/86299299)

IT network

You must create an artificial N-conductor (for example, by means of a 1:1 voltage transformer) in IT networks due to the missing neutral conductor. You can then use the module.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

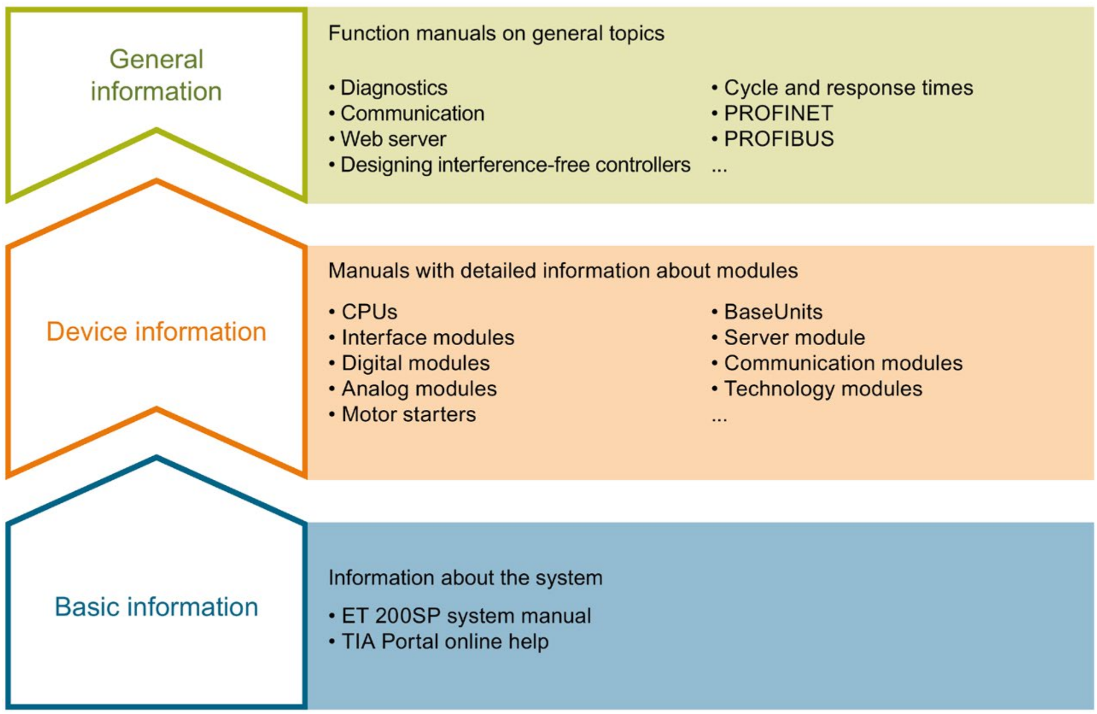
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑥	LED for supply voltage	⑫	Article number

Figure 2-1 View of the module AI Energy Meter HF

Properties

The module has the following technical properties:

- Measurement of electrical variables from single-phase, two-phase and three-phase supply networks
- Max. nominal voltage between two line conductors 480 V AC
- Retentive storage of the counter values
- Use on frequency converters
- Recording of:
  - Voltages
  - Currents
  - Phase angles
  - Power
  - Energy / electrical work
  - Frequencies
  - Minimum and maximum values with time stamp
  - Power factors
  - Operating hours
  - Limits
  - Power quality data for voltages and currents

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7	GSD file	
			TIA Portal	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	---
Calibration in runtime	FS01	V6.0.0 or higher	V15 or higher with HSP0253	---	---
Identification data I&M0 to I&M3	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	X
Reconfiguration in RUN	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	X
Diagnostic interrupts	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	X
Hardware interrupts	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	---

---

Note

The AI Energy Meter HF is released as of TIA Portal V15.0.0.2.

Accessories

The following accessories must be ordered separately:

- BaseUnit type U0
- Labeling strips
- Reference identification label

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/es/58649293) system manual.

2.2 Area of application

Introduction

Energy efficiency is playing an increasingly important role in industry. Rising energy prices, increasing pressure to improve profitability and the growing awareness of climate protection are important factors for reducing energy costs and for introducing an energy data management system.

Where can you use the AI Energy Meter HF?

AI Energy Meter HF is designed for machine-level deployment in an ET 200SP distributed I/O system. AI Energy Meter HF records over 500 different electrical measurement and energy values. It lets you create transparency about the energy requirements of individual components of a production plant even down to the machine level.

You can use the following measurement values supplied by the AI Energy Meter HF for the following applications:

- Energy consumption
- Power consumption
- Power quality
- Forecasts of consumption
- Efficiency

Power consumption measurements are relevant for load management and maintenance. In addition, you can use the measurements for emission reporting and for determining the CO_2 footprint.

Note

Measuring dangerous electrical quantities

The AI Energy Meter HF is not tested according to DIN EN 61010-2-030 and may therefore not be used to verify, measure or monitor protective measures according to DIN EN 61557.

Qualified personnel must ensure through additional measures that no danger ensues for humans and the environment in case of an incorrect display.

TB, TT and IT system

The AI Energy Meter HF can be used in TN, TT and IT systems.

Measuring with AI Energy Meter HF

A typical supply network of a production plant is usually divided into three voltage ranges:

- The infeed of the entire plant
- The subdistribution, for example, to individual lines within the plant
- The end consumers such as the machines in the lines.

The following figure shows the measurement in an electricity supply network:

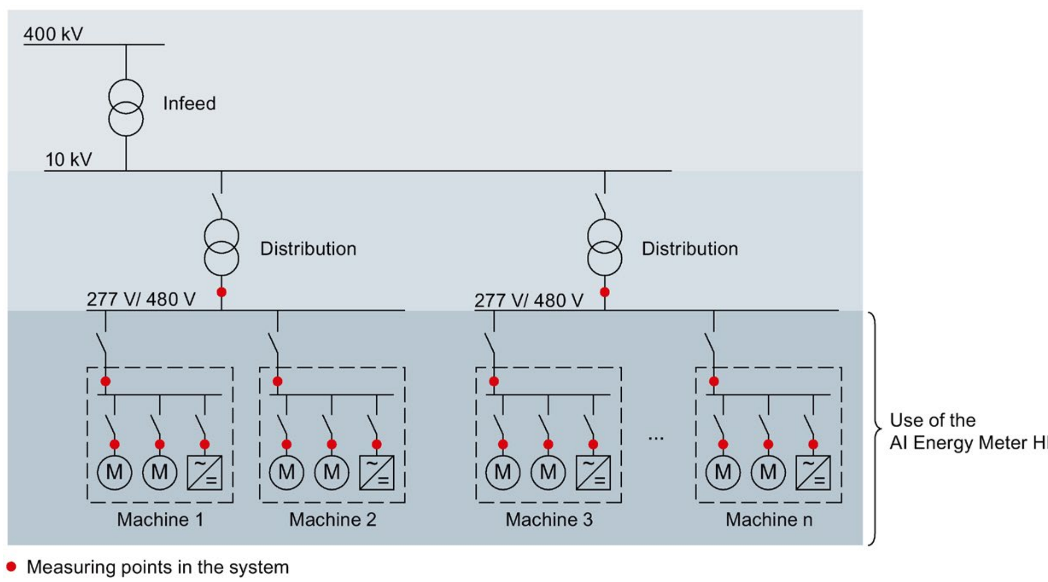

Figure 2-2 Use of the AI Energy Meter HF

Advantages of the AI Energy Meter HF

The AI Energy Meter HF has the following advantages:

- Space-saving especially for use in control cabinet
- PROFINET IO or PROFIBUS DP (depending on the interface module in use)
- Multiple modules can be used with one interface module
- Extension of existing stations by components for energy recording

2.3 Special considerations for use on the PROFIBUS DP and PROFINET IO

You can read data records from the module or write them to the module with both PROFIBUS DP and PROFINET IO.

Operation of the module on PROFIBUS DP

Please note that with PROFIBUS DP you can write data records up to a maximum length of 240 bytes to the module or read them from the module.

PROFIBUS DPV 1

If the DP Master supports the DPV1, you can reconfigure in your user program with the parameter data records DS 128, DS 129, DS 130, DS 131 or DS 135. Note that the maximum data record length is 240 bytes for DS 135.

The following applies for the measured value data records:

- DS 142: When you read the data record, the module returns the measured value data record DS 142 in version 2.
- DS 147, DS 148, DS 149: When you read the data record, the module returns the measured value data record in version 0.
- DS 154, DS 155, DS 161, DS 163, DS 164: When you read the data record, the module returns the first 240 bytes of the structure of the measured value data record.
- DS 151: You define the user-defined measured value data record DS 151 in the parameter data record DS 135. If the structure in the measured value data record DS 151 is greater than 240 bytes, the module returns the first 240 bytes of the structure.

  Information on the data record length of data records DS 135 and DS151 can be found in the appendix Structure of the parameter data record 135 for data record mapping (Page 160).

PROFIBUS DPV 0

If the DP Master does **not** support DPV1, you cannot reassign parameters which results in the following restrictions:

- There are no phase-specific parameters. All parameters apply for all three phases and the neutral conductor.
- The connection types und user data variants are limited.
- The voltage transformers are not configurable (default: 1:1).
- The current transformer value range primary current is restricted.
- The low limit for measuring current cannot be adjusted (default: 50 mA).
- Energy metering is performed continuously (the gate is not enabled).
- Min/Max calculation of values is enabled (the gate is not enabled).
- 3P4W can be set in the parameters for the connection type 3P3W.
- 3P4W can be set in the parameters for the connection type 3P3W1.
- Counting of operating hours is enabled (the gate is not enabled).
- The residual current measurement is enabled.
- Limit value monitoring cannot be used.
- Energy meter default cannot be used.
- The user-defined user data interface cannot be used.
- The user-defined data record cannot be used.
- The power quality analysis cannot be used.
- The separate settings for measuring the neutral current cannot be used.
- The measured value data records cannot be used.

Operation of the module on PROFINET IO

When reading data records partially from the module, please note the following:

- Measured value data record DS 142:
  - When you read the data record with a length of 240 bytes or less, the module returns the measured value data record DS 142 in version 2.
  - When you read the data record with a length of more than 240 bytes, the module returns the measured value data record DS 142 in version 3.
- Measured value data records DS 147, DS 148, DS 149:
  - When you read the data record with a length of 240 bytes or less, the module returns the measured value data record in version 0.
  - When you read the data record with a length of more than 240 bytes, the module returns the measured value data record in version 1.

3.1 Terminal and block diagram

General safety instructions

> **WARNING**
>
> **Danger to life due to electric shock**
>
> Touching live parts can lead to death or severe injuries.
>
> Before beginning any work deenergize the system and the AI Energy Meter HF and short-circuit installed transformers.

> **WARNING**
>
> **Danger to life, dangerous system conditions and material damage possible**
>
> Removing and inserting the AI Energy Meter HF under live voltage is prohibited.
>
> If you remove and insert the AI Energy Meter HF under live voltage during operation, the transformers used can produce dangerous induction voltages and electric arcs and dangerous system conditions can arise.
>
> The AI Energy Meter HF may only be removed and inserted during operation if the measuring voltages supplied to the BaseUnit at terminals U_{L1}, U_{L2}, U_{L3} are disconnected at all poles **and** special current transformer terminals are used that short-circuit the transformer on the secondary side on removal.

Supplying the module

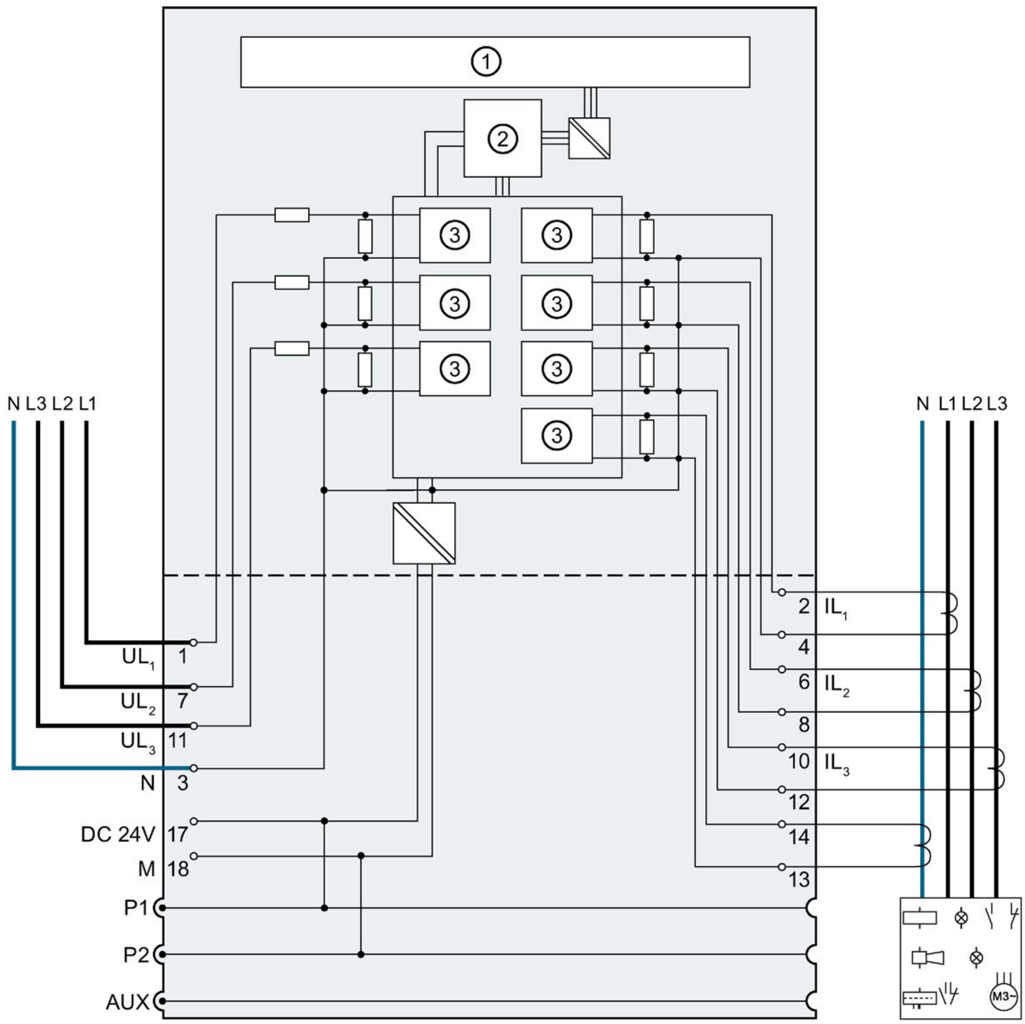
The AI Energy Meter HF receives its supply voltage via terminals 17 (24 V DC) and 18 (M).

Protecting the connection cables

To protect the connection cables at U_{L1}, U_{L2} and U_{L3}, make sure there is adequate cable protection, especially after cross-section transitions.

If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter HF.

Terminal and block diagram



①	Microcontroller	UL_n	Connection of voltage transformers
②	Backplane bus interface	IL_n	Connection of current transformers
③	Analog-to-digital converter (ADC)	N	Neutral
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)		

Figure 3-1 Block diagram of the AI Energy Meter HF

Useable BaseUnits

You can use the following BaseUnits:

- Type BU type U0 dark-colored
- Type BU type U0 light-colored

A potential group opened with a light-colored BU type U0 must contain no dark-colored BaseUnit of BU type A0 or A1.

Connection types

The AI Energy Meter HF supports the following connection types:

- 3P4W1, 3 phases, 4 conductors, balanced load
- 3P4W, 3 phases, 4 conductors
- 2P3W, 2 phases, 3 conductors
- 1P2W, 1 phase, 2 conductors
- 3 x 1P2W, 3 x 1 phase, 2 conductors
- 3P3W, 3 phases, 3 conductors
- 3P3W1, 3 phases, 3 conductors, balanced load
- 3P4WI, 3 phases, 4 conductors (only for current measurement)

The input circuit of the module must correspond to one of the listed connection types. Select the appropriate connection type for the intended use.

You will find examples of connections in the section Connection examples (Page 23).

Information on the selection of a current transformer is available in the section Current transformer selection data (Page 27).

3.2 Connection examples

The following figures show the connection of the AI Energy Meter HF for three-phase, two-phase and single-phase measurements. Note that the AI Energy Meter HF must always be connected via a current transformer. The use of voltage transformers is optional.

Connection type	Wiring diagram	Comment
3P4W Three-phase measurement, 4 wires		Any load Connection with three current transformers
3P4W Three-phase measurement, 4 wires		Any load Connection with three current transformers and three voltage transformers.
3P4W1 Three-phase measurement, 4 wires		Balanced load Connection with one current transformer

Connection type	Wiring diagram	Comment
3P4W1 Three-phase measurement, 4 wires		Balanced load Connection with one current transformer and one voltage transformer.
2P3W Two-phase measurement, 3 conductors		Any load Connection with two current transformers AI Energy Meter HF supplies the value "0" for all measured values of Phase 3 as well as for some cross-phase measured values.
2P3W Two-phase measurement, 3 conductors		Any load Connection with two current transformers and two voltage transformers. AI Energy Meter HF supplies the value "0" for all measured values of Phase 3 as well as for some cross-phase measured values.
1P2W Single-phase measurement, 2 conductors		Measurement in an AC network with a current transformer. AI Energy Meter HF supplies the value "0" for all measured values of Phase 2 and 3 as well as for some cross-phase measured values.

Connection type	Wiring diagram	Comment
1P2W Single-phase measurement, 2 conductors		Measuring the load in an AC network with one current transformer and one voltage transformer. AI Energy Meter HF supplies the value "0" for all measured values of Phase 2 and 3 as well as for some cross-phase measured values.
3 x 1P2W 3 x single-phase measurement		Measurement with three current transformers for any three loads that are each connected to one of the three phases.
3 x 1P2W 3 x single-phase measurement		Measurement with three current transformers and three voltage transformers for any three loads that are each connected to one of the three phases.
3P3W Three-phase measurement		Any load Connection with three current transformers

Connection type	Wiring diagram	Comment
3P3W Three-phase measurement		Any load Connection with three current transformers and three voltage transformers.
3P3W1 Three-phase measurement		Balanced load Connection with one current transformer
3P3W1 Three-phase measurement		Balanced load Connection with one current transformer and one voltage transformer.
3P4WI Three-phase measurement (only for current measure-ment)		Connection with three current transformers

* If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter HF.

Current transformer connection requirements

DIN VDE 0100-557 and IEC 60364-5-55 require the following for the connection of current transformers:

- The secondary circuits of current transformers must not be grounded.
- Guards must not be used in the secondary circuits of current transformers.
- The insulation of the secondary cables of transformers must be designed for the highest voltage of all active components, or the secondary cables must be installed in such a way that their insulation cannot touch any active components, such as busbars.
- Connection points must be provided for temporary measurements.

3.3 Current transformer selection data

Introduction

Connection via a current transformer is always required for the current measurement. Use toroids with an accuracy class of 0.5, 1 or 3.

Dimensioning of the current transformer

The correct dimensioning of the current transformer is important for the following reasons:

- You achieve correct results from the measurements and
- You do not overload or damage the current transformers.

Selecting a current transformer

Use current transformers with a burden capacity 1.5 to 2 times greater than the power dissipation in the terminal circuit (consisting of resistance of the connection cables and burden of the AI Energy Meter HF). 1.5 times the power loss is required in order to prevent the transformer from overloading. 2 times the power dissipation is important to ensure the current limiting in case of a short-circuit.

Maximum length of the connection cable

To avoid overloading or damaging the current transformer, the burden Z_n specified on the data sheet of the current transformer (in VA) must not be exceeded. To prevent this being exceeded, the entire burden resistance (consisting of the resistance of the connection cable and the internal resistance of the AI Energy Meter HF (see figure below) must be below a certain resistance value (depending on Z_n and I_{max}).

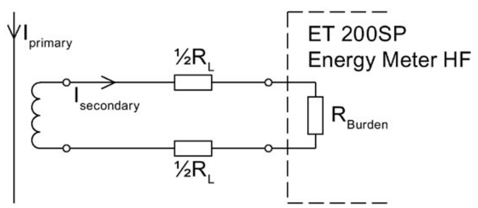


Figure 3-2 Maximum length of the connection cable

The maximum value of the resistance of the connection cable is obtained with the following formula:

$$R_{L,\,max} = \frac{Z_n}{I_{max}^{\ 2}} - R_{burden}$$

R_L	Cable resistance in ohms	I_{max}	Secondary current of the current transformer
Z_n	Rated burden current transformer in VA	R_{burden}	Resistance of the AI Energy Meter HF (25 mΩ)

Figure 3-3 Maximum value for the resistance of the connection cable

Based on the maximum cable resistance in ohms, you then calculate the maximum length of the connection cable. To do this, check the data sheet of the connection cable you are using.

Note

The length of the connection cable (outwards and return) must not exceed the value of 200 meters.

Example: Usage of a current transformer 500/5 A

You use a current transformer with a transmission ration of 500/5 A that has a rated burden Z_n of 5 VA according to the data sheet.

The maximum primary current in the application amounts to 400 A. This means that the maximum secondary current $I_{max.}$ amounts to 4 A. The burden of the AI Energy Meter HF including connection resistance amounts to R_{Burden} = 25 mΩ.

The maximum value of the resistance of the connection cable (outgoing and incoming line) is obtained using the following formula:

$$R_{L,\,max} = \frac{Z_n}{I_{max}{}^2} - R_{Burden} = \frac{5\text{ AV}}{16\text{ A}^2} - 25\text{ m}\Omega = 312.5\text{ m}\Omega - 25\text{ m}\Omega = 287.5\text{ m}\Omega$$

The maximum cable resistance between the transformer and the terminals of the AI Energy Meter HF may not exceed 287.5 mΩ in this case. The corresponding cable length (outgoing and incoming line) depends on the cross-section used of the copper line and can be determined by using the following table.

The following table shows the resistance values of copper cables for typical cross-sections with ρ = 0.017857 Ω x mm²/m

Estimating the length for a connection cable

The value in the table must be less than the calculated terminal resistance $R_{L\ max}$ of the cable. For the resistance R_{Lmax} of 287.5 mΩ used in the above example it is possible to use a connection cable (outgoing and incoming line) with a length of 10 m from a cross-section of 0.75 mm² upward.

Cross-section	AWG	Cable overview for copper				
		0.5 m	1 m	5 m	10 m	50 m
0.25 mm²	24	35.7 mΩ	71.4 mΩ	357.1 mΩ	714.3 mΩ	3571.4 mΩ
0.34 mm²	22	26.3 mΩ	52.5 mΩ	262.6 mΩ	525.2 mΩ	2626.0 mΩ
0.5 mm²	21	17.9 mΩ	35.7 mΩ	178.6 mΩ	357.1 mΩ	1785.7 mΩ
0.75 mm²	19/20	11.9 mΩ	23.8 mΩ	119.0 mΩ	238.1 mΩ	1190.5 mΩ
1.0 mm²	18	8.9 mΩ	17.9 mΩ	89.3 mΩ	178.6 mΩ	892.9 mΩ
1.5 mm²	16	6.0 mΩ	11.9 mΩ	59.5 mΩ	119.0 mΩ	595.2 mΩ
2.5 mm²	14	3.6 mΩ	7.1 mΩ	35.7 mΩ	71.4 mΩ	357.1 mΩ

Checking the ratio of burden load and power loss

The rated burden of the transformer must be 1.5 to 2 times greater than the power loss in the connection circuit to ensure that the transformer is not overloaded and that the current limitation is ensured during a short-circuit.

At a maximum secondary current of 4 A the power loss in the connection circuit is calculated in accordance with the following formula for a connection cable (outgoing and incoming line) with a length of 10 m and a cross-section of 1.0 mm² and a burden resistance of the AI Energy Meter HF of 25 mΩ:

$$P_{\text{Connection circuit}} = (R_{\text{Connection cable}} + R_{\text{Burden}}) \times I^2_{\text{Max. secondary}}$$

$$P_{\text{Connection circuit}} = (178.6\ \text{m}\Omega + 25\ \text{m}\Omega) \times 4^2\ \text{A}^2\ 3.26\ \text{W}$$

The ratio of the rated burden and the power loss in the connection circuit thus amounts to:

$$\frac{Z_{\text{N rated burden}}}{P_{\text{Connection circuit}}} = \frac{5\ \text{VA}}{3.26\ \text{W}} = 1.54$$

The required ratio of rated burden and power loss in the connection circuit lies within the required range. The transformer is dimensioned sufficiently large.

4 Configuration / address space

4.1 Configuring

Introduction

To configure the AI Energy Meter HF after connecting it, use configuration software such as STEP 7 (TIA Portal). In addition, you can also change numerous parameters of the AI Energy Meter HF in RUN via the user program.

Configuring

You configure the AI Energy Meter HF with:

- STEP 7 (TIA Portal) as of V15 and HSP0253
- GSD file for PROFIBUS or PROFINET

Note

Consistency check of the parameter assignment only with STEP 7

If you configure the AI Energy Meter HF using STEP 7 (TIA Portal), STEP 7 (TIA Portal) already checks the various parameters for consistency while they are being entered.

If you configure the AI Energy Meter HF using a GSD file, a consistency check is not carried out. The module does not recognize incorrect entries until after the parameter data record has been transferred. If the module recognizes an invalid parameter, the module rejects the complete data record.

Preferably use STEP 7 (TIA Portal) to configure the AI Energy Meter HF.

The following instructions show the theoretical procedure for configuring the AI Energy Meter HF with STEP 7 (TIA Portal) V15 or higher with HSP0253.

1. Select the ET 200SP distributed I/O system you are using in the hardware catalog.
2. Insert the module into your station.
3. Open the device view of the ET 200SP and insert the AI Energy Meter HF.
4. Configure the AI Energy Meter HF to suit your requirements.

   Once the configuration has been compiled without errors, you can download the configuration to the CPU and commission the ET 200SP station while the AI Energy Meter HF is running.

4.2 Selecting the module versions

Introduction

The AI Energy Meter HF has different module versions.

During the configuration you use the selection of the module version to specify which measured values can be read.

Each module version supplies quality information via the input user data.

With the exception of the module version "2 I / 2 Q" you can read the measured values as user data cyclically from the process image. At each module version you have the option to read measured value records from the AI Energy Meter HF by using the RDREC instruction asynchronously.

Influence of the module version on the address space

Note

Influence of the AI Energy Meter HF on the maximum configuration of the ET 200SP

The available address space of the ET 200SP is influenced by the following factors:

- CPU or interface module
- Plugged I/O modules

The address space made **additionally** available by the AI Energy Meter HF is essentially influenced by the length of the user data supplied. The module version determines the length of the user data, which can be supplied by the AI Energy Meter HF at maximum.

4.2.1 Module versions at configuration with STEP 7

Module versions with fixed user data assignment

Module version	User data	Address space	Comment
2 I / 2 Q	No cyclic user data. Access to measured values through "Read data record".	2-byte inputs 2-byte outputs	Information about the structure of the 2 I / 2 Q module version is available in the appendix Module version "2 I / 2 Q" (Page 192).
EE@Industry E0	User data in accordance with EE@Industry measurement data profiles	12-byte inputs / 20-byte outputs	Information about the structure of the EE@Industry measured data profiles is available in the appendix Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3" (Page 203).
EE@Industry E1		4-byte inputs / 20-byte outputs	
EE@Industry E2		12-byte inputs / 20-byte outputs	
EE@Industry E3		104-byte inputs / 20-byte outputs	

Module versions with selectable user data variants

Module version	User data	Address space	Comment
32 I / 20 Q	User data selectable through defined user data variants	32-byte inputs / 20-byte outputs	You can change over the user data variant during operation. Information about the structure of the 32 I / 20 Q module version is available in appendix Module version "32 I / 20 Q" (Page 195). Information about the user data variants at 32 I / 20 Q is available in appendix User data variants (Page 205).
User-specific	User data selectable through user data mapping or through defined user data variant	variable* / 20-byte outputs	You have to activate the check box "User data-mapping" in STEP 7 to use the module version user-specifically. You can change over the user data variant during operation. Information about the structure of the user-specific module version is available in the appendix "User-specific" module version (Page 201).

Module versions with selectable user data variants

Module version	User data	Address space	Comment
32 I / 20 Q	User data selectable through user data variants or through user-specific user data*	32-byte inputs / 20-byte outputs	You can change over the user data variant during operation. If you use user-specific user data, you write your measured value profile into the AI Energy Meter HF with the data record 130. To do this use the WRREC instruction. Information about the structure of data record 130 is available in appendix Structure of the parameter data records 130/131 for user-data mapping (Page 157).
64 I / 20 Q		64-byte inputs / 20-byte outputs	
128 I / 20 Q		128-byte inputs / 20-byte outputs	
256 I / 20 Q		256-byte inputs / 20-byte outputs	

*Ensure that the user data do not exceed the size of the address space of the module version. If necessary, use a module version with a larger address space

4.2.3 Changing over the user data variant during operation

Introduction

You change the user data variant in the output data of each user data variant in Byte 0.

The following figure shows to which user data you can change over at various module versions during operation.

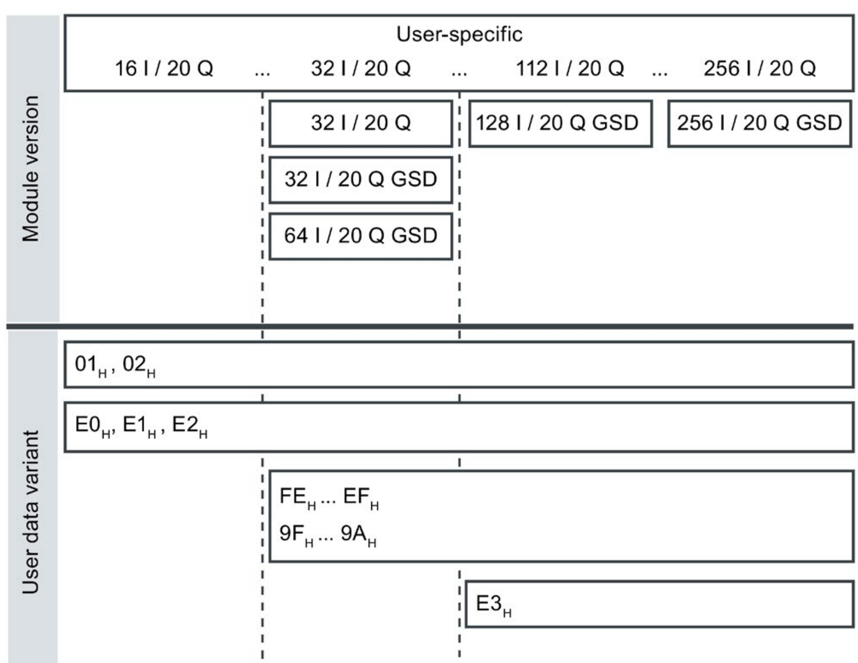

Figure 4-1 Possible user data variants

Requirement

- User program has been created.
- AI Energy Meter HF is configured as one of the module versions mentioned in the figure above.
- The start address of the module is known in the process image output.

Procedure

1. Create one constant with the data type BYTE per user data variant.
2. Enter the user data ID as a value in each case.
3. Write the constant to the start address of the module in the process image output.

Result

The user data variant is switched with the next cycle.

Note

Information about user data changeover

The parameterized user data variant is set in the following cases:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  – Coding of the user data variant not available
    or
  – Available address space is not sufficient for the selected user data variant.

4.2.4 Recommendations for selecting the module version

The following table shows which module version is suitable for a given purpose.

<table>
<tr><th>Module version</th><th>Application</th><th>Note</th></tr>
<tr><td>2 I / 2 Q</td><td>• Use of many AI Energy Meter HF in an ET 200SP or little address space is available</td><td>• Read the measured values solely via the RDREC instruction from a measured value data record.
• Quality information about the measured values is always available.</td></tr>
<tr><td>EE@Industry measurement data profile
E0 / E1 / E2 / E3</td><td>• Cyclic measurement per phase
• Supplied measured values in accordance with the EE@Industry measured data profile</td><td>• Available measured values depend on the configured measurement data profile.
• The user data are fixed and cannot be changed dynamically. Alternatively, read the measured values acyclically from a measured value data record via the RDREC instruction.
• No quality information</td></tr>
<tr><td>32 I / 20 Q</td><td>• Cyclic measurement per phase
• Flexibility by switching predefined user data variants</td><td rowspan="3">• Quality information about the measured values is always available.
• Depending on the user data variant, you must convert the measured values in the CPU to physical values using the supplied scaling factor.
• One cycle elapses for each user data changeover. Measured values from the next user data variant are thus supplied with a slight time offset.
Alternatively, read the measured values acyclically from a measured value data record via the RDREC instruction. Consistent measured values of a measuring cycle are supplied.</td></tr>
<tr><td>User-specific</td><td rowspan="2">• Cyclic measurement of up to 64 measured values configurable
• Flexibility by switching predefined user data variants</td></tr>
<tr><td>With GSD configuration
• 32 I / 20 Q
• 64 I / 20 Q
• 128 I / 20 Q
• 256 I / 20 Q</td></tr>
</table>

4.3 Applicable modules

Configuring with STEP 7

The following table shows with which controllers the different module versions can be configured with STEP 7.

Table 4- 1 Module versions configured with STEP 7

Controller	Module version						
	2 I / 2Q	32 I / 20 Q	User-specific	EE@Industry measurement data profile

Quick start 5

Introduction

This section shows you how to read and view your first measured values on the AI Energy Meter HF in a particularly quick and easy way.

Requirement

You have already connected the AI Energy Meter HF to your network with one of the connection types shown in the section Wiring (Page 20). The AI Energy Meter HF has already been integrated in your configuration tool (such as STEP 7), or the AI Energy Meter HF has been integrated in your hardware catalog of your configuration tool with the GSD file.

Procedure

1. Configure an ET 200SP station

   Configure an ET 200SP station with a CPU 151xSP or an IM 155-6.
2. Plug module in ET 200S station

   Plug the AI Energy Meter HF into the ET 200SP station and use the module version with 32-byte inputs and 20-byte outputs.
3. Set the module parameters

   Set the following parameters for the AI Energy Meter HF:

   – Connection type that you have used for the AI Energy Meter HF (e.g. 3P4W)

   – Voltage measuring range

   – Frequency of your network (for example 50 Hz)

   – Nominal value current and nominal value voltage for the phases

   – Primary and secondary current of the used current transformer (e.g. 100 A and 1 A)

   – Primary and secondary voltages of the used voltage transformer (e.g. 230 V and 230 V)

   Leave all other parameters at their default settings and do not change them.
4. Load configuration

   Switch on the ET 200SP station and download the configuration to the CPU.

Result

After being switched on, the AI Energy Meter HF supplies the measured values for the "Total power L1L2L3" user data variant with the ID 254 or FE_H.

Read and check the measured values provided by the AI Energy Meter HF in the input data.

The table below shows the structure of the user data variant, the measured variables and the data type of the measured values in STEP 7 (TIA Portal) that are stored in the 32 bytes of output data of the module. Each measured variable is referenced via the measured value ID. An overview of all the measured variables with their measured value IDs is provided in the section Measured variables (Page 163).

Table 5- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-
2 ... 3	Current L1	UINT	1 mA	0 … 65535	66007

28	Scaling total reactive power L1L2L3	USINT	-	0 ... 255	-
29	Scaling total apparent power L1L2L3	USINT	-	0 ... 255	-
30	Scaling total active energy L1L2L3	USINT	-	0 ... 255	-
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

Additional information

If you require further information about the evaluation and interpretation of the measured values, please refer to the section Reading and processing measured values (Page 41).

Reading and processing measured values 6

6.1 Basics for reading measured values

Introduction

The AI Energy Meter HF provides the measured values and variables through the following methods:

- Cyclic: User data
- Acyclic: Measured value data records

User data

User data provide pre-defined or user-defined measured values depending on the configured user data variant. The supplied measured values are cyclically written to the process image of the CPU. With some user data variants, the measured values are supplied as raw data, which you have to convert to the corresponding physical values using a supplied scaling factor.

Measured value data records

Each measured value data record supplies physical values that you can further process immediately. You read the values of a measured value data record acyclically with the RDREC instruction in a PLC tag. You need a corresponding PLC tag for each measured value data record to be read. It is also possible to create the corresponding structure in the static variables of an FB or store this structure in a DB.

You can display the read measured values in a watch table in STEP 7.

Note

If you are using CPUs other than S7-1200 or S7-1500, convert 64-bit measured values to 32-bit measured values. Note the conversion can cause loss of accuracy.

For more information, read FAQ: Processing 64-bit-floating-point numbers in S7-300/400 (https://support.industry.siemens.com/cs/ww/en/view/56600676)

Validity of the measured values

After turning on the 24 V DC supply voltage, the first measured values are available at terminal 17 after approximately 2 seconds. In the input user data, the content of byte 0 is set to the selected user data variant. You can use this change in byte 0 as a trigger event.

As soon as the module has valid measured values, the value of this byte changes to a value within the value range.

Initial module startup

After the first startup or restart of the module, the parameters are transferred to the module. You can preset a user data variant in the parameters of the hardware configuration. This remains in effect until a different user data variant is selected in the output data (byte 0). This allows input user data to be modified dynamically according to the requirements of the process.

The user data variant defined in parameter data record 128 or configuration tool is used under the following conditions:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  – Coding of the user data variant not available, or
  – Available address space is not sufficient for the selected user data variant.
    See "Selecting the module versions (Page 32)".

Current measured values become "0"

The current and all other measured values based on it are suppressed (or set to "0") in the data records and in the user data in the following cases:

- The fed-in current of the current transformer is less than the configured "Low limit for measuring current in relation to nominal value current [0.1%]" parameter.
- Fed-in secondary current at the channel is higher than 12 A.

Among others, the following measured values and derived measured variables of the phase involved become "0":

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A floating mean value is formed from the power values. These only become "0" after a corresponding time. The operating hours counter and the energy counter for active, reactive and apparent energy of the reset phase stops counting.

General reset

With module versions with 20 bytes of output data you can reset some measured values and counter levels.

An edge change of 0 -> 1 at the bit for the general reset has the following effect:

- Counters for energy, operating hours and limits start at "0" again.
- Results of the power quality analysis are deleted.
- Minimum and maximum value calculation starts again with initial values.

For the general reset, set bit 7 in byte 16 of the output user data. (Page 195)

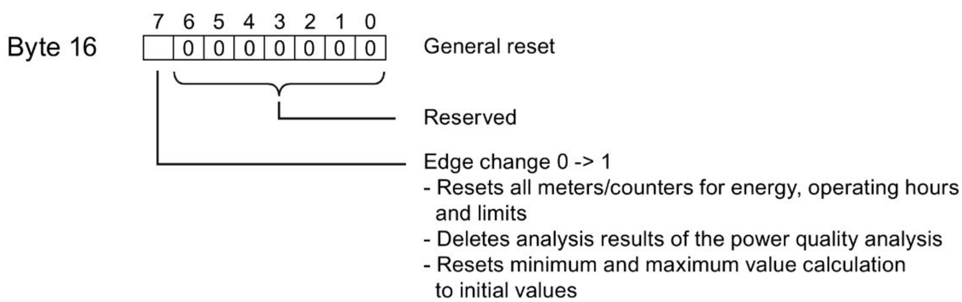

Figure 6-1 Control byte 16 in the output user data for general reset

Substitute value behavior

The substitute values for input values of the AI Energy Meter HF amount to "0".

See also

Reading measured values from user data cyclically (Page 50)

6.2 Quality information

Use the quality information to evaluate the status for currents, voltage, operating quadrants and the rotating field.

The AI Energy Meter HF provides quality information:

- In byte 1 of the user data
- In measured value IDs 65500 to 65503
- In the power quality analysis Qualifier ID 65496 (Page 89)

See also

Module version "32 I / 20 Q" (Page 195)

6.2.1 Quality information in byte 1 of the user data

For all user data variants, the module provides brief quality information in an 8-bit field in byte 1 for:

- Currents (I_{L1}, I_{L2}, I_{L3})
- Voltages (U_{L1}, U_{L2}, U_{L3})
- Operating quadrant for a phase

Please note that quality information assignment with user data variants for phase-specific measurement (ID 154 to ID 159) is different from user data variant assignment for 3-phase measurement (ID 244 to ID 254).

Quality information in byte 1 of the user data for 3-phase measurement

The quality information for 3-phase measurement is provided by the module in user data variants ID 244 to ID 254.

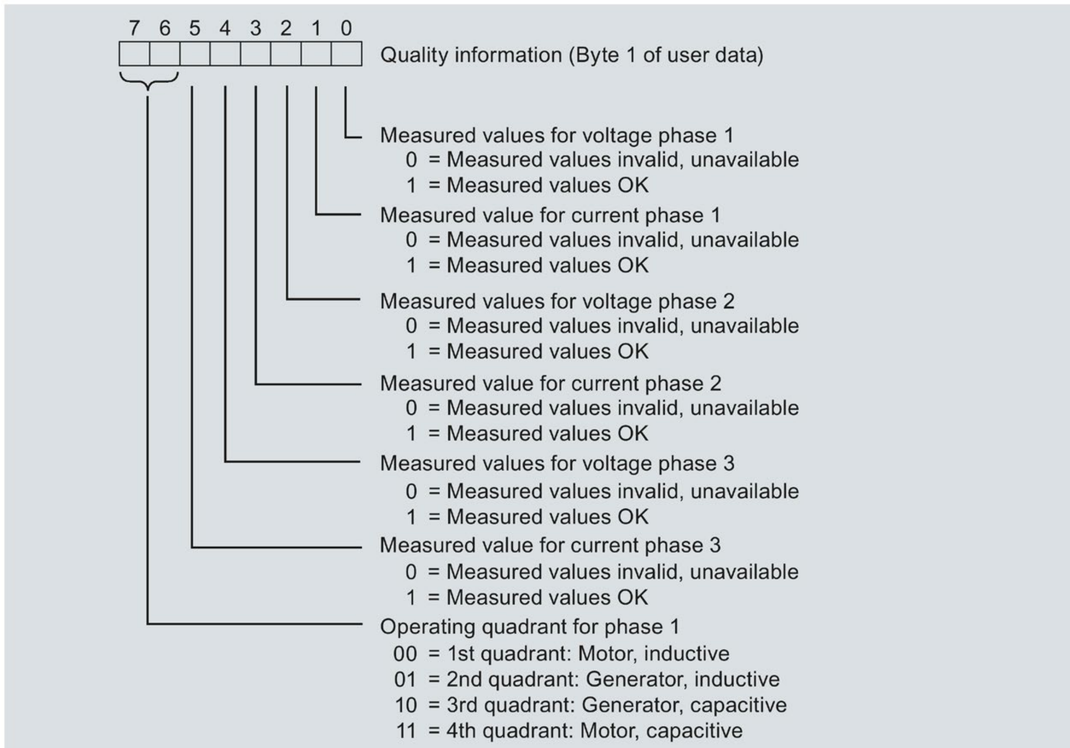

Figure 6-2 Assignment of byte 1 for user data variants ID 224 to ID 254

Quality information in byte 1 for phase-specific measurement

The quality information for phase-specific measurement is provided by the module in user data variants ID 154 to ID 159.

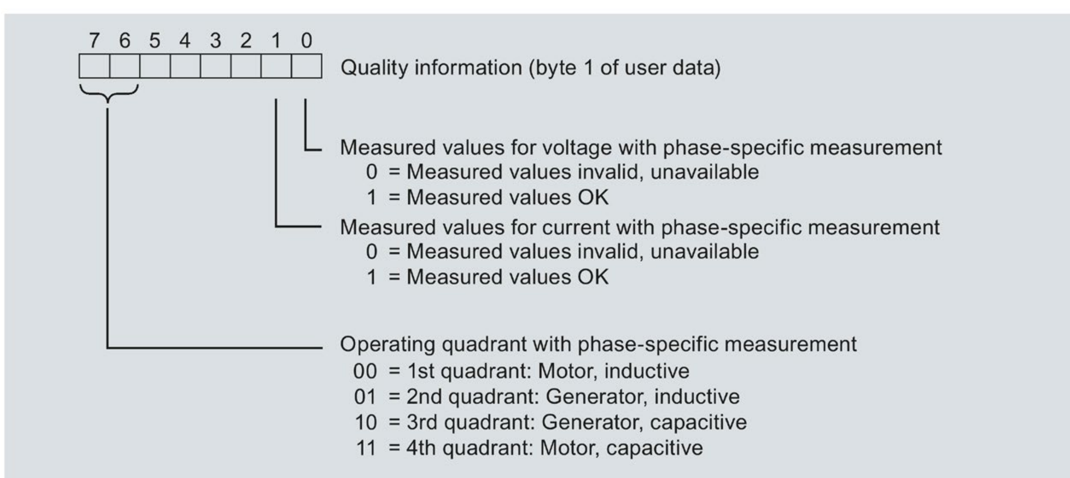

Figure 6-3 Byte 1 assignment for user data variants ID 154 to ID 159

6.2.2 Quality information with measured value IDs

Complete quality information is provided by the module in a 16-bit field with measured value IDs 65500 to 65503.

- Measured value ID 65503 for 3-phase measurement
- Measured value ID 65500, 65501 or 65502 for phase-specific measurement in phase 1, phase 2 or phase 3

Quality information with measured value ID 65503 for 3-phase measurement

The quality information for 3-phase measurement is provided by the module with:

- User data variant "Basic variables quality values three-phase measurement (ID 240 or $F0_H$)
- User data (measured value ID 66503)
- Measured value data record 150

The measured value ID 65503 provides information on:

- Currents (I_{L1}, I_{L2}, I_{L3})
- Voltages (U_{L1}, U_{L2}, U_{L3})
- Operating quadrants for all 3 phases
- Rotating field for the 3-phase system

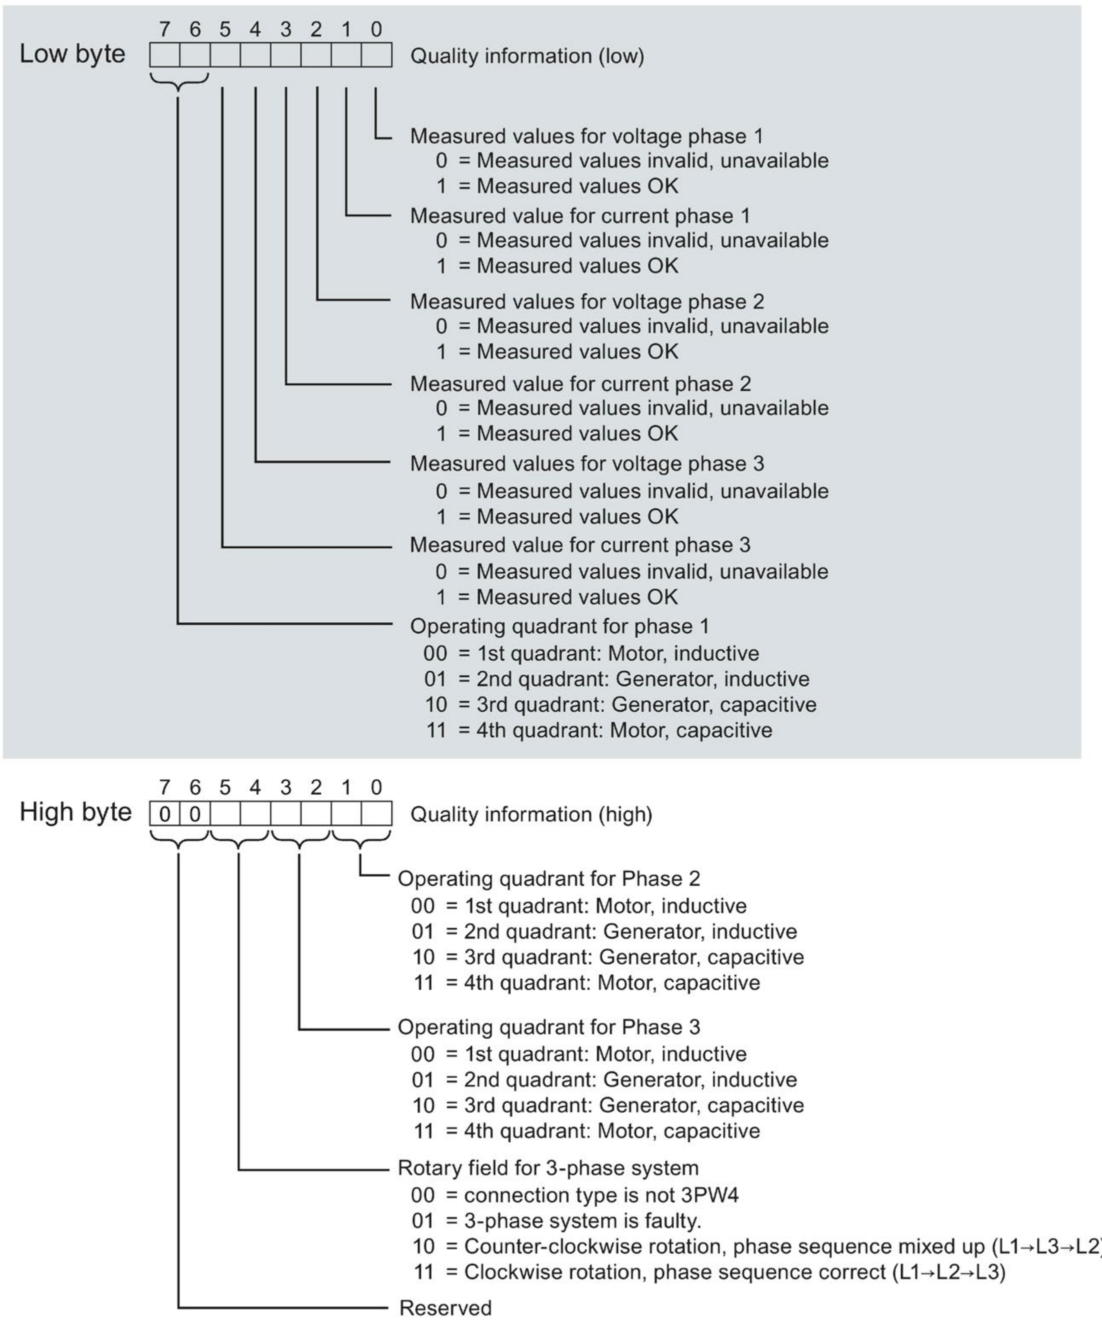

Figure 6-4 Quality information for low and high byte of the measured value ID 65503

Quality information with measured value ID 65500, 65501 or 65502 for phase-specific measurement

The module provides quality information for phase-specific measurement in phase 1, phase 2 or phase 3 with:

- User data (with measured value ID 65500, 65501 or 65502)
- Measured value data record DS 147, 148 or 149

Measured value IDs 65500, 65501 and 65502 provide information on:

- Current of the phase in question
- Voltage of the phase in question
- Operating quadrant of the phase in question

In contrast to the assignment for measured value ID 65503 (figure above), measured value IDs 65500, 65501 and 65502 only contain the phase-specific information for current, voltage and operating quadrant. The information about the other phases and the rotating field have the value 0.

6.2.3 Operating quadrant

The figure below shows the quality information of the operating quadrants.

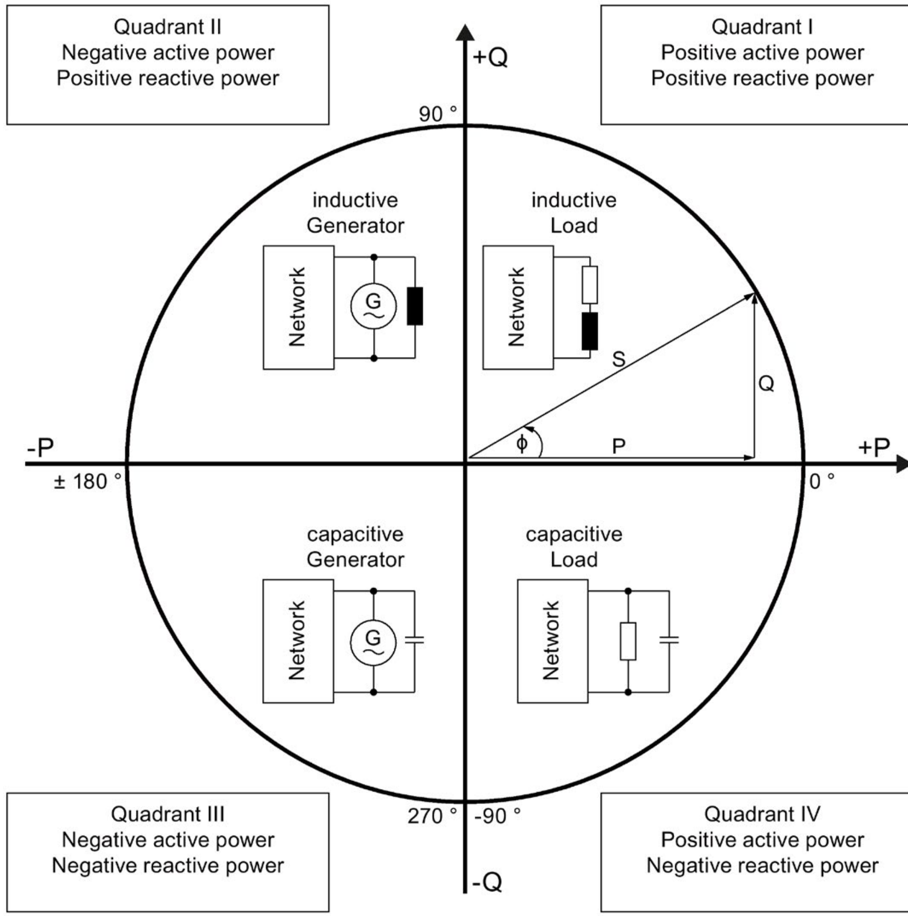

Figure 6-5 Quadrant in the quality bits

6.3 Reading measured values from user data cyclically

Requirement

- STEP 7 is open.
- The AI Energy Meter HF Is configured.

Scaling of measured values in the user data

Since the value range of 16-bit values is often smaller than the value range of the physical value, a scaling factor is supplied together with the basic value in the user data for the respective measured or calculated values. You determine the actual value of the measured variable with the following formula:

Actual value of measured quantity = measured value in the user data x $10^{\text{scaling factor}}$

Procedure

To read measured values from the user data cyclically, proceed as follows:

1. Read the relevant measured value from the input data.
2. Observe the scaling factor at scaled measured values and convert the read measured value using the scaling factor.

Example

The user data variant 254 (FE_H) "Total power L1L2L3" is configured on the AI Energy Meter HF. The measured value for "Current L1" should be read.

Table 6- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Meas-ured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-
2 ... 3	**Current L1**	**UINT**	**1 mA**	**0 … 65535**	**66007**
4 ... 5	Current L2	UINT	1 mA	0 … 65535	66008
6 ... 7	Current L3	UINT	1 mA	0 … 65535	66009
8 ... 9	Total active power L1L2L3	INT	1 W	-27648 … 27648	66034
10 ... 11	Total reactive power Qtot L1L2L3	INT	1 var	-27648 … 27648	66038
12 ... 13	Total apparent power L1L2L3	INT	1 VA	-27648 … 27648	66036
14 ... 17	Total active energy L1L2L3	DINT	1 Wh	-2147483647 to +2147483647	225

Byte	Allocation	Data type	Unit	Value range	Meas-ured value ID
18 ... 21	Total reactive energy L1L2L3	DINT	1 varh	-2147483647 to +2147483647	226
22	Reserved	BYTE	-	0	-
23	Total power factor λ L1L2L3	USINT	0.01	0 … 100	66037
24	**Scaling current L1**	**USINT**	**-**	**0 ... 255**	**-**
25	Scaling current L2	USINT	-	0 ... 255	-
26	Scaling current L3	USINT	-	0 ... 255	-
27	Scaling total active power L1L2L3	USINT	-	0 ... 255	-
28	Scaling total reactive power L1L2L3	USINT	-	0 ... 255	-
29	Scaling total apparent power L1L2L3	USINT	-	0 ... 255	-
30	Scaling total active energy L1L2L3	USINT	-	0 ... 255	-
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

In the user data variant FE_H (254) the measured value for the current L1 is stored in Byte 2 + 3. The current is supplied by the module as a 16-bit-fixed-point number in the value range from 0 to 65535 in the unit 1 mA. In addition the scaling factor for the current L1 has to be considered additionally. The module supplies the related scaling factor in Byte 24.

The actual value for current L1 is calculated as follows:

Actual value for current L1 = Current L1 x $10^{\text{Scaling current L1}}$

Basics for reading measured values (Page 41)

6.4 Read out measured values acyclically using data records

With all module versions you can read out the measured values using data records.

An overview of all measured value data records and exact information about the structure is available in the appendix Overview of all measured value data records (Page 226).

Requirement

In the STEP 7 project you have created a PLC data type that has an identical structure to the data record you want to evaluate.

Example of the structure of a data record

The following overview shows the structure of the data record DS 142.

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version = 2	UINT8	-	-	-
1	Reserved	UINT8	-	-	-
2...5	Voltage UL1-N	REAL	V	0.0 ... 1000000.0	1
6...9	Voltage UL2-N	REAL	V	0.0 ... 1000000.0	2
10...13	Voltage UL3-N	REAL	V	0.0 ... 1000000.0	3
14...17	Voltage UL1-L2	REAL	V	0.0 ... 1000000.0	4
18...21	Voltage UL2-L3	REAL	V	0.0 ... 1000000.0	5
22...25	Voltage UL3-L1	REAL	V	0.0 ... 1000000.0	6
26...29	Current L1	REAL	A	0.0 … 100000.0	7
30...33	Current L2	REAL	A	0.0 … 100000.0	8
34...37	Current L3	REAL	A	0.0 … 100000.0	9
:		:	:	:	:
210...213	Neutral current	REAL	A	0.0 ... 100000.0	61149

Procedure

1. Read the desired data record with the RDREC instruction.

   The measured values are in the target range of the data block which you specified with the RDREC instruction.
2. Evaluate the measured values for the desired measured variables.

Note

If you want to read or write several data records at the same time in the user program, note that the number of active jobs that you started with the RDREC or WRREC instruction is limited by the resources of the CPU used.

Measured value data record for base measurements (DS 142) (Page 227)

6.5 Time-of-day synchronization and time stamp

The AI Energy Meter HF supports time-of-day synchronization and time stamp.

Time stamps are used to date the exact occurrence of information. You can find time information in the measured value data records "Measured value data record for maximum values with time stamp (DS 154)" and "Measured value data record for minimum values with time stamp (DS 155)", for example, or the power quality analysis data records DS160, DS161 and DS163. For the time on the AI Energy Meter HF to correspond to the current system time, the clock must be synchronized externally. Information on this and additional requirements can be found in the application example (http://support.automation.siemens.com/WW/view/en/109754890). In the absence of time-of-day synchronization, the internal time stamp of the AI Energy Meters HF starts at 01.01.1970, 0:00.

7 Energy counters

Introduction

The AI Energy Meter HF provides several energy and overflow counters that detect both line-based and phase-based energy values, e.g.:

- Active energy (total, outflow, inflow)
- Reactive energy (total, outflow, inflow)
- Apparent energy (total)

Retentivity

The AI Energy Meter HF stores all counter values retentively. After an interruption (e.g. Power System Off), the energy counting resumes with the retentively stored values.

Functions

The energy meters provide the following basic functions:

- Measured values for infinite and periodical counting can be read out

  End values for periodic counting: 10^3, 10^6, 10^9, 10^{12} and 10^{15} can be selected with overflow counters
- Measuring ranges can be changed in RUN
- Starting and stopping counters via gate is possible
- Preset and apply start values in RUN
- Measured variables can be evaluated via data records and user data.

7.1 Evaluate measured values for energy

There are two ways of evaluating the measured values:

- Reading measured values using the instruction "RDREC".
- Reading measured values from the user data variants (not for module versions with 2 bytes of input data).

Data records for energy meters

You can read out measured values for energy and overflow counters in the following data records.

The evaluation of measured data using data records is described in section Read out measured values acyclically using data records (Page 52).

Name of the data record	Number of the data record	Comment
Data record for basic measured values (Page 227)	Data record 142	Measured values of the total energy L1L2L3
Data record for energy meter (Page 232)	DS 143	Measured values of energy and overflow counters for phases L1, L2 and L3
Data record for phase-specific measured values L1 (Page 248)	DS 147	Measured values of the phase-specific energy meters L1
Data record for phase-specific measured values L2 (Page 251)	DS 148	Measured values of the phase-specific energy meters L2
Measured value data record for phase-specific measured values L3 (Page 254)	DS 149	Measured values of the phase-specific energy meters L3

User data variants for energy meters

You can read out measured values for energy and overflow meters in the following user data variants.

The evaluation of measured data using user data variants is described in section Reading measured values from user data cyclically (Page 50).

Name of the user data variant	Number of the user data variant	Comment
Total energy L1 L2 L3 (Page 211)	ID 249 or $F9_H$	Measured values of the total energy L1L2L3
Energy L1 (Page 212)	ID 248 or $F8_H$	Measured values of the phase-specific energy meters L1
Energy L2 (Page 213)	ID 247 or $F7_H$	Measured values of the phase-specific energy meters L2
Energy L3 (Page 214)	ID 246 or $F6_H$	Measured values of the phase-specific energy meters L3
Basic variable quality measurement three-phase measurement (Page 214)	ID 240 or $F0_H$	Status on the overflow of the energy meters for phases L1, L2 and L3
Basic variables energy meter measurement (periodic) L1L2L3 (Page 217)	ID 239 or EF_H	Number of counter overflows for energy of phases L1, L2 and L3
EE@Industry measurement data profile E3 (Page 219)	ID 227 or $E3_H$	Measured values for total active energy and total reactive energy L1L2L3

Name of the user data variant	Number of the user data variant	Comment
EE@Industry measurement data profile E2 (Page 219)	ID 226 or $E2_H$	Measured values for total active energy L1L2L3
Basic variables for phase-specific measurement L1 (Page 220)	ID 159 or $9F_H$	Measured values for phase-specific active, reactive and apparent energy for phase L1
Basic variables for phase-specific measurement L1a (Page 221)	ID 158 or $9E_H$	Measured values for phase-specific active, reactive and apparent energy for phase L1
Basic variables for phase-specific measurement L2 (Page 222)	ID 157 or $9D_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L2
Basic variables for phase-specific measurement L2a (Page 223)	ID 156 or $9C_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L2
Basic variables for phase-specific measurement L3 (Page 224)	ID 155 or $9B_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L3
Basic variables for phase-specific measurement L3a (Page 225)	ID 154 or $9A_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L3
User-defined user data variant	ID 1 or 01_H and ID 2 or 02_H	Measured variables for energy can be selected in a user-defined manner

7.2 Preset and apply start values for energy and overflow counters

At the beginning of a new work order, it may be useful to start the energy and overflow counter with new start values.

Define the new start values for the energy and overflow counter in data record DS 143.

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

With **all** the module versions there are two ways of applying the start values:

- Transfer start values from data record DS 143 and apply them **immediately**
- Transfer start values from data record DS 143 and only apply them after setting a special bit (DQ bit for counter reset)

Both options are described in the following sections.

General reset

With module versions with 20 bytes of output data you can reset the energy and overflow counters. With a general reset, you cannot preset any start values; the start values for energy and overflow counters are always zero with a general reset.

You can find additional information on the general reset in the section Basics for reading measured values (Page 41).

See also

Structure for energy counters (DS 143) (Page 232)

7.2.1 Preset start values for the energy meters

Define the start values for the energy and overflow meters in data record DS 143.

Introduction

You have created a PLC data type that has an identical structure to data record DS 143.

Structure of data record DS 143

The following overview shows the structure of the data record DS 143 in simplified form.

More detailed information about the structure of data record DS 143 is available in section Structure for energy counters (DS 143) (Page 232).

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-

Assignment of data record DS 143

Byte 0 and Byte 1: Version of the data record

Header information for the version of the data record.

Byte 2 ... Byte 7: Control bytes for energy and overflow counter

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy meters, overflow counters and operating hours counters. The length of the control information amounts to 2 bytes for each phase.

Byte 8 ... Byte 127: Start values for the individual energy meters

The start values for energy meters in data record 143 are 64-bit floating point numbers. The format corresponds to the data type LREAL in S7-1200 and in S7-1500.

Byte 128 ... Byte 157: Initial values for overflow counters

The initial values for overflow counters in data record 143 are 16-bit integers. The format corresponds to the data type UINT in S7-1200 and in S7-1500.

7.2.2 Apply start values from data record DS 143 immediately

It is possible to apply the start values for energy counters and overflow counters for each **individual** phase separately by active, reactive and apparent energy.

Requirement

In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and you have entered the start values.

Procedure for all module versions

1. In control byte 2 of the DS 143 (bytes 3, 5 and 7), for each phase set the category of the energy meters (active, reactive, apparent energy) for which you want to set the start values.

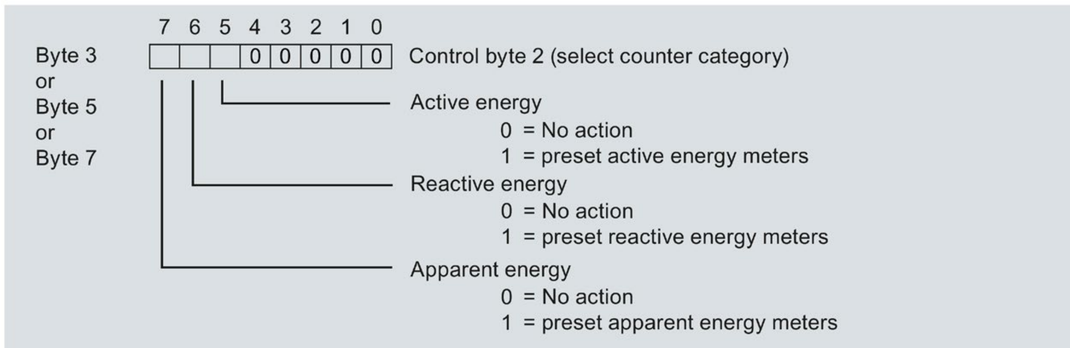

Figure 7-1 Assignment of control byte 2 in DS 143

2. In control byte 1 of DS 143 (bytes 2, 4 and 6), for each phase define whether you want to apply the start values for energy or overflow counters.

   Applying depends on the category selection from control byte 2.

   – Set Bit 0 if you want to apply the start values for the overflow counters.

   – Set Bit 2 if you want to apply the start values for the energy meters.

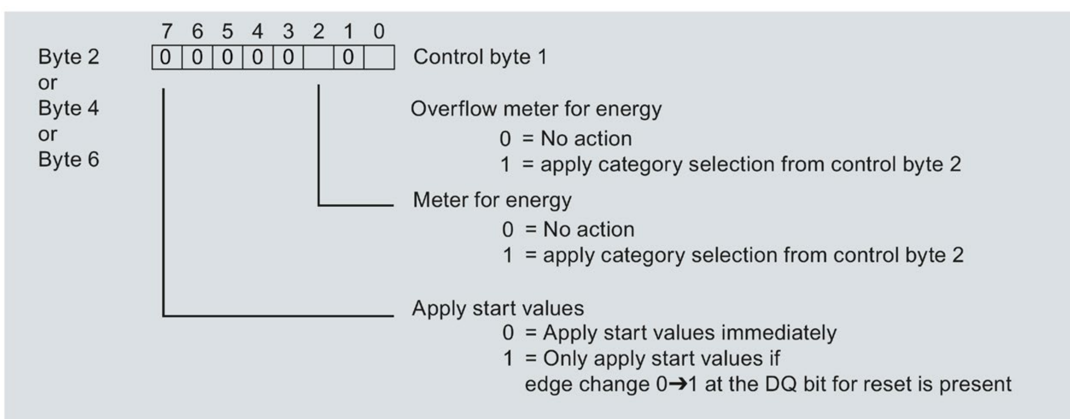

Figure 7-2 Assignment of control byte 1 in DS 143

3. In control byte 1 of DS 143 define that you want to immediately apply the start values.

   – Set Bit 7 to 0 so that the start values are immediately applied after writing the data record.

4. Transfer the data record with the WRREC instruction to the CPU.

7.2.3 Apply start values from data record DS 143 with DQ bit

Due to the differing lengths of the output data, setting of the start values for the energy counters and overflow counters depends on the configured module version.

Module versions with 20 bytes of output data

If you use module versions with 20 bytes of output data, you can:

- Apply start values for energy counters and overflow counters for **all** phases separately by active, reactive and apparent energy.
- Apply start values for energy counters and overflow counters for each **individual** phase separately by active, reactive and apparent energy.

Module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, then you always apply the start values for **all** the energy counters and overflow counters simultaneously.

Requirement

- In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and have entered the start values.

  Applying depends on the category selection from control byte 2.

  – Set Bit 0 if you want to apply the start values for the overflow counters.

  – Set Bit 2 if you want to apply the start values for the energy meters.
- In control byte 1 of the DS 143 you have set Bit 7 to "1" (apply start values via DQ bit)
- You have transferred the data record DS 143 with new start values to the CPU. The assignment of the data record can be found in Structure for energy counters (DS 143) (Page 232)

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

Procedure for module version with 20 bytes of output data

Apply start values for energy counters and overflow counters for all three phases

1. In Byte 2 of the output data, select the categories for which you want to apply start values.
   – Set bit 5 for active energy counters.
   – Set bit 6 for reactive energy counters.
   – Set bit 7 for apparent energy counters.

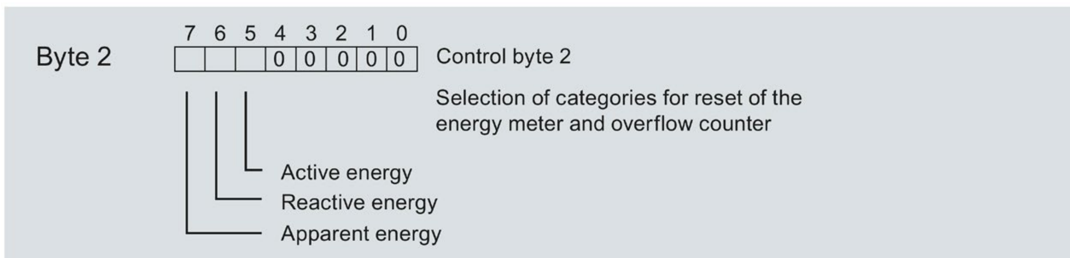

Figure 7-3 Selection of categories for reset

2. Set the reset bit (Bit 7) in byte 1 of the output data.

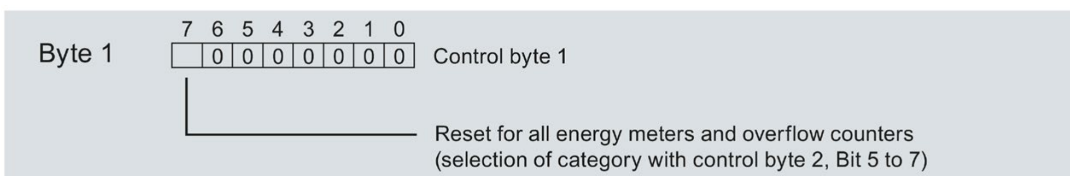

Figure 7-4 Reset bit for energy and overflow counter

   If there is an edge change of the reset bit from 0 -> 1, the module resets the energy and overflow counters that you previously selected in byte 2 to their start values.

Apply start values for energy counters and overflow counters for phase-specific counting

You can also reset the energy and overflow counters on a phase-specific basis using the output data.

Follow the procedure as described in "Applying start values for energy counters and overflow counters for all three phases", as applicable.

1. In bytes 7, 9 and 11 of the output data, select the categories for which you want to apply the phase-specific start values.
   - Set Bit 5 for active energy counters.
   - Set Bit 6 for reactive energy counters.
   - Set Bit 7 for apparent energy counters.

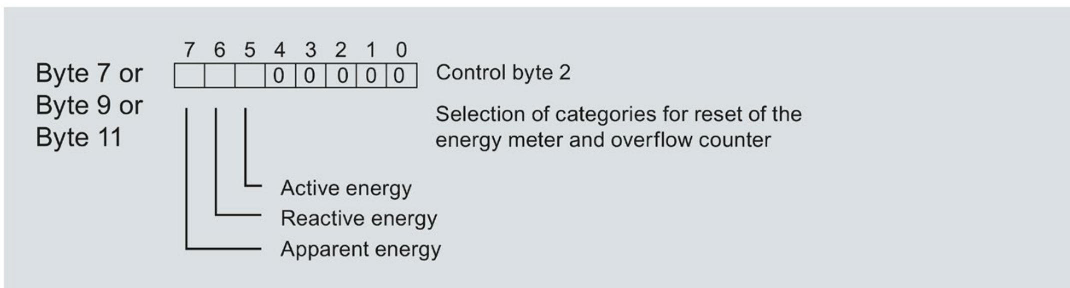

Figure 7-5 Selection of category

2. In bytes 6, 8 and 10 of the output data, set the reset bits (Bit 7) for the phase-specific start values.

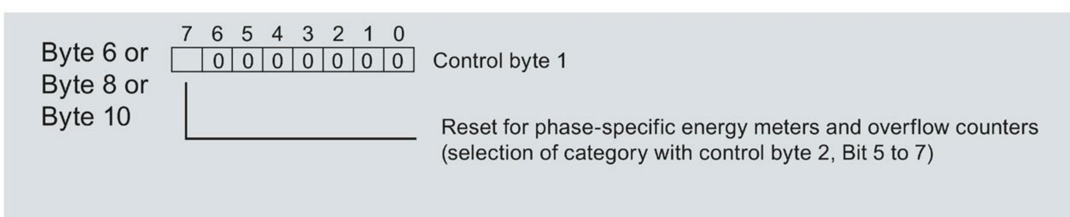

Figure 7-6 Reset bit for phase-specific energy and overflow counters

   If there is an edge change of the phase-specific reset bit from 0 -> 1, the module resets the energy and overflow counters that you previously selected in bytes 7, 9 and 11 to their start values.

Procedure for module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, always apply the start values **for all** the energy counters and overflow counters.

- Set the reset bit (Bit 7) in byte 1 of the output data.

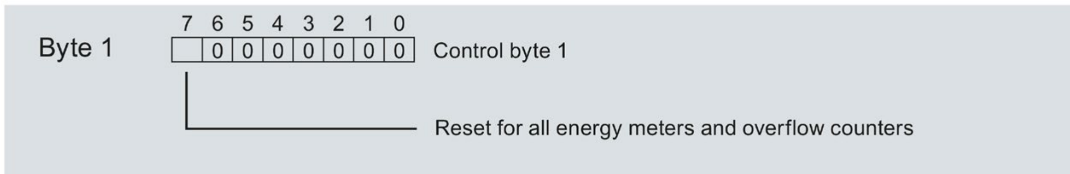

Figure 7-7 Reset bit for all energy and overflow counters

If there is an edge change of the reset bit from 0 -> 1, the module resets **all** energy and overflow counters to their start values.

7.3 Starting and and stopping energy meters

There are two ways of starting or stopping measurement with the energy meter AI Energy Meter HF:

- Counting with gate

  The module starts counting when you set the DQ bit for the counter gate in the output data using an edge change from 0 -> 1. If you reset the DQ bit using an edge change from 1 -> 0, the counter stops.

- Counting without gate

  The module starts counting immediately as soon as the module is switched on. Counting cannot be stopped.

Both options are described in the following sections.

Counting with gate

Requirements:

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

If you wish to start counting using the gate, proceed as follows:

1. Activate the parameter "Enable energy meter gate" in the parameter assignment of the module.
2. Set the DQ bit for the counter gate (Bit 6) in control byte 1 in the output data.

The module starts counting as soon as there is an edge change from 0 -> 1 at the DQ bit for the counter gate.

If you wish to stop the counting again, then reset Bit 6 in control byte 1 in the output data. Counting stops at an edge change from 1 -> 0.

The "Enable gate control for the energy counter" parameter and the DQ bit for the "counter date" behave like the parallel connection of contacts.

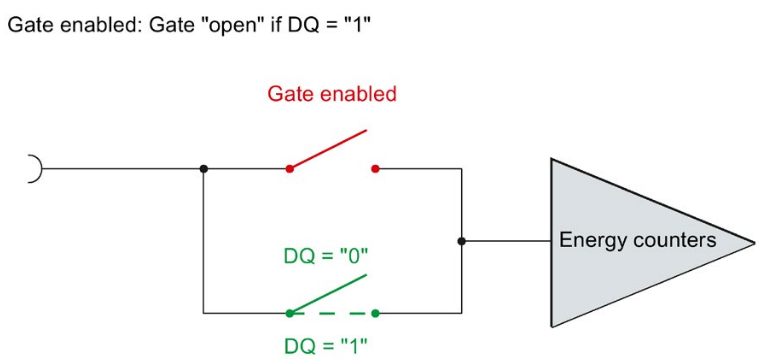

Figure 7-8 Gate enabled

Counting without gate

Requirement

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

Deactivate the parameter "Enable energy meter gate" in the parameter assignment of the module.

The module starts counting as soon as the module is started. The counter continues to count.

Gate disabled: Gate is always "open" (signal path closed)

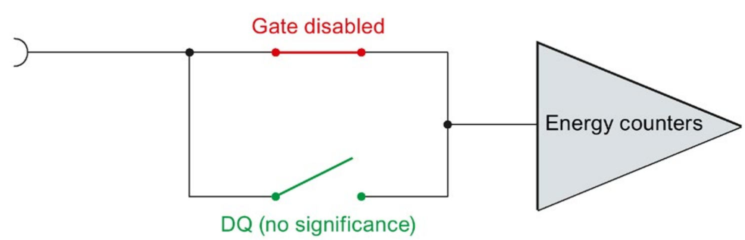

Figure 7-9 Gate disabled

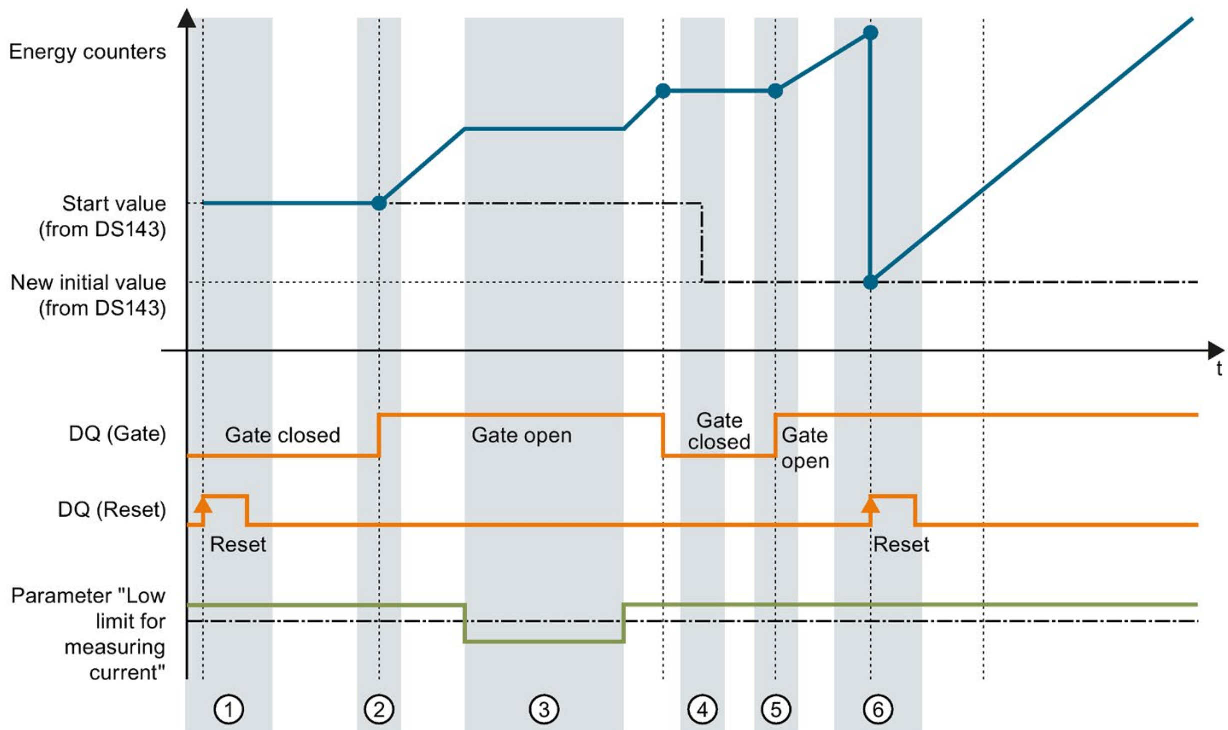
7.4 Example of measuring and resetting an energy meter

The following figure shows resetting and starting/stopping with activated gating using the energy meter as an example:



① The counter is reset to the value specified in the configuration. The gate is closed. The counter does not count.

② The gate is opened via the control byte 1 in the output data of the user data variant. The counter counts.

③ The configured current low limit has been violated. The counter does not count.

④ The gate is closed. The counter does not count. A new start value is written to the measured value data record 143 (Page 232) with the WRREC instruction.

⑤ The gate is opened again via the control byte 1 in the output data of the user data variant. The counter counts with the new start value.

⑥ The counter is reset via the control byte 1 in the output data of the user data variant. The counter counts from the new start value that was transferred via the measured value data record 143.

Figure 7-10 Example of an energy meter

7.5 What is the structure of the control and feedback interface for DS 143?

Introduction

Bytes 2 to 7 of data record 143 (Page 232) form the phase-based control and feedback interface for the data record DS 143.

- Bytes 2 and 3: Control and feedback interface for phase 1
- Bytes 4 and 5: Control and feedback interface for phase 2
- Bytes 6 and 7: Control and feedback interface for phase 3

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

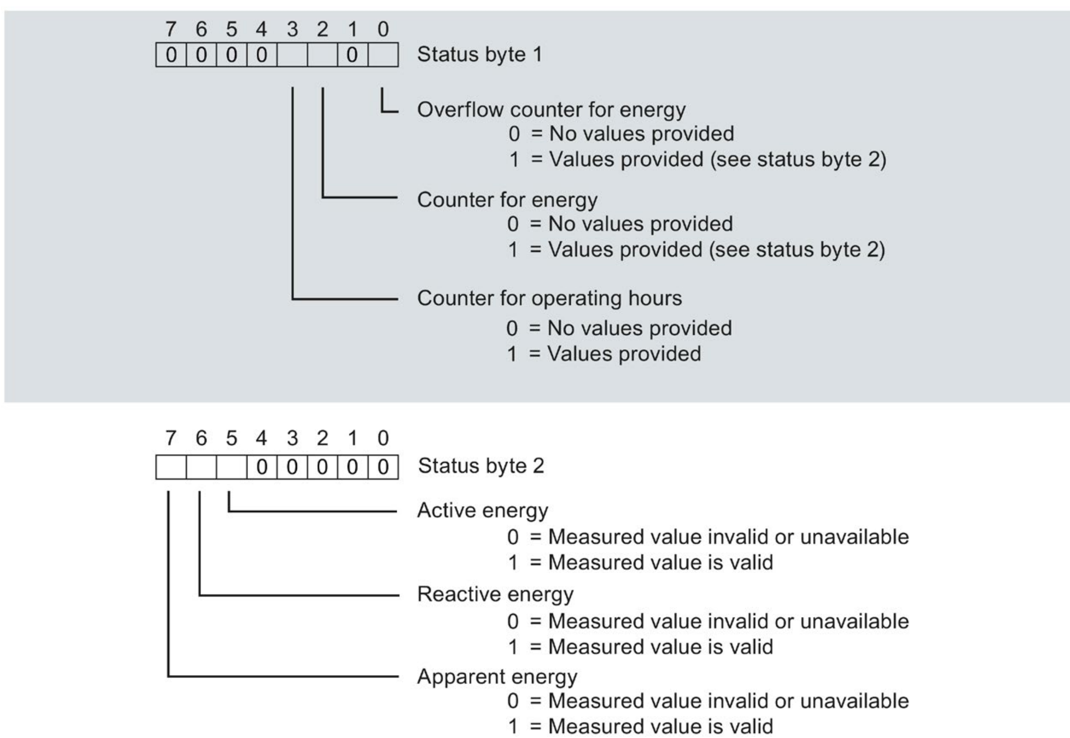


Figure 7-11 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy meters, overflow counters and operating hours counters. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to preset and the time at which counters are to be preset.

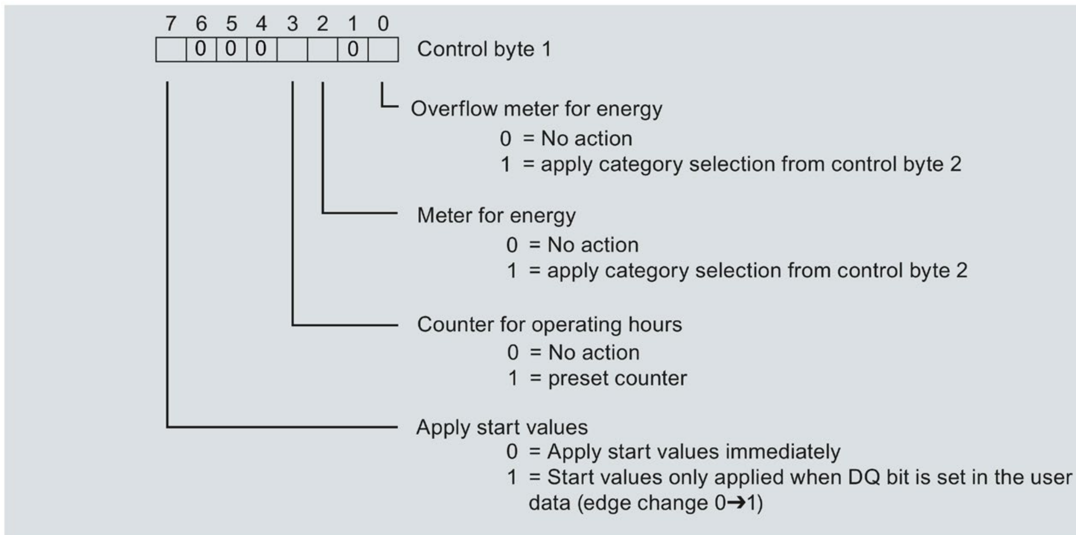

Figure 7-12 Control information DS 143, control byte 1 (write access)

- In control byte 2 you determine which energy meter categories you want to preset.

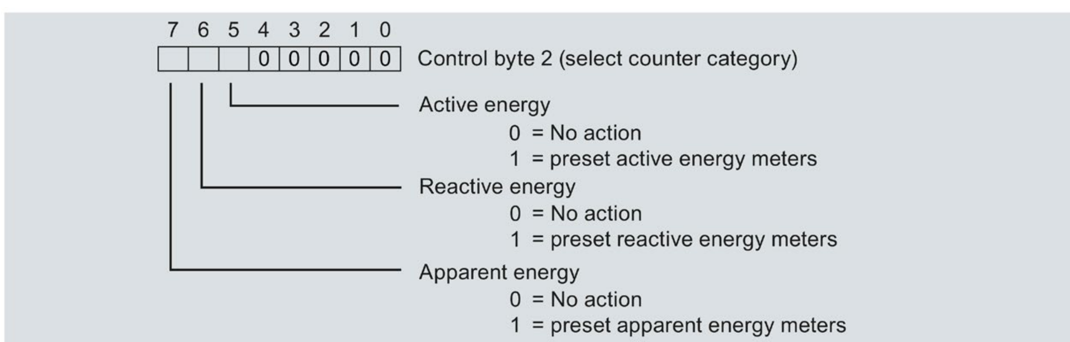

Figure 7-13 Control information DS 143, control byte 2 (write access)

8 Operating hours counter

Introduction

The AI Energy Meter HF provides four operating hours counters which count the operating hours of the connected consumers:

- Three phase-specific operating hours counters
- 1 operating hours counter which displays the value of the largest phase-specific operating hours counter.

Retentivity

The AI Energy Meter HF stores all counter values retentively. After an interruption (e.g. Power System Off), counting resumes with the retentively stored values.

Functions

The operating hours counters provide the following basic functions:

- Measuring ranges from 0 to 3.4 x 10^{38} hours.
- Starting and stopping operating hours counters via gate
- Preset and apply start values in RUN
- Evaluating counter states using data records and user data

8.1 Evaluating operating hours counters

There are two ways of evaluating the operating hours counters:

- Reading counter states using data records with the instruction RDREC.
- Reading counter states from the user-defined user data variants.

Data records for operating hours counter

You can read out measured values for operating hours in the following data records.

The evaluation of measured data using data records is described in section Reading and processing measured values (Page 41).

Name of the data record	Number of the data record	Comment
Data record for energy meter (Page 232)	DS 143	Phase-specific operating hours counter for phase L1, phase L2, phase L3 and largest phase-specific operating hours counter L1L2L3
Measured value data record for advanced measurement and status values (Page 257)	DS 150	
Measured value data record of user-defined data record (Page 258)	DS 151	Operating hours counters can be selected in a user-defined manner

User data variants for operating hours counters

You can read out measured values for operating hours in the following user data variants.

The evaluation of measured data using user data variants is described in section User data variants (Page 205).

Name of the user data variant	Number of the user data variant	Comment
User-defined user data variant	ID 1 or 01_H and ID 2 or 02_H	Operating hours counters can be selected in a user-defined manner

8.2 Preset and apply start values for operating hours counters

Introduction

At the beginning of a new work order, it may be useful to start counting of the operating hours counters with new start values.

Define the new start values for the operating hours counters in data record DS 143.

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

With **all** the module versions there are two ways of applying the start values:

- Transfer start values from data record DS 143 and apply them **immediately**
- Transfer start values from data record DS 143 and only apply them after setting a special bit (DQ bit for operating hours counter reset)

Both options are described in the following sections.

General reset

With module versions with 20 bytes of user data you can reset the operating hours counters. With a general reset, you cannot preset any start values; the start values for operating hours counters are always zero with a general reset.

You can find additional information on the general reset in the section Basics for reading measured values (Page 41).

8.2.1 Preset start values for operating hours counters

Define the start values for operating hours counters using data record DS 143.

Introduction

You have created a PLC data type that has an identical structure to data record DS 143.

Structure of data record DS 143

The following overview shows the structure of the data record DS 143 in simplified form.

More detailed information about the structure of data record 143 is available in section Structure for energy counters (DS 143) (Page 232).

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-
3	Control byte 2 - L1	BYTE	Bit string		
4	Control byte 1 - L2	BYTE	Bit string		
5	Control byte 2 - L2	BYTE	Bit string		
6	Control byte 1 - L3	BYTE	Bit string		
7	Control byte 2 - L3	BYTE	Bit string		
8...15	Start value for active energy inflow L1	LREAL	Wh	You will find the exact assignment in the section Structure for energy counters (DS 143) (Page 232).	61180
16...23	Initial value active energy outflow L1	LREAL	Wh		61181
:	:	:	:		:
158...161	Start value operating hours L1	REAL	h		65505
162...165	Start value operating hours L2	REAL	h		65506
166...169	Start value operating hours L3	REAL	h		65507

Assignment of data record DS 143

Byte 0 and Byte 1: Version of the data record

Header information for the version of the data record.

Byte 2 ... Byte 7: Control bytes for energy and overflow counter

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy meters, overflow counters and operating hours counters. The length of the control information amounts to 2 bytes for each phase.

Byte 8 ... byte 157: Start values for the individual energy meters and overflow counters

The start values for energy counters in data record 143 are 64-bit floating point numbers. The format corresponds to the data type LREAL in S7-1200 and in S7-1500.

The initial values for overflow counters in data record 143 are 16-bit integers. The format corresponds to the data type UINT in S7-1200 and in S7-1500.

Byte 158 ... byte 169: Start values for operating hours counter

The start values for operating hours counters in data record 143 are 32-bit integers. The format corresponds to the data type REAL in S7-1200 and in S7-1500.

8.2.2 Apply start values from data record DS 143 immediately

Applying the start values for each separate operating hours counter is possible.

Requirement

In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and you have entered the start values.

Procedure for all module versions

1. In Control byte 1 of DS 143 (bytes 2, 4 and 6), for each phase, define that you want to immediately apply the start values for operating hours counters.
   – Set the Bit 3 to 1 so that the start values for the operating hours counters are preset.
   – Set the Bit 7 to 0 so that the module **immediately** applies the start values after writing the data record.

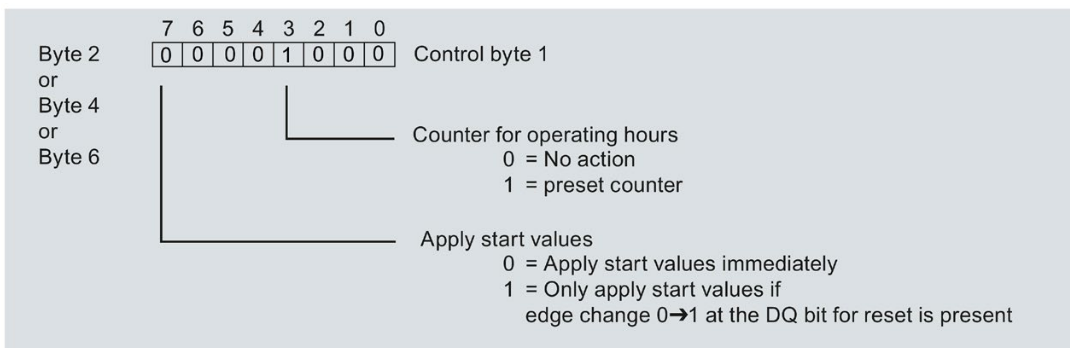

Figure 8-1 Allocation of the control bytes in DS 143 for operating hours

2. Transfer the data record with the WRREC instruction to the CPU.

8.2.3 Apply start values from data record DS 143 with DQ bit

Due to the differing lengths of the output data, setting of the start values for the operating hours counters depends on the configured module version.

Module versions with 20 bytes of output data

If you use module versions with 20 bytes of output data, you can:

- Apply start values for **all** operating hours counters.
- Apply start values for **individual** operating hours counters separately.

Module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, apply the start values for **all** operating hours counters simultaneously.

Requirement

- In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and have entered the start values.
- Set the Bit 3 to 1 so that the start values for the operating hours counters are preset.
- In control byte 1 of DS 143 you have set Bit 7 to "1" (apply start values via DQ bit). (see previous figure)
- You have transferred the data record DS 143 with new start values to the CPU. The assignment of the data record can be found in Structure for energy counters (DS 143) (Page 232)

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

Procedure for applying the start values of all operating hours counters

Applying the start values for all operating hours counters with the module versions with 2 bytes and 20 bytes of output data is identical.

1. Set the reset bit for operating hours counters (Bit 5) in Byte 1 in the output data.

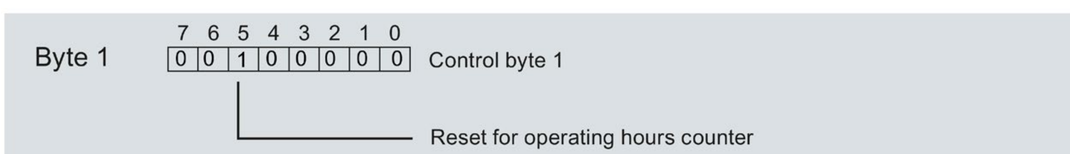

Figure 8-2 Control byte 1 Reset for all operating hours counters

If there is an edge change of the reset bit from 0 to 1, the module applies the start values for all operating hours counters.

Procedure for applying the start values of individual operating hours counters

---

Note

Applying the start values for phase-specific operating hours counters

Applying the start values for phase-specific operating hours counters does not differ from the procedure described above. In the output data, select the reset bits for the phase-specific operating hours counters in bytes 6, 8 and 10.

8.3 Starting and stopping operating hours counters

There are two ways of starting or stopping counting with the operating hours counter AI Energy Meter HF:

- Counting with gate

  The module starts counting when you set the DQ bit for the counter gate in the output data using an edge change from 0 -> 1. If you reset the DQ bit for the counter gate using an edge change from 1 -> 0, the counter stops.

- Counting without gate

  The module starts counting immediately as soon as the module is switched on. Counting cannot be stopped.

Both options are described in the following sections.

Counting with gate

Requirements:

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

If you wish to start counting using the gate, proceed as follows:

1. Activate the parameter "Enable operating hours counter gate" in the parameter assignment of the module.
2. Set the DQ bit for the counter gate (Bit 4) in control byte 1 in the output data.

The module starts counting as soon as there is an edge change from 0 -> 1 at the DQ bit for the counter gate.

If you wish to stop the counting again, then reset Bit 4 in control byte 1 in the output data. Counting stops at an edge change from 1 -> 0.

The "Enable operating hours counter gate" parameter and the DQ bit for the "counter date" behave like the parallel connection of contacts.

Gate enabled: Gate "open" if DQ = "1"

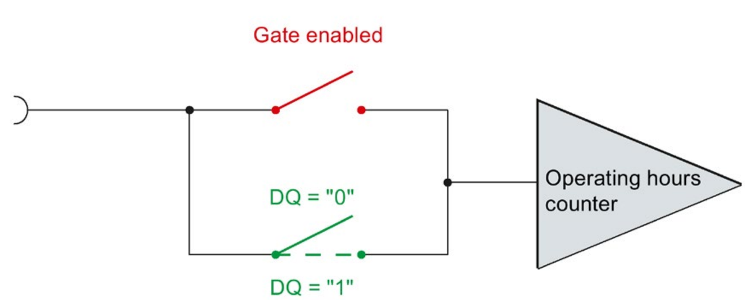

Figure 8-3 Gate enabled

Counting without gate

Requirement

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

Deactivate the parameter "Enable operating hours counter gate" in the parameter assignment of the module.

The module starts counting as soon as the data record has been applied by the CPU.

The counter continues to count.

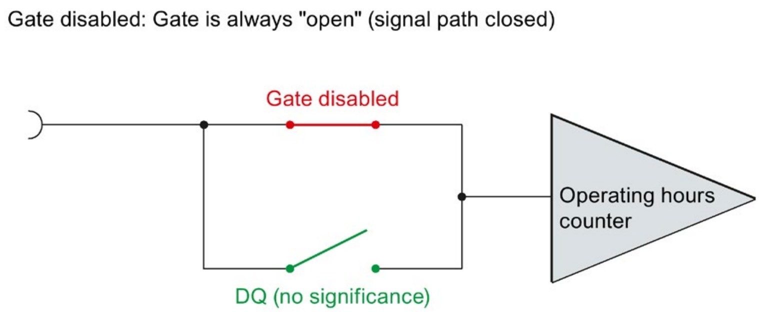

Figure 8-4 Gate disabled

Limit monitoring 9

9.1 How limit monitoring works

Introduction

The AI Energy Meter HF supports monitoring of parameterizable low **or** high limits for up to 16 analog measured or calculated variables.

You can also specify multiple limits for each measured or calculated variable, in order to define a high or low value range.

The measured value data record 150 returns the current status of limit violations and one counter per limit that displays the number of limit violations. In addition, a hardware interrupt may be generated for each limit violation.

The status of the limit violations can also be evaluated in the user data variant 240 ($F0_H$) or via the user-defined user data variant or the user-defined data record via the measured value ID 65509.

Benefits

With activated limit monitoring you can already detect any irregularities in the measured value acquisition already in field level.

Retentivity

All the counter states are stored retentively in the AI Energy Meter HF. After an interruption (e.g. Power System Off), the counting resumes with the retentively stored values.

Configuring

You configure the following limit monitoring settings in STEP 7:

- Measured variable that is to be monitored.
- Activate / Deactivate limit monitoring.
- High or low limit values.
- Delay time and hysteresis for each limit.
- Activate / Deactivate hardware interrupts at limit violation.
- Measured value that is subject to limit monitoring.

Hardware interrupt at a limit violation

The hardware interrupt provides the following information:

- Measured value ID of the monitored measured or calculated variable
- Number of the limit (0 = Limit 1. 15 = Limit 16)
- Information on whether limit was exceeded or fallen below

For more detailed information, refer to section Hardware interrupts (Page 110).

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Enable/disable monitoring per limit[1]	Disabled	Module version with 20 bytes of output data
Reset number of total limit violations	0	Module version starting at 2 bytes of output data

[1] Effective only with enabled gate

9.2 Influence of hysteresis and delay time on limit monitoring

Delay time and hysteresis

In order to prevent the triggering of limit violations with small fluctuations, you have the following configuration options in STEP 7:

- Delay time in seconds (0 to 10 s)

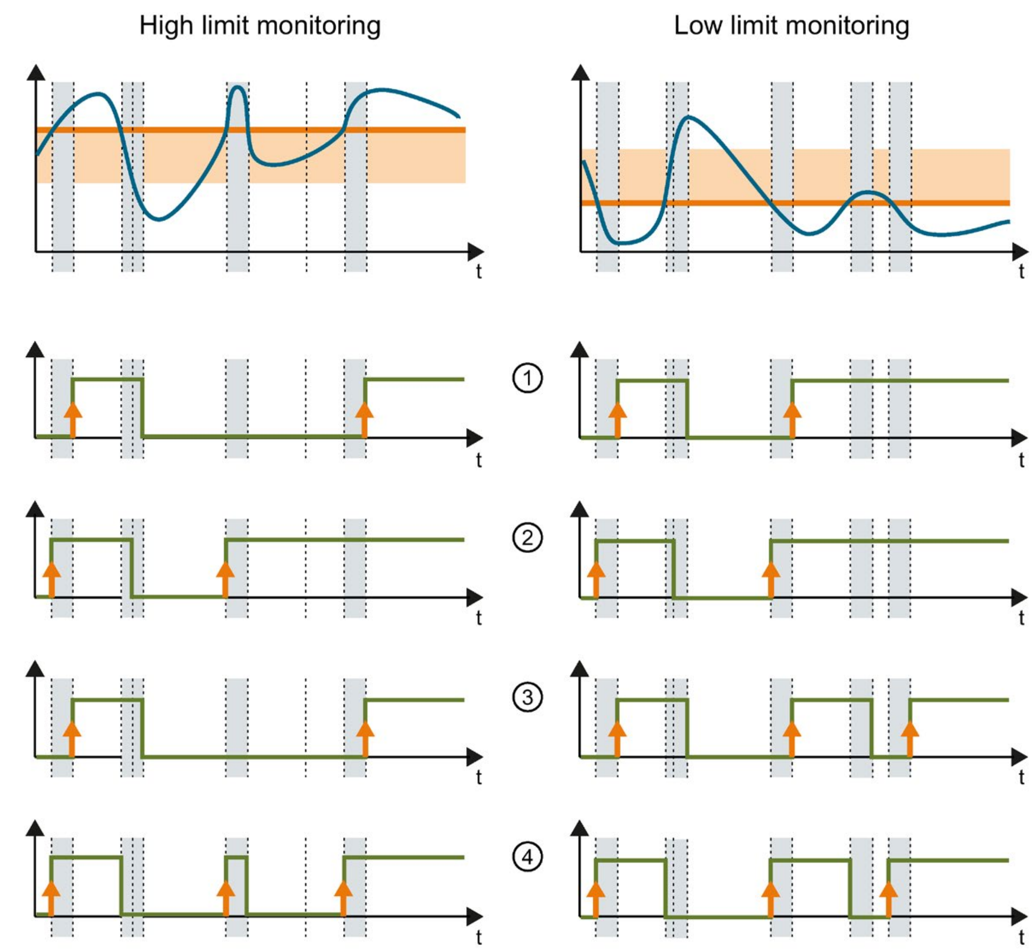
  With the delay time, you filter faults and thereby prevent limit value monitoring from triggering too frequently. The limit violation is counted only when the limit violation is present for longer than the configured delay time. The delay time is also taken into consideration with an outgoing limit violation, directly after a high or low limit has been violated in the permitted range. If the measured variable lies between limit violation and hysteresis after the limit violation has been corrected again, the delay time expires also without leaving the hysteresis.
- Hysteresis as a percentage (0 to 20%)

  With the hysteresis, you suppress fluctuations around the limit. The hysteresis is a tolerance range that you define as a percentage deviation of the configured limit. The limit violation is considered to be corrected only when the monitored value leaves the tolerance range.

Note

You can get information about underflow and overflow from the calculation of minimum (Page 243) and maximum values (Page 237) of selected measured variables.

The following figure shows the value-over-time for two measured values using the example of a high and low limit as well as the influence of hysteresis and delay time on the counting of the limit violations.



Configured limit.	Signal wave
Configured delay time. Is taken into consideration during coming and going.	① Limit monitoring with hysteresis and delay time
Hysteresis range. Only considered for outgoing.	② Limit monitoring with hysteresis, but without delay time
Value-over-time for which the limit is monitored.	③ Limit monitoring without hysteresis, but with delay time
Edge change. Counter for limit violations is incremented by 1. If parameterized, a hardware interrupt is triggered.	④ Limit monitoring without hysteresis and delay time

Figure 9-1 Influence of hysteresis and delay time on the limit

Minimum and maximum values (Page 84)

9.3 Reset, activate and deactivate counters for limit violation

Introduction

At the beginning of a new work order, it can be useful to reset or also enable/disable the counters for limit violations of the AI Energy Meter HF.

Resetting here means that the counters for limit violations are reset to 0.

Due to the differing lengths of the output data resetting of the counters for limit violations depends on the configured module version.

Resetting at module version with 20 bytes of output data

1. Select the counters for limit violations that you want to reset in control bytes 3 and 4; see "Enabling/disabling the counters for limit violations".
2. In control byte 1, set the rest bit (bit 3) with an edge change from 0 to 1; see "Resetting the counters for limit violations".

Resetting for module version with 2 bytes of output data

Set the reset bit (Bit 3) in Control byte 1 from 0 to 1 through an edge change. Resetting acts globally on all the configured counters for limit violation.

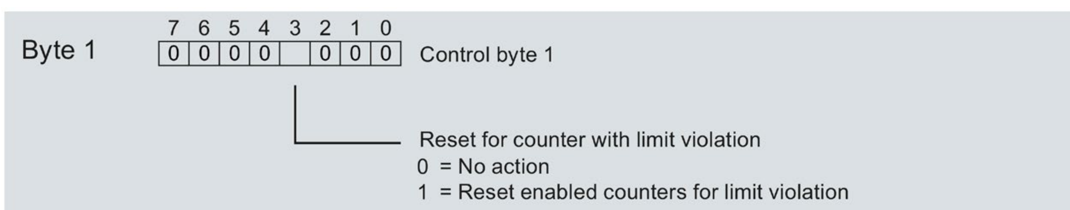

Figure 9-2 Resetting of the counters for limit violations

Activating / Deactivating counters for limit violations

Activating/deactivating of the counters for limit violations is only possible for module versions with 20 bytes of output data.

Requirements: "Gate for limit value monitoring" was parameterized during configuration of the module using STEP 7 or by writing the data record DS 128.

Select the counters for limit violations that you want to activate / deactivate in Control bytes 3 and 4.

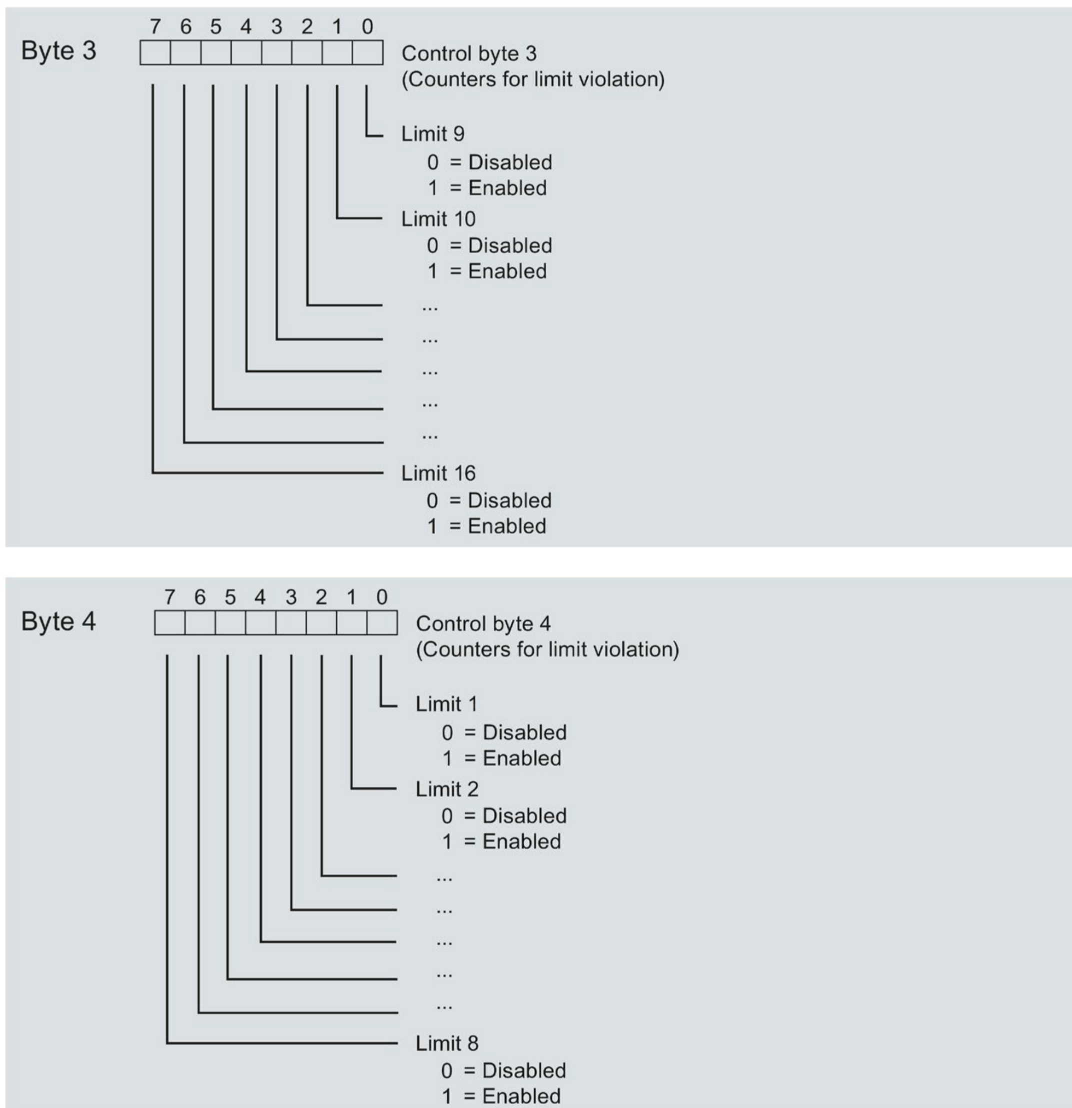

Figure 9-3 Activating / deactivating of the counters for limit violations

9.4 Measured variables for limit monitoring

You can use measured variables from the section Measured variables (Page 163) for limit value monitoring.

The value range of the parameter "Limit x" is -3.0E+09 ... +3.0E+09.

The table below shows you which measured variables are not available for limit monitoring.

Measured value ID	Measured variables
220	Total active energy inflow L1L2L3
221	Total active energy outflow L1L2L3
222	Total reactive energy inflow L1L2L3
223	Total reactive energy outflow L1L2L3

66038	Frequency

Minimum and maximum values 10

10.1 Minimum and maximum values

Introduction

The AI Energy Meter HF determines the respective highest and lowest measured or calculated value for a series of measured and calculated values. The values are stored retentively in the module and can be read using measured value data records DS 144 (Page 237), DS 145 (Page 243), DS 154 (Page 239) and DS 155 (Page 245).

Benefits

Using the stored minimum and maximum values, for example, you can detect further irregularities in addition to limit monitoring.

Calculation of minimum and maximum values

Minimum and maximum values are only calculated for the phases in accordance with the configured connection type. Existing minimum and maximum values that have not been calculated are assigned initial values. If faults such as under or overcurrent occur during operation, new minimum and maximum values are calculated.

The measured and calculated values are initialized as follows during commissioning of the AI Energy Meter HF so that the first calculation of minimum and maximum values supplies a plausible result:

- Maximum values for measured and calculated values: Minimum values
- Minimum values for measured and calculated values: Maximum values

Minimum and maximum values are determined as "slave pointer procedures" from the start of calculation. Start is effective as of activation of the function or after a reset. The module uses the current actual value as the start value.

When you activate the parameter "Enable minimum and maximum value calculation gate", the calculation only starts if the corresponding DQ bit ("gate open") was set (output data Byte 1, Bit 2 = "1"). You can stop the calculation at any time by deactivating the parameter or closing the gate. Calculation starts again after reactivation. The gate for calculation of the minimum and maximum values functions in the same way as the gate for energy meters.

Configuring

You configure the following settings in STEP 7:

- Enable calculation of minimum and maximum values
- Enable minimum and maximum value calculation gate

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Reset saved maximum values	0	Module version starting at 2 bytes of output data
Reset saved minimum values	0	Module version starting at 2 bytes of output data

---

Note

Automatic reset

If you change the parameters for current or voltage transformers, the minimum and maximum values are reset automatically to their initial values.

10.2 Resetting minimum and maximum values

Description

At the beginning of a new work order, it may be useful to reset the minimum and maximum values of the AI Energy Meter HF. Resetting means that the minimum and maximum values are reset to their initial values. Initial values are described, see section Measured value data record for maximum values (DS 144) version 1 (Page 237), Measured value data record for minimum values (DS 145) version 1 (Page 243), Measured value data record for maximum values with time stamp (DS 154) (Page 239) and Measured value data record for minimum values with time stamp (DS 155) (Page 245).

Minimum and maximum values are only reset using a Reset via output data (DQ bit).

Due to the differing lengths of the output data resetting of the minimum and maximum values depends on the configured module version. If you use module versions with 20 bytes of output data, you can:

- Reset the minimum and maximum values for **all** phases.
- Reset minimum and maximum values for each **individual** phase.

If you use the module version with 2 bytes of output data, you always reset **all** the minimum and maximum values simultaneously.

Time stamps are set to initial values (01.01.1970, 0:00) on reset.

Procedure for module version with 20 bytes of output data

Resetting the minimum and maximum values for all 3 phases.

1. Select the categories of minimum and maximum value that you want to reset in byte 2.
   - Set bit 0 for voltage and frequency.
   - Set bit 1 for current and power factor.
   - Set bit 2 for active power.
   - Set bit 3 for reactive power.
   - Set bit 4 for apparent power.

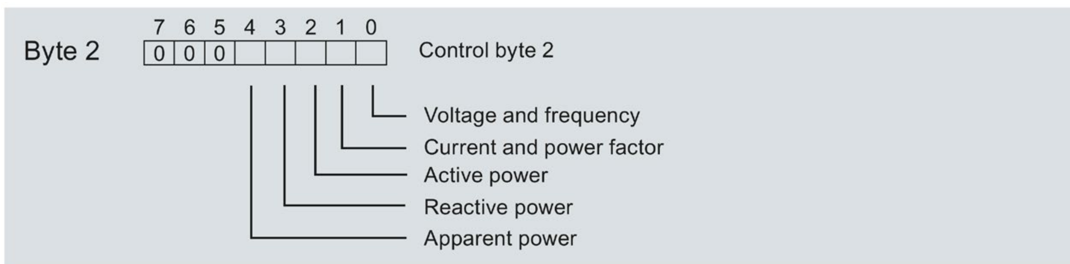

Figure 10-1 Selection of minimum and maximum value category

2. In Byte 1, set reset bit 0 for minimum values or reset bit 1 for maximum values.
   If there is an edge change of the reset bits from 0 to 1, the module resets the selected minimum or maximum values for all 3 phases that you previously selected in Byte 2.

Figure 10-2 Reset bit for minimum and maximum values

Resetting minimum and maximum values for phase-specific measurement

You can also reset the minimum and maximum values on a phase-specific basis using the output data.

Follow the procedure for "Resetting minimum and maximum values for all 3 phases" as applicable.

1. Select the categories of minimum and maximum value that you want to reset on a phase-specific basis.
   – In byte 7, set the bits for the category of minimum and maximum values in phase 1.
   – In byte 9, set the bits for the category of minimum and maximum values in phase 2.
   – In byte 11, set the bits for the category of minimum and maximum values in phase 3.
2. Set the reset bit (bit 0 and bit 1) for minimum or maximum values.
   – in byte 6 for phase 1
   – in byte 8 for phase 2
   – in byte 10 for phase 3

If there is an edge change of the phase-specific reset bits from 0 to 1, the module resets the minimum or maximum values for the given phase.

Procedure for module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, you always reset **all** the minimum and maximum values simultaneously.

Set the reset bit (Bit 0 or Bit 1) in Control byte 1 from 0 to 1 through an edge change.

Figure 10-3 Resetting the minimum and maximum values at module version with 2 bytes of output data

Power quality analysis functions 11

Introduction

Power quality analysis functions are used as an aid to evaluate the quality of the supply network. In a three-phase system, many of these functions only make sense or can be executed if a functioning symmetrical three-phase supply system is available, the detection sensors of the three phases are identical in design and the nominal values current or voltage of the phases have the same values.

The AI Energy Meter HF provides you with the following power quality analysis functions in accordance with IEC 6100-4-30 for monitoring the power quality in your power network:

- Measure the neutral current
- Perform residual current analysis
- Determine active and power factor
- Carry out reactive power compensation
- Analyze fundamental values three-phase (voltage, current, power)
- Analyze the harmonics up to the 40th harmonic
- Determine the total harmonic distortion THD+N current/voltage for all three phases
- Detect voltage dip and voltage swell
- Detect overcurrent
- Detect peak value for current and voltage

The power quality analysis only returns useful results if some basic requirements are met. These include:

- Accuracy of the line frequency (50 Hz or 60 Hz) is maintained according to IEC 61557-12.
- Wiring has been carried out correctly.

Delete the results of the power quality analysis

Delete the results of the power quality analysis by setting the corresponding bits in Byte 12 of the output range (Page 200) for at least 100 ms to "1".

Deletion has the following effects:

- Deletion of the result values and status bits for
  - Peak values of the instantaneous values for voltage and current
  - Overcurrent of the current half value
  - Voltage dip and voltage swell of the voltage half-wave value
- Any pending diagnostics "External fault" is deleted.

Harmonic

Harmonics are superimposed vibrations deviating from the fundamental frequency of the supply network (50 Hz or 60 Hz) with an integer multiple of the fundamental frequency. Harmonics are generated by equipment with a non-linear current–voltage characteristic such as transformers, gas discharge lamps and power electronics devices.

Harmonic component THD (Total Harmonic Distortion)

The THD defines the ratio of the power of the harmonics to the power of the fundamental and provides information about the power quality. The value is dimensionless and is stated as a percentage [%].

The AI Energy Meter HF returns THD+N (Noise) and considers the entire current signal (DS 163) or voltage signal (DS 161). Interference in the network is not filtered out.

11.1 Power quality analysis status

Information about the power quality status can be found in the measured value "Power quality analysis qualifier" with the measured value ID 65496.

The bits 0 to 4 in byte 1 to 3 show in status "1" that information has been available since the last reset, which can be retrieved. The bits 5 to 7 in byte 1 to 3 in status "1" show that the event is currently active. If the event is not active, "0" is displayed.

The measured value "Network analysis qualifier" has the following structure:

<table>
<tr><th>Address</th><th>Content</th><th>Bit 7</th><th>Bit 6</th><th>Bit 5</th><th>Bit 4</th><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th></tr>
<tr><td>Byte 0</td><td>Power quality analysis qualifier module</td><td>Reserved</td><td>Reserved</td><td colspan="6">Status of harmonics analysis:
0_D: No data, no start
1_D … 62_D: running
63_D: Completed, data is available</td></tr>
<tr><td>Byte 1</td><td>Power quality analysis qualifier phase L1</td><td rowspan="3">Overcurrent
Event currently active</td><td rowspan="3">Voltage swell
Event currently active</td><td rowspan="3">Voltage dip
Event currently active</td><td rowspan="3">Overcurrent
Event occurred, data available</td><td rowspan="3">Peak value current
Event occurred, data available</td><td rowspan="3">Voltage peak
Event occurred, data available</td><td rowspan="3">Voltage swell
Event occurred, data available</td><td rowspan="3">Voltage dip
Event occurred, data available</td></tr>
<tr><td>Byte 2</td><td>Power quality analysis qualifier phase L2</td></tr>
<tr><td>Byte 3</td><td>Power quality analysis qualifier phase L3</td></tr>
</table>

11.2 Harmonics analysis

The AI Energy Meter HF can determine the effective values for current and voltage up to the 40th harmonic of the fundamental.

The harmonics of the voltage are stored in the data record DS 161 (Page 261).

The harmonics of the current are stored in the data record DS 163 (Page 265).

In addition, you can incorporate the results on IDs with the parameter data records DS 130/DS 131 (Page 157) in the user-defined user data and DS 135 (Page 160) in the user-defined data record DS 151 (Page 258).

The calculation of the harmonics takes several cycles. To determine whether calculation is completed, evaluate the Bits 0 to 5 in the power quality analysis data record DS 160 (Page 259) in Byte 218. If the value 63 is in the Bits 0 to 5, the calculation is completed and the measured values are available.

Note

While the calculation is in progress, you cannot read the data records DS 161 and DS 163.

Note

While the calculation is in progress, quick measured value acquisition (e.g. for controlling reactive-power compensation) is not possible.

Requirement

- The parameter "Power quality analysis function" is activated.
- The parameter "Analyse harmonics" for the corresponding phase must be released.

Voltage and current are always analyzed simultaneously for the enabled phases.

Control via data outputs

The harmonics analysis starts by setting the DQ bit 6 "Power quality analysis Start/Stop L1L2L3" in Byte 12 of the output data. The results of a previous analysis of harmonics are deleted in the process. Results of non-selected channels are "0". If channels which have not yet been analyzed are added, the data are not plausible at the start of the analysis.

If the DQ bit is reset during an ongoing analysis, the analysis stops.

11.3 Reactive power compensation

Use the power factor of the fundamental for the reactive power compensation.

When you activate the power quality analysis function, the power factor of the fundamental is available in the measured value data record DS 160 (Page 259) or in the user data.

See also

User data variants (Page 205)

11.4 Detection of residual current

For the residual current analysis (function "Tamper Detect" = Detection of unauthorized interventions), the total current must be determined:

Isum L1L2L3 (t) = IL1 (t) + IL2 (t) + IL3 (t)

The instantaneous residual current If is obtained by subtracting the results of the current neutral current In from the total current:

If = Isum L1L2L3 – In

Analysis starts immediately after parameter assignment. The measured value "Total current IL1+IL2+IL3-IN" (ID = 61153) returns the residual current. It is contained in DS 160, for example. You can monitor a threshold relevant for your application for a limit value (see function Limit monitoring (Page 77)).

Requirements

- "3P4W" or "3P4WI" is parameterized as the connection type.
- The same current transformers are connected to all three phases.
- The parameter "Reverse current direction" is parameterized identically for all three phases.
- The neutral current is parameterized with "Measuring".
- The residual current analysis is activated in the parameter assignment.

11.5 Active factor and power factor

The AI Energy Meter HF returns the active and power factor individually for each phase and as an aggregate.

Active factor

The active factor is defined as follows:

cos φ (active factor, signed, fundamental oscillation): cos φ = P1 / S1

φ = phase shift angle of fundamental oscillation

P1 = active power of fundamental oscillation

S1 = apparent power of fundamental oscillation

Power factor

The power factor λ = cos Φ is the ratio of active power (P) to the total apparent power (S) over the fundamental oscillation and all harmonics (total):

λ (power factor, unsigned, total): λ = cos Φ = |P| / S

11.6 Neutral current In

The module can measure or calculate the neutral current.

For measuring, you have to connect a current transformer to neutral. The behavior "measuring or calculating" can be set for each parameter. The main application of the measured value "Neutral current IN" (ID: 61149) are three-phase networks with existing 4th conductor, neutral: The neutral current usually shows incorrectly flowing currents. In an ideal three-phase network, the neutral current = 0.

An additional possible application is measuring any 4th current on this channel. Please note that in this case the measured value "Neutral current" displays this 4th current and not the actual neutral current.

Additional values in conjunction with the neutral current is set to 0.

The calculation of the neutral current and the comparison of calculated and measured neutral current (used for residual current analysis) is only possible in the operating modes "3P4W" and "3P4WI".

The determination of the neutral current is not subject to current suppression.

Parameter assignment options

If there a neutral in a connection type, the following parameters are available:

- Neutral current measurement deactivated
- Calculate the neutral current measurement
- Measure the neutral current measurement

If there is no neutral in a connection type, the following parameters are available:

- Do not use current channel
- Measure current channel

Display via channel LED

Neutral exists for connection type	calculate	measuring	Error	Channel LED
Yes	Yes	Yes	No	Green
Channel disabled	---	---	---	Off
No	No	Yes	No	Green

11.7 Monitoring the instantaneous or half-wave values

You can enable the following functions:

- Voltage swell (Page 116)
- Voltage dip (Page 118)
- Voltage peaks (Page 121)
- Current peak value (Page 127)
- Overcurrent value (Page 129)

The results are mapped in the phase-specific data records DS 147 (Page 248), DS 148 (Page 251) and DS 149 (Page 254) and in the power quality analysis data record DS 160 (Page 259).

In addition, you can incorporate the results using IDs in the measured value data record of the user-defined data record DS 151 (Page 258) and in the user data variants 1/2.

You can monitor the results for limits (Page 77) and generate hardware interrupts.

12 Phase-based measured values

Introduction

The AI Energy Meter HF makes the measured values of individual phases available.

- Through the user data variants
  - Phase-specific measurement Phase L1 with user data variants 154 ($9A_H$) and 155 ($9B_H$)
  - Phase-specific measurement Phase L2 with user data variants 156 ($9C_H$) and 157 ($9D_H$)
  - Phase-specific measurement Phase L3 with user data variants 158 ($9E_H$) and 159 ($9F_H$)
- Via measured value data records
  - Phase-specific measurement for the phases L1, L2 and L3 with data record 142
  - Phase-specific measurement for phase L1 with data record 147
  - Phase-specific measurement for phase L2 with data record 148
  - Phase-specific measurement for phase L3 with data record 149

User data variants

Through the user data variants 154 ($9A_H$) to 159 ($9F_H$) you can evaluate the following measured values for each phase of an AC / three-phase network:

- Quality information
- Current and voltage
- Active, reactive and apparent power
- Active, reactive and apparent energy
- Power factor

You can find the structure of the user data variants in appendix User data variants (Page 205).

Measured value data records

Through the measured value data records DS 142, DS 147, DS 148 and DS 149 you can evaluate the following measured values for each phase of an AC / three-phase network:

- Quality information
- Current and voltage
- Minimum current and minimum voltage
- Maximum current and maximum voltage
- Active, reactive and apparent power
- Minimum active, reactive and apparent power
- Maximum active, reactive and apparent power
- Active, reactive and apparent energy
- Power factor
- Minimum power factor
- Maximum power factor
- Harmonic distortion for voltage and current including minimum/maximum values
- Voltage dip
- Voltage swell
- Peak value for voltage and current
- Overcurrent value

You can find the structure of the measured value data records in appendix Measured value data record for phase-based measured values L1 (DS 147) version 1 (Page 249).

See also

Measured value data record for phase-based measured values L2 (DS 148) version 1 (Page 252)

Overview of all measured value data records (Page 226)

Parameters 13

13.1 Parameters

Parameters of the AI Energy Meter HF

You will usually configure the AI Energy Meter HF with STEP 7 (TIA Portal, if necessary with HSP). In this case, STEP 7 (TIA Portal) checks the configured properties for plausibility during configuration.

You can also assign parameters to the module using a GSD file and STEP 7 or the configuration software of any provider. In this case, the module checks the validity of the configured properties only after the configuration has been downloaded. Note that some parameters depend on the selected connection type of the AI Energy Meter HF. For example in the connection type 1P2W for measurements in single-phase AC network it does not make sense to enter parameters for Phases 2 and 3. This is not checked by the system if the GSD file is used.

The effective range of the parameters that can be set using a GSD file depends on the type of bus system used:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

In addition you can change the parameterized properties via the user program in RUN mode. When you assign parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records (see appendix Configuration via parameter data records (Page 139)).

The following table summarizes all the configurable parameters with STEP 7 (GSD file).

Table 13- 1 Parameters AI Energy Meter HF (GSD file)

Parameters	Value range	Default setting	Reconfiguration in RUN
Hardware interrupt	• Disable • Enable	Disable	No
Inputs			
Diagnostics: Missing supply voltage L+	• Disable • Enable	Disable	Yes
Connection type	• Disabled • 1P2W - 1 phase, 2 conductors • 3P4W - 3 phase current measurement, 4 conductors • 3P4W1, 3 phases, 4 conductors, balanced load • 3P4W - 3 phases, 4 conductors • 3x1P2W - 3 x 1 phase, 2 conductors each • 2P3W - 2 phases, 3 conductors • 3P3W, 3 phases, 3 conductors • 3P3W1, 3 phases, 3 conductors, balanced load	3P4W - 3 phases, 4 conductors	Yes
Voltage measuring range	• 100 V • 110 V • 115 V • 120 V • 127 V • 190 V • 200 V • 208 V • 220 V • 230 V • 240 V • 277 V	230 V	Yes
Line frequency	• 50 Hz • 60 Hz	50 Hz	Yes
Energy meter gate enabled	• Disable • Enable	Disable	Yes

Parameters	Value range	Default setting	Reconfigu-ration in RUN
End value energy meter	• No end value (infinite counting) • Count periodically to 10^3 • Count periodically to 10^6 • Count periodically to 10^9 • Count periodically to 10^{12} • Count periodically to 10^{15}	No end value (infinite counting)	Yes
User data variant	See the table Overview of the user data variants (Page 205)	Total power L1L2L3 (W#16#FE)	Yes
Minimum and maximum value calculation	• Disable • Enable	Disable	Yes
Minimum and maximum value calculation gate	• Disable • Enable	Disable	Yes
Power quality analysis functions	• Disable • Enable	Disable	Yes
Residual current analysis	• Disable • Enable	Disable	Yes
Neutral: Current transformer primary current [A]	• 0 = Disabled • 1 ... 99999 = measuring • 4294967295 = Calculating	0	Yes
Neutral: Current transformer secondary current [A]	• 1 • 5	1	Yes
Voltage dip limit value in relation to nominal value voltage [0.1%]	• 10 ... 1000	100	Yes
Voltage swell limit value in rela-tion to nominal value voltage [0.1%]	• 10 ... 10000	100	Yes
Threshold overcurrent in relation to nominal value current [0.1%]	• 10 ... 60000	100	Yes
Number of cycles for voltage swell and dip analysis	• 4 ... 32767	10	Yes
Diagnostics power quality	• Disable • Enable	Disable	Yes
Diagnostics overflow current	• Disable • Enable	Disable	Yes
Diagnostics overflow voltage	• Disable • Enable	Disable	Yes
Diagnostics underflow voltage	• Disable • Enable	Disable	Yes

Parameters	Value range	Default setting	Reconfiguration in RUN
Diagnostics overflow cumulative values	• Disable • Enable	Disable	Yes
Detect voltage swell and dip	• Disable • Enable	Disable	Yes
Detect peak value current	• Disable • Enable	Disable	Yes
Detect peak value voltage	• Disable • Enable	Disable	Yes
Detect overcurrent	• Disable • Enable	Disable	Yes
Analyse harmonics	• Disable • Enable	Disable	Yes
Nominal value current [A]	• 0 ... 99999	1	Yes
Tolerance factor overcurrent in relation to nominal value current [0.1%]	• 10 ... 60000	100	Yes
Tolerance time overcurrent [ms]	• 0 ... 60000	40000	Yes
Low limit current measurement in relation to nominal value current [0.1%]	• 0 ... 200	10	Yes
Enable operating hours counter	• Disable • Enable	Disable	Yes
Enable gate of operating hours counter	• Disable • Enable	Disable	Yes
Current transformer primary current [A]	• 1 ... 99999 A	1 A	Yes
Current transformer secondary current	• 1 A • 5 A	1 A	Yes
Reverse current direction	• Disabled • Reverse current direction	Disabled	Yes
Nominal value voltage [V]	• 1 ... 999999	230 V	Yes
Tolerance factor overvoltage/undervoltage [0.1%]	• 10 ... 500	100	Yes
Voltage transformer primary voltage [V]	• 1 ... 999999 V	230 V	Yes
Voltage transformer secondary voltage [V]	• 1 ... 500 V	230 V	Yes

Parameters	Value range	Default setting	Reconfiguration in RUN
Limits			
Number of limits	• 0 ... 16	0	Yes
Limit monitoring	• Disable • Enable	Disable	Yes
Measured variable	• Measured value ID see Measured value data records (Page 226)	None	Yes
Enable limit monitoring gate	• Disable • Enable	Disable	Yes
Hardware interrupt	• Disable • Enable	Disable	Yes
Limit	• depending on the selected measured variable	0.0000	Yes
Type	• High limit • Low limit	High limit	Yes
Hysteresis for limit monitoring [0.1%]	• 0 ... 200 [0.1%]	1%	Yes

13.2 Description of parameters

Hardware interrupt

Enable the hardware interrupt for the entire module here.

Inputs

Diagnostics: Missing supply voltage L+

Activate the diagnostics No supply voltage L+. If there is no voltage or too little voltage at terminal 17, the message "No supply voltage" is output and a diagnostic interrupt is triggered.

Connection type

Specify the connection type you used for the AI Energy Meter HF.

For more detailed information, refer to "Connection examples (Page 23)".

Voltage measuring range

Here you set the voltage measuring range in which the system connected to the AI Energy Meter HF works.

Line frequency

Here you set the line frequency in which the system connected to the AI Energy Meter HF works.

Enable gate energy meter

Enable the gate for the energy meter When the gate is enabled, the energy meter only counts when the corresponding output data bit (DQ bit) is set to "1".

End value energy meter

Select the end value for the periodic counting of the energy meter. You can also specify that the energy meter is to count without a full-scale value (infinite counting). The calculated energy counter values are stored retentively in the module.

User data variant

Select user data variant with which the module is to operate once it is started up.

Minimum and maximum value calculation

Enable calculation of the minimum and maximum values. The minimum and maximum value are calculated from the start of the measurement. The values determined are stored retentively in the AI Energy Meter HF together with the time stamp.

Minimum and maximum value calculation gate

Enable the gate for minimum and maximum value calculation. When the gate is enabled, the energy meter only counts when the corresponding output data bit (DQ bit) is set to "1".

Power quality analysis function

Enable the power quality analysis function for the entire module.

Residual current analysis

Enable the residual current analysis for the entire module. The residual current analysis is only available in the connection types 3P4W or 3P4WI and the concurrently activated parameter "Neutral current measurement".

Neutral current measurement

Defines whether the neutral current is measured or calculated.

This parameter does not apply to parameter assignment with GSD file.

Neutral: Current transformer primary current [A]

To determine the current transformer ratio, enter the primary current. The transformer ratio is calculated from the primary and secondary current.

The following applies to parameter assignment with GSD file:

- 0 = Neutral function deactivated
- 1 ... 99999 = measure neutral current
- 4294967295 = calculate neutral current

Neutral: Current transformer secondary current [A]

To determine the current transformer ratio, enter the secondary current. The transformer ratio is calculated from the primary and secondary current.

Voltage dip limit value in relation to nominal value voltage [0.1%]

Further information can be found under Voltage dip of the voltage half-wave value (Page 118).

Voltage swell limit value in relation to nominal value voltage [0.1%]

Further information can be found under Voltage swell of the voltage half-wave value (Page 116).

Threshold overcurrent in relation to nominal value current [0.1%]

Further information can be found under Overcurrent of the current half value (Page 129).

Number of cycles for voltage swell and dip analysis

Further information can be found under Voltage swell of the voltage half-wave value (Page 116) and Voltage dip of the voltage half-wave value (Page 118).

Diagnostics power quality

Depending on the enable of the individual functions the diagnostics are triggered when a voltage swell, voltage dip or overcurrent event has occurred.

Diagnostics overflow current

The measured current is monitored after expiry of the "Tolerance time" for "Overcurrent [0.1 A] tolerance value". Exceeding the value generates the diagnostics "overflow current".

Diagnostics overflow voltage

The nominal values voltage are monitored for tolerance. An overflow triggers a diagnostic interrupt.

Diagnostics underflow voltage

The nominal values voltage are monitored for tolerance. An underflow triggers a diagnostic interrupt.

Diagnostics overflow cumulative values

A cumulative overflow in the calculated variables is displayed. The values stop at the high or low limit. A violation triggers a diagnostic interrupt.

Detect voltage swell and dip

Activates the detection of voltage swell and dip. Further information can be found under Diagnostics: Overflow/underflow (Page 114).

Detect peak value current

Activates the detection of current peak values. Further information can be found under Peak values of the instantaneous values for current (Page 127).

Detect peak value voltage

Activates the detection of voltage peak values. Further information can be found under Peak values of the instantaneous values for voltage (Page 121).

Detect overcurrent

Activates the detection of overcurrent. Further information can be found under Overcurrent of the current half value (Page 129).

Analyse harmonics

Activates harmonics analysis

Nominal value current [A]

Enter the nominal value for the current. This is the "operating point" in your application.

Tolerance factor overcurrent in relation to nominal value current [0.1%]

Further information can be found under Diagnostics: Overload (Page 123).

Tolerance time overcurrent [ms]

Further information can be found under Diagnostics: Overload (Page 123).

Low limit current measurement in relation to nominal value current [0.1%]

The configurable low limit for measuring current refers to the nominal value and is used to avoid incorrect calculations in the case of very low currents. Incorrect measurements of very low currents in particular are a cause of inaccuracies in the current transformer used. Set the low limit for the current measurement to the required value depending on your process.

Note

Tip: If you want to find the low limit for the current measurement experimentally, set it to a lower value. Then, feed in a very precise low current and determine the measurement error that can no longer be tolerated. Afterwards, set the low limit for the current measurement to the limit value you have determined.

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Neutral current
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy as well as the operating hours counters do not count any longer.

Further information can be found under Low limit for measuring current undershot (Page 125).

Enable operating hours counter

Enable the operating hours counter. The counting starts from the configurable low limit of the current measurement. The counter can be reset or pre-assigned using data record or output bit.

Enable gate of operating hours counter

Enable the gate for the operating hours counter. When the gate is activated, the operating hours counter only counts when the corresponding output data bit (DQ bit) is set to "1".

Current transformer primary current

Enter the nominal value for the primary current of the current transformer used. The transformer ratio is calculated from the primary and secondary current.

Current transformer secondary current

Enter the nominal value for the secondary current (1 A or 5 A) of the current transformer used. The transformer ratio is calculated from the primary and secondary current.

Reverse current direction

Setting to determine whether or not to reverse the direction of current.

In the event of inadvertent incorrect connection, this parameter can be used to correct the measured values, thus saving the hassle of rewiring. The direction of the current is only evident from the power measurement values. The current measurement value is an rms value.

Nominal value voltage [V]

Enter the nominal value for the voltage. This is the "operating point" in your application.

Tolerance factor overvoltage/undervoltage [0.1%]

Enter the tolerance factor overvoltage/undervoltage here in increments of 0.1%. You can find additional information under Diagnostics: Overflow/underflow (Page 114).

Voltage transformer primary voltage [V]

Enter the nominal value for the primary voltage of the voltage transformer used. The transformer ratio is calculated from the primary and secondary voltage.

Voltage transformer secondary voltage [V]

Enter the nominal value for the secondary voltage of the voltage transformer used. The transformer ratio is calculated from the primary and secondary voltage.

Limits

Number of limits

Enter the number of measured values that you want to monitor for limits.

Limit monitoring

Enable the monitoring of the limit for a freely definable measured value here. Limit violations are counted and the count values stored retentively.

Measured variable

Enter the measured value ID (Page 163) that you want to use for limit monitoring.

Enable limit monitoring gate

Enable the limit monitoring gate. When the gate is enabled, the limit monitoring is only started when the corresponding bit of the associated output user data is set to "1".

Hardware interrupt

Enable the hardware interrupt. The hardware interrupt is triggered if a high or low limit is violated. Without activation of a hardware interrupt, a limit violation is only displayed in the user data and in DS 150.

Limit

Enter the limit that is to trigger a limit violation when exceeded or fallen below. Limit violations are displayed in the user data and in DS 150.

Type

Select whether it is a high or low limit. Depending on this selection, the limit violation or hardware interrupt is triggered when a value exceeds (high limit) or falls below (low limit) the limit.

Hysteresis for limit monitoring [0.1%]

Enter the hysteresis for limit in percent.

The hysteresis band is below the high limit or above the low limit. The parameter in % refers to the configured limit. If a measured value fluctuates around the limit but does not leave the hysteresis band, a new limit violation is not triggered.

Delay time for limit monitoring [s]

Select the delay time for limit violation. The delay refers to the time that must elapse before an occurrence of a limit violation is reported. Faults can be filtered out by selection of the delay time. The deceleration time is also taken into consideration during outgoing of the limit violation.

User data mapping I/II

Number of measured values

Specify the number of measured values/variables that you want to use for the user-specific user data mapping.

Measured variable

Select the measured variable (with the measured value ID (Page 163)) that you want to use for the user-specific user data mapping.

Data record mapping

Number of measured values

Specify the number of measured values/variables that you want to use for the user-specific data record mapping.

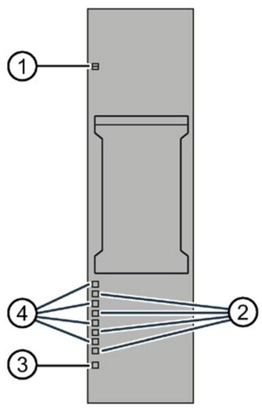
Measured variable

Select the measured variable (with the measured value ID (Page 163)) that you want to use for the user-specific data record mapping.

14 Interrupts/diagnostic alarms

14.1 Status and error display

LED display



① DIAG (green/red)
② Error (red)
③ PWR (green)
④ Status (green)

Figure 14-1 LED display

Meaning of the LED displays

The following table explains the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostic alarms (Page 111).

DIAG LED

Table 14- 1 Meaning of the DIAG LED

DIAG	Meaning
Off	Supply voltage of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Status LED

Table 14- 2 Meaning of the Status LED

Status	Meaning
Off	Channel disabled
On	Channel activated and no error
On	Channel enabled and error

see also Neutral current In (Page 92)

Error LED

Table 14- 3 Meaning of the Error LED

Status	Meaning
Off	Channel is OK
On	Channel is faulty

PWR LED

Table 14- 4 Meaning of the PWR LED

PWR	Meaning
Off	Line voltage missing
On	Line voltage available

14.2 Interrupts

The analog input module AI Energy Meter HF supports hardware and diagnostic interrupts.

14.2.1 Hardware interrupts

Hardware interrupts

The module generates a hardware interrupt at the following events:

- Violation of low limit 1 to 16
- Violation of high limit 1 to 16

You can find detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment of the local data double word 8 by the start information of the hardware interrupt organization block.

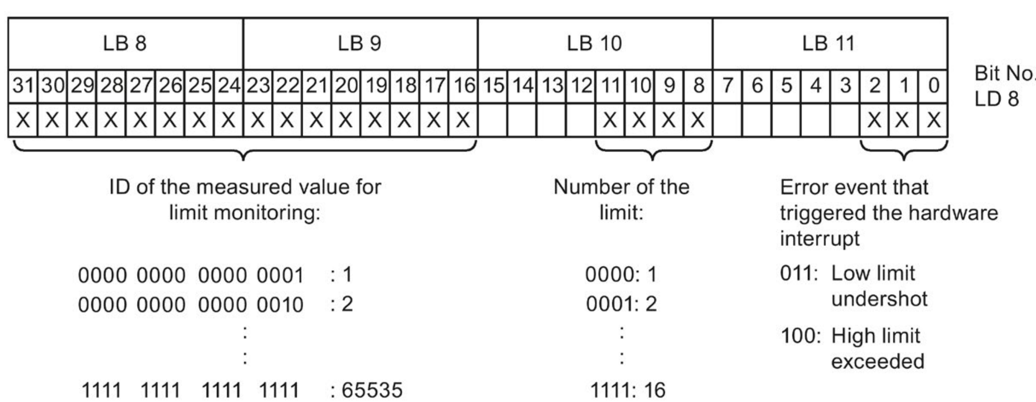


Figure 14-2 Start information of the organization block

14.2.2 Diagnostics interrupt

Diagnostic interrupt

The module generates a diagnostic error interrupt at the following events:

- Power quality
- Channel is temporarily unavailable
- Hardware interrupt lost
- Error
- Supply voltage missing
- Parameter assignment error
- Underflow voltage (tolerance for supply voltage) violated
- Overflow voltage (tolerance for supply voltage) exceeded
- Overload (current measurement > 12 A or tolerance overcurrent exceeded after expiry of the tolerance time)
- Overflow of the calculated values (measured or calculated values screen exceed the representable range of values)

14.3 Diagnostic alarms

Note

Assignment channel in diagnostic message ⇔ Phase

In the diagnostic messages the channels are counted from Channel "0" on, in the AI Energy Meter HF from phase "1" on.

Note the following assignment:

- Channel "0" ⇔ Phase "1"
- Channel "1" ⇔ Phase "2"
- Channel "2" ⇔ Phase "3"

Table 14- 5 Error types

Diagnostic message	Error code	Meaning	Solution
Undervoltage	2_H	Line voltage (measuring range) is monitored for tolerance. Violation leads to voltage overflow/underflow	Observe the line voltage range
Overvoltage	3_H		
Overload	4_H	• The measured current is monitored after the "Tolerance time" for "Tolerance value overcurrent [0.1A]" has expired. Exceeding this results in overflow current. • The maximum value of the secondary current (12 A) has been exceeded.	Observe the current range
Error	9_H	Internal module error (diagnostic alarm on channel 0 applies to the entire module).	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Load voltage missing	11_H	Missing or insufficient line voltage at terminal 17	Check supply
External fault	$1A_H$	Voltage swell/dip and overcurrent	see: • Voltage swell of the voltage half-wave value (Page 116) • Voltage dip of the voltage half-wave value (Page 118) • Overcurrent of the current half value (Page 129)
Channel is temporarily unavailable	$1F_H$	Firmware upgrade is being performed. Channel 0 applies to the entire module. The module is currently not performing any measurements.	--
		A user calibration is being executed at the channel.	Complete the user calibration

14.4 Diagnostics response

Diagnostics response

This section describes the response of the AI Energy Meters HF when diagnostics information is reported.

Measured values in the case of diagnostics

Even in the case of diagnostics, measured values continue to be displayed as long as they can still be acquired. If measured values cannot be measured or calculated, "0" is displayed.

Low limit for current measurement undershot (zero suppression)

If the supplied current is less than the configured "Low limit for current measurement" parameter, the current measurement and all dependent variables are suppressed and set to "0".

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy as well as the operating hours counters do not count any longer.

If the secondary current fed in at the channel is higher than 12 A, the module changes to limitation and the current measurement value of the current and all dependent variables are set to "0".

Input data to "0"

If the AI Energy Meter HF is no longer recognized by the interface module (for example, because it is defective or not plugged in), all input data are set to "0".

14.4.1 Voltage diagnostics

14.4.1.1 Diagnostics: Overflow/underflow

Introduction

You use the parameter "Tolerance factor overvoltage/undervoltage" to define a tolerance range around the set nominal value voltage at the operating point. If the effective value of the primary voltage exceeds this tolerance range, the module reports the diagnostics "overflow" or "underflow".

Calculation of tolerance value measuring voltage

The tolerance value measuring voltage is calculated with the following formula:

Tolerance value measuring voltage = "Nominal value voltage" ± ("Tolerance factor overvoltage/undervoltage [%]" × "Nominal value voltage")

The "Nominal value voltage" is the primary voltage at the operating point.

Parameter assignment

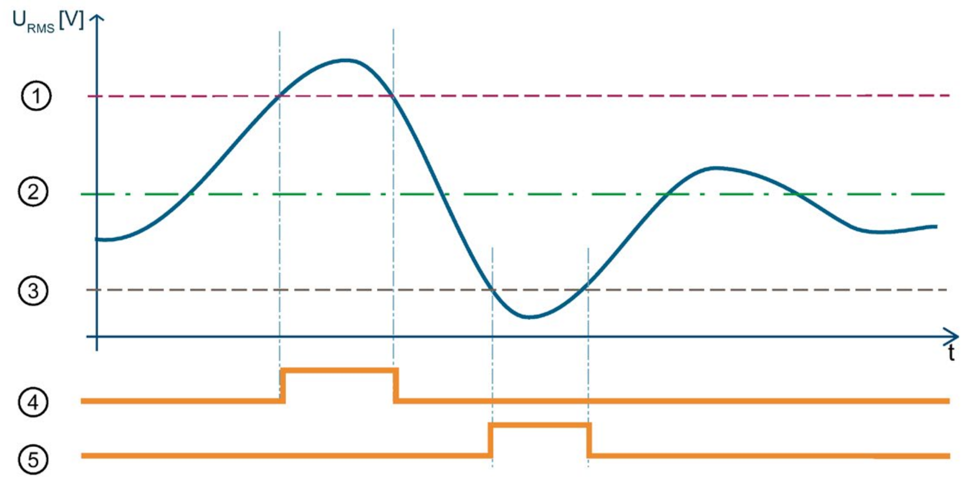
The following table shows the necessary parameters:

Table 14- 6 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics overflow	Enable
Diagnostics underflow	Enable
Nominal value voltage	1 ... 999999 V
Voltage transformer primary voltage	1 ... 999999 V
Voltage transformer secondary voltage	1 ... 500 V
Tolerance factor overflow/underflow	10 ... 50%

Example

The following figure is a schematic diagram of the principle of operation:



① Upper tolerance value measuring voltage
② Nominal voltage
③ Lower tolerance value measuring voltage
④ Diagnostics "overflow"
⑤ Diagnostics "underflow"

Figure 14-3 "Overflow/Underflow" diagnostics of the effective voltage value

The following table shows the parameter assignment for the example:

Table 14- 7 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics overflow	Enable
Diagnostics underflow	Enable
Nominal value voltage	230 V
Voltage transformer primary voltage	1000 V
Voltage transformer secondary voltage	500 V
Tolerance factor overflow/underflow	20%

In this example you define a tolerance range of ± 20%. The tolerance range corresponds to an effective value of primary voltage of ± 46 V.

In the figure the effective value of the primary voltage first exceeds the tolerance range. As long as the effective value of the primary voltage exceeds the tolerance range the module reports the diagnostics "overflow".

The effective value of the primary voltage then exceeds the tolerance range. As long as the effective value of the primary voltage exceeds the tolerance range the module reports the diagnostics "underflow".

14.4.1.2 Voltage swell of the voltage half-wave value

Introduction

Voltage swells are short-term increases in the line voltage which can occur, for example, when switching off large consumers.

With the parameter "Number of cycles for analysis" you define how many measuring cycles the voltage swell must apply at until the module reports the voltage swell. The module reports the diagnostics "Power quality". The module also sets the qualifier bit 6 for the respective phase in data record DS 160 (Page 259). If the voltage lies below the limit for voltage swell again, the module sets the diagnostics "Power quality" again and resets the qualifier bit 6 again.

The AI Energy Meter HF returns the maximum value and the duration of the voltage swell, e.g. in data record 160. The duration is determined exactly to ± 2 cycles.

In the event of voltage swell again, only the diagnostics "Power quality" is reported again and the duration, and if applicable, the maximum voltage swell value is updated.

Calculation of voltage swell limit value

The Voltage swell limit value is the value from which level of voltage the AI Energy Meter HF recognizes a voltage swell.

The "Voltage swell limit value" is calculated by the following formula:

Voltage swell limit = "Nominal value voltage" + ("Voltage swell limit [%]" × "Nominal value voltage")

The "Nominal value voltage" is the primary voltage at the operating point.

Parameter assignment

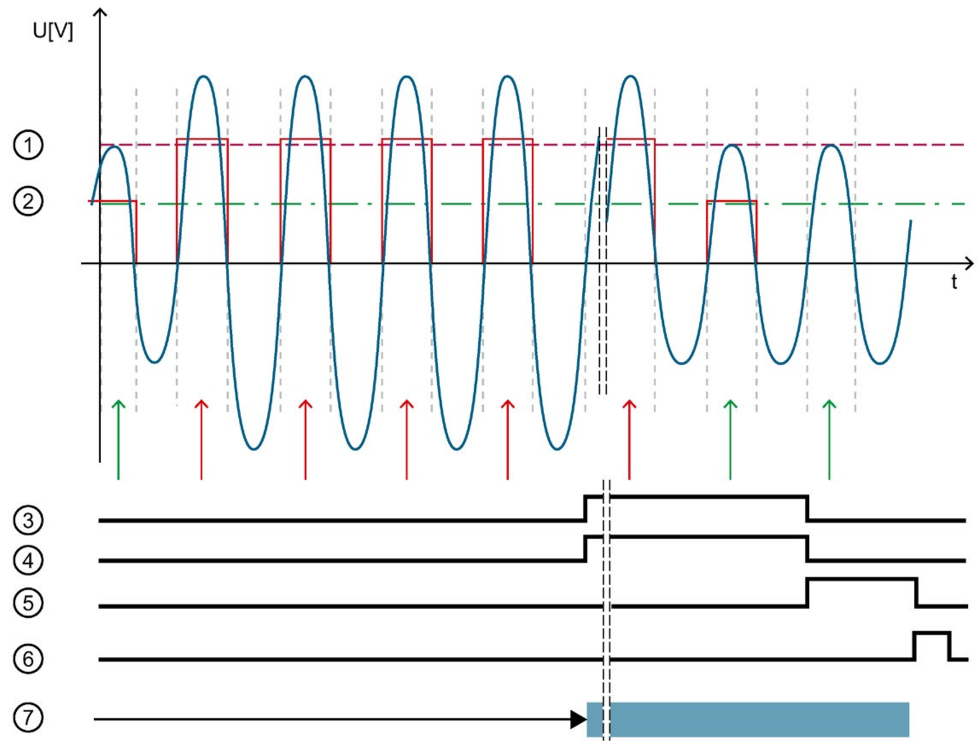
The following table shows the necessary parameters:

Table 14- 8 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4 ... 32767
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal value voltage	1 ... 999999 V
Voltage swell limit	1 ... 1000%

Example

The following figure is a schematic diagram of the principle of operation:



① Voltage swell limit
② Nominal voltage
③ Diagnostics "power quality"
④ Qualifier Bit 6
⑤ Status "Power quality voltage swell"
⑥ Bit "Reset status "power quality""
⑦ Min. voltage swell (half-wave) and duration can be read

Figure 14-4 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 9 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal value voltage	230 V
Voltage swell limit	40%

If the module detects that the "Voltage swell limit value" has been exceeded:

- The module reports the diagnostics "Power quality" from "Number of cycles for analysis" as long as there is a voltage swell.
- The module sets the qualifier bit 6 from "Number of cycles for analysis" as long as there is a voltage swell.
- After the module has reset the diagnostics "Power quality" and reset the qualifier bit again, Bit 1 is set.

As long as Bit 1 is set, the module returns the maximum value and the duration of the voltage swell, e.g. in data record 160.

You reset Bit 1 with the bit "reset status "power quality"".

14.4.1.3 Voltage dip of the voltage half-wave value

Introduction

Voltage dips are short-term decreases in the line voltage which can occur, for example, when switching on large consumers.

With the parameter "Number of cycles for analysis" you define how many measuring cycles the voltage dip must be present until the module reports the voltage dip. If the voltage lies above the "Voltage dip limit" again, the module sets the diagnostics "Power quality" and resets the qualifier bit 5 again.

The AI Energy Meter HF returns the maximum value and the duration of the voltage dip, e.g. in data record DS 160 (Page 259). The duration is determined exactly to ± 2 cycles.

In the event of voltage dip, the module reports a "Power quality" diagnostic. The module also sets the qualifier bit 5 for the respective phase in data record DS 160. In the event of voltage dip again, only the "Power quality" diagnostics is reported again and the duration, and if applicable, the minimum voltage dip value is updated.

Calculation of voltage dip limit

The voltage dip limit is the value from which level of voltage the AI Energy Meter HF detects a voltage dip.

The voltage dip limit is calculated by the following formula:

Voltage dip limit = "Nominal value voltage" - ("Voltage dip limit [%]" × "Nominal value voltage")

The "Nominal value voltage" is the primary voltage at the operating point.

Parameter assignment

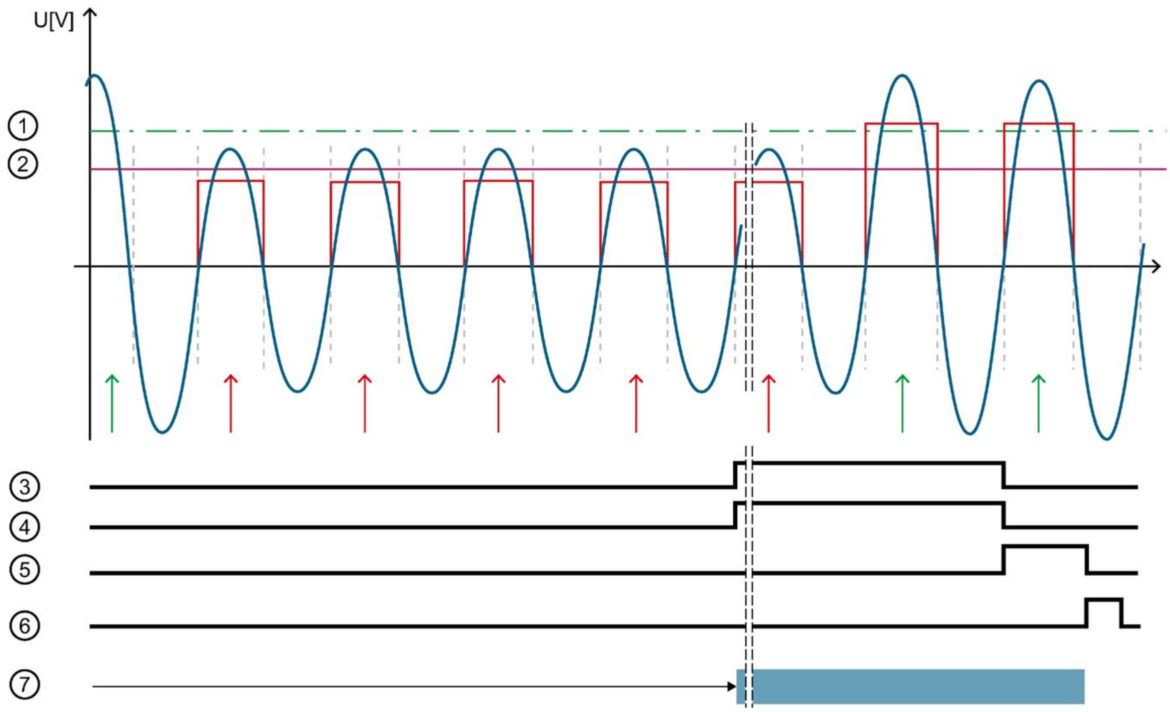
The following table shows the necessary parameters:

Table 14- 10 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4 ... 32767
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal value voltage	1 ... 999999 V
Voltage dip limit	1 ... 100%

Example

The following figure is a schematic diagram of the principle of operation:



① Nominal voltage
② Voltage dip limit
③ Diagnostics "power quality"
④ Qualifier Bit 0
⑤ Status "Power quality voltage dip"
⑥ Bit "Reset status "power quality""
⑦ Min. voltage dip (half-wave) and duration can be read

Figure 14-5 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 11 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal voltage	230 V
Voltage dip limit	50%

If the module detects that the "Voltage dip limit" has been undershot:

- The module reports the diagnostics "Power quality" from "Number of cycles for analysis" as long as there is a voltage dip.
- The module sets the qualifier bit 5 from "Number of cycles for analysis" as long as there is a voltage dip.
- After the module has reset the diagnostics "Power quality" and reset the qualifier bit again, bit 0 is set.

As long as bit 0 is set, the module returns the minimum value and the duration of the voltage dip, e.g. in data record 160.

You reset Bit 0 with the bit "Reset status "power quality"".

14.4.1.4 Peak values of the instantaneous values for voltage

Introduction

The AI Energy Meter HF determines the maximum instantaneous value for the voltage for up to three phases.

The function "Detect peak value voltage" returns the largest voltage value and the associated phase. The module sets the qualifier bit 2 ("Power quality voltage peak") for the phase in question. You can read the maximum voltage value, for example, in the data record DS 160 (Page 259).

Voltage peak detection is based on the function for recording swells of the supply voltage in accordance with IEC 61000-4-30. This function is used to record the maximum voltage value in the supply network. In three-phase systems this function is only useful if the system is symmetrical and when all phases show the same voltage transformers.

Accordingly, measurement always records only the peak value over all phases. In addition to the requirements of IEC 61000-4-30, the phase on which the peak value voltage occurred is detected.

For metrological reasons, only the phase concerned that shows this maximum value can be returned. This may mean that the maximum voltage values of the other phases remain "0". With a "reset power quality analysis" the analysis starts afresh and the current results are discarded.

Parameter assignment

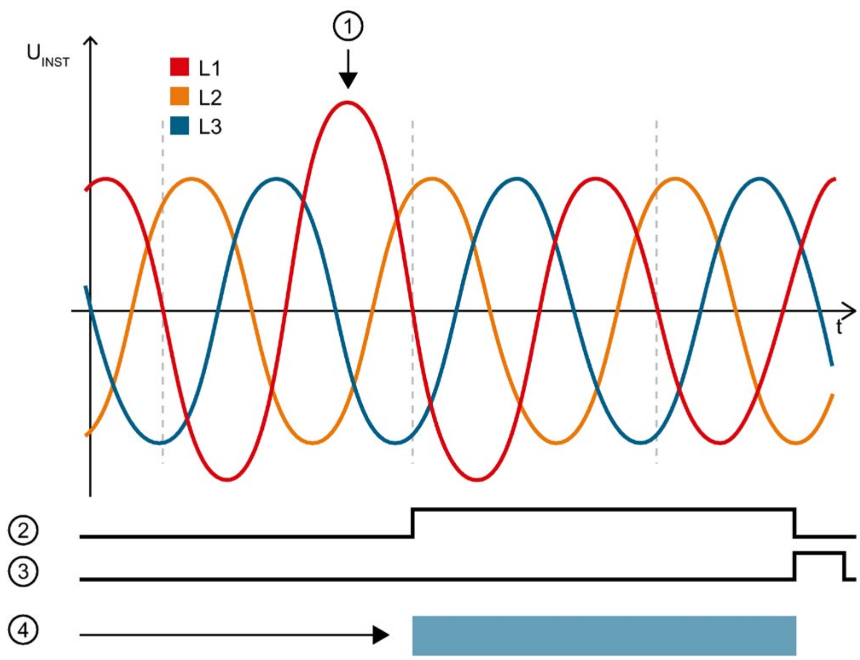
The following table shows the necessary parameters:

Table 14- 12 Parameter assignment

Parameter	
Power quality analysis function (module)	Enable
Determine peak value voltage (channel)	Enable

Example

The following figure is a schematic diagram of the principle of operation:



① Voltage peak in L1
② Status "Power quality voltage peak"
③ Bit "Reset status "power quality""
④ Max. voltage peaks instantaneous value can be read out

Figure 14-6 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 13 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Determination of voltage peak value L1	Enable
Determination of voltage peak value L2	Enable
Determination of voltage peak value L3	Enable

The module detects the voltage peak in phase 1 and sets the qualifier bit 2 for phase 1. You can find the maximum voltage value, for example, in the data record DS 160 in bytes 174 to 177 ("Voltage peak value L1").

14.4.2 Current diagnostics

14.4.2.1 Diagnostics: Overload

Introduction

As long as one of the following conditions is met, the module reports the diagnostics "Overload" for each phase:

- If the tolerance value measured current parameterized for each phase is exceeded for the tolerance time overcurrent parameterized for each phase.
- If the maximum measured current of the AI Energy Meters HF is exceeded:
  - Secondary measured current: 12 A

Calculation of tolerance value measured current

The tolerance value measured current is calculated with the following formula:

Tolerance value measured current = "Nominal value current" + ("Tolerance factor overcurrent [%]" × "Nominal value current")

The "Nominal value current" is the primary current at the operating point.

Parameter assignment

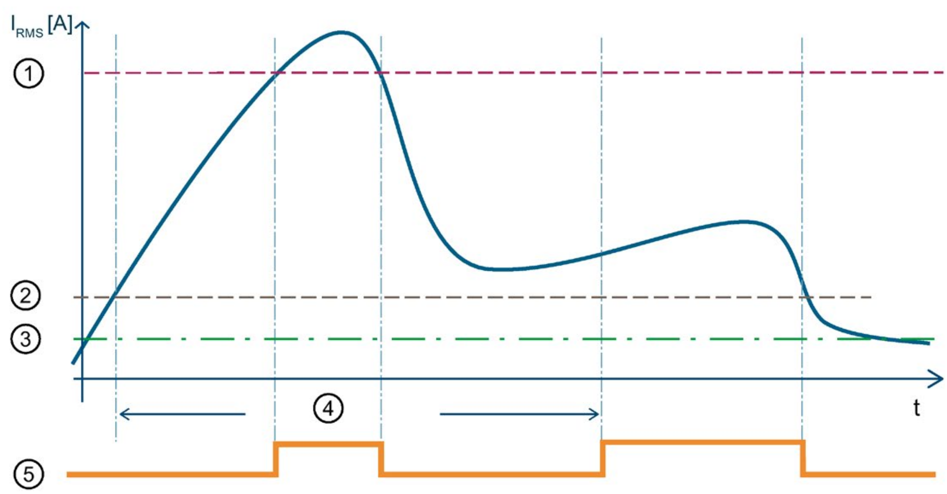
The following table shows the necessary parameters:

Table 14- 14 Parameter assignment

Parameter	
Diagnostics overload	Enable
Nominal value current	0 ... 99999 A
Current transformer primary current	1 ... 99999 A
Current transformer secondary current	5 A
Tolerance factor overcurrent	1 ... 6000%
Tolerance time overcurrent	0 ... 60000 ms

Example

The following figure is a schematic diagram of the principle of operation:



① Maximum measured current 12 A secondary current (CT) or 424 mV secondary voltage (RC)
② Tolerance value measured current
③ Nominal value current
④ Tolerance time
⑤ Diagnostics "overload"

Figure 14-7 Diagnostics "overload" of the effective current value

The following table shows the parameter assignment for the example:

Table 14- 15 Parameter assignment

Parameter	
Diagnostics overload	Enable
Nominal value current	2000 A
Current transformer primary current	5000 A
Current transformer secondary current	5 A
Tolerance factor overcurrent	20%
Tolerance time overcurrent	40000 ms

If the maximum measured current for the module (12000 A primary current) is exceeded, the module reports the diagnostics "Overload" as long as the maximum measured current is exceeded.

After the "Tolerance time overcurrent" of 40000 ms has expired, the module reports the diagnostics "Overload" as long as the configured "Tolerance value measured current" is exceeded.

14.4.2.2 Low limit for measuring current undershot

Introduction

With the function "Low limit for measuring current undershot" the AI Energy Meter HF monitors the low limit of the effective value of the current per phase.

If the low limit for measuring current is undershot, the module sets the current value to 0. Information as to which current measured values are set to 0 can be found under Basics for reading measured values (Page 41).

You activate the function by setting the parameter "Low limit for measuring current" > 0%.

Calculation of low limit for measuring current

The low limit for measuring current is calculated with the following formula:

Low limit measured current = "Nominal value current" × "Low limit for measuring current [%]"

The "Nominal value current" is the primary current at the operating point.

Parameter assignment

The following table shows the necessary parameters:

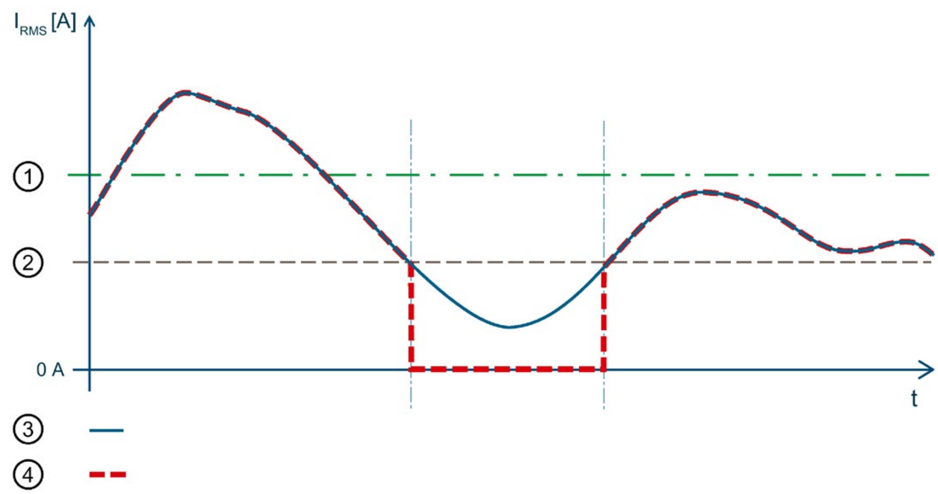
Table 14- 16 Parameter assignment

Parameter	
Nominal value current	0 ... 99999 A
Current transformer primary current	1 ... 99999 A
Current transformer secondary current	1 ... 16000 A
Low limit for current measurement	0 ... 20% *

* 0% means deactivation of the function

Example

The following figure is a schematic diagram of the principle of operation:



① Nominal current
② Low limit measured current
③ Measured value
④ Returned value

Figure 14-8 Behavior in the event of value falling below "Low limit for measuring current undershot"

The following table shows the parameter assignment for the example:

Table 14- 17 Parameter assignment

Parameter	
Nominal value current	2000 A
Current transformer primary current	5000 A
Current transformer secondary current	5 A
Low limit for current measurement	10%

In this example you define the "Low limit for measuring current" with 10%. This corresponds to an effective value of the primary voltage of 200 A.

If the value falls below the calculated low limit for current measurement, the module sets all current-dependent measured values (effective value current, active power, reactive power, apparent power, phase angle and power factor) to 0 A until the low limit for measuring current is exceeded again. The energy meters and operating hours counters are stopped during this time.

14.4.2.3 Peak values of the instantaneous values for current

Introduction

The AI Energy Meter HF determines the maximum instantaneous value for the current for up to three phases.

The function "Detect peak value current" returns the largest current value and the associated phase. The module sets the qualifier bit 3 ("Power quality current peak") for the phase in question. You can read the maximum current value, for example, in the data record DS 160 (Page 259).

Current peak detection is based on the function for recording swells of the supply voltage in accordance with IEC 61000-4-30. This function is used to record the maximum current value in the supply network. In three-phase systems this function is only useful if current recording is symmetrical and if all phases show the same current transformers.

Accordingly, measurement always records only the peak value over all phases. In addition to the requirements of IEC 61000-4-30, the phase on which the peak value current occurred is detected.

For metrological reasons, only the phase concerned that shows this maximum value can be returned. This may mean that the maximum current values of the other phases remain "0". With a "reset power quality analysis" the analysis starts afresh and the current results are discarded.

Parameter assignment

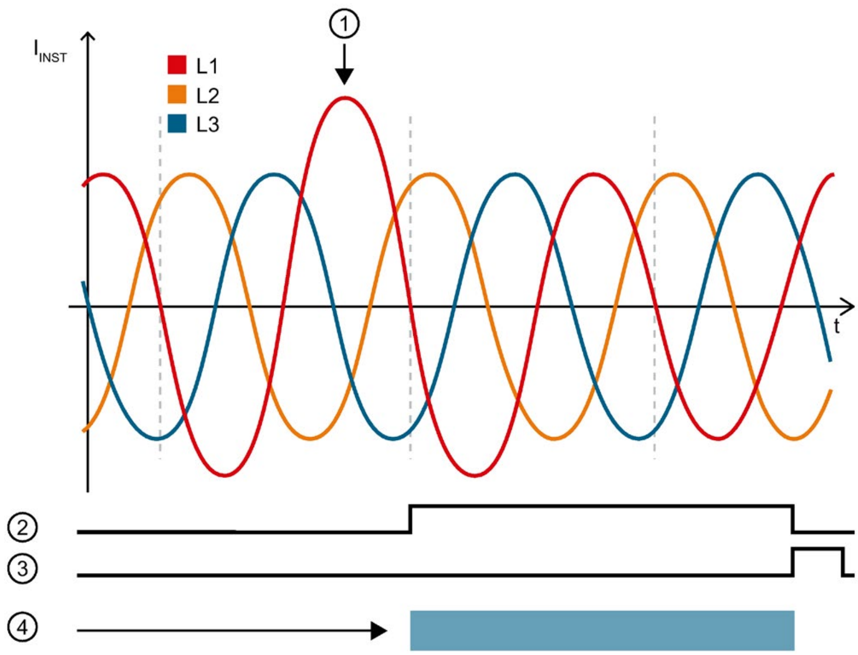
The following table shows the necessary parameters:

Table 14- 18 Parameter assignment

Parameter	
Power quality analysis function (module)	Enable
Determine peak value current (Channel)	Enable

Example

The following figure is a schematic diagram of the principle of operation:



① Current peak in L1
② Status "Power quality current peak"
③ Bit "Reset status "power quality""
④ Max. current peaks instantaneous value can be read out

Figure 14-9 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 19 Parameter assignment

Parameter	
Power quality analysis function	Enable
Determine peak value current (L1)	Enable
Determine peak value current (L2)	Enable
Determine peak value current (L3)	Enable

The module detects the peak value current in phase 1 and sets the qualifier bit 3 for phase 1. You can find the maximum current value, for example, in the data record DS 160 in bytes 186 to 189 ("Current peak value L1").

14.4.2.4 Overcurrent of the current half value

Introduction

The AI Energy Meter HF returns the maximum overcurrent value of the current half-wave value. If the value to be monitored is exceeded, the module reports the diagnostics "Power quality" and the qualifier bit 7 is set. The module also sets Bit 4 for the respective phase in data record DS 160 (Page 259). In the event that the current half-value is exceeded again, only the diagnostics "Power quality" is reported again and, if applicable, the maximum current swell value is updated.

Calculation of overcurrent limit

The overcurrent limit is calculated based on the following formula:

Overcurrent limit = "Nominal value current" + ("Threshold overcurrent [%]" × "Nominal value current")

The "Nominal value current" is the primary current at the operating point.

Parameter assignment

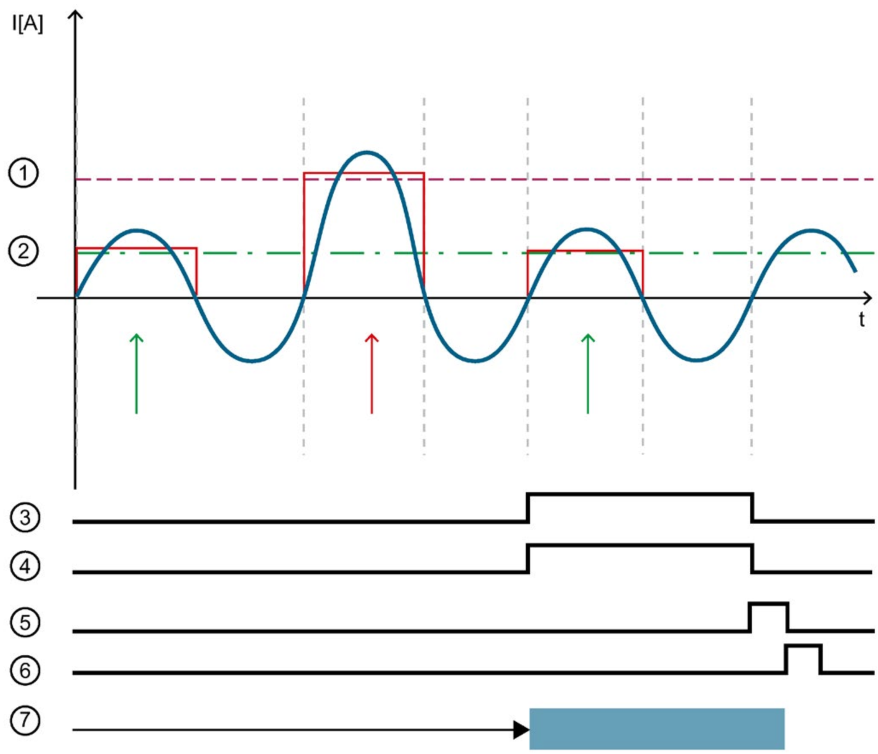
The following table shows the necessary parameters:

Table 14- 20 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics power quality	Enable
Determining the overcurrent	Enable
Nominal value current	0 ... 99999 A
Threshold overcurrent	1 ... 6000%

Example

The following figure is a schematic diagram of the principle of operation:



① Threshold overcurrent
② Nominal current
③ Qualifier Bit 7
④ Diagnostics power quality
⑤ Status "power quality overcurrent"
⑥ Bit "Reset status "power quality""
⑦ Max. overcurrent (half-wave) value can be read

Figure 14-10 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 21 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics power quality	Enable
Determining the overcurrent	Enable
Nominal value current	2000 A
Threshold overcurrent	100%

In this example you define the Threshold overcurrent of 100%. This corresponds to a primary current of 4000 A.

If the "Threshold overcurrent" is exceeded, the module sets Bit 4 "Overcurrent" for the phase in the data record DS 160.

As long as the "Threshold overcurrent" is exceeded, the module reports the diagnostics "Power quality" and the qualifier bit 7 is set.

Technical specifications 15

15.1 Technical specifications

Technical specifications of the AI Energy Meter HF

The following table shows the technical specifications as of 07/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6PA00-0CU0/td?dl=en).

Article number	6ES7134-6PA00-0CU0
General information	
Product type designation	AI Energy Meter 480 VAC/CT HF, PU 1
Firmware version	V6.0
• FW update possible	Yes
usable BaseUnits	BU type U0
Color code for module-specific color identification plate	CC20
Supported power supply systems	TT, TN, IT
Product function	
• Voltage measurement	Yes
– without voltage transformer	Yes
– with voltage transformer	Yes
• Current measurement	Yes
– without current transformer	No
– with current transformer	Yes; 1 A or 5 A current transformer
– with Rogowski coil	No
– with current/voltage transformer	No
• Energy measurement	Yes
• Frequency measurement	Yes
• Power measurement	Yes
• Active power measurement	Yes
• Reactive power measurement	Yes
• Power factor measurement	Yes
• Active factor measurement	Yes
• Reactive power compensation	Yes
• Line analysis	Yes

Article number	6ES7134-6PA00-0CU0
– Monitoring of instantaneous and half-wave values	Yes
– THD measurement for current and voltage	Yes
– Harmonics for current and voltage	Yes
– Voltage dip (DIP)	Yes
– Voltage swell	Yes
• I&M data	Yes; I&M0 to I&M3
• Isochronous mode	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	STEP 7 V15 or higher
• STEP 7 configurable/integrated as of version	Configurable via GSD file
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	V2.3
Operating mode	
• Switching between operating modes in RUN	Yes; For module version 32 I/20 Q, it is possible to dynamically switch between 25 user data variants, 23 of which are pre-defined and 2 of which can be defined by the specific user
• Cyclic measured value access	Yes
• Acyclic measured value access	Yes
• Fixed measured value sets	Yes
• Freely definable measured value sets	Yes
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	Yes
Installation type/mounting	
Mounting position	Any
Supply voltage	
Design of the power supply	DC
Type of supply voltage	24 V DC
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Input current	
Current consumption (rated value)	12.5 mA
Current consumption, max.	17 mA

Article number	6ES7134-6PA00-0CU0
Power loss	
Power loss, typ.	1.4 W; 4x 5 A input current, 3x 230 V AC
Address area	
Address space per module	
• Inputs	256 byte
• Outputs	20 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 2-wire connection	BU type U0
Time of day	
Operating hours counter	
• present	Yes
Analog inputs	
Cycle time (all channels), typ.	50 ms; Time for consistent update of all measured and calculated values (cyclic und acyclic data)
Cable length	
• shielded, max.	200 m
• unshielded, max.	200 m
Analog value generation for the inputs	
Sampling frequency, max.	2 048 kHz
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes
• Hardware interrupt	Yes; Monitoring of up to 16 freely selectable process values (exceeding or undershooting of value)

Article number	6ES7134-6PA00-0CU0
Diagnostic messages	
• Line quality	Yes
• Supply voltage	Yes
• Hardware interrupt lost	Yes
• Parameter assignment error	Yes
• Module fault	Yes
• Channel not available	Yes
• Overflow/underflow	Yes
• Overload current	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; red Fn LED
• for module diagnostics	Yes; green/red DIAG LED
Integrated Functions	
Measuring functions	
• Measuring procedure for voltage measurement	TRMS
• Measuring procedure for current measurement	TRMS
• Type of measured value acquisition	seamless
• Curve shape of voltage	Sinusoidal or distorted
• Buffering of measured variables	Yes
• Parameter length	128 byte
• Bandwidth of measured value acquisition	3.2 kHz; Harmonics: 63 / 50 Hz, 52 / 60 Hz
Measuring range	
– Frequency measurement, min.	45 Hz
– Frequency measurement, max.	65 Hz

Article number	6ES7134-6PA00-0CU0
Measuring inputs for voltage	
– Measurable line voltage between phase and neutral conductor	300 V
– Measurable line voltage between the line conductors	519 V
– Measurable line voltage between phase and neutral conductor, min.	3 V
– Measurable line voltage between phase and neutral conductor, max.	300 V
– Measurable line voltage between the line conductors, min.	6 V
– Measurable line voltage between the line conductors, max.	519 V
– Measurement category for voltage measurement in accordance with IEC 61010-2-030	CAT II
– Internal resistance line conductor and neutral conductor	1.5 MΩ
– Power consumption per phase	60 mW; 300 V AC
– Impulse voltage resistance 1,2/50µs	2.5 kV
Measuring inputs for current	
– measurable relative current (AC), min.	1 %; Relative to the secondary rated current 5 A
– measurable relative current (AC), max.	100 %; Relative to the secondary rated current 5 A
– Continuous current with AC, maximum permissible	5 A; 6 A permanent thermal overload
– Apparent power consumption per phase for measuring range 5 A	0.6 V·A
– Rated value short-time withstand current restricted to 1 s	100 A
– Input resistance measuring range 0 to 5 A	25 mΩ; At the terminal
– Zero point suppression	0 ... 20%, referred to the nominal current
– Surge strength	10 A; for 1 minute

Article number	6ES7134-6PA00-0CU0
Accuracy class according to IEC 61557-12	
– Measured variable voltage	0,2
– Measured variable current	0,2
– Measured variable apparent power	0.5
– Measured variable active power	0.5
– Measured variable reactive power	1
– Measured variable power factor	0.5
– Measured variable active energy	0.5
– Measured variable reactive energy	1
– Measured variable neutral current	0,2
– Measured variable phase angle	±0.5 °; not covered by IEC 61557-12
– Measured variable frequency	0.05
– Measured variable harmonic	1
– Measured variable THDU	1
– Measured variable THDI	1
Accuracy class line analysis acc. to IEC 61000-4-30	
– Measured variable voltage	Class S
– Measured variable current	Class S
– Measured variable frequency	Class S
– Measured variable voltage interruption	Class S
– Measured variable voltage dip and swell	Class S
– Measured variable harmonic voltage	Class S
– Measured variable harmonic current	Class S
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• Between the channels and load voltage L+	Yes; Including FE
Isolation	
Isolation tested with	Between channels and backplane bus, 24 V supply: Routine test, 1 920 V AC, 2 s; between backplane bus and 24 V supply: Type test, 707 V DC

Parameter data records A

A.1 Configuration via parameter data records

The parameter data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Overview of the parameter data records

- Parameter data record DS 128 for the complete module
- Parameter data record DS 129 for limit monitoring
- Parameter data records DS 130/131 for user data mapping
- Parameter data record DS 135 for data record mapping

Parameter assignment in the user program

You can reassign the module parameters in RUN mode, for example change the diagnostics behavior, define new limits or configure a modified user data mapping.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module via the respective data record. The parameters set in STEP 7 do not change in the CPU, which means the parameters set in STEP 7 are still valid after a restart.

If you reconfigure a module (so that the user data size changes) and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing". The diagnostics "Supply voltage missing" is signaled as outgoing.

STATUS output parameter

If errors occur during the transfer of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help.

A.2 Structure of the parameter data record 128 for the entire module

Structure of data record 128

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check bytes 1 to 3, 32, 33, 52, 53, 72 and 73. Correct the length and number of the parameter blocks.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	01	Reserved bits are not 0.	Check bytes 8, 14, 15, 30, 31, 34, 42, 50...53, 54, 62, 70...73, 74, 82, 90...93 and set the reserved bits back to 0.
DF	80	E1	05	"Voltage measuring range" invalid	Check Byte 5. Permitted values: 01_H to $0C_H$
DF	80	E1	20	"Connection type" invalid	Check Byte 4. Permitted values: 00_H, $0B_H$ ... 01_H
DF	80	E1	21	"User data variant" not possible or input data configuration not large enough	Check Byte 9. Select a different user data variant or change the configuration.
DF	80	E1	22	"User data variant" invalid	Check Byte 9. Select a valid code for the user data variant.
DF	80	E1	23	"Line frequency" invalid	Check Byte 6. Enter valid values.
DF	80	E1	29	"Tolerance factor overcurrent in relation to nominal value current [0.1%]" invalid	Check bytes 35, 55 and 75. Enter valid values.
DF	80	E1	2A	"Tolerance time overcurrent" invalid	Check bytes 36...37, 56...57, 67...77. Enter valid values.
DF	80	E1	2B	"Low limit current measurement" in relation to nominal value current [0.1%] invalid	Check bytes 43, 63 and 83. Enter valid values.
DF	80	E1	2C	"Current transformer primary current [A]" invalid.	Check bytes 38...41, 58...61, 78...81. Enter valid values.
DF	80	E1	2D	"Voltage transformer primary voltage [V]" invalid	Check bytes 46...49, 66...69, 66...69, 88...89. Enter valid values.
DF	80	E1	2E	"Voltage transformer secondary voltage [V]" invalid	Check bytes 38…42 with bytes 58…62 and bytes 78…82 and bytes 44…49 with bytes 64…69 and bytes 84…89 for identical values.
DF	80	E1	2F	"End value energy meter" invalid	Check Bit 4...6 in Byte 6. Enter valid values.
DF	80	E1	30	Invalid data record number.	Check the data record number. Enter a valid data record number.
DF	80	E1	3E	Only for connection type 3P4W1 and 3P3W1. Current or voltage transformer parameters for the different phases are not identical.	Check bytes 38...42 with bytes 58...62 and bytes 78...82 as well as bytes 44...49 with bytes 64...69 and bytes 84...80 for identical values. Enter identical values for current transformer (secondary current, primary current, direction of current) and voltage transformer (secondary voltage, primary voltage) at all three phases.
DF	80	E1	3F	"End value for energy meter" or transmission ratio (primary value, secondary value) of current and voltage too low.	Increase the end value of the energy meter or the ratio of primary to secondary current for current transformer and/or primary to secondary voltage for voltage transformer.
DF	80	E1	43	"Current transformer secondary current" for neutral or all three phases invalid	Check bits 4...5 in bytes 14, 42, 62, 82. Enter valid values.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	44	"Voltage dip limit value in relation to nominal value voltage [0.1%]" invalid	Check bytes 16...17. Enter valid values (voltage dip limit value must be smaller than the respective nominal voltage)
DF	80	E1	45	"Voltage swell limit value in relation to nominal value voltage [0.1%]" invalid	Check bytes 20...23. Enter valid values (voltage swell limit value must be greater than the respective nominal voltage)
DF	80	E1	46	"Threshold overcurrent in relation to nominal value current [0.1%]" invalid	Check bytes 24...27. Enter valid values (threshold overcurrent must be greater than primary current)
DF	80	E1	47	"Number of cycles for analysis of voltage swell/dip" invalid	Check bytes 28...29. Enter valid values.
DF	80	E1	49	Current transformer parameter for "residual current analysis" invalid	Only with connection type 3P4W and 3P4WI and if neutral current is measured. Current transformer primary current and secondary current and direction of current of the three phases must have identical parameters.
DF	80	E1	4 A	Voltage transformer parameters for voltage swell/dip invalid	Check the parameters secondary voltage, primary voltage, nominal value voltage. Enabled channels must have identical parameters.
DF	80	E1	4B	Current transformer parameter for "Detect overcurrent" invalid	Check the parameters secondary current, primary current, nominal value current and direction of current. Enabled channels must have identical parameters.
DF	80	E1	4C	Parameters for determining the neutral current invalid	Neutral current can only be determined with connection type 3P4W and 3P4WI Current transmission parameters primary current, secondary current, nominal value current and direction of current of the three phases must be identical.
DF	80	E1	4D	"Nominal value current [A]" invalid	Check bytes 34...37, 66...69, 98...101. Enter valid values.
DF	80	E1	4E	"Nominal value voltage [V]" invalid	Check bytes 50...53, 82...85, 114...117. Enter valid values.
DF	80	E1	4F	"Low limit current measurement in relation to nominal value current [0.1%]" invalid	Check bytes 42...43, 74...75, 106...107. Enter valid values.
DF	80	E1	50	The combination of "Nominal value voltage [V]" and "Voltage dip limit value in relation to nominal value voltage [0.1%]" invalid.	Select the permissible value in % so that the secondary measuring voltage of 0 V is not undershot.
DF	80	E1	51	The combination of "Nominal value voltage [V]" and "Voltage swell limit value in relation to nominal value voltage [0.1%]" invalid.	Select the permissible value in % so that the secondary measuring voltage of 300 V is not exceeded.
DF	80	E1	52	The combination of "Nominal value current [A]" and "Threshold overcurrent in relation to nominal value current [0.1%]" invalid	Select the permissible value in % so that the secondary measuring current of 6 A is not exceeded.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	53	The combination of "Nominal value current [A]" and "Tolerance factor overcurrent in relation to nominal value current [0.1%]" invalid	Select the permissible value in % so that the secondary measuring current of 6 A is not exceeded.
DF	80	E1	54	The combination of "Nominal value voltage [V]" and "Tolerance factor overvoltage/undervoltage in relation to nominal value voltage [0.1%]" lies outside the permissible range.	Select the permissible value in % so that the secondary measuring voltage of 300 V is not exceeded.
DF	80	E1	55	"Nominal value current [A]" is too high. "Nominal value current" x transmission factor current generates a secondary current measured variable which exceeds its value range.	Select the permissible value in A so that the secondary measuring current of 6 A is not exceeded. The transmission factor current is calculated from "Current transformer primary current [A]" / "Current transformer secondary current [A]"
DF	80	E1	56	"Nominal value voltage [V]" is too high. "Nominal value voltage" x transmission factor voltage generates a secondary voltage measured variable which exceeds its value range.	Select the permissible value in V so that the secondary measuring voltage of 300 V is not exceeded. The transmission factor voltage is calculated from "Voltage transformer primary voltage [V]" / "Voltage transformer secondary voltage [V]"

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 129.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check bytes 3, 13, 23, 33...163 and set the reserved bits back to 0.
DF	80	E1	31	"Length of the parameter block" invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	"Number of parameter blocks" invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	"ID of the measured value for limit monitoring" invalid.	Check Bytes 4 and 5. Enter valid values.
DF	80	E1	34	Parameters for monitoring the limits invalid	Check bits 0...3 in Byte 6. Enter valid values.
DF	80	E1	35	"Number of limit" in 'Monitoring assigned multiple times' parameter	Check bits 0...3 in Byte 6. Do not use limit number several times.
DF	80	E1	36	"Hysteresis for limit monitoring" invalid	Check Byte 7. Enter valid values.
DF	80	E1	37	"Limit" invalid.	Check Byte 8...11. Enter valid values.
DF	80	E1	38	"Delay time for limit monitoring" invalid.	Check Byte 12. Enter valid values.

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 130/131.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check Byte 3 and set reserved bits back to 0.
DF	80	E1	21	"User data variant" not possible or input data configuration not large enough	Select a different user data variant or change the configuration.
DF	80	E1	30	Data record number invalid	Check the data record number. Enter a valid data record number.
DF	80	E1	31	"Length of the parameter block" invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	"Number of parameter blocks" invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	"ID of the measured value for limit monitoring" invalid.	Check Bytes 4 and 5. Enter valid values.
DF	80	E1	3B	"ID of the type of user data mapping" not permitted.	Check Byte 1. Number for user-specific user data variant has to be 01_H or 02_H.

Measured variables for user data mapping

You can find the measured variables under Measured variables (Page 163). The following measured variables are not available to you for user data mapping:

- 220 to 226
- 62110 to 62116
- 62210 to 62216
- 62310 to 62316

A.5 Structure of the parameter data record 135 for data record mapping

Structure of data record 135

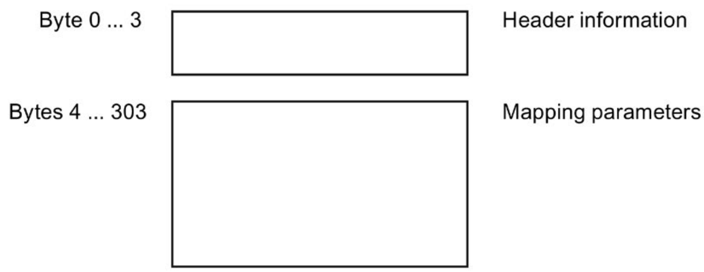

Figure A-15 Structure of data record 135

Header information

The figure below shows the structure of the header information.

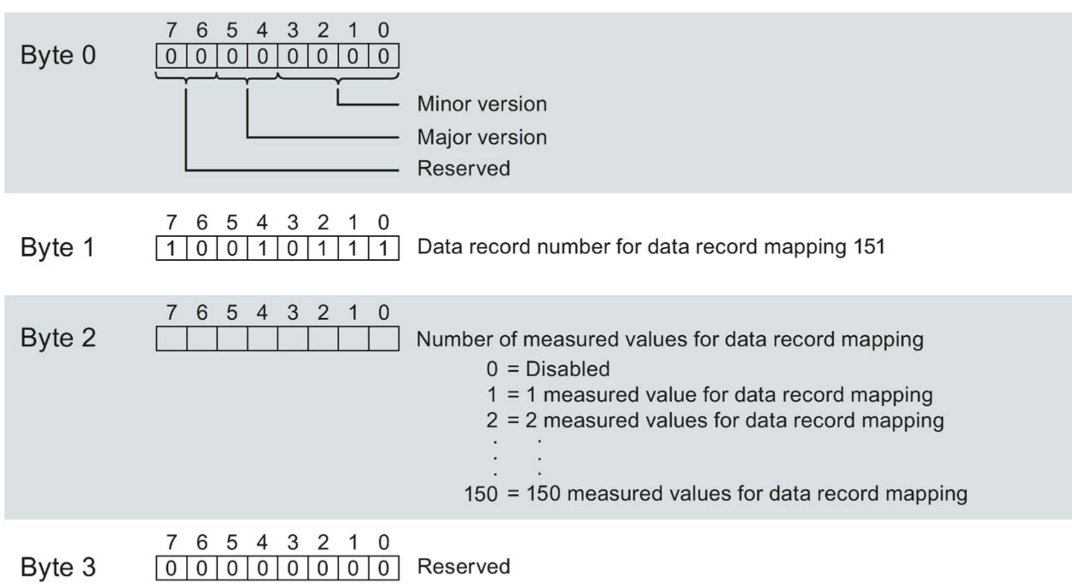

Figure A-16 Header information DS 135

Parameter block for data record mapping

The following diagram shows the structure of the parameter blocks for data record mapping.

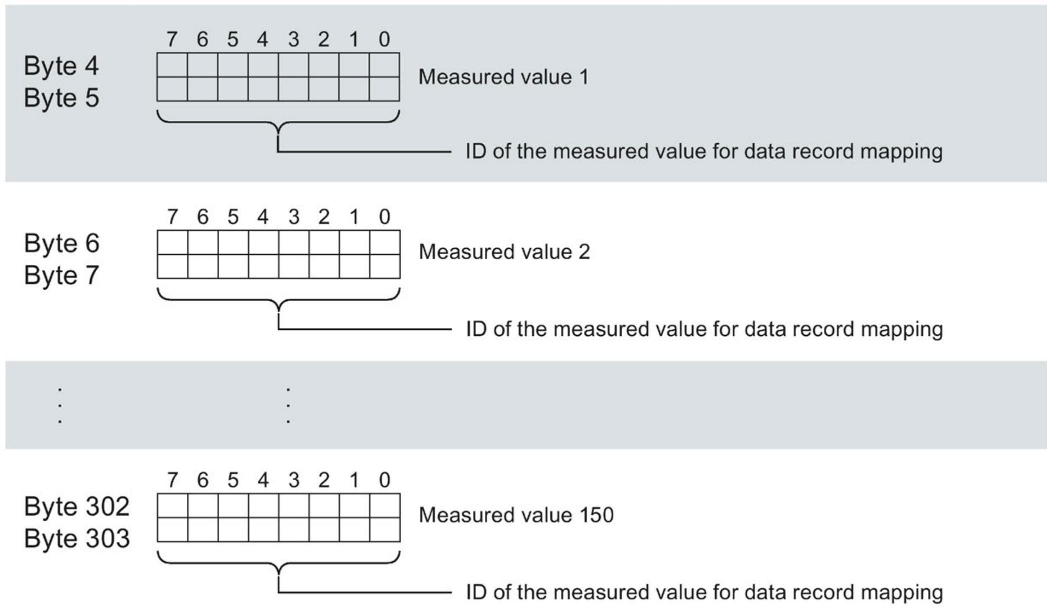

Figure A-17 Parameter block for data record mapping

Data record length DS 135 and DS151

The table below shows the data record lengths of the parameter data record DS 135 and the user-defined data record DS 151 (Page 258).

The length of the data records depends on the number and the format of the measured values.

Number Measured values	Data record length in bytes		
	REAL measured values		LREAL measured values
	DS 135	DS 151	DS 151
29	62	118	234
30	64	122	242 *
40	84	162	322 *
50	104	202	402 *
59	122	238	474 *
100	204	402 *	802 *
118	240	474 *	946 *
150	304*	602 *	1202 *

* not with PROFIBUS DP

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 130/131/135.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check Byte 3 and set reserved bits back to 0.
DF	80	E1	21	"User data variant" not possible or input data configuration not large enough	Select a different user data variant or change the configuration.
DF	80	E1	30	Data record number invalid	Check the data record number. Enter a valid data record number.
DF	80	E1	31	"Length of the parameter block" invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	"Number of parameter blocks" invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	"ID of the measured value for limit monitoring" invalid.	Check Bytes 4 and 5. Enter valid values.

Measured variables for data record mapping

You can find the measured variables under Measured variables (Page 163). The following measured variables are not available to you for data record mapping:

- 220 to 226
- 62110 to 62116
- 62210 to 62216
- 62310 to 62316

Measured variables

B

Measured variables for data records and user data

The following table provides an overview of all measured variables that are used in the data records and user data.

Note that the format and unit differ in the evaluation of records and user data.

On the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755917) you can find an overview of the assignment of the measured values to the user data variants and data records.

Table B- 1 Measured variables for data records and user data

Meas-ured value ID	Measured variables	Data type	Unit	Value range	Connection type							
					1P 2W	2P 3W	3x 1P2W	3P 4W	3P 4W1	3P 3W	3P 3W1	3P 4WI
1	Voltage L1-N [1]	REAL	V	0.0 ... 300.0	✓	✓	✓	✓	✓	✓	✓	
2	Voltage L2-N [1]	REAL	V	0.0 ... 300.0		✓	✓	✓	✓	✓	✓	
3	Voltage L3-N [1]	REAL	V	0.0 ... 300.0			✓	✓	✓	✓	✓	
4	Voltage L1-L2 [2]	REAL	V	0.0 ... 600.0		✓		✓	✓	✓	✓	
5	Voltage L2-L3 [2]	REAL	V	0.0 ... 600.0				✓	✓	✓	✓	
6	Voltage L3-L1 [2]	REAL	V	0.0 ... 600.0				✓	✓	✓	✓	
7	Current L1 [1]	REAL	A	0.0 … 100000.0	✓	✓	✓	✓	✓	✓	✓	✓
8	Current L2 [1]	REAL	A	0.0 … 100000.0		✓	✓	✓	✓	✓	✓	✓

Z = additionally possible measured values in the current path (e.g. instead of neutral current)

[1] Effective value

[2] IEC 61557-12

[3] floating arithmetic average value above 200 ms

[4] floating arithmetic average value above 10 s

[5] Simple summation

[6] Calculation from the start/restart (inflow and outflow values are positive numbers)

[7] floating arithmetic average value above 3 s

[8] floating arithmetic average value above 600 s

[9] floating arithmetic average value above 900 s

[10] Block measurement over 900 s

[11] direct measurement of the signal wave at 8 ksps

[12] Total of the parts / number of parts

[13] THD (Total Harmonic Distortion) is calculated once per second by the RMS of the fundamental oscillation and the total effective value (IEEE standard 1459–2010)

[14] Min./Max: Slave pointer function of the respective basic value from start/reset

[15] Calculation according to DIN EN 61000-3-316 half-wave value

[16] Half-wave value

[17] Instantaneous value

[18] FFT (Fast Fourier Transformation)

[19] While pure RMS measured values only contain AC voltage components of the signal, 10/12 and half-wave measured values also show DC voltage components of the signal

Format

Table B- 2 Format and its length in bytes

Format in STEP 7 (TIA Portal)	Format to IEEE	Length in bytes	Comment
BYTE	BYTE	1 byte	Bit field with 8 bit
WORD	WORD	2 bytes	Bit field with 16 bit
SINT	INT8 (signed)	1 byte	Fixed-point number 8 bits with sign
USINT	INT8 (unsigned)	1 byte	Fixed-point number 8 bits without sign
INT	INT (signed)	2 bytes	Fixed-point number 16 bits with sign
UINT	INT (unsigned)	2 bytes	Fixed-point number 16 bits without sign
UDINT	INT32 (unsigned)	4 bytes	Fixed-point number 32 bits without sign
DINT	INT32 (signed)	4 bytes	Fixed-point number, 32 bits with sign
REAL	Float32	4 bytes	Floating-point number 32 bits with sign
LREAL	Float64	8 bytes	Floating-point number 64 bits with sign

Module versions C

C.1 Module version "2 I / 2 Q"

User data of the module

The module has 2 bytes of input user data and 2 bytes of output user data for status and control information. At this module version measured variables can be read solely via measured value data records (no measured variables can be evaluated via user data).

Structure of input user data

The structure of the input user data is fixed.

Table C- 1 Structure of input user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Constant = 0x80
1	Module	Quality information	Quality bits to describe the quality of the basic measured values

Allocation of the input user data

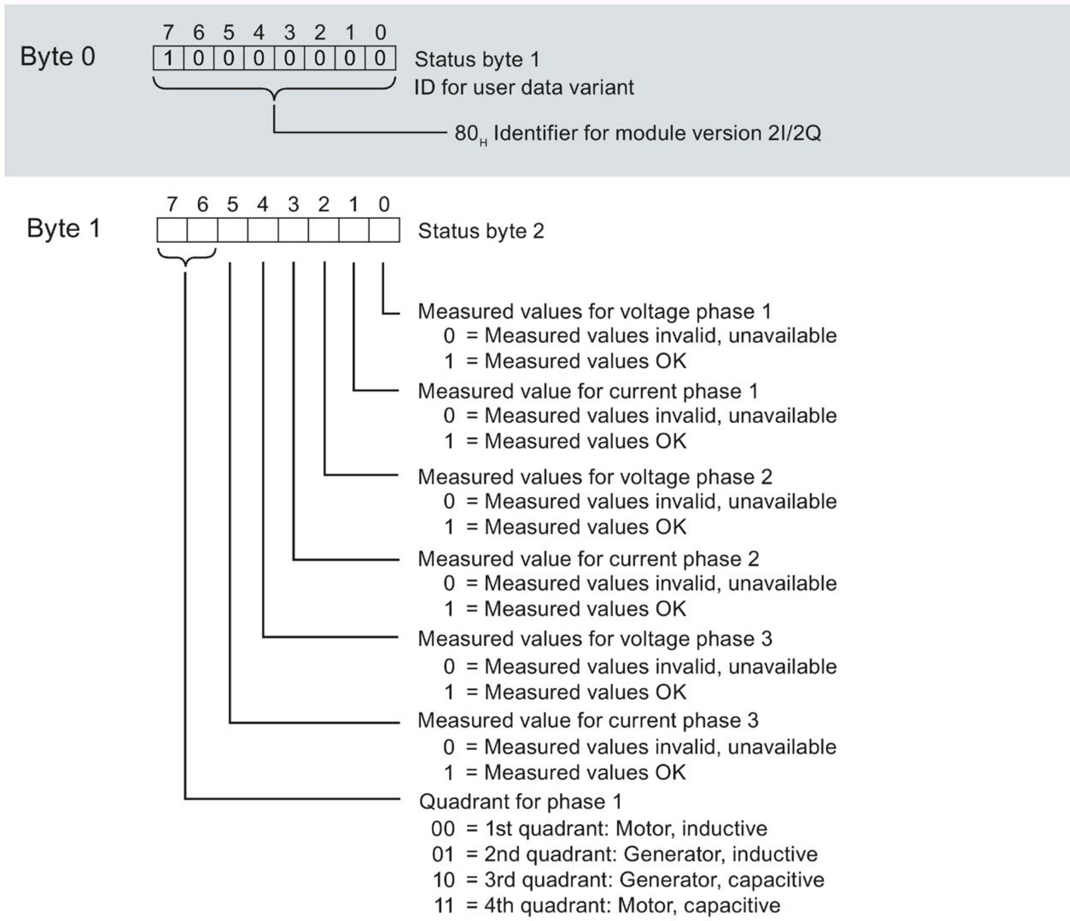

Figure C-1 Allocation of the status bytes in the input user data (2 bytes)

Structure of output user data

The structure of the output user data is fixed.

Table C- 2 Structure of output user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	Reserved	Reserved
1	Module	Control outputs	Reset of values and counters, gate

Assignment of the output user data

Via the output user data you control for all phases

- Resetting for all minimum values, maximum values, limits, operating hours counter and energy meters.
- The counter gates for operating hours counter and energy counters.

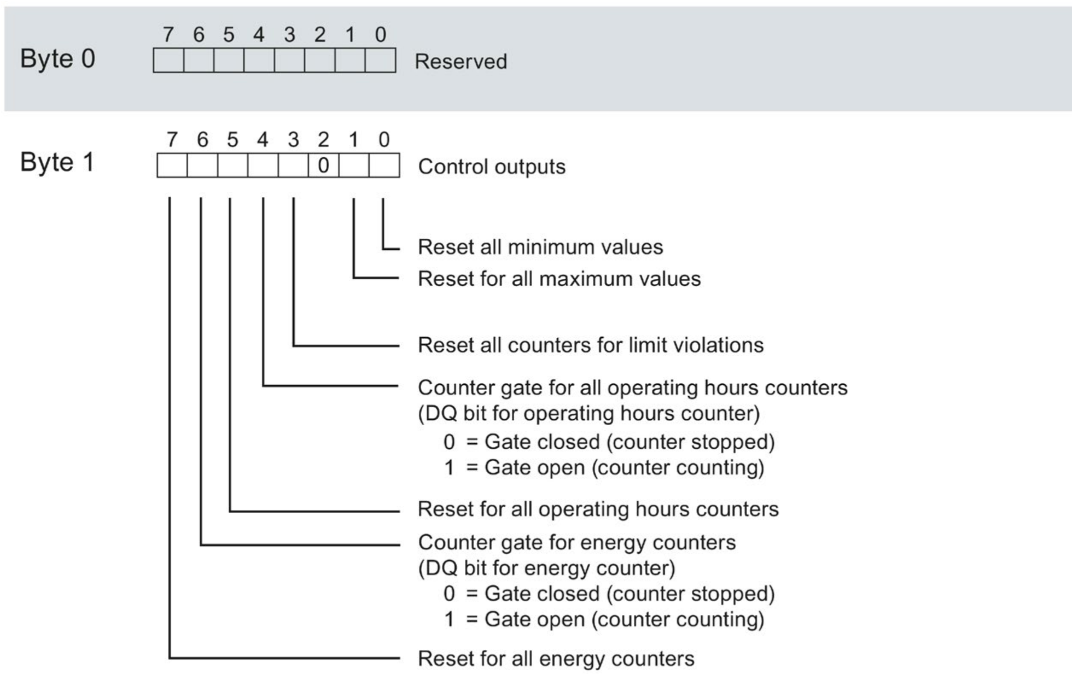

Figure C-2 Allocation of the control byte in the output user data (1 byte)

Note

For module version 2 **I** / 2 Q, a reset of the selected variables always acts on **all** measured values/counter levels of the three phases.

- Reset energy counter: Acts on all active, reactive and apparent energies of all phases
- Reset operating hours counter: Acts on the counters of Phases 1 to 3
- Reset minimum / maximum values: Acts on the minimum and maximum value calculations of Phases 1-3
- Reset all counters for limit violations: Acts on all 16 limit values.

C.2 Module version "32 I / 20 Q"

User data of the module

The module occupies 32 bytes of input user data and 20 bytes of output user data. Of these the module uses 2 bytes input data for status information and 20 bytes output data for control information. Measured variables can be read cyclically via user data (Bytes 2 to 31) or acyclically via measured value data records

Structure of input user data

You can set the contents of the input user data dynamically. You can choose between different user data variants.

Table C- 3 Structure of input user data (32 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	-
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 31	Module or phase	Data	2 or 4 byte measured values or cumulative values according to user data variant

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

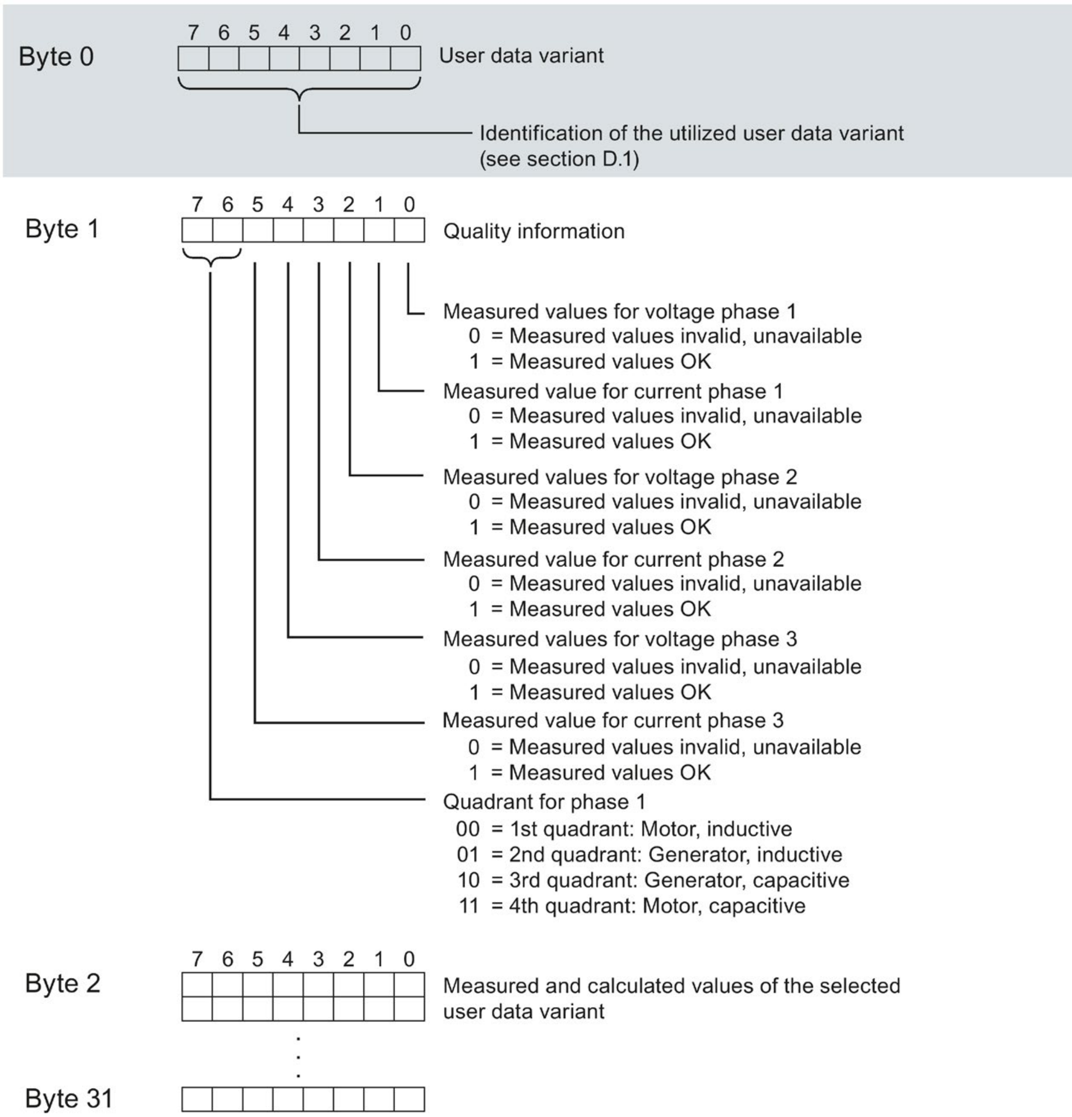

Figure C-3 Assignment of the input user data (32 bytes)

Structure of output user data

The structure of the output user data is fixed and is the same at all the selectable user data variants.

Via the output user data you control globally or phase-specifically

- Resetting for minimum values, maximum values, limits, operating hours counter and energy meters.
- The counter gates for operating hours counter and energy counters.
- Gate for limits, minimum values and maximum values.

Table C- 4 Structure of output user data (20 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Control byte for switching the user data variant
1	Module	Control byte 1	Global resetting of values and counters, gate
2	Module	Control byte 2	Selection of the energy counter to be reset
3	Module	Control byte 3	Control of the limit monitoring of limit values 9 to 16
4	Module	Control byte 4	Control of the limit monitoring of limit values 1 to 8
5	Module	Reserved	-
6	Phase L1	Control byte 6	Phase-specific resetting of values and counters, gate for Phase L1
7	Phase L1	Control byte 7	
8	Phase L2	Control byte 8	Phase-specific resetting of values and counters, gate for Phase L2
9	Phase L2	Control byte 9	
10	Phase L3	Control byte 10	Phase-specific resetting of values and counters, gate for Phase L3
11	Phase L3	Control byte 11	
12	Module and phases L1, L2, L3	Control byte 12	Deletion of power quality analysis results or starting/stopping the analysis of harmonics
13	Reserved

Control bytes for limit monitoring

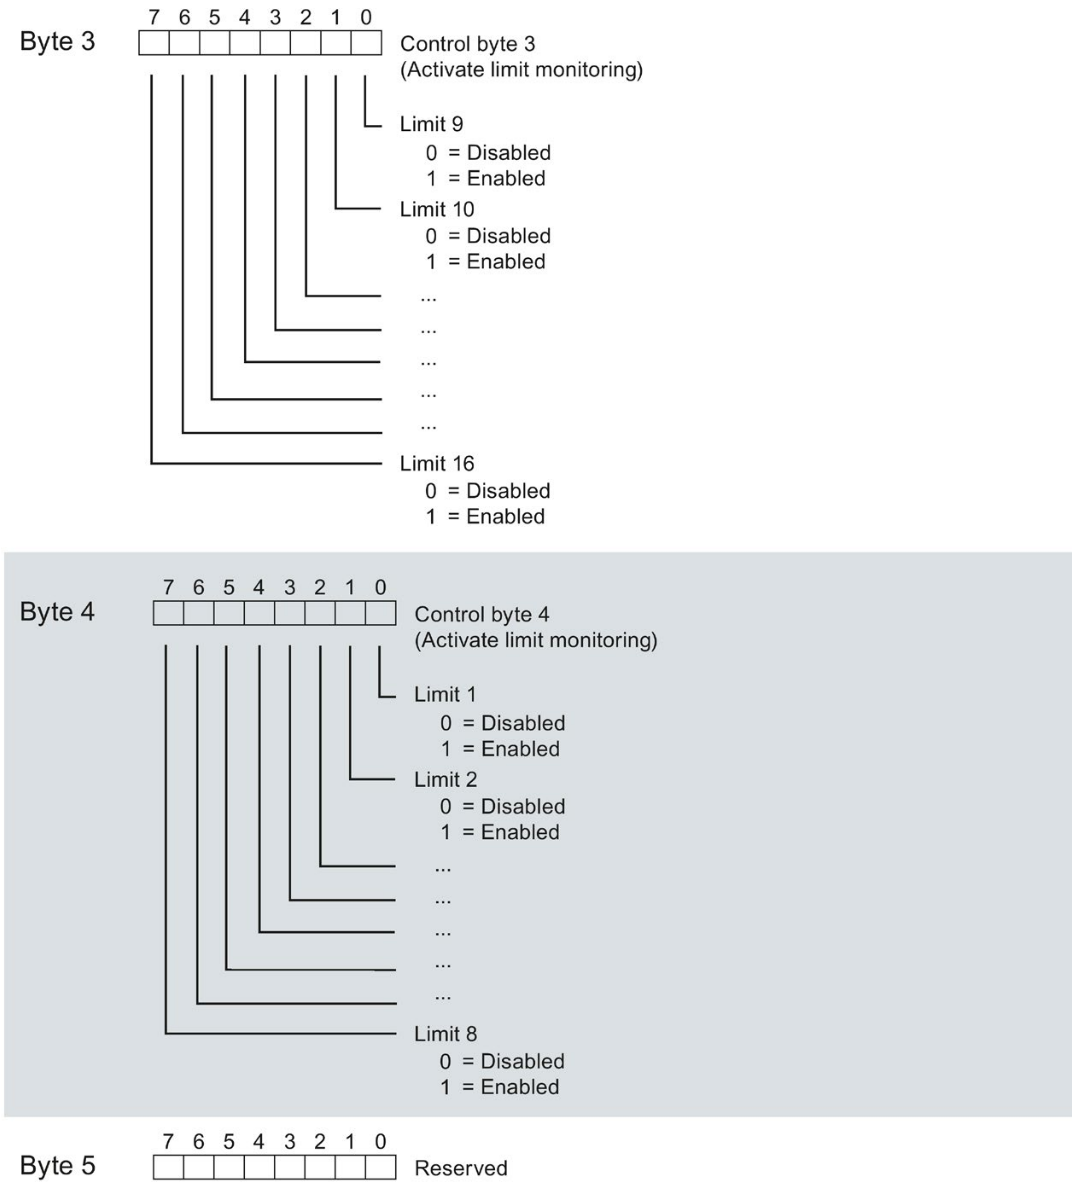

Figure C-6 Allocation of the control bytes for limit monitoring (bytes 3 to 5)

Control bytes for each individual phase

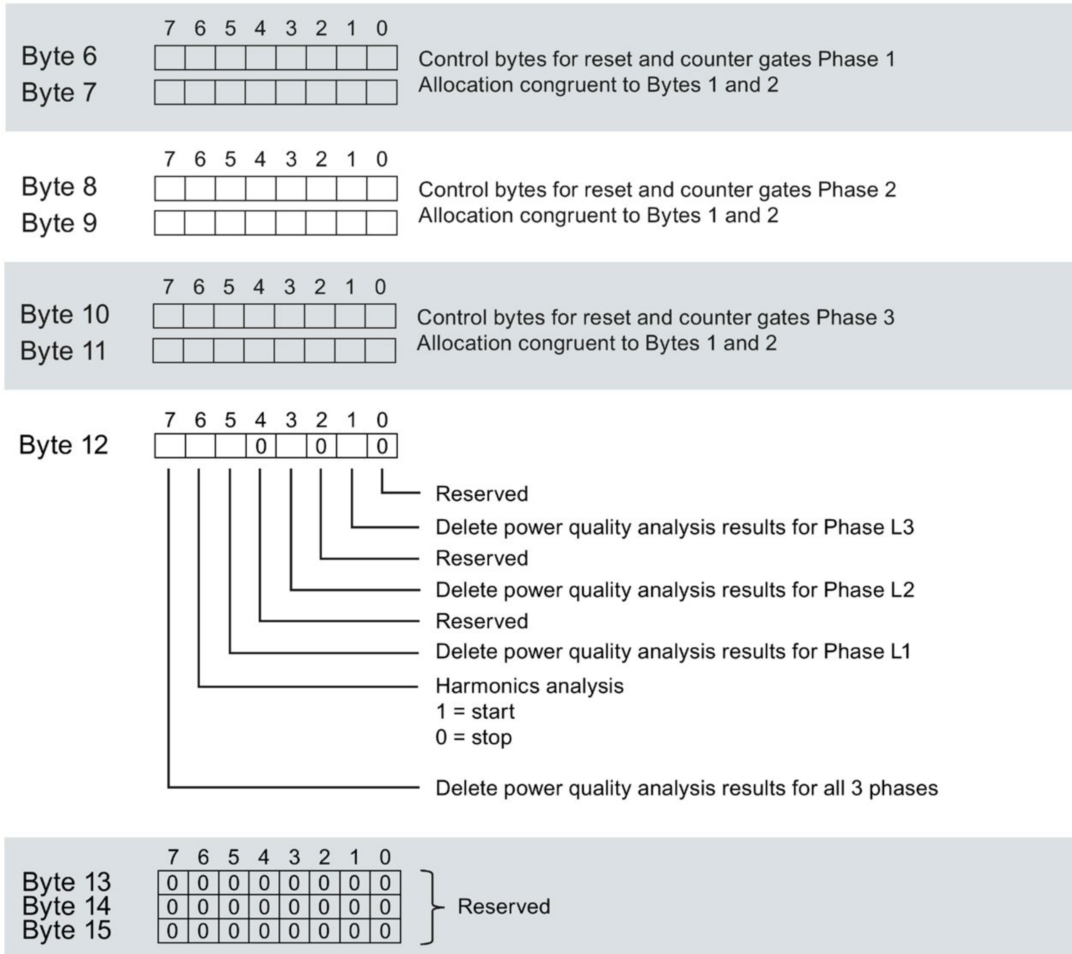

Figure C-7 Allocation of the control bytes for each individual phase (bytes 6 to 15)

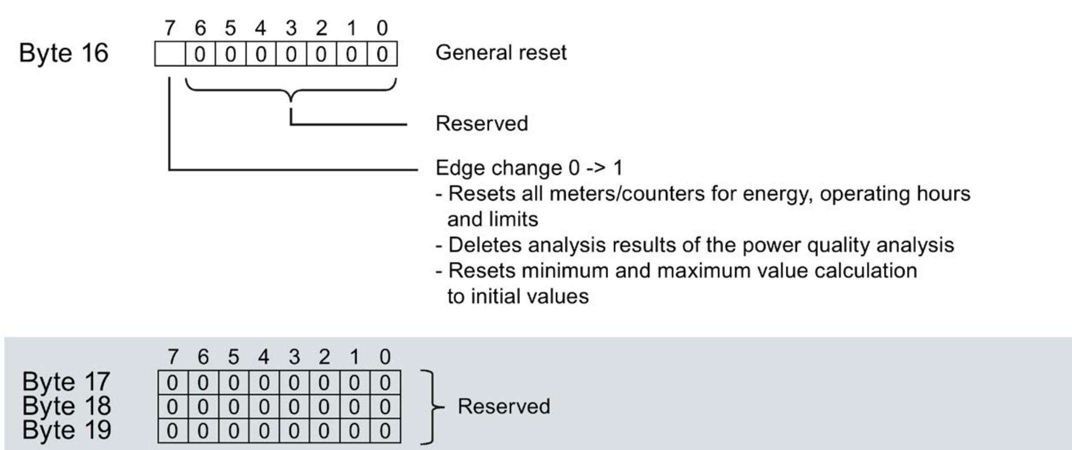

Figure C-8 Allocation of the control bytes for each individual phase (bytes 16 to 19)

C.3 "User-specific" module version

User data of the module

The module occupies between 16 and 256 bytes of input user data and 20 bytes of output user data. Of these the module uses 2 bytes input data for status information and 20 bytes output data for control information. Measured variables can be read cyclically via user data (as of Byte 2) or acyclically via measured value data records

Structure of input user data

You configure the structure of the input user data starting at Byte 2 at this module version itself. An input user data length of 32 bytes also allows you to set the input user data dynamically. You can choose between different user data variants.

Table C- 5 Structure of input user data (16 to 256 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	-
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 255	Module or phase	Data	Measured values or calculated values in accordance with their configuration: • At configuration in STEP 7 the size of the input user data is calculated automatically. • With configuration via the GSD file the size of the input user data amounts to 32, 64, 128 or 256 bytes. The memory area has to be sufficiently large for the measured variables defined in parameter data record 130 or 131.

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

The allocation of the status information in bytes 0 and 1 corresponds to the module version 32 I / 20 Q, see appendix Module version "32 I / 20 Q" (Page 195).

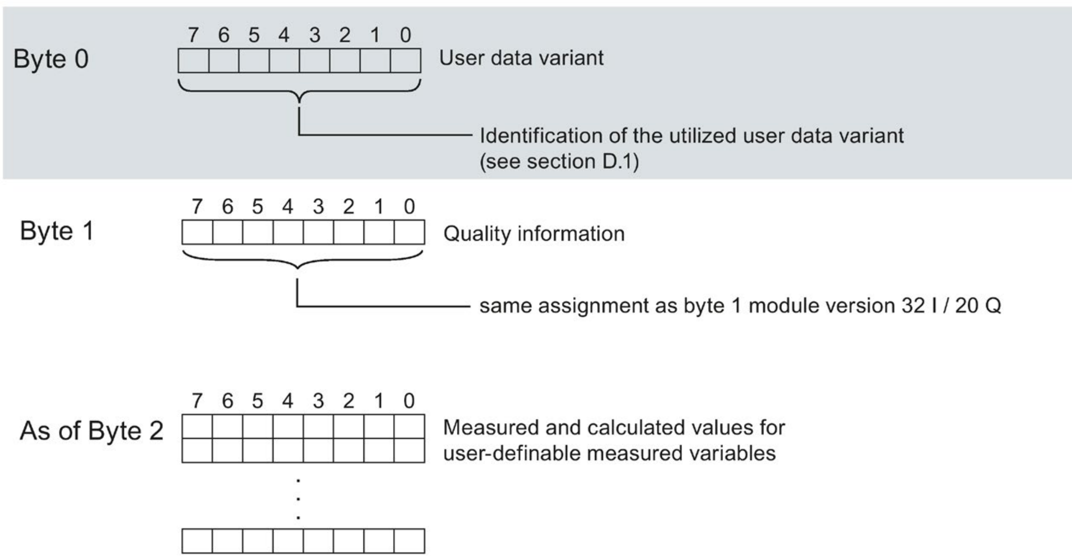

Figure C-9 Allocation of the input user data ("User-specific" module version"

Note

Behavior at switchover in case of the input user data being too small

If the configured size of the variable input user data is smaller than the sized of the fixed user data variant, the response depends on the type of switchover:

- Re-assigning parameters via parameter data records DS 128 / DS 130 / DS 131: Output of a parameter assignment error (33). No switchover.
- Switchover using output byte 0 of a user data variant: No switchover and no error message.

Structure of output user data

The structure of the 20-byte output user data is fixed and is identical to the output user data (control bytes) of the Module version "32 I / 20 Q" (Page 195).

C.4 Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3"

User data of the module

The four versions according to EE@Industry use between 4 and 104 bytes of input user data and 20 bytes of output user data. A dynamic switchover of the input user data is not possible.

Structure of input user data

The structure of the input user data for the module versions according to the EE@Industry standard is fixed and depends on the selected measurement data profile.

Table C- 6 Measurement data profile E0

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0...3	Current L1	REAL	1 A	0.0 … 100000.0	7
4...7	Current L2	REAL	1 A	0.0 … 100000.0	8
8...11	Current L3	REAL	1 A	0.0 … 100000.0	9

Table C- 7 Measurement data profile E1

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0...3	Total active power L1L2L3	REAL	1 W	-3.0e+9 ... +3.0e+9	34

Table C- 8 Measurement data profile E2

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0...3	Total active power L1L2L3	REAL	1 W	-3.0e+9 ... +3.0e+9	34
4...7	Total active energy L1L2L3 inflow	REAL	1 Wh	0.0 ... 3.4028e+38	200
8...11	Total active energy L1L2L3 outflow	REAL	1 Wh	0.0 ... 3.4028e+38	201

Table C- 9 Measurement data profile E3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0...3	Active power L1	REAL	1 W	-3.0e+9 ... +3.0e+9	13
4...7	Active power L2	REAL	1 W	-3.0e+9 ... +3.0e+9	14
8...11	Active power L3	REAL	1 W	-3.0e+9 ... +3.0e+9	15

100...103	Power factor L3	REAL	-	0.0 … 1.0	21

Structure of output user data

The structure of the 20-byte output user data is fixed and is identical to the output user data (control bytes) of the Module version "32 I / 20 Q" (Page 195).

User data variants D

User data

The following table shows the existing user data variants.

Table D- 1 Overview of the user data variants

User data	User data variant
Total power L1L2L3	254 (FE_H) - default setting
Active power L1L2L3	253 (FD_H)
Reactive power L1L2L3	252 (FC_H)
Apparent power L1L2L3	251 (FB_H)
Basic measured values L1L2L3	250 (FA_H)
Total energy L1L2L3	249 ($F9_H$)
Energy L1	248 ($F8_H$)
Energy L2	247 ($F7_H$)
Energy L3	246 ($F6_H$)
Basic variables three-phase measurement L1L2L3	245 ($F5_H$)
Reactive power compensation	244 ($F4_H$)
Quality values three-phase measurement	240 ($F0_H$)
Energy measurement (periodic) overflow counter	239 (EF_H)
EE@Industry measurement data profile E3	227 ($E3_H$)
EE@Industry measurement data profile E2	226 ($E2_H$)
EE@Industry measurement data profile E1	225 ($E1_H$)
EE@Industry measurement data profile E0	224 ($E0_H$)
Basic variables phase-specific measurement L1	159 ($9F_H$)
Single-phase measurement L1 with voltage scal-ing value	158 ($9E_H$)
Basic variables phase-specific measurement L2	157 ($9D_H$)
Single-phase measurement L2 with voltage scal-ing value	156 ($9C_H$)
Basic variables phase-specific measurement L3	155 ($9B_H$)
Single-phase measurement L3 with voltage scal-ing value	154 ($9A_H$)
User-defined user data structure I	1 (01_H)
User-defined user data structure II	2 (02_H)

Information on using and dynamic switching of the user data variants can be found under "Selecting the module versions (Page 32)".

Measured value data records

E

E.1 Overview of all measured value data records

The AI Energy Meter HF writes the measured values in several data records that you can read acyclically using the RDREC instruction in the user program.

The following tables show the structure of the individual data records:

- Data record DS 142 for basic measured values version 2 (read only).
- Data record DS 142 for basic measured values version 3 (read only).
- Data record DS 143 for energy counters (read and write).
- Data record DS 144 for basic measured values version 1 (read only).
- Data record DS 154 for maximum values with time stamp (read only).
- Data record DS 145 for minimum values version 1 (read only).
- Data record DS 155 for minimum values with time stamp (read only).
- Data record DS 147 for phase-specific measured values L1 version 0 (read only).
- Data record DS 147 for phase-specific measured values L1 version 1 (read only).
- Data record DS 148 for phase-specific measured values L2 DS version 0 (read only).
- Data record DS 148 for phase-specific measured values L2 DS version 1 (read only).
- Data record DS 149 for phase-specific measured values L3 DS version 0 (read only).
- Data record DS 149 for phase-specific measured values L3 DS version 1 (read only).
- Data record DS 150 for advanced measurement and status values version 1 (read only).
- Data record DS 151 for user-defined data record (read only).
- Data record DS 160 for power quality analysis (read only).
- Data record DS 161 for harmonics voltage (DS 161) (read only).
- Data record DS 163 for harmonics current (DS 163) (read only).
- Data record DS 170 information data record on available measured values.

Note

- The cumulative value of the energy counters in 3-phase operation is obtained from the sums of the respective individual values of the phases.
- Inflow and outflow energy meters are always positive values.
- The operating hours counter for the entire module is calculated from the maximum of the operating hours of the individual phases.

E.2.1 Measured value data record for basic measured values (DS 142) version 2

Measured variables of the module

The following table provides an overview of all the measured variables that data record 142 supplies. Please note that, depending on the connection type used the display of some measured variables does not make sense and that the module deletes measured values that are not relevant.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix (Measured variables (Page 163)).

Neutral current

If you operate the AI Energy Meter HF with connection type 3P4W, 3P4W1 or 3P3W, the neutral current is also calculated under the following conditions:

- Transmission factors of all phase currents (primary and secondary currents) are identical.
- Measured phase currents are greater than the value of the "Low limit for measuring current parameter.
- The parameter "Reverse current direction" must be the same on all phases.

If one of the conditions is not met, 0 is entered as the value for the neutral current. You can read the neutral current calculated using measured value data record 142.

Procedure

Data record 142 is located on the AI Energy Meter HF. Use the RDREC instruction to read out the data record from the module. This system function block is stored in the STEP 7 library.

E.2.2 Measured value data record for basic measured values (DS 142) version 3

Measured variables of the module

The following table provides an overview of all the measured variables that data record 142 supplies. Please note that, depending on the connection type used the display of some measured variables does not make sense and that the module deletes measured values that are not relevant.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix (Measured variables (Page 163)).

Neutral current

If you operate the AI Energy Meter HF with connection type 3P4W, 3P4W1 or 3P3W, the neutral current is also calculated under the following conditions:

- Transmission factors of all phase currents (primary and secondary currents) are identical.
- Measured phase currents are greater than the value of the "Low limit for measuring current parameter.
- The parameter "Reverse current direction" must be the same on all phases.

If one of the conditions is not met, 0 is entered as the value for the neutral current. You can read the neutral current calculated using measured value data record 142.

Procedure

Data record 142 is located on the AI Energy Meter HF. Use the RDREC instruction to read out the data record from the module. This system function block is stored in the STEP 7 library.

E.3 Structure for energy counters (DS 143)

Energy meter data record 143 for different actions

The energy meter data record 143 includes all energy meters available on the module phase-by-phase. The data record can be used for different actions:

- Reset the energy meters to user-specific value (e.g. "0")
- Reading the current values of the energy counters
- Reading the overflow counters
- Reading the operating hours

166...169	Operating hours counter L3 (initial value)	REAL	h		65507

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

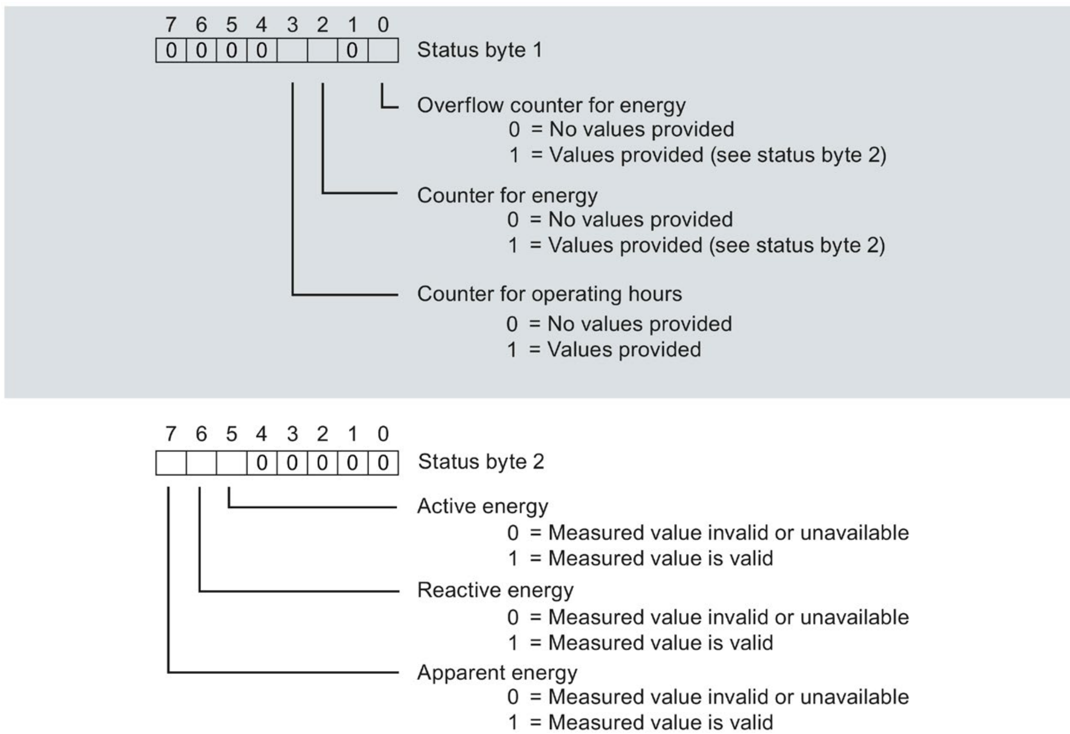

Figure E-1 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy counters, overflow counters and operating hours counter. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to reset and the time at which counters are reset.
- In Control byte 2 you determine which energy counters and which overflow counters you want to reset.

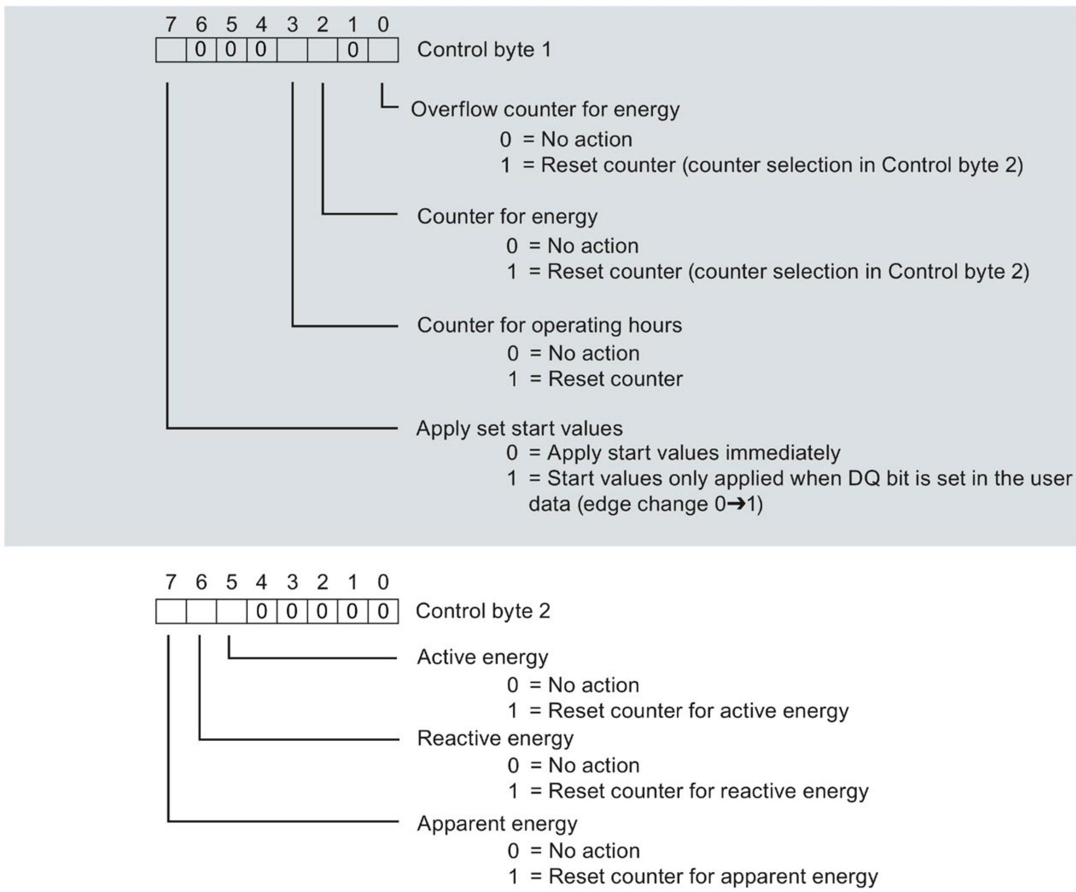

Figure E-2 Control information DS 143 (write access)

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the measured value data record 143:

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E1	01	Reserved bits are not 0.	Check Byte 2...7 and set the reserved bits back to 0.
DF	80	E1	39	Incorrect version entered.	Check Byte 0. Enter a valid version.
DF	80	E1	3A	Incorrect data record length entered.	Check the parameters of the WRREC instruction. Enter a valid length.
DF	80	E1	3C	At least one start value is invalid.	Check Bytes 8...103 and Bytes 158...169. The start values may not be negative.
DF	80	E1	3D	At least one start value is too large	Check Bytes 8...103 and Bytes 158...169. Observe the ranges of values for start values.

E.4 Measured value data record for maximum values (DS 144)

E.4.1 Measured value data record for maximum values (DS 144) version 1

Measured variables of the module

The largest values ever measured or calculated from the time AI Energy Meter HF was started are stored in this data record.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables (Page 163)).

Byte	Measured variable	Data type	Unit	Default	Measured value ID
0	Version	UINT8	-	0	-
1	Reserved	UINT8	-	0	-

[1] The values reference the amount of the current measured value

Structure of time stamp

The table below shows the structure of the time stamp:

Byte	PN Time	Format	Length
0	Status 0: Synchronization from system time master available 1: local synchronization available 2: no synchronization	UINT16	2 bytes
2	Seconds high	UINT16	2 bytes
4	Seconds low	UINT32	4 bytes
8	Nanoseconds	UINT32	4 bytes

The start value (initial value) is 01.01.1970, 0:00

Note

If you use the FAQ from the section Time-of-day synchronization and time stamp (Page 53), the status is always 2.

E.6 Measured value data record for minimum values (DS 145)

E.6.1 Measured value data record for minimum values (DS 145) version 1

Measured variables of the module

The smallest values ever measured or calculated from the time AI Energy Meter HF was started are stored in this data record.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables (Page 163)).

Byte	Measured variable	Data type	Unit	Default	Measured value ID

E.15 Measured value data record for harmonics current (DS 163)

Measured variables of the module

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables (Page 163)).

Byte	Measured variable	Data type	Unit	Value range	Meas-ured value ID
0	Version	BYTE	-	-	-

Tips and tricks

F

F.1 Tips and tricks

Processing and visualizing energy data

On the basis of an application example we show you how the measured values of the AI Energy Meter can be processed further and visualized.

You can find this application example on the Internet (http://support.automation.siemens.com/WW/view/en/86299299).

Overview of the measuring data

We provide you with an overview of the assignment of the measured values to the user data variants and data records in an Excel file.

You will find the Excel file on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755917).

Time-of-day synchronization and time stamp

In an application example we show you how to synchronize the time with the AI Energy Meter HF and work with measured values with time stamps.

You can find this application example on the Internet (http://support.automation.siemens.com/WW/view/en/109754890).

Measured values in STEP 7 as of V5.5

Measured values are represented as negative values in STEP 7 as of V5.5 if the value range of the integer format (32767 dec) is exceeded. This is not an error in the measured value. Solution: Select hexadecimal representation.

Conversion of 64-bit floating-point numbers

If you cannot process 64-bit floating-point numbers in your automation system, we recommend conversion to 32-bit floating-point numbers. Note the conversion can cause loss of accuracy. For a description of the conversion of the 64-bit floating-point numbers (data type LREAL) into 32-bit floating-point numbers (data type REAL) please refer to the Internet (http://support.automation.siemens.com/WW/view/en/56600676).

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Current measuring transformer: When the term "current measuring transformer" is used in this manual, it applies both to current/voltage transformers and Rogowski coils.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

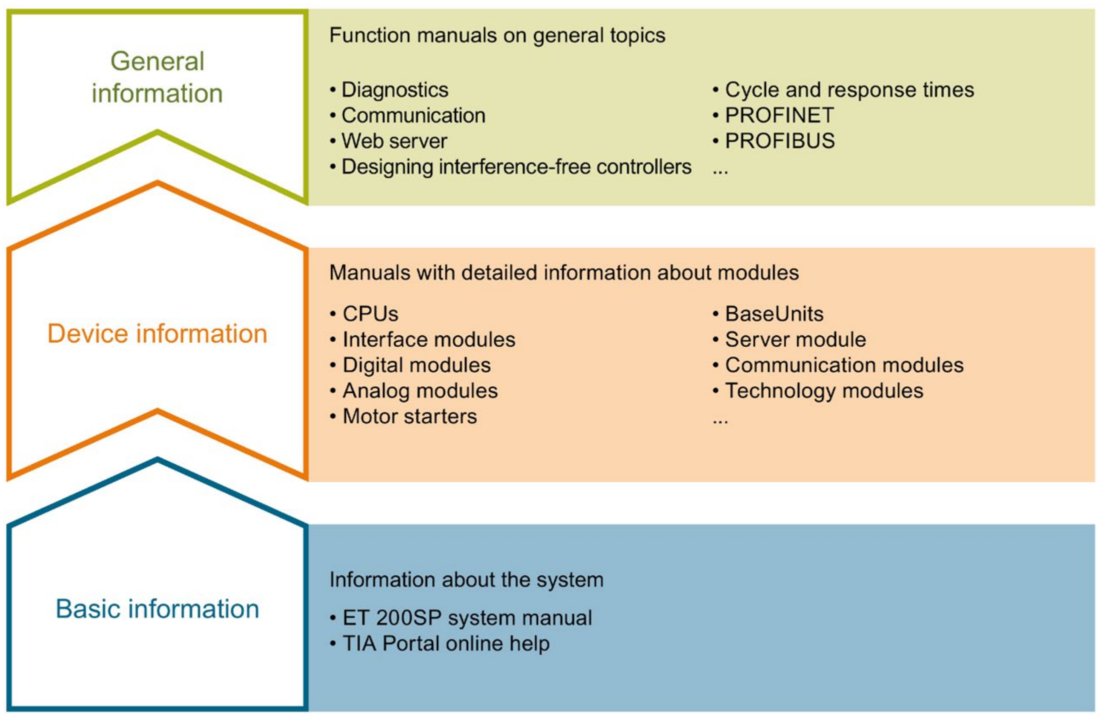
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑪ BU type
⑫ Article number

Figure 2-1 View of the module AI Energy Meter HF

Properties

The module has the following technical properties:

- Measurement of electrical variables from single-phase, two-phase and three-phase supply networks
- Max. nominal voltage between two line conductors 480 V AC
- Retentive storage of the counter values
- Use on frequency converters
- Recording of:
  – Voltages
  – Currents
  – Phase angles
  – Power
  – Energy / electrical work
  – Frequencies
  – Minimum and maximum values with time stamp
  – Power factors
  – Operating hours
  – Limits
  – Power quality data for voltages and currents

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	HW version	FW version	STEP 7	GSD file	
			TIA Portal	PROFINET IO	PROFIBUS DP
Firmware update	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	---
Calibration in runtime	FS01	V6.0.0 or higher	V15 or higher with HSP0253	---	---
Identification data I&M0 to I&M3	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	X
Reconfiguration in RUN	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	X
Diagnostic interrupts	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	X
Hardware interrupts	FS01	V6.0.0 or higher	V15 or higher with HSP0253	X	---

Note

The AI Energy Meter HF is released as of TIA Portal V15.0.0.2.

Accessories

The following accessories must be ordered separately:

- BaseUnit type U0
- Labeling strips
- Reference identification label

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/es/58649293) system manual.

2.2 Area of application

Introduction

Energy efficiency is playing an increasingly important role in industry. Rising energy prices, increasing pressure to improve profitability and the growing awareness of climate protection are important factors for reducing energy costs and for introducing an energy data management system.

Where can you use the AI Energy Meter HF?

AI Energy Meter HF is designed for machine-level deployment in an ET 200SP distributed I/O system. AI Energy Meter HF records over 500 different electrical measurement and energy values. It lets you create transparency about the energy requirements of individual components of a production plant even down to the machine level.

You can use the following measurement values supplied by the AI Energy Meter HF for the following applications:

- Energy consumption
- Power consumption
- Power quality
- Forecasts of consumption
- Efficiency

Power consumption measurements are relevant for load management and maintenance. In addition, you can use the measurements for emission reporting and for determining the CO_2 footprint.

Note

Measuring dangerous electrical quantities

The AI Energy Meter HF is not tested according to DIN EN 61010-2-030 and may therefore not be used to verify, measure or monitor protective measures according to DIN EN 61557.

Qualified personnel must ensure through additional measures that no danger ensues for humans and the environment in case of an incorrect display.

TB, TT and IT system

The AI Energy Meter HF can be used in TN, TT and IT systems.

Measuring with AI Energy Meter HF

A typical supply network of a production plant is usually divided into three voltage ranges:

- The infeed of the entire plant
- The subdistribution, for example, to individual lines within the plant
- The end consumers such as the machines in the lines.

The following figure shows the measurement in an electricity supply network:

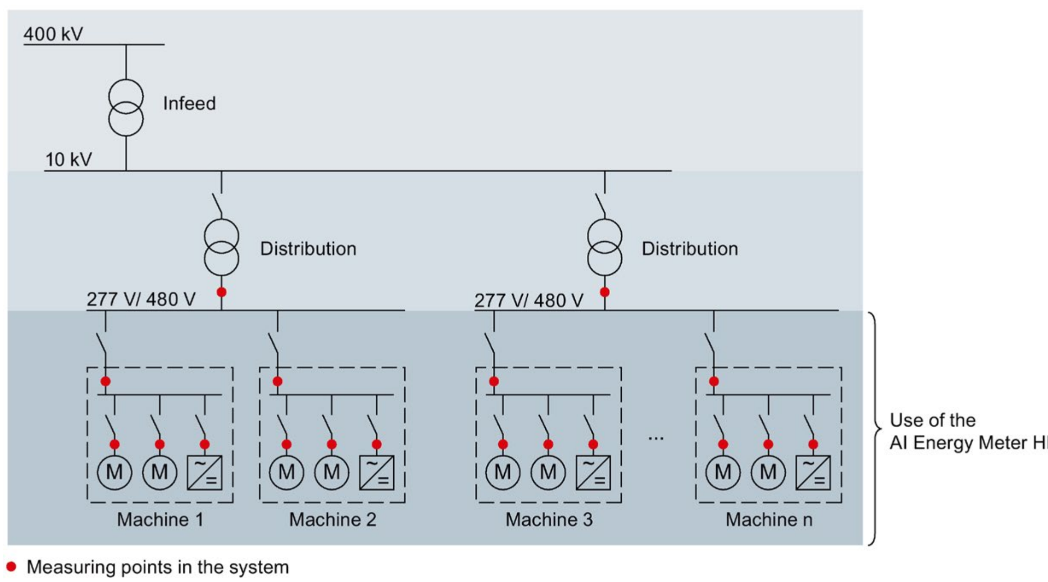

Figure 2-2 Use of the AI Energy Meter HF

Advantages of the AI Energy Meter HF

The AI Energy Meter HF has the following advantages:

- Space-saving especially for use in control cabinet
- PROFINET IO or PROFIBUS DP (depending on the interface module in use)
- Multiple modules can be used with one interface module
- Extension of existing stations by components for energy recording

2.3 Special considerations for use on the PROFIBUS DP and PROFINET IO

You can read data records from the module or write them to the module with both PROFIBUS DP and PROFINET IO.

Operation of the module on PROFIBUS DP

Please note that with PROFIBUS DP you can write data records up to a maximum length of 240 bytes to the module or read them from the module.

PROFIBUS DPV 1

If the DP Master supports the DPV1, you can reconfigure in your user program with the parameter data records DS 128, DS 129, DS 130, DS 131 or DS 135. Note that the maximum data record length is 240 bytes for DS 135.

The following applies for the measured value data records:

- DS 142: When you read the data record, the module returns the measured value data record DS 142 in version 2.
- DS 147, DS 148, DS 149: When you read the data record, the module returns the measured value data record in version 0.
- DS 154, DS 155, DS 161, DS 163, DS 164: When you read the data record, the module returns the first 240 bytes of the structure of the measured value data record.
- DS 151: You define the user-defined measured value data record DS 151 in the parameter data record DS 135. If the structure in the measured value data record DS 151 is greater than 240 bytes, the module returns the first 240 bytes of the structure.

  Information on the data record length of data records DS 135 and DS151 can be found in the appendix Structure of the parameter data record 135 for data record mapping (Page 159).

PROFIBUS DPV 0

If the DP Master does **not** support DPV1, you cannot reassign parameters which results in the following restrictions:

- There are no phase-specific parameters. All parameters apply for all three phases and the neutral conductor.
- The connection types und user data variants are limited.
- The voltage transformers are not configurable (default: 1:1).
- The current transformer value range primary current is restricted.
- The low limit for measuring current cannot be adjusted (default: 50 mA).
- Energy metering is performed continuously (the gate is not enabled).
- Min/Max calculation of values is enabled (the gate is not enabled).
- 3P4W can be set in the parameters for the connection type 3P3W.
- 3P4W can be set in the parameters for the connection type 3P3W1.
- Counting of operating hours is enabled (the gate is not enabled).
- The residual current measurement is enabled.
- Limit value monitoring cannot be used.
- Energy meter default cannot be used.
- The user-defined user data interface cannot be used.
- The user-defined data record cannot be used.
- The power quality analysis cannot be used.
- The separate settings for measuring the neutral current cannot be used.
- The measured value data records cannot be used.

Operation of the module on PROFINET IO

When reading data records partially from the module, please note the following:

- Measured value data record DS 142:
  - When you read the data record with a length of 240 bytes or less, the module returns the measured value data record DS 142 in version 2.
  - When you read the data record with a length of more than 240 bytes, the module returns the measured value data record DS 142 in version 3.
- Measured value data records DS 147, DS 148, DS 149:
  - When you read the data record with a length of 240 bytes or less, the module returns the measured value data record in version 0.
  - When you read the data record with a length of more than 240 bytes, the module returns the measured value data record in version 1.

General safety instructions

⚠ WARNING
Danger to life due to electric shock
Touching live parts can lead to death or severe injuries.
Before beginning any work deenergize the system and the AI Energy Meter HF and short-circuit installed transformers.

⚠ WARNING
Danger to life, dangerous system conditions and material damage possible
Removing and inserting the AI Energy Meter HF under live voltage is prohibited.
If you remove and insert the AI Energy Meter HF under live voltage during operation, the transformers used can produce dangerous induction voltages and electric arcs and dangerous system conditions can arise.
The AI Energy Meter HF may only be removed and inserted during operation if the measuring voltages supplied to the BaseUnit at terminals U_{L1} , U_{L2}, U_{L3} are disconnected at all poles **and** special current/voltage transformer terminals are used that short-circuit the transformer on the secondary side on removal.

Supplying the module

The AI Energy Meter HF receives its supply voltage via the terminals 17 (24 V DC) and 18 (M).

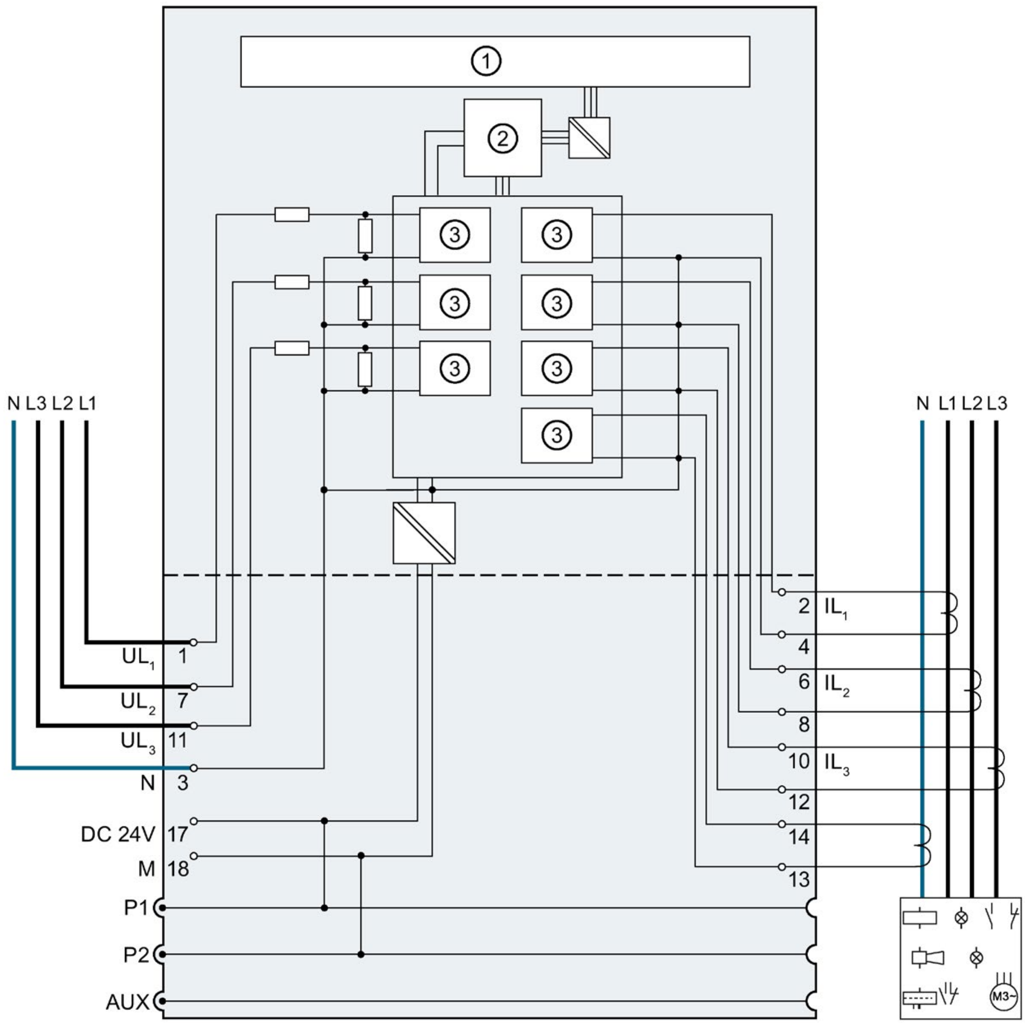
Protecting the connection cables

To protect the connection cables at U_{L1}, U_{L2} and U_{L3}, make sure there is adequate cable protection, especially after cross-section transitions.

If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter HF.

Terminal and block diagram

The figure below shows the pin assignments for connecting voltage transformers, current-voltage transformers and Rogowski coils.



①	Microcontroller	UL_n	Connection of voltage transformers
②	Backplane bus interface	IL_n	Connection of current/voltage transformers and Rogowski coils
③	Analog-to-digital converter (ADC)	N	Neutral
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)		

Figure 3-1 Block diagram of the AI Energy Meter HF

Useable BaseUnits

You can use the following BaseUnits:

- Type BU type U0 dark-colored
- Type BU type U0 light-colored

A potential group opened with a light-colored BU type U0 must contain no dark-colored BaseUnit of BU type A0 or A1.

Connection types

The AI Energy Meter HF supports the following connection types:

- 3P4W1, 3 phases, 4 conductors, balanced load
- 3P4W, 3 phases, 4 conductors
- 2P3W, 2 phases, 3 conductors
- 1P2W, 1 phase, 2 conductors
- 3 x 1P2W, 3 x 1 phase, 2 conductors
- 3P3W, 3 phases, 3 conductors
- 3P3W1, 3 phases, 3 conductors, balanced load
- 3P4WI, 3 phases, 4 conductors (only for current measurement)

The input circuit of the module must correspond to one of the listed connection types. Select the appropriate connection type for the intended use.

You will find examples of connections in the section Connection examples (Page 23).

Selection of a current/voltage transformer can be found in the section Selection of a current measuring transformer (Page 27).

3.2 Connection examples

The following figures show the connection of the AI Energy Meter HF for three-phase, two-phase and single-phase measurements. Note that the AI Energy Meter HF must always be connected via a current measuring transformer. The use of voltage transformers is optional.

Connection type	Wiring diagram	Comment
3P4W Three-phase measurement, 4 wires		Any load Connection with three current transformers
3P4W Three-phase measurement, 4 wires		Any load Connection with three current measuring transformers and three voltage transform-ers.
3P4W1 Three-phase measurement, 4 wires		Balanced load Connection with one current measuring transformer

Connection type	Wiring diagram	Comment
3P4W1 Three-phase measurement, 4 wires		Balanced load Connection with one current measuring transformer and one voltage transformer.
2P3W Two-phase measurement, 3 conductors		Any load Connection with two current measuring transformers AI Energy Meter HF supplies the value "0" for all measured values of Phase 3 as well as for some cross-phase measured values.
2P3W Two-phase measurement, 3 conductors		Any load Connection with two current measuring transformers and two voltage transformers. AI Energy Meter HF supplies the value "0" for all measured values of Phase 3 as well as for some cross-phase measured values.
1P2W Single-phase measurement, 2 conductors		Measurement in an AC network with a current measuring transformer AI Energy Meter HF supplies the value "0" for all measured values of Phase 2 and 3 as well as for some cross-phase measured values.

Connection type	Wiring diagram	Comment
1P2W Single-phase measurement, 2 conductors		Measuring the load in an AC network with a current measuring transformer and a voltage transformer. AI Energy Meter HF supplies the value "0" for all measured values of Phase 2 and 3 as well as for some cross-phase measured values.
3 x 1P2W 3 x single-phase measurement		Measurement with three current measuring transformers for any three loads that are each connected to one of the three phases.
3 x 1P2W 3 x single-phase measurement		Measurement with three current measuring transformers and three voltage transformers for any three loads that are each connected to one of the three phases.
3P3W Three-phase measurement		Any load Connection with three current transformers

Connection type	Wiring diagram	Comment
3P3W Three-phase measurement		Any load Connection with three current measuring transformers and three voltage transformers.
3P3W1 Three-phase measurement		Balanced load Connection with one current measuring transformer.
3P3W1 Three-phase measurement		Balanced load Connection with one current measuring transformer and one voltage transformer.
3P4WI Three-phase measurement (only for current measurement)		Connection with three current transformers

* If short-circuit resistance according to IEC 61439-1:2009 is ensured by the design, there is no need for separate cable protection for the AI Energy Meter HF.

3.3 Selection of a current measuring transformer

Introduction

The AI Energy Meter HF is designed for the connection of current/voltage transformers with 333 mV interface and Rogowski coils.

Note

Overall accuracy

For the total accuracy of the system consisting of the AI Energy Meter HF and current/voltage transformer or Rogowski coil, ensure that the secondary voltage of the current/voltage transformer or Rogowski coil lies in the specified accuracy range of the AI Energy Meters HF.

Current/voltage transformer

The accuracy specified by the transformer manufacturer, in contrast to pure current transformers, depends on the cable length and the resulting load resistance. Observe the specified minimum resistance of the evaluation electronics. The AI Energy Meter HF has a minimum differential input resistance at the channel terminals of 165 kΩ and a typical input resistance of 185 kΩ.

Rogowski coils

Rogowski coils are current/voltage transformers based on air coils. They do not work on a transformer principle like current transformers, but instead convert the rate of change of the current to a proportional voltage. This principle generates a phase shift of the secondary voltage vis-a-vis the primary current of 90°. An integrator in the AI Energy Meter HF, connected by the selection of the current transformer type in the configuration, compensates the phase shift again.

Interposing current transformers or integrators for connecting Rogowski coils are not required.

The accuracy of Rogowski coils is independent of the cable length. Ensure that the required minimum input resistance of the evaluation electronics is observed. The AI Energy Meter HF has a minimum differential input resistance at the channel terminals of 165 kΩ and a typical input resistance of 185 kΩ.

4 Configuration / address space

4.1 Configuring

Introduction

To configure the AI Energy Meter HF after connecting it, use configuration software such as STEP 7 (TIA Portal). In addition, you can also change numerous parameters of the AI Energy Meter HF in RUN via the user program.

Configuring

You configure the AI Energy Meter HF with:

- STEP 7 (TIA Portal) as of V15 and HSP0253
- GSD file for PROFIBUS or PROFINET

Note

Consistency check of the parameter assignment only with STEP 7

If you configure the AI Energy Meter HF using STEP 7 (TIA Portal), STEP 7 (TIA Portal) already checks the various parameters for consistency while they are being entered.

If you configure the AI Energy Meter HF using a GSD file, a consistency check is not carried out. The module does not recognize incorrect entries until after the parameter data record has been transferred. If the module recognizes an invalid parameter, the module rejects the complete data record.

Preferably use STEP 7 (TIA Portal) to configure the AI Energy Meter HF.

The following instructions show the theoretical procedure for configuring the AI Energy Meter HF with STEP 7 (TIA Portal) V15 or higher with HSP0253.

1. Select the ET 200SP distributed I/O system you are using in the hardware catalog.
2. Insert the module into your station.
3. Open the device view of the ET 200SP and insert the AI Energy Meter HF.
4. Configure the AI Energy Meter HF to suit your requirements.

   Once the configuration has been compiled without errors, you can download the configuration to the CPU and commission the ET 200SP station while the AI Energy Meter HF is running.

4.2 Selecting the module versions

Introduction

The AI Energy Meter HF has different module versions.

During the configuration you use the selection of the module version to specify which measured values can be read.

Each module version supplies quality information via the input user data.

With the exception of the module version "2 I / 2 Q" you can read the measured values as user data cyclically from the process image. At each module version you have the option to read measured value records from the AI Energy Meter HF by using the RDREC instruction asynchronously.

Influence of the module version on the address space

Note

Influence of the AI Energy Meter HF on the maximum configuration of the ET 200SP

The available address space of the ET 200SP is influenced by the following factors:

- CPU or interface module
- Plugged I/O modules

The address space made **additionally** available by the AI Energy Meter HF is essentially influenced by the length of the user data supplied. The module version determines the length of the user data, which can be supplied by the AI Energy Meter HF at maximum.

4.2.1 Module versions at configuration with STEP 7

Module versions with fixed user data assignment

Module version	User data	Address space	Comment
2 I / 2 Q	No cyclic user data. Access to measured values through "Read data record".	2-byte inputs 2-byte outputs	Information about the structure of the 2 I / 2 Q module version is available in the appendix Module version "2 I / 2 Q" (Page 191).
EE@Industry E0	User data in accordance with EE@Industry measurement data profiles	12-byte inputs / 20-byte outputs	Information about the structure of the EE@Industry measured data profiles is available in the appendix Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3" (Page 202).
EE@Industry E1		4-byte inputs / 20-byte outputs	
EE@Industry E2		12-byte inputs / 20-byte outputs	
EE@Industry E3		104-byte inputs / 20-byte outputs	

Module versions with selectable user data variants

Module version	User data	Address space	Comment
32 I / 20 Q	User data selectable through defined user data variants	32-byte inputs / 20-byte outputs	You can change over the user data variant during operation. Information about the structure of the 32 I / 20 Q module version is available in appendix Module version "32 I / 20 Q" (Page 194). Information about the user data variants at 32 I / 20 Q is available in appendix User data variants with 32 bytes input data / 20 bytes output data (Page 204).
User-specific	User data selectable through user data mapping or through defined user data variant	variable* / 20-byte outputs	You have to activate the check box "User data-mapping" in STEP 7 to use the module version user-specifically. You can change over the user data variant during operation. Information about the structure of the user-specific module version is available in the appendix "User-specific" module version (Page 200).

* 16 ... 256 bytes in steps of 16 bytes, depending on the mapped measured values

4.2.2 Module versions at configuration with GSD file

Module versions with fixed user data assignment

Module version	User data	Address space	Comment
2 I / 2 Q	No cyclic user data. Access to measured values through "Read data record".	2-byte inputs 2-byte outputs	Information about the structure of the 2 I / 2 Q module version is available in the appendix Module version "2 I / 2 Q" (Page 191).
E0	User data in accordance with EE@Industry measurement data profiles	12-byte inputs / 20-byte outputs	Information about the structure of the EE@Industry measured data profiles is available in the appendix Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3" (Page 202).
E1		4-byte inputs / 20-byte outputs	
E2		12-byte inputs / 20-byte outputs	
E3		104-byte inputs / 20-byte outputs	

Module versions with selectable user data variants

Module version	User data	Address space	Comment
32 I / 20 Q	User data selectable through user data variants or through user-specific user data*	32-byte inputs / 20-byte outputs	You can change over the user data variant during operation. If you use user-specific user data, you write your measured value profile into the AI Energy Meter HF with the data record 130. To do this use the WRREC instruction. Information about the structure of data record 130 is available in appendix Structure of the parameter data records 130/131 for user-data mapping (Page 156).
64 I / 20 Q		64-byte inputs / 20-byte outputs	
128 I / 20 Q		128-byte inputs / 20-byte outputs	
256 I / 20 Q		256-byte inputs / 20-byte outputs	

*Ensure that the user data do not exceed the size of the address space of the module version. If necessary, use a module version with a larger address space

4.2.3 Changing over the user data variant during operation

Introduction

You change the user data variant in the output data of each user data variant in Byte 0.

The following figure shows to which user data you can change over at various module versions during operation.

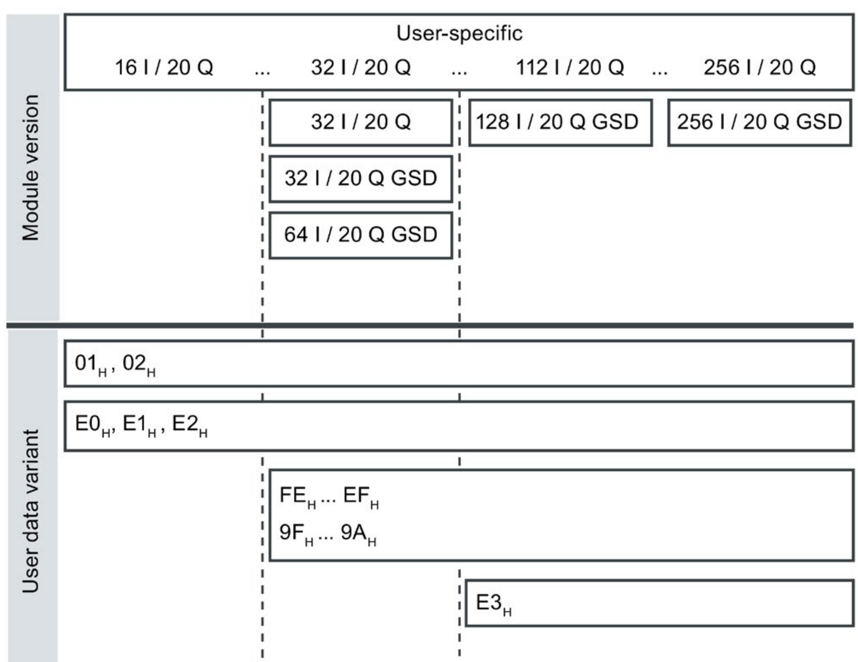

Figure 4-1 Possible user data variants

Requirement

- User program has been created.
- AI Energy Meter HF is configured as one of the module versions mentioned in the figure above.
- The start address of the module is known in the process image output.

Procedure

1. Create one constant with the data type BYTE per user data variant.
2. Enter the user data ID as a value in each case.
3. Write the constant to the start address of the module in the process image output.

Result

The user data variant is switched with the next cycle.

Note

Information about user data changeover

The parameterized user data variant is set in the following cases:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  - Coding of the user data variant not available

    or
  - Available address space is not sufficient for the selected user data variant.

4.2.4 Recommendations for selecting the module version

The following table shows which module version is suitable for a given purpose.

<table>
<tr><th>Module version</th><th>Application</th><th>Note</th></tr>
<tr><td>2 I / 2 Q</td><td>Use of many AI Energy Meter HF in an ET 200SP or little address space is available</td><td>Read the measured values solely via the RDREC instruction from a measured value data record.
Quality information about the measured values is always available.</td></tr>
<tr><td>EE@Industry measurement data profile
E0 / E1 / E2 / E3</td><td>Cyclic measurement per phase
Supplied measured values in accordance with the EE@Industry measured data profile</td><td>Available measured values depend on the configured measurement data profile.
The user data are fixed and cannot be changed dynamically. Alternatively, read the measured values acyclically from a measured value data record via the RDREC instruction.
No quality information</td></tr>
<tr><td>32 I / 20 Q</td><td>Cyclic measurement per phase
Flexibility by switching predefined user data variants</td><td rowspan="2">Quality information about the measured values is always available.
Depending on the user data variant, you must convert the measured values in the CPU to physical values using the supplied scaling factor.
One cycle elapses for each user data changeover. Measured values from the next user data variant are thus supplied with a slight time offset.
Alternatively, read the measured values acyclically from a measured value data record via the RDREC instruction. Consistent measured values of a measuring cycle are supplied.</td></tr>
<tr><td>User-specific
With GSD configuration
32 I / 20 Q

Quick start 5

Introduction

This section shows you how to read and view your first measured values on the AI Energy Meter HF in a particularly quick and easy way.

Note

Current measuring transformer:

When the term "current measuring transformer" is used in this manual, it applies both to current/voltage transformers and Rogowski coils.

Requirement

You have already connected the AI Energy Meter HF to your network with one of the connection types shown in the section Wiring (Page 20). The AI Energy Meter HF has already been integrated in your configuration tool (such as STEP 7), or the AI Energy Meter HF has been integrated in your hardware catalog of your configuration tool with the GSD file.

Procedure

1. Configure an ET 200SP station

   Configure an ET 200SP station with a CPU 151xSP or an IM 155-6.

2. Plug module in ET 200S station

   Plug the AI Energy Meter HF into the ET 200SP station and use the module version with 32-byte inputs and 20-byte outputs.

3. Set the module parameters

   Set the following parameters for the AI Energy Meter HF:

   – Connection type that you have used for the AI Energy Meter HF (e.g. 3P4W)

   – Voltage measuring range (e.g. 230 V)

   – Frequency of your network (for example 50 Hz)

   – Current transformer type for line conductors L1, L2, L3 and neutral conductor (e.g. Rogowski coil)

   – Current transformer primary rated current and secondary voltage (e.g. 1000 A and 333 mV)

   – Voltage transformer primary and secondary voltages (e.g. 230 V and 230 V)

   Leave all other parameters at their default settings and do not change them.

4. Load configuration

   Switch on the ET 200SP station and download the configuration to the CPU.

Result

After being switched on, the AI Energy Meter HF supplies the measured values for the "Total power L1L2L3" user data variant with the ID 254 or FE_H.

Read and check the measured values provided by the AI Energy Meter HF in the input data.

The table below shows the structure of the user data variant, the measured variables and the data type of the measured values in STEP 7 (TIA Portal) that are stored in the 32 bytes of output data of the module. Each measured variable is referenced via the measured value ID. An overview of all the measured variables with their measured value IDs is provided in the section Measured variables for connection type (Page 162).

Table 5- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = $QQ_1\ I_3\ U_3\ I_2\ U_2\ I_1\ U_1$	BYTE	Bit string	qq xx xx xx	-

28	Scaling total reactive power L1L2L3	USINT	-	0 ... 255	-
29	Scaling total apparent power L1L2L3	USINT	-	0 ... 255	-
30	Scaling total active energy L1L2L3	USINT	-	0 ... 255	-
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

Additional information

If you require further information about the evaluation and interpretation of the measured values, please refer to the section Reading and processing measured values (Page 38).

Reading and processing measured values 6

6.1 Basics for reading measured values

Introduction

The AI Energy Meter HF provides the measured values and variables through the following methods:

- Cyclic: User data
- Acyclic: Measured value data records

User data

User data provide pre-defined or user-defined measured values depending on the configured user data variant. The supplied measured values are cyclically written to the process image of the CPU. With some user data variants, the measured values are supplied as raw data, which you have to convert to the corresponding physical values using a supplied scaling factor.

Measured value data records

Each measured value data record supplies physical values that you can further process immediately. You read the values of a measured value data record acyclically with the RDREC instruction in a PLC tag. You need a corresponding PLC tag for each measured value data record to be read. It is also possible to create the corresponding structure in the static variables of an FB or store this structure in a DB.

You can display the read measured values in a watch table in STEP 7.

Note

If you are using CPUs other than S7-1200 or S7-1500, convert 64-bit measured values to 32-bit measured values. Note the conversion can cause loss of accuracy.

For more information, read FAQ: Processing 64-bit-floating-point numbers in S7-300/400 (https://support.industry.siemens.com/cs/ww/en/view/56600676)

Validity of the measured values

After turning on the 24 V DC supply voltage, the first measured values are available at terminal 17 after approximately 2 seconds. In the input user data, the content of byte 0 is set to the selected user data variant. You can use this change in byte 0 as a trigger event.

As soon as the module has valid measured values, the value of this byte changes to a value within the value range.

Initial module startup

After the first startup or restart of the module, the parameters are transferred to the module. You can preset a user data variant in the parameters of the hardware configuration. This remains in effect until a different user data variant is selected in the output data (byte 0). This allows input user data to be modified dynamically according to the requirements of the process.

The user data variant defined in parameter data record 128 or configuration tool is used under the following conditions:

- A "0" is written in byte 0 in the output data of a user data variant.
- Byte 0 in the output data of a user data variant contains an invalid value:
  - Coding of the user data variant not available, or
  - Available address space is not sufficient for the selected user data variant.

    See "Selecting the module versions (Page 29)".

Current measured values become "0"

The current and all other measured values based on it are suppressed (or set to "0") in the data records and in the user data in the following cases:

- The incoming current of the current measuring transformer is lower than the configured "Low limit for measuring current in relation to nominal value current [0.1%]" parameter
- Fed-in secondary voltage at the current measuring channel is higher than 424 mV.

Among others, the following measured values and derived measured variables of the phase involved become "0":

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A floating mean value is formed from the power values. These only become "0" after a corresponding time. The operating hours counter and the energy counter for active, reactive and apparent energy of the reset phase stops counting.

General reset

With module versions with 20 bytes of output data you can reset some measured values and counter levels.

An edge change of 0 -> 1 at the bit for the general reset has the following effect:

- Counters for energy, operating hours and limits start at "0" again.
- Results of the power quality analysis are deleted.
- Minimum and maximum value calculation starts again with initial values.

For the general reset, set bit 7 in byte 16 of the output user data. (Page 194)

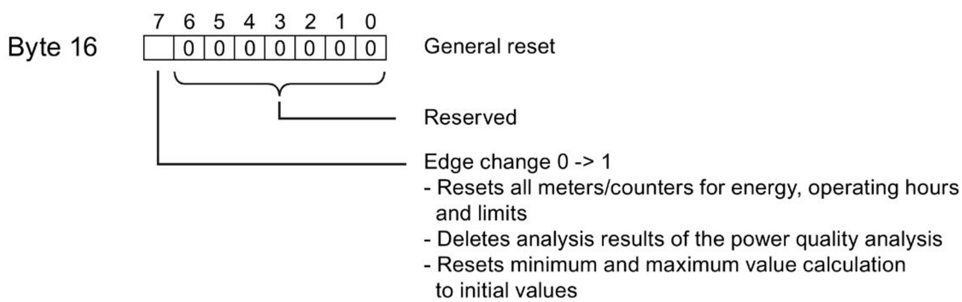

Figure 6-1 Control byte 16 in the output user data for general reset

Substitute value behavior

The substitute values for input values of the AI Energy Meter HF amount to "0".

See also

Reading measured values from user data cyclically (Page 47)

6.2 Quality information

Use the quality information to evaluate the status for currents, voltage, operating quadrants and the rotating field.

The AI Energy Meter HF provides quality information:

- In byte 1 of the user data
- In measured value IDs 65500 to 65503
- In the power quality analysis Qualifier ID 65496 (Page 87)

See also

Module version "32 I / 20 Q" (Page 194)

6.2.1 Quality information in byte 1 of the user data

For all user data variants, the module provides brief quality information in an 8-bit field in byte 1 for:

- Currents (I_{L1}, I_{L2}, I_{L3})
- Voltages (U_{L1}, U_{L2}, U_{L3})
- Operating quadrant for a phase

Please note that quality information assignment with user data variants for phase-specific measurement (ID 154 to ID 159) is different from user data variant assignment for 3-phase measurement (ID 244 to ID 254).

Quality information in byte 1 of the user data for 3-phase measurement

The quality information for 3-phase measurement is provided by the module in user data variants ID 244 to ID 254.

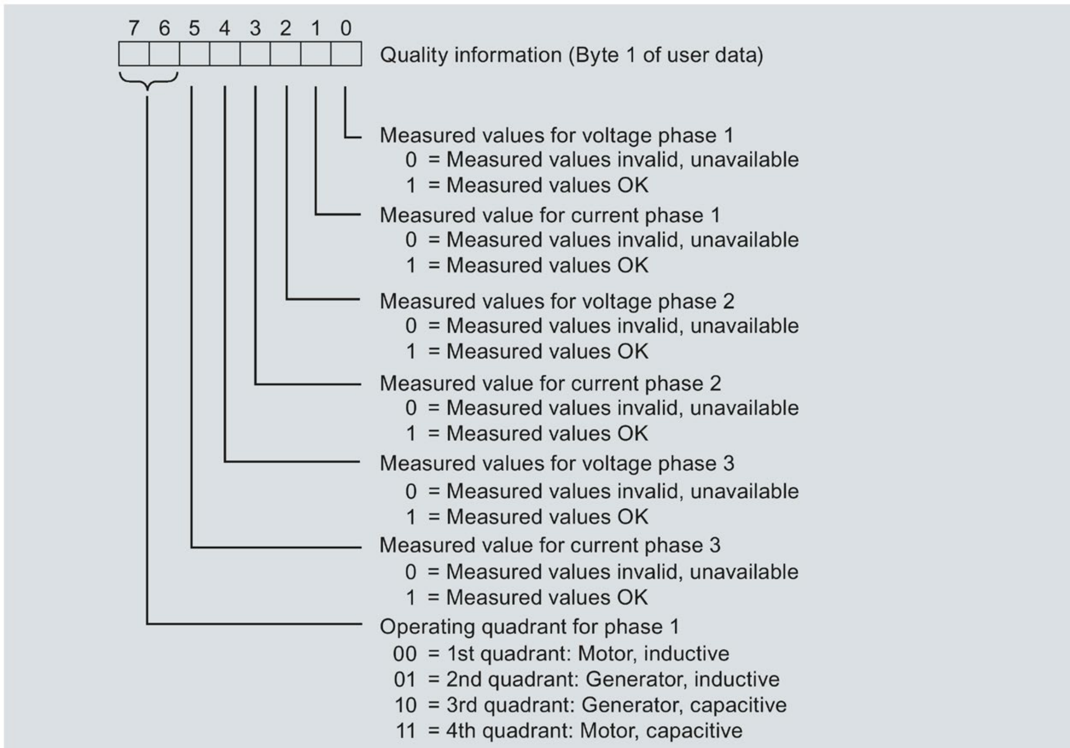

Figure 6-2 Assignment of byte 1 for user data variants ID 224 to ID 254

Quality information in byte 1 for phase-specific measurement

The quality information for phase-specific measurement is provided by the module in user data variants ID 154 to ID 159.

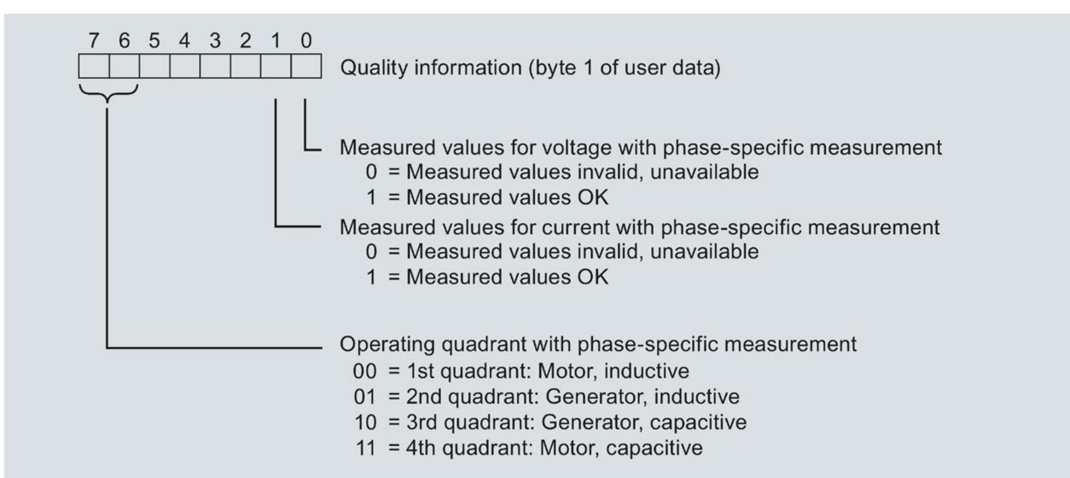

Figure 6-3 Byte 1 assignment for user data variants ID 154 to ID 159

6.2.2 Quality information with measured value IDs

Complete quality information is provided by the module in a 16-bit field with measured value IDs 65500 to 65503.

- Measured value ID 65503 for 3-phase measurement
- Measured value ID 65500, 65501 or 65502 for phase-specific measurement in phase 1, phase 2 or phase 3

Quality information with measured value ID 65503 for 3-phase measurement

The quality information for 3-phase measurement is provided by the module with:

- User data variant "Basic variables quality values three-phase measurement (ID 240 or $F0_H$)
- User data (measured value ID 66503)
- Measured value data record 150

The measured value ID 65503 provides information on:

- Currents (I_{L1}, I_{L2}, I_{L3})
- Voltages (U_{L1}, U_{L2}, U_{L3})
- Operating quadrants for all 3 phases
- Rotating field for the 3-phase system

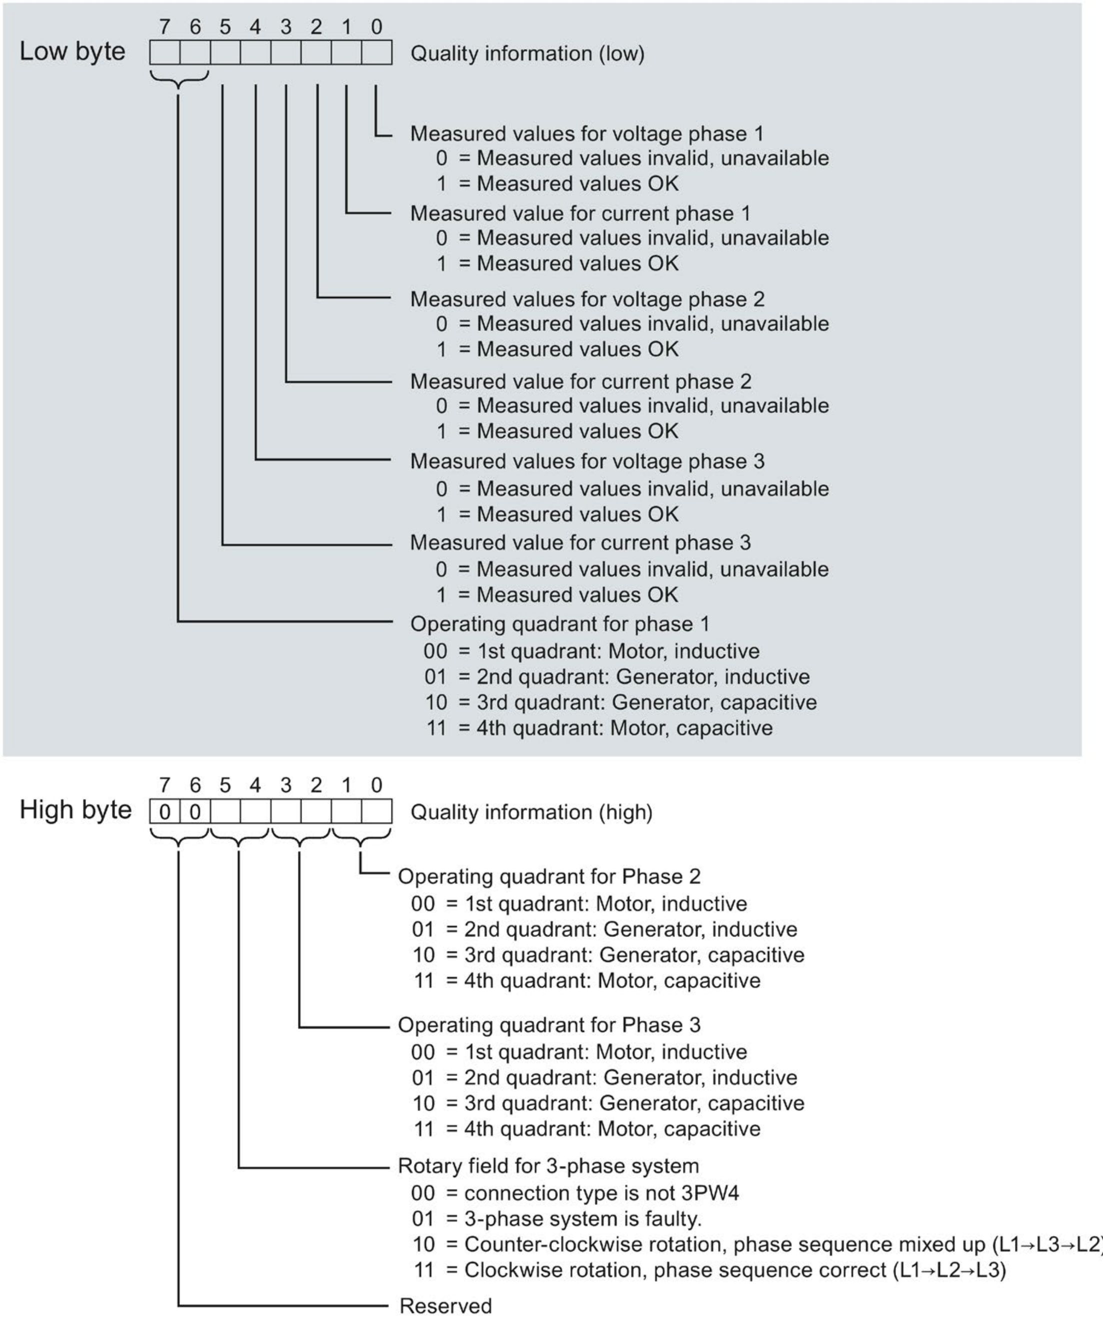

Figure 6-4 Quality information for low and high byte of the measured value ID 65503

Quality information with measured value ID 65500, 65501 or 65502 for phase-specific measurement

The module provides quality information for phase-specific measurement in phase 1, phase 2 or phase 3 with:

- User data (with measured value ID 65500, 65501 or 65502)
- Measured value data record DS 147, 148 or 149

Measured value IDs 65500, 65501 and 65502 provide information on:

- Current of the phase in question
- Voltage of the phase in question
- Operating quadrant of the phase in question

In contrast to the assignment for measured value ID 65503 (figure above), measured value IDs 65500, 65501 and 65502 only contain the phase-specific information for current, voltage and operating quadrant. The information about the other phases and the rotating field have the value 0.

6.2.3 Operating quadrant

The figure below shows the quality information of the operating quadrants.

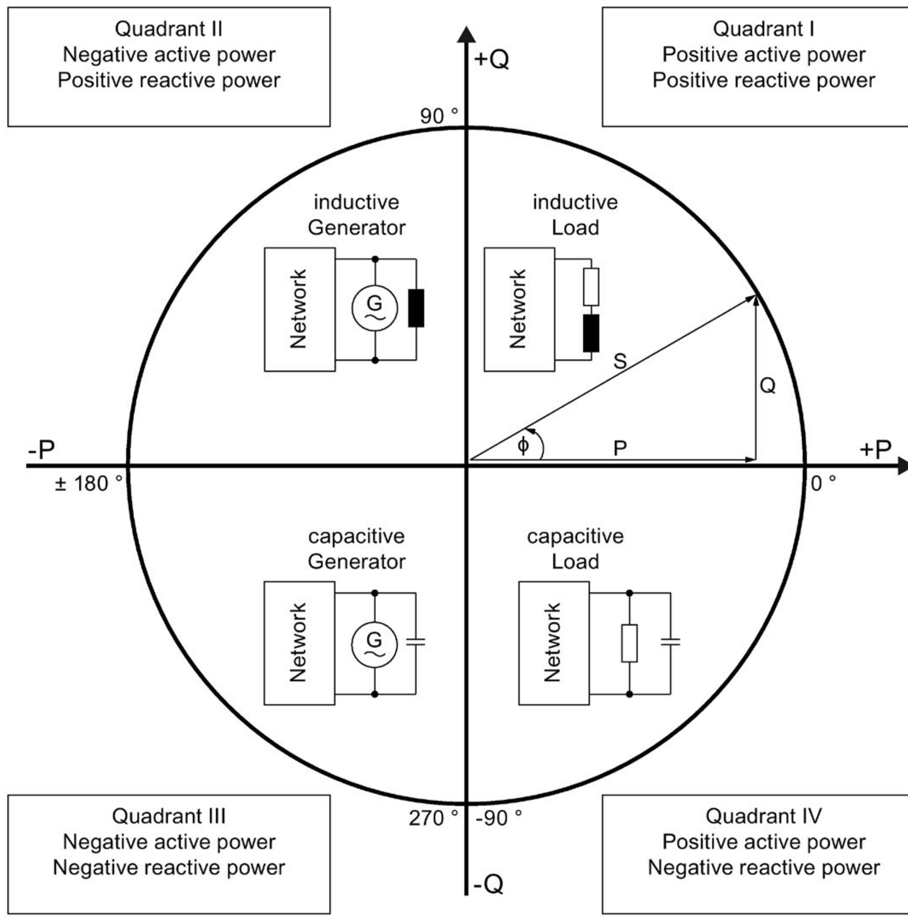

Figure 6-5 Quadrant in the quality bits

6.3 Reading measured values from user data cyclically

Requirement

- STEP 7 is open.
- The AI Energy Meter HF Is configured.

Scaling of measured values in the user data

Since the value range of 16-bit values is often smaller than the value range of the physical value, a scaling factor is supplied together with the basic value in the user data for the respective measured or calculated values. You determine the actual value of the measured variable with the following formula:

Actual value of measured quantity = measured value in the user data x $10^{\text{scaling factor}}$

Procedure

To read measured values from the user data cyclically, proceed as follows:

1. Read the relevant measured value from the input data.
2. Observe the scaling factor at scaled measured values and convert the read measured value using the scaling factor.

Example

The user data variant 254 (FE_H) "Total power L1L2L3" is configured on the AI Energy Meter HF. The measured value for "Current L1" should be read.

Table 6- 1 Total power L1L2L3

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	User data variant	BYTE	-	254 (FE_H)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-
2 ... 3	**Current L1**	**UINT**	**1 mA**	**0 … 65535**	**66007**
4 ... 5	Current L2	UINT	1 mA	0 … 65535	66008
6 ... 7	Current L3	UINT	1 mA	0 … 65535	66009
8 ... 9	Total active power L1L2L3	INT	1 W	-27648 … 27648	66034
10 ... 11	Total reactive power Qtot L1L2L3	INT	1 var	-27648 … 27648	66038
12 ... 13	Total apparent power L1L2L3	INT	1 VA	-27648 … 27648	66036
14 ... 17	Total active energy L1L2L3	DINT	1 Wh	-2147483647 to +2147483647	225
18 ... 21	Total reactive energy L1L2L3	DINT	1 varh	-2147483647 to +2147483647	226
22	Reserved	BYTE	-	0	-
23	Total power factor λ L1L2L3	USINT	0.01	0 … 100	66037

Byte	Allocation	Data type	Unit	Value range	Measured value ID
24	**Scaling current L1**	**USINT**	**-**	**0 ... 255**	**-**
25	Scaling current L2	USINT	-	0 ... 255	-
26	Scaling current L3	USINT	-	0 ... 255	-
27	Scaling total active power L1L2L3	USINT	-	0 ... 255	-
28	Scaling total reactive power L1L2L3	USINT	-	0 ... 255	-
29	Scaling total apparent power L1L2L3	USINT	-	0 ... 255	-
30	Scaling total active energy L1L2L3	USINT	-	0 ... 255	-
31	Scaling total reactive energy L1L2L3	USINT	-	0 ... 255	-

In the user data variant FE_H (254) the measured value for the current L1 is stored in Byte 2 + 3. The current is supplied by the module as a 16-bit-fixed-point number in the value range from 0 to 65535 in the unit 1 mA. In addition the scaling factor for the current L1 has to be considered additionally. The module supplies the related scaling factor in Byte 24.

The actual value for current L1 is calculated as follows:

Actual value for current L1 = Current L1 x $10^{\text{Scaling current L1}}$

Basics for reading measured values (Page 38)

6.4 Read out measured values acyclically using data records

With all module versions you can read out the measured values using data records.

An overview of all measured value data records and exact information about the structure is available in the appendix Overview of all measured value data records (Page 224).

Requirement

In the STEP 7 project you have created a PLC data type that has an identical structure to the data record you want to evaluate.

Example of the structure of a data record

The following overview shows the structure of the data record DS 142.

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version = 2	UINT8	-	-	-
1	Reserved	UINT8	-	-	-
2...5	Voltage UL1-N	REAL	V	0.0 ... 1000000.0	1
6...9	Voltage UL2-N	REAL	V	0.0 ... 1000000.0	2
10...13	Voltage UL3-N	REAL	V	0.0 ... 1000000.0	3
14...17	Voltage UL1-L2	REAL	V	0.0 ... 1000000.0	4
18...21	Voltage UL2-L3	REAL	V	0.0 ... 1000000.0	5
22...25	Voltage UL3-L1	REAL	V	0.0 ... 1000000.0	6
26...29	Current L1	REAL	A	0.0 … 100000.0	7
30...33	Current L2	REAL	A	0.0 … 100000.0	8
34...37	Current L3	REAL	A	0.0 … 100000.0	9
:		:	:	:	:
210...213	Neutral current	REAL	A	0.0 ... 100000.0	61149

Procedure

1. Read the desired data record with the RDREC instruction.

   The measured values are in the target range of the data block which you specified with the RDREC instruction.
2. Evaluate the measured values for the desired measured variables.

Note

If you want to read or write several data records at the same time in the user program, note that the number of active jobs that you started with the RDREC or WRREC instruction is limited by the resources of the CPU used.

6.5 Time-of-day synchronization and time stamp

The AI Energy Meter HF supports time-of-day synchronization and time stamp.

Time stamps are used to date the exact occurrence of information. You can find time information in the measured value data records "Measured value data record for maximum values with time stamp (DS 154)" and "Measured value data record for minimum values with time stamp (DS 155)", for example, or the power quality analysis data records DS160, DS161 and DS163. For the time on the AI Energy Meter HF to correspond to the current system time, the clock must be synchronized externally. Information on this and additional requirements can be found in the application example (http://support.automation.siemens.com/WW/view/en/109754890). In the absence of time-of-day synchronization, the internal time stamp of the AI Energy Meters HF starts at 01.01.1970, 0:00.

7 Energy counters

Introduction

The AI Energy Meter HF provides several energy and overflow counters that detect both line-based and phase-based energy values, e.g.:

- Active energy (total, outflow, inflow)
- Reactive energy (total, outflow, inflow)
- Apparent energy (total)

Retentivity

The AI Energy Meter HF stores all counter values retentively. After an interruption (e.g. Power System Off), the energy counting resumes with the retentively stored values.

Functions

The energy meters provide the following basic functions:

- Measured values for infinite and periodical counting can be read out

  End values for periodic counting: 10^3, 10^6, 10^9, 10^{12} and 10^{15} can be selected with overflow counters
- Measuring ranges can be changed in RUN
- Starting and stopping counters via gate is possible
- Preset and apply start values in RUN
- Measured variables can be evaluated via data records and user data.

7.1 Evaluate measured values for energy

There are two ways of evaluating the measured values:

- Reading measured values using the instruction "RDREC".
- Reading measured values from the user data variants (not for module versions with 2 bytes of input data).

Data records for energy meters

You can read out measured values for energy and overflow counters in the following data records.

The evaluation of measured data using data records is described in section Read out measured values acyclically using data records (Page 49).

Name of the data record	Number of the data record	Comment
Data record for basic measured values (Page 225)	Data record 142	Measured values of the total energy L1L2L3
Data record for energy meter (Page 230)	DS 143	Measured values of energy and overflow counters for phases L1, L2 and L3
Data record for phase-specific measured values L1 (Page 246)	DS 147	Measured values of the phase-specific energy meters L1
Data record for phase-specific measured values L2 (Page 249)	DS 148	Measured values of the phase-specific energy meters L2
Measured value data record for phase-specific measured values L3 (Page 252)	DS 149	Measured values of the phase-specific energy meters L3

User data variants for energy meters

You can read out measured values for energy and overflow meters in the following user data variants.

The evaluation of measured data using user data variants is described in section Reading measured values from user data cyclically (Page 47).

Name of the user data variant	Number of the user data variant	Comment
Total energy L1 L2 L3 (Page 210)	ID 249 or $F9_H$	Measured values of the total energy L1L2L3
Energy L1 (Page 211)	ID 248 or $F8_H$	Measured values of the phase-specific energy meters L1
Energy L2 (Page 212)	ID 247 or $F7_H$	Measured values of the phase-specific energy meters L2
Energy L3 (Page 213)	ID 246 or $F6_H$	Measured values of the phase-specific energy meters L3
Basic variable quality measurement three-phase measurement (Page 214)	ID 240 or $F0_H$	Status on the overflow of the energy meters for phases L1, L2 and L3
Basic variables energy meter measurement (periodic) L1L2L3 (Page 216)	ID 239 or EF_H	Number of counter overflows for energy of phases L1, L2 and L3
EE@Industry measurement data profile E3 (Page 217)	ID 227 or $E3_H$	Measured values for total active energy and total reactive energy L1L2L3
EE@Industry measurement data profile E2 (Page 217)	ID 226 or $E2_H$	Measured values for total active energy L1L2L3
Basic variables for phase-specific measurement L1 (Page 218)	ID 159 or $9F_H$	Measured values for phase-specific active, reactive and apparent energy for phase L1
Basic variables for phase-specific measurement L1a (Page 219)	ID 158 or $9E_H$	Measured values for phase-specific active, reactive and apparent energy for phase L1
Basic variables for phase-specific measurement L2 (Page 220)	ID 157 or $9D_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L2
Basic variables for phase-specific measurement L2a (Page 221)	ID 156 or $9C_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L2
Basic variables for phase-specific measurement L3 (Page 222)	ID 155 or $9B_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L3
Basic variables for phase-specific measurement L3a (Page 223)	ID 154 or $9A_H$	Measured values for phase-specific active, reactive and apparent energy for Phase L3
User-defined user data variant	ID 1 or 01_H and ID 2 or 02_H	Measured variables for energy can be selected in a user-defined manner

7.2 Preset and apply start values for energy and overflow counters

At the beginning of a new work order, it may be useful to start the energy and overflow counter with new start values.

Define the new start values for the energy and overflow counter in data record DS 143.

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

With **all** the module versions there are two ways of applying the start values:

- Transfer start values from data record DS 143 and apply them **immediately**
- Transfer start values from data record DS 143 and only apply them after setting a special bit (DQ bit for counter reset)

Both options are described in the following sections.

General reset

With module versions with 20 bytes of output data you can reset the energy and overflow counters. With a general reset, you cannot preset any start values; the start values for energy and overflow counters are always zero with a general reset.

You can find additional information on the general reset in the section Basics for reading measured values (Page 38).

7.2.1 Preset start values for the energy meters

Define the start values for the energy and overflow meters in data record DS 143.

Introduction

You have created a PLC data type that has an identical structure to data record DS 143.

Structure of data record DS 143

The following overview shows the structure of the data record DS 143 in simplified form.

More detailed information about the structure of data record DS 143 is available in section Structure for energy counters (DS 143) (Page 230).

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-

Assignment of data record DS 143

Byte 0 and Byte 1: Version of the data record

Header information for the version of the data record.

Byte 2 ... Byte 7: Control bytes for energy and overflow counter

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy meters, overflow counters and operating hours counters. The length of the control information amounts to 2 bytes for each phase.

Byte 8 ... Byte 127: Start values for the individual energy meters

The start values for energy meters in data record 143 are 64-bit floating point numbers. The format corresponds to the data type LREAL in S7-1200 and in S7-1500.

Byte 128 ... Byte 157: Initial values for overflow counters

The initial values for overflow counters in data record 143 are 16-bit integers. The format corresponds to the data type UINT in S7-1200 and in S7-1500.

7.2.2 Apply start values from data record DS 143 immediately

It is possible to apply the start values for energy counters and overflow counters for each **individual** phase separately by active, reactive and apparent energy.

Requirement

In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and you have entered the start values.

Procedure for all module versions

1. In control byte 2 of the DS 143 (bytes 3, 5 and 7), for each phase set the category of the energy meters (active, reactive, apparent energy) for which you want to set the start values.

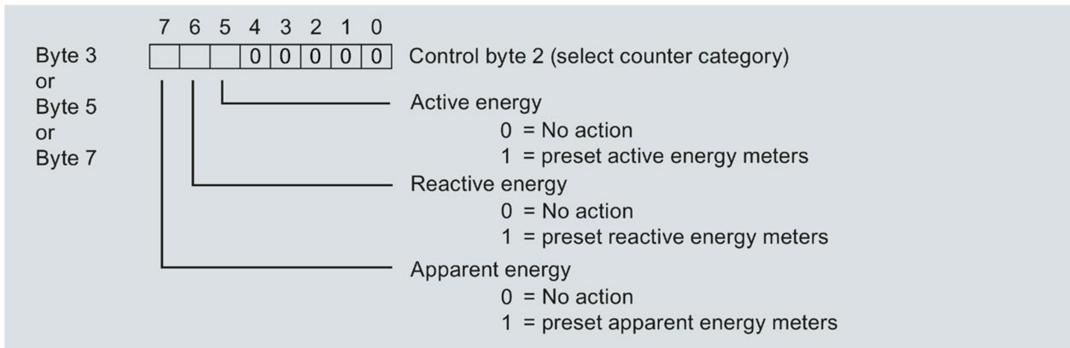

Figure 7-1 Assignment of control byte 2 in DS 143

2. In control byte 1 of DS 143 (bytes 2, 4 and 6), for each phase define whether you want to apply the start values for energy or overflow counters.

   Applying depends on the category selection from control byte 2.

   – Set Bit 0 if you want to apply the start values for the overflow counters.

   – Set Bit 2 if you want to apply the start values for the energy meters.

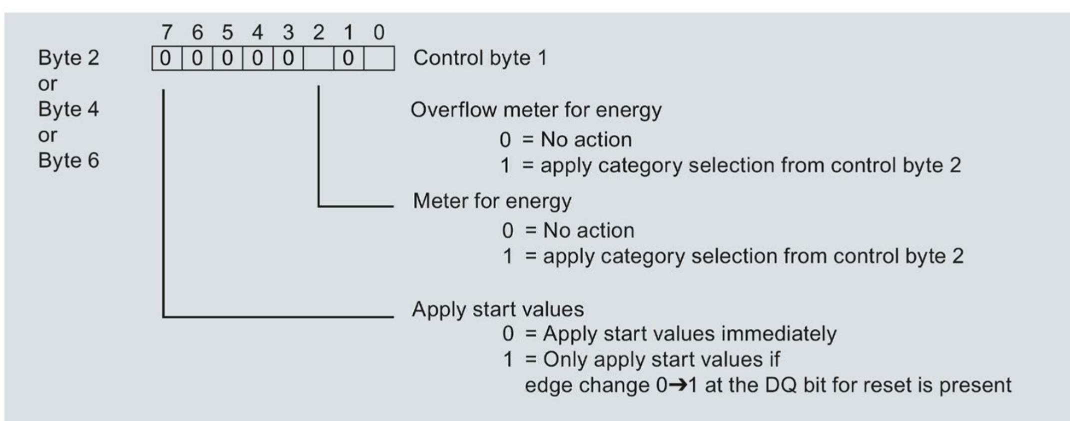

Figure 7-2 Assignment of control byte 1 in DS 143

3. In control byte 1 of DS 143 define that you want to immediately apply the start values.

   – Set Bit 7 to 0 so that the start values are immediately applied after writing the data record.

4. Transfer the data record with the WRREC instruction to the CPU.

7.2.3 Apply start values from data record DS 143 with DQ bit

Due to the differing lengths of the output data, setting of the start values for the energy counters and overflow counters depends on the configured module version.

Module versions with 20 bytes of output data

If you use module versions with 20 bytes of output data, you can:

- Apply start values for energy counters and overflow counters for **all** phases separately by active, reactive and apparent energy.
- Apply start values for energy counters and overflow counters for each **individual** phase separately by active, reactive and apparent energy.

Module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, then you always apply the start values for **all** the energy counters and overflow counters simultaneously.

Requirement

- In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and have entered the start values.

  Applying depends on the category selection from control byte 2.

  – Set Bit 0 if you want to apply the start values for the overflow counters.

  – Set Bit 2 if you want to apply the start values for the energy meters.
- In control byte 1 of the DS 143 you have set Bit 7 to "1" (apply start values via DQ bit)
- You have transferred the data record DS 143 with new start values to the CPU. The assignment of the data record can be found in Structure for energy counters (DS 143) (Page 230)

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

Procedure for module version with 20 bytes of output data

Apply start values for energy counters and overflow counters for all three phases

1. In Byte 2 of the output data, select the categories for which you want to apply start values.
   – Set bit 5 for active energy counters.
   – Set bit 6 for reactive energy counters.
   – Set bit 7 for apparent energy counters.

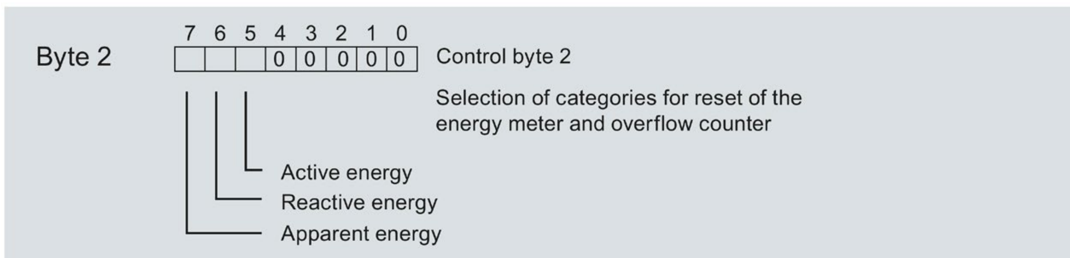

Figure 7-3 Selection of categories for reset

2. Set the reset bit (Bit 7) in byte 1 of the output data.

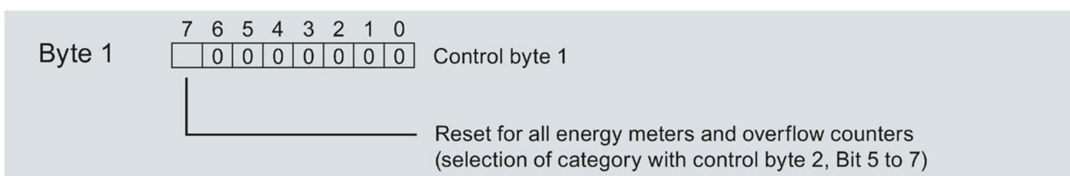

Figure 7-4 Reset bit for energy and overflow counter

If there is an edge change of the reset bit from 0 -> 1, the module resets the energy and overflow counters that you previously selected in byte 2 to their start values.

Apply start values for energy counters and overflow counters for phase-specific counting

You can also reset the energy and overflow counters on a phase-specific basis using the output data.

Follow the procedure as described in "Applying start values for energy counters and overflow counters for all three phases", as applicable.

1. In bytes 7, 9 and 11 of the output data, select the categories for which you want to apply the phase-specific start values.
   - Set Bit 5 for active energy counters.
   - Set Bit 6 for reactive energy counters.
   - Set Bit 7 for apparent energy counters.

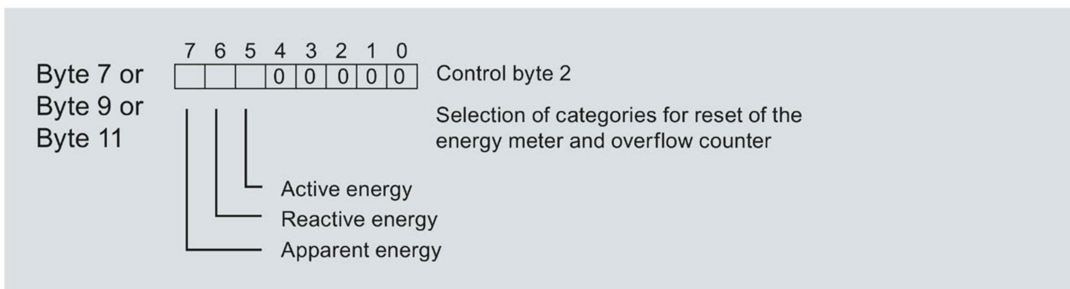

Figure 7-5 Selection of category

2. In bytes 6, 8 and 10 of the output data, set the reset bits (Bit 7) for the phase-specific start values.

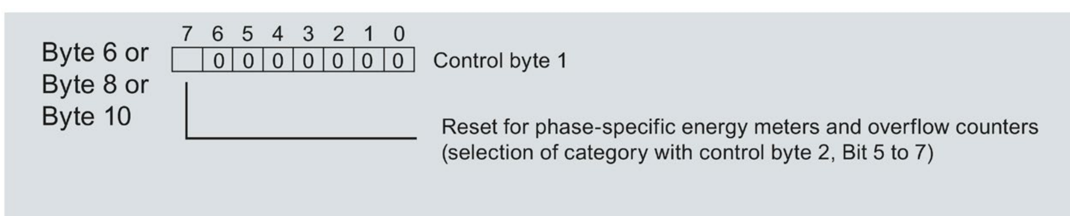

Figure 7-6 Reset bit for phase-specific energy and overflow counters

   If there is an edge change of the phase-specific reset bit from 0 -> 1, the module resets the energy and overflow counters that you previously selected in bytes 7, 9 and 11 to their start values.

Procedure for module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, always apply the start values **for all** the energy counters and overflow counters.

- Set the reset bit (Bit 7) in byte 1 of the output data.

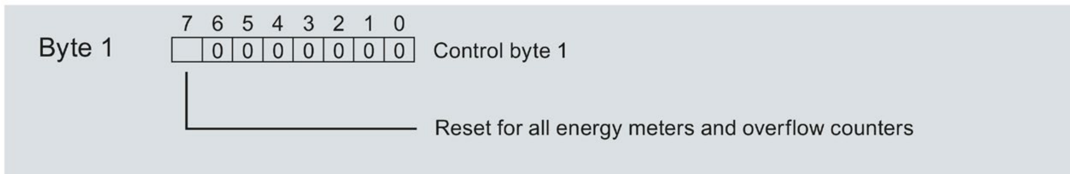

Figure 7-7 Reset bit for all energy and overflow counters

If there is an edge change of the reset bit from 0 -> 1, the module resets **all** energy and overflow counters to their start values.

7.3 Starting and and stopping energy meters

There are two ways of starting or stopping measurement with the energy meter AI Energy Meter HF:

- Counting with gate

  The module starts counting when you set the DQ bit for the counter gate in the output data using an edge change from 0 -> 1. If you reset the DQ bit using an edge change from 1 -> 0, the counter stops.

- Counting without gate

  The module starts counting immediately as soon as the module is switched on. Counting cannot be stopped.

Both options are described in the following sections.

Counting with gate

Requirements:

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

If you wish to start counting using the gate, proceed as follows:

1. Activate the parameter "Enable energy meter gate" in the parameter assignment of the module.
2. Set the DQ bit for the counter gate (Bit 6) in control byte 1 in the output data.

The module starts counting as soon as there is an edge change from 0 -> 1 at the DQ bit for the counter gate.

If you wish to stop the counting again, then reset Bit 6 in control byte 1 in the output data. Counting stops at an edge change from 1 -> 0.

The "Enable gate control for the energy counter" parameter and the DQ bit for the "counter date" behave like the parallel connection of contacts.

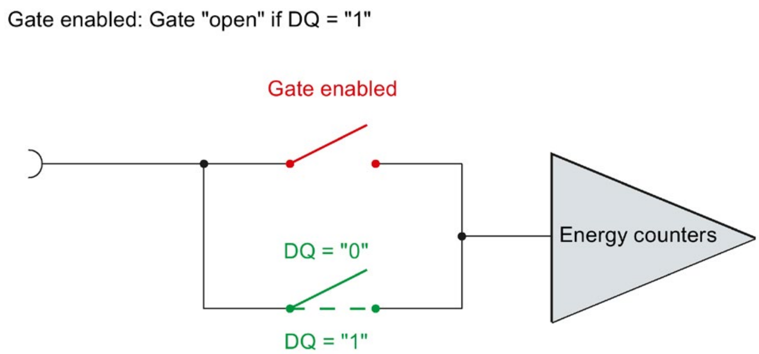

Figure 7-8 Gate enabled

Counting without gate

Requirement

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

Deactivate the parameter "Enable energy meter gate" in the parameter assignment of the module.

The module starts counting as soon as the module is started. The counter continues to count.

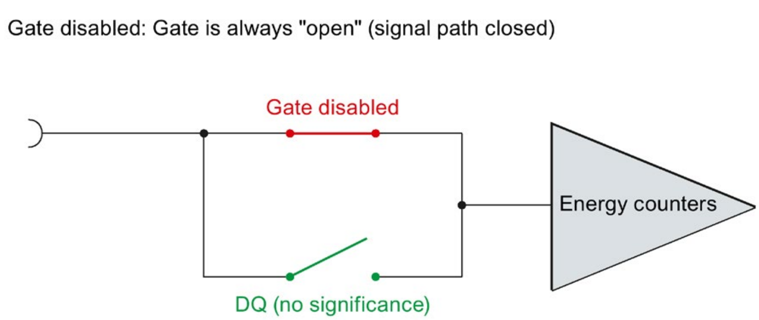

Figure 7-9 Gate disabled

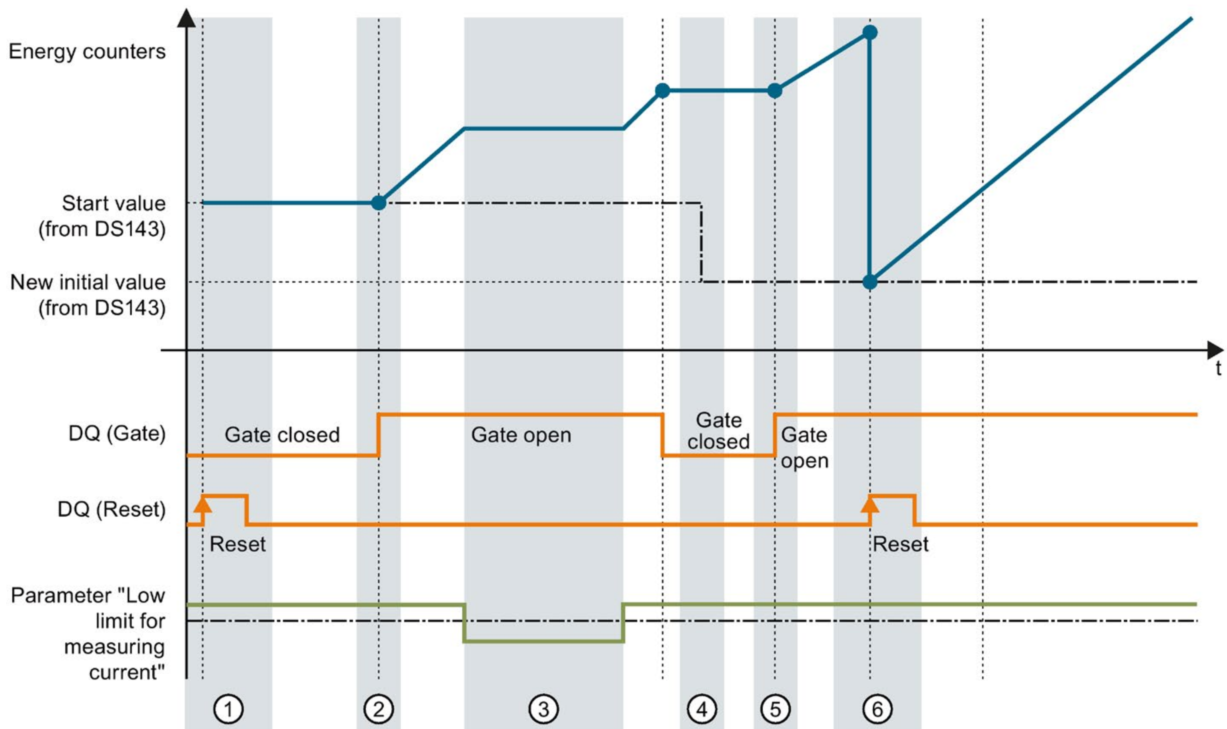
7.4 Example of measuring and resetting an energy meter

The following figure shows resetting and starting/stopping with activated gating using the energy meter as an example:



① The counter is reset to the value specified in the configuration. The gate is closed. The counter does not count.

② The gate is opened via the control byte 1 in the output data of the user data variant. The counter counts.

③ The configured current low limit has been violated. The counter does not count.

④ The gate is closed. The counter does not count. A new start value is written to the measured value data record 143 (Page 230) with the WRREC instruction.

⑤ The gate is opened again via the control byte 1 in the output data of the user data variant. The counter counts with the new start value.

⑥ The counter is reset via the control byte 1 in the output data of the user data variant. The counter counts from the new start value that was transferred via the measured value data record 143.

Figure 7-10 Example of an energy meter

7.5 What is the structure of the control and feedback interface for DS 143?

Introduction

Bytes 2 to 7 of data record 143 (Page 230) form the phase-based control and feedback interface for the data record DS 143.

- Bytes 2 and 3: Control and feedback interface for phase 1
- Bytes 4 and 5: Control and feedback interface for phase 2
- Bytes 6 and 7: Control and feedback interface for phase 3

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

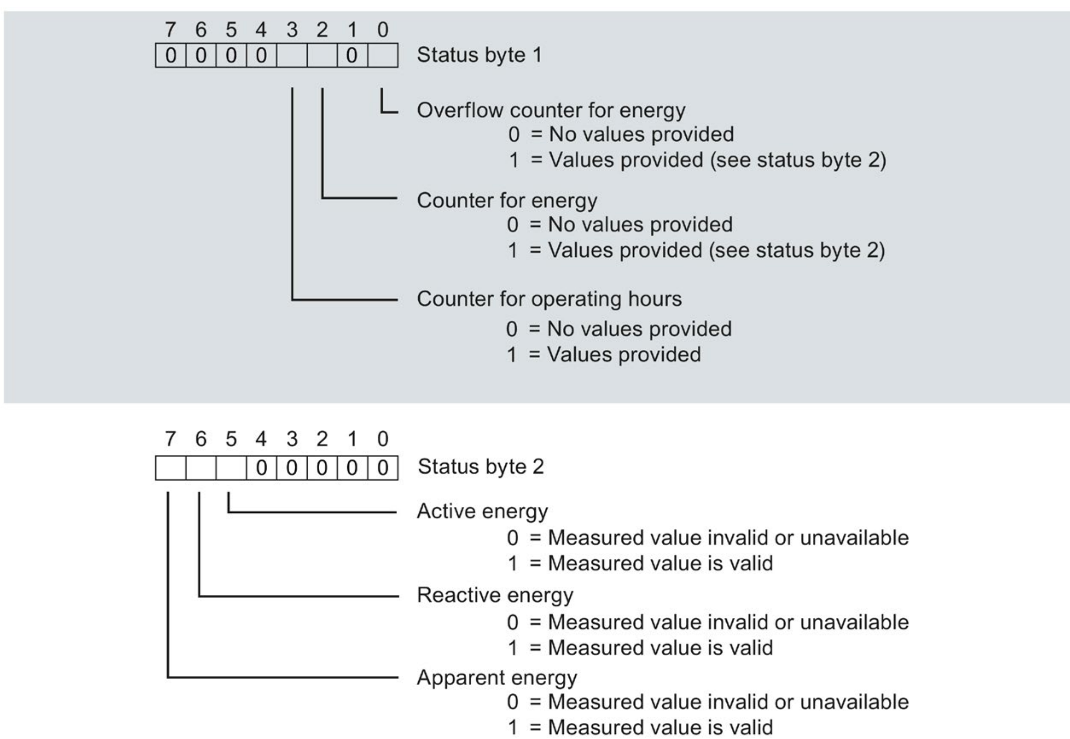


Figure 7-11 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy meters, overflow counters and operating hours counters. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to preset and the time at which counters are to be preset.

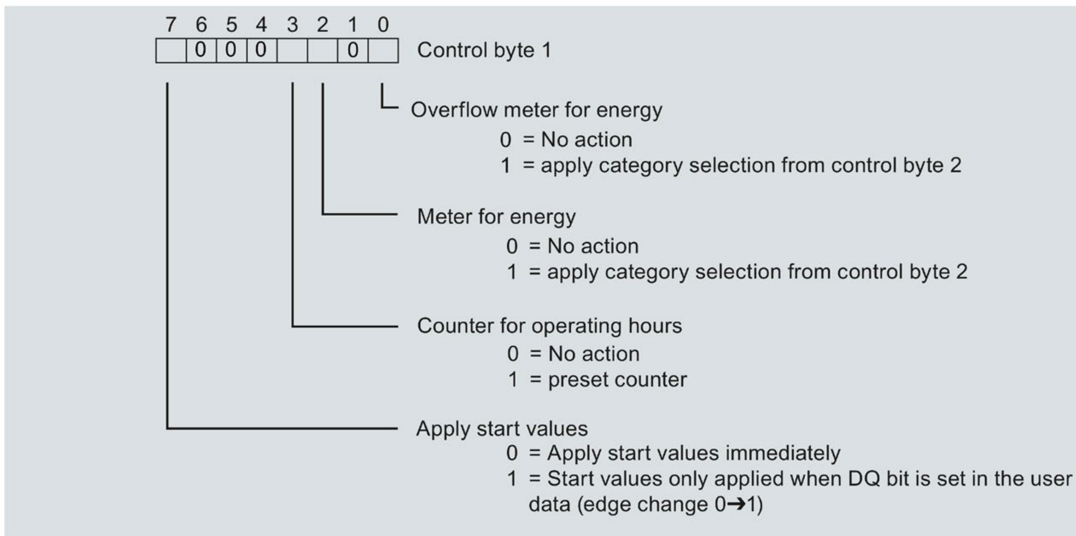

Figure 7-12 Control information DS 143, control byte 1 (write access)

- In control byte 2 you determine which energy meter categories you want to preset.

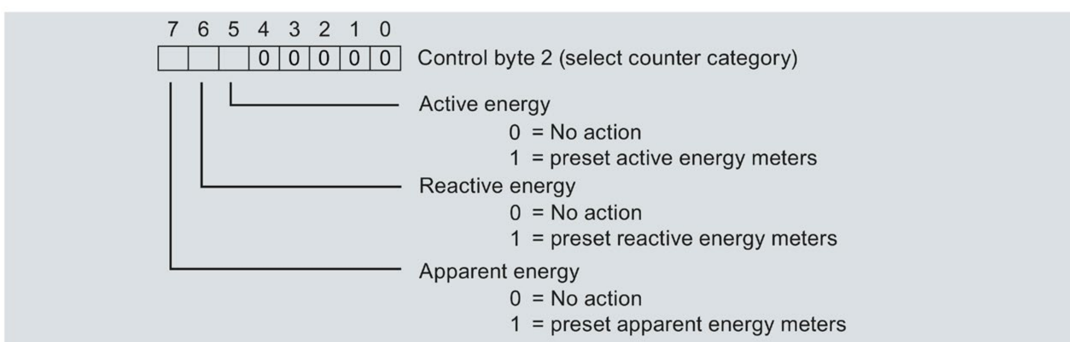

Figure 7-13 Control information DS 143, control byte 2 (write access)

Operating hours counter 8

Introduction

The AI Energy Meter HF provides four operating hours counters which count the operating hours of the connected consumers:

- Three phase-specific operating hours counters
- 1 operating hours counter which displays the value of the largest phase-specific operating hours counter.

Retentivity

The AI Energy Meter HF stores all counter values retentively. After an interruption (e.g. Power System Off), counting resumes with the retentively stored values.

Functions

The operating hours counters provide the following basic functions:

- Measuring ranges from 0 to 3.4 x 10^{38} hours.
- Starting and stopping operating hours counters via gate
- Preset and apply start values in RUN
- Evaluating counter states using data records and user data

8.1 Evaluating operating hours counters

There are two ways of evaluating the operating hours counters:

- Reading counter states using data records with the instruction RDREC.
- Reading counter states from the user-defined user data variants.

Data records for operating hours counter

You can read out measured values for operating hours in the following data records.

The evaluation of measured data using data records is described in section Reading and processing measured values (Page 38).

Name of the data record	Number of the data record	Comment
Data record for energy meter (Page 230)	DS 143	Phase-specific operating hours counter for phase L1, phase L2, phase L3 and largest phase-specific operating hours counter L1L2L3
Measured value data record for advanced measurement and status values (Page 255)	DS 150	
Measured value data record of user-defined data record (Page 257)	DS 151	Operating hours counters can be selected in a user-defined manner

User data variants for operating hours counters

You can read out measured values for operating hours in the following user data variants.

The evaluation of measured data using user data variants is described in section User data variants with 32 bytes input data / 20 bytes output data (Page 204).

Name of the user data variant	Number of the user data variant	Comment
User-defined user data variant	ID 1 or 01_H and ID 2 or 02_H	Operating hours counters can be selected in a user-defined manner

8.2 Preset and apply start values for operating hours counters

Introduction

At the beginning of a new work order, it may be useful to start counting of the operating hours counters with new start values.

Define the new start values for the operating hours counters in data record DS 143.

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

With **all** the module versions there are two ways of applying the start values:

- Transfer start values from data record DS 143 and apply them **immediately**
- Transfer start values from data record DS 143 and only apply them after setting a special bit (DQ bit for operating hours counter reset)

Both options are described in the following sections.

General reset

With module versions with 20 bytes of user data you can reset the operating hours counters. With a general reset, you cannot preset any start values; the start values for operating hours counters are always zero with a general reset.

You can find additional information on the general reset in the section Basics for reading measured values (Page 38).

8.2.1 Preset start values for operating hours counters

Define the start values for operating hours counters using data record DS 143.

Introduction

You have created a PLC data type that has an identical structure to data record DS 143.

Structure of data record DS 143

The following overview shows the structure of the data record DS 143 in simplified form.

More detailed information about the structure of data record 143 is available in section Structure for energy counters (DS 143) (Page 230).

Byte	Measured variable	Data type	Unit	Value range	Measured value ID
0	Version	BYTE	-	1	-
1	Reserved	BYTE	-	0	-
2	Control byte 1 - L1	BYTE	Bit string	-	-
3	Control byte 2 - L1	BYTE	Bit string		
4	Control byte 1 - L2	BYTE	Bit string		
5	Control byte 2 - L2	BYTE	Bit string		
6	Control byte 1 - L3	BYTE	Bit string		
7	Control byte 2 - L3	BYTE	Bit string		
8...15	Start value for active energy inflow L1	LREAL	Wh	You will find the exact assignment in the section Structure for energy counters (DS 143) (Page 230).	61180
16...23	Initial value active energy outflow L1	LREAL	Wh		61181
:	:	:	:		:
158...161	Start value operating hours L1	REAL	h		65505
162...165	Start value operating hours L2	REAL	h		65506
166...169	Start value operating hours L3	REAL	h		65507

Assignment of data record DS 143

Byte 0 and Byte 1: Version of the data record

Header information for the version of the data record.

Byte 2 ... Byte 7: Control bytes for energy and overflow counter

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy meters, overflow counters and operating hours counters. The length of the control information amounts to 2 bytes for each phase.

Byte 8 ... byte 157: Start values for the individual energy meters and overflow counters

The start values for energy counters in data record 143 are 64-bit floating point numbers. The format corresponds to the data type LREAL in S7-1200 and in S7-1500.

The initial values for overflow counters in data record 143 are 16-bit integers. The format corresponds to the data type UINT in S7-1200 and in S7-1500.

Byte 158 ... byte 169: Start values for operating hours counter

The start values for operating hours counters in data record 143 are 32-bit integers. The format corresponds to the data type REAL in S7-1200 and in S7-1500.

8.2.2 Apply start values from data record DS 143 immediately

Applying the start values for each separate operating hours counter is possible.

Requirement

In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and you have entered the start values.

Procedure for all module versions

1. In Control byte 1 of DS 143 (bytes 2, 4 and 6), for each phase, define that you want to immediately apply the start values for operating hours counters.
   – Set the Bit 3 to 1 so that the start values for the operating hours counters are preset.
   – Set the Bit 7 to 0 so that the module **immediately** applies the start values after writing the data record.

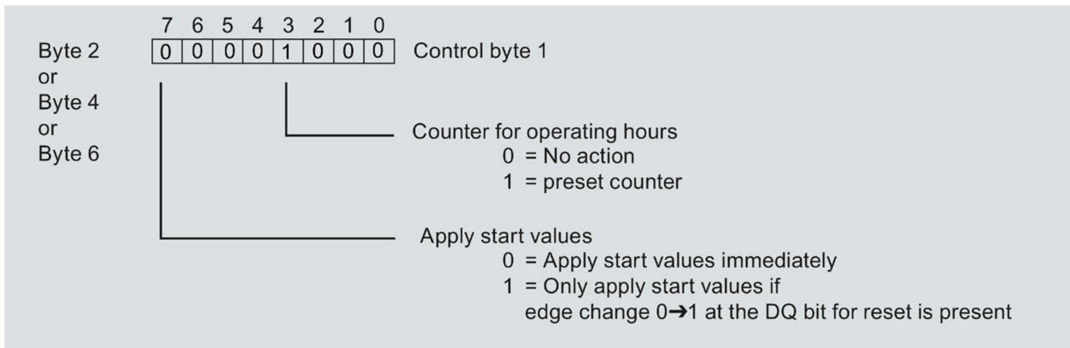

Figure 8-1 Allocation of the control bytes in DS 143 for operating hours

2. Transfer the data record with the WRREC instruction to the CPU.

8.2.3 Apply start values from data record DS 143 with DQ bit

Due to the differing lengths of the output data, setting of the start values for the operating hours counters depends on the configured module version.

Module versions with 20 bytes of output data

If you use module versions with 20 bytes of output data, you can:

- Apply start values for **all** operating hours counters.
- Apply start values for **individual** operating hours counters separately.

Module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, apply the start values for **all** operating hours counters simultaneously.

Requirement

- In your STEP 7 project you have created a PLC data type that has an identical structure to data record DS 143 and have entered the start values.
- Set the Bit 3 to 1 so that the start values for the operating hours counters are preset.
- In control byte 1 of DS 143 you have set Bit 7 to "1" (apply start values via DQ bit). (see previous figure)
- You have transferred the data record DS 143 with new start values to the CPU. The assignment of the data record can be found in Structure for energy counters (DS 143) (Page 230)

Note

Pre-set start values for counters

If you have not yet transferred any start values to the CPU using the data record DS 143, then start the counters with the value 0.

Procedure for applying the start values of all operating hours counters

Applying the start values for all operating hours counters with the module versions with 2 bytes and 20 bytes of output data is identical.

1. Set the reset bit for operating hours counters (Bit 5) in Byte 1 in the output data.

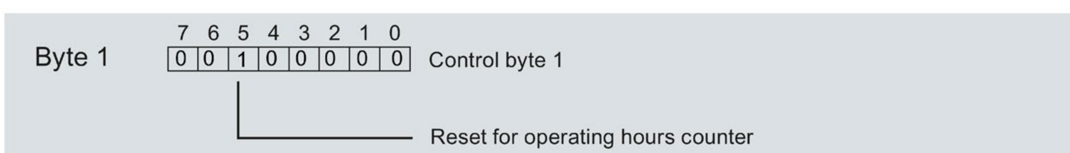

Figure 8-2 Control byte 1 Reset for all operating hours counters

If there is an edge change of the reset bit from 0 to 1, the module applies the start values for all operating hours counters.

Procedure for applying the start values of individual operating hours counters

---

Note

Applying the start values for phase-specific operating hours counters

Applying the start values for phase-specific operating hours counters does not differ from the procedure described above. In the output data, select the reset bits for the phase-specific operating hours counters in bytes 6, 8 and 10.

8.3 Starting and stopping operating hours counters

There are two ways of starting or stopping counting with the operating hours counter AI Energy Meter HF:

- Counting with gate

  The module starts counting when you set the DQ bit for the counter gate in the output data using an edge change from 0 -> 1. If you reset the DQ bit for the counter gate using an edge change from 1 -> 0, the counter stops.

- Counting without gate

  The module starts counting immediately as soon as the module is switched on. Counting cannot be stopped.

Both options are described in the following sections.

Counting with gate

Requirements:

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

If you wish to start counting using the gate, proceed as follows:

1. Activate the parameter "Enable operating hours counter gate" in the parameter assignment of the module.
2. Set the DQ bit for the counter gate (Bit 4) in control byte 1 in the output data.

The module starts counting as soon as there is an edge change from 0 -> 1 at the DQ bit for the counter gate.

If you wish to stop the counting again, then reset Bit 4 in control byte 1 in the output data. Counting stops at an edge change from 1 -> 0.

The "Enable operating hours counter gate" parameter and the DQ bit for the "counter date" behave like the parallel connection of contacts.

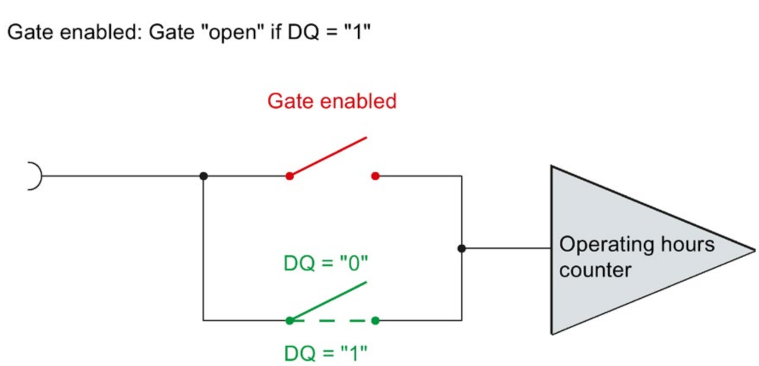

Figure 8-3 Gate enabled

Counting without gate

Requirement

The current value is higher than the configured "Low limit for measuring current in relation to nominal value current [0.1%]".

Procedure

Deactivate the parameter "Enable operating hours counter gate" in the parameter assignment of the module.

The module starts counting as soon as the data record has been applied by the CPU.

The counter continues to count.

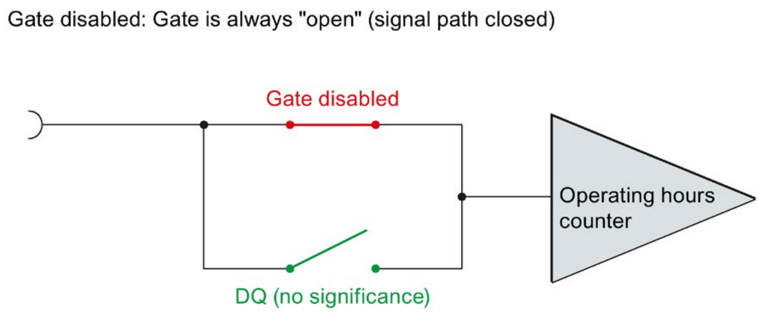

Figure 8-4 Gate disabled

Limit monitoring 9

9.1 How limit monitoring works

Introduction

The AI Energy Meter HF supports monitoring of parameterizable low **or** high limits for up to 16 analog measured or calculated variables.

You can also specify multiple limits for each measured or calculated variable, in order to define a high or low value range.

The measured value data record 150 returns the current status of limit violations and one counter per limit that displays the number of limit violations. In addition, a hardware interrupt may be generated for each limit violation.

The status of the limit violations can also be evaluated in the user data variant 240 ($F0_H$) or via the user-defined user data variant or the user-defined data record via the measured value ID 65509.

Benefits

With activated limit monitoring you can already detect any irregularities in the measured value acquisition already in field level.

Retentivity

All the counter states are stored retentively in the AI Energy Meter HF. After an interruption (e.g. Power System Off), the counting resumes with the retentively stored values.

Configuring

You configure the following limit monitoring settings in STEP 7:

- Measured variable that is to be monitored.
- Activate / Deactivate limit monitoring.
- High or low limit values.
- Delay time and hysteresis for each limit.
- Activate / Deactivate hardware interrupts at limit violation.
- Measured value that is subject to limit monitoring.

Hardware interrupt at a limit violation

The hardware interrupt provides the following information:

- Measured value ID of the monitored measured or calculated variable
- Number of the limit (0 = Limit 1. 15 = Limit 16)
- Information on whether limit was exceeded or fallen below

For more detailed information, refer to section Hardware interrupts (Page 109).

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Enable/disable monitoring per limit[1]	Disabled	Module version with 20 bytes of output data
Reset number of total limit violations	0	Module version starting at 2 bytes of output data

[1] Effective only with enabled gate

9.2 Influence of hysteresis and delay time on limit monitoring

Delay time and hysteresis

In order to prevent the triggering of limit violations with small fluctuations, you have the following configuration options in STEP 7:

- Delay time in seconds (0 to 10 s)

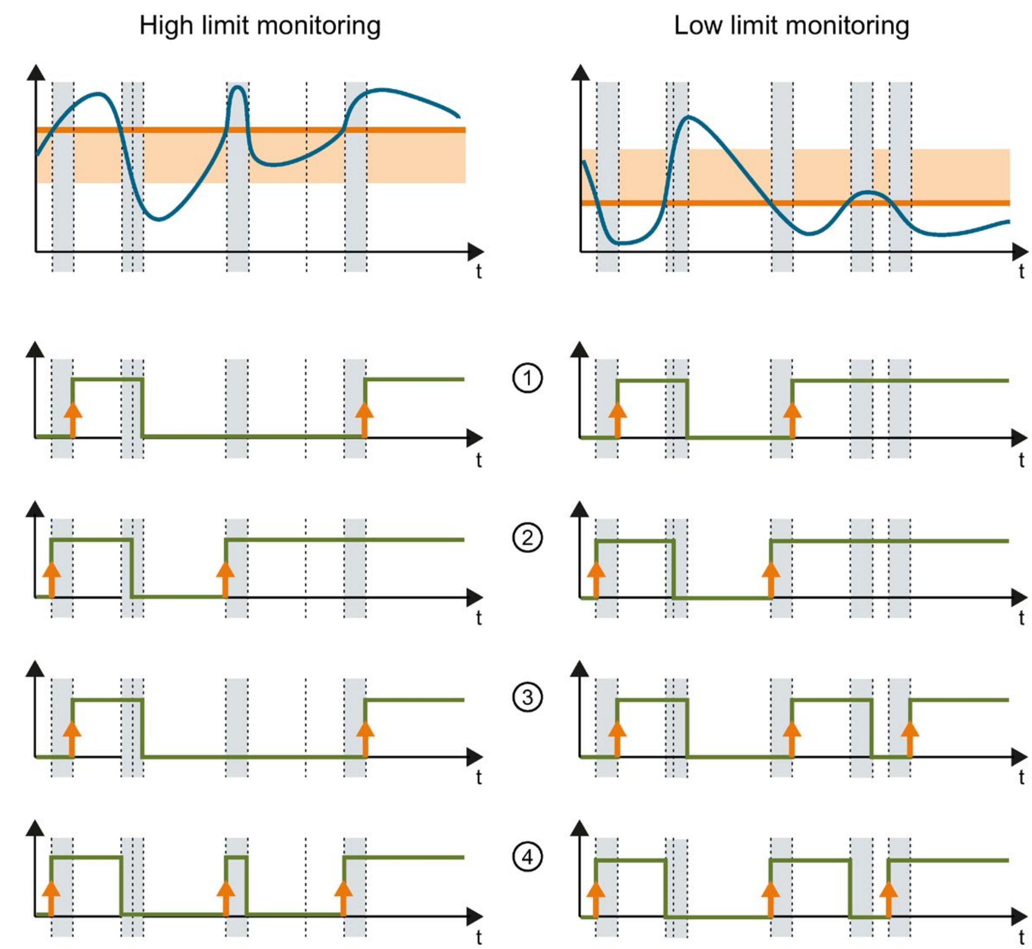
  With the delay time, you filter faults and thereby prevent limit value monitoring from triggering too frequently. The limit violation is counted only when the limit violation is present for longer than the configured delay time. The delay time is also taken into consideration with an outgoing limit violation, directly after a high or low limit has been violated in the permitted range. If the measured variable lies between limit violation and hysteresis after the limit violation has been corrected again, the delay time expires also without leaving the hysteresis.
- Hysteresis as a percentage (0 to 20%)

  With the hysteresis, you suppress fluctuations around the limit. The hysteresis is a tolerance range that you define as a percentage deviation of the configured limit. The limit violation is considered to be corrected only when the monitored value leaves the tolerance range.

Note

You can get information about underflow and overflow from the calculation of minimum (Page 241) and maximum values (Page 235) of selected measured variables.

The following figure shows the value-over-time for two measured values using the example of a high and low limit as well as the influence of hysteresis and delay time on the counting of the limit violations.



(orange line)	Configured limit.	(green line)	Signal wave
(grey bar)	Configured delay time. Is taken into consideration during coming and going.	①	Limit monitoring with hysteresis and delay time
(light orange area)	Hysteresis range. Only considered for outgoing.	②	Limit monitoring with hysteresis, but without delay time
(blue line)	Value-over-time for which the limit is monitored.	③	Limit monitoring without hysteresis, but with delay time
(orange arrow)	Edge change. Counter for limit violations is incremented by 1. If parameterized, a hardware interrupt is triggered.	④	Limit monitoring without hysteresis and delay time

Figure 9-1 Influence of hysteresis and delay time on the limit

Minimum and maximum values (Page 82)

9.3 Reset, activate and deactivate counters for limit violation

Introduction

At the beginning of a new work order, it can be useful to reset or also enable/disable the counters for limit violations of the AI Energy Meter HF.

Resetting here means that the counters for limit violations are reset to 0.

Due to the differing lengths of the output data resetting of the counters for limit violations depends on the configured module version.

Resetting at module version with 20 bytes of output data

1. Select the counters for limit violations that you want to reset in control bytes 3 and 4; see "Enabling/disabling the counters for limit violations".
2. In control byte 1, set the rest bit (bit 3) with an edge change from 0 to 1; see "Resetting the counters for limit violations".

Resetting for module version with 2 bytes of output data

Set the reset bit (Bit 3) in Control byte 1 from 0 to 1 through an edge change. Resetting acts globally on all the configured counters for limit violation.

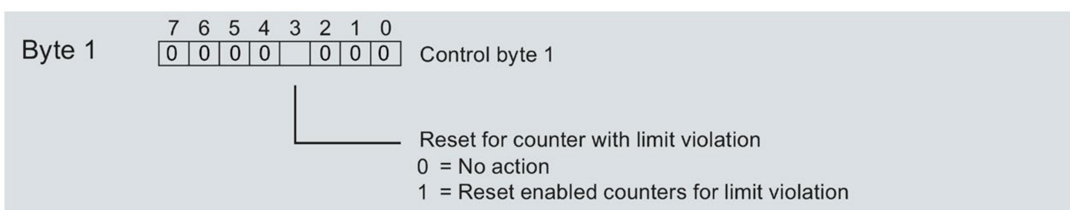

Figure 9-2 Resetting of the counters for limit violations

Activating / Deactivating counters for limit violations

Activating/deactivating of the counters for limit violations is only possible for module versions with 20 bytes of output data.

Requirements: "Gate for limit value monitoring" was parameterized during configuration of the module using STEP 7 or by writing the data record DS 128.

Select the counters for limit violations that you want to activate / deactivate in Control bytes 3 and 4.

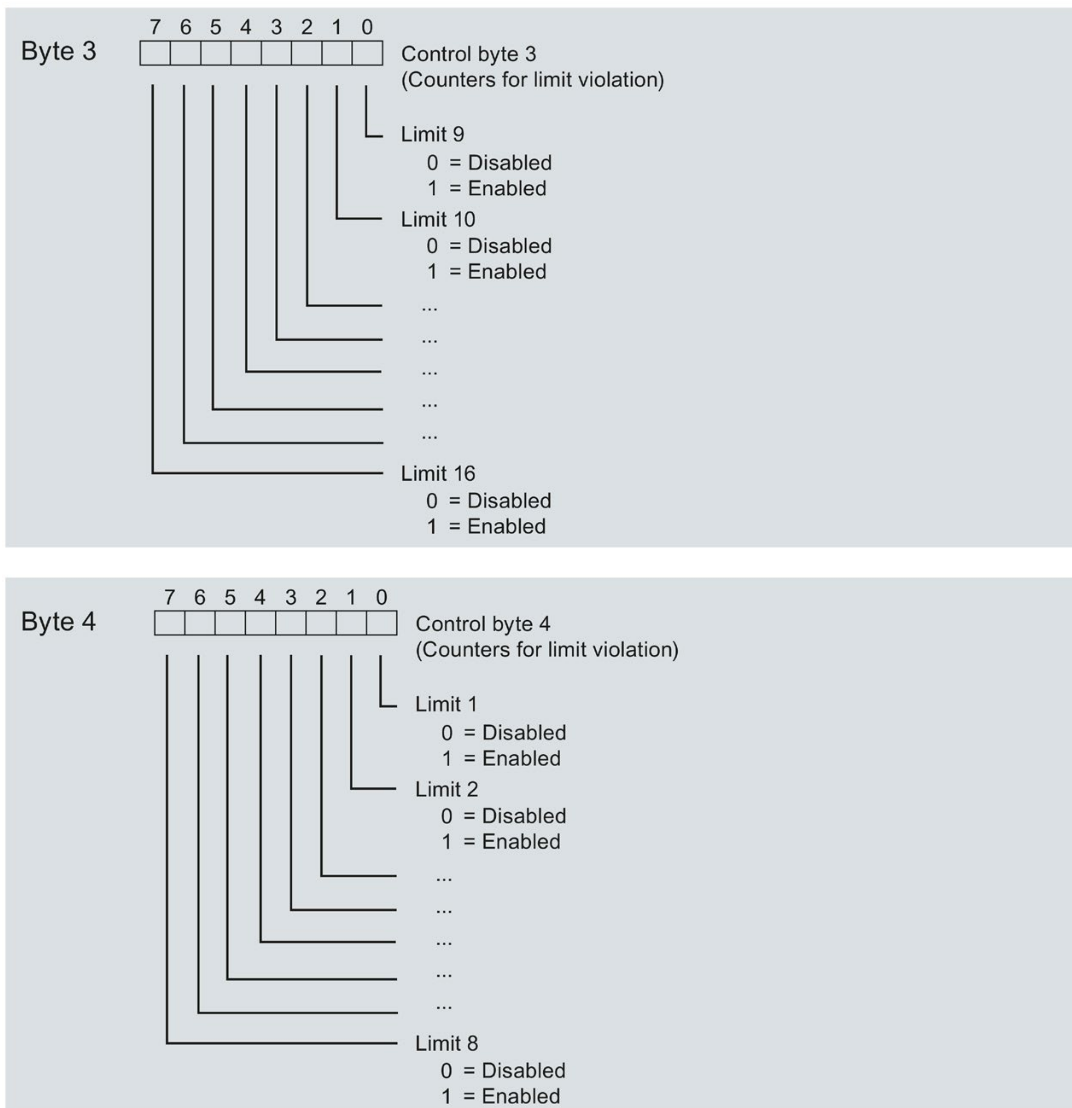

Figure 9-3 Activating / deactivating of the counters for limit violations

9.4 Measured variables for limit monitoring

You can use measured variables from the section Measured variables (Page 162) for limit value monitoring.

The value range of the parameter "Limit x" is -3.0E+09 ... +3.0E+09.

The table below shows you which measured variables are not available for limit monitoring.

Measured value ID	Measured variables
220	Total active energy inflow L1L2L3
221	Total active energy outflow L1L2L3
222	Total reactive energy inflow L1L2L3
223	Total reactive energy outflow L1L2L3

66038	Frequency

Minimum and maximum values 10

10.1 Minimum and maximum values

Introduction

The AI Energy Meter HF determines the respective highest and lowest measured or calculated value for a series of measured and calculated values. The values are stored retentively in the module and can be read using measured value data records DS 144 (Page 235), DS 145 (Page 241), DS 154 (Page 237) and DS 155 (Page 243).

Benefits

Using the stored minimum and maximum values, for example, you can detect further irregularities in addition to limit monitoring.

Calculation of minimum and maximum values

Minimum and maximum values are only calculated for the phases in accordance with the configured connection type. Existing minimum and maximum values that have not been calculated are assigned initial values. If faults such as under or overcurrent occur during operation, new minimum and maximum values are calculated.

The measured and calculated values are initialized as follows during commissioning of the AI Energy Meter HF so that the first calculation of minimum and maximum values supplies a plausible result:

- Maximum values for measured and calculated values: Minimum values
- Minimum values for measured and calculated values: Maximum values

Minimum and maximum values are determined as "slave pointer procedures" from the start of calculation. Start is effective as of activation of the function or after a reset. The module uses the current actual value as the start value.

If you activate the parameter "Enable minimum and maximum value calculation gate", the calculation only starts if the corresponding DQ bit ("gate open") was set (output data byte 1, bit 2 = "1"). You can stop the calculation at any time by deactivating the parameter or closing the gate. Calculation starts again after reactivation. The gate for calculation of the minimum and maximum values functions in the same way as the gate for energy meters.

Configuring

You configure the following settings in STEP 7:

- Enable calculation of minimum and maximum values
- Enable minimum and maximum value calculation gate

Changing properties in RUN

The following table shows the supported control information:

Control information	Default value	Available in
Reset saved maximum values	0	Module version starting at 2 bytes of output data
Reset saved minimum values	0	Module version starting at 2 bytes of output data

Note

Automatic reset

If you change the parameters for current or voltage transformers, the minimum and maximum values are reset automatically to their initial values.

10.2 Resetting minimum and maximum values

Description

At the beginning of a new work order, it may be useful to reset the minimum and maximum values of the AI Energy Meter HF. Resetting means that the minimum and maximum values are reset to their initial values. Initial values are described, see section Measured value data record for maximum values (DS 144) version 1 (Page 235), Measured value data record for minimum values (DS 145) version 1 (Page 241), Measured value data record for maximum values with time stamp (DS 154) (Page 237) and Measured value data record for minimum values with time stamp (DS 155) (Page 243).

Minimum and maximum values are only reset using a Reset via output data (DQ bit).

Due to the differing lengths of the output data resetting of the minimum and maximum values depends on the configured module version. If you use module versions with 20 bytes of output data, you can:

- Reset the minimum and maximum values for **all** phases.
- Reset minimum and maximum values for each **individual** phase.

If you use the module version with 2 bytes of output data, you always reset **all** the minimum and maximum values simultaneously.

Time stamps are set to initial values (01.01.1970, 0:00) on reset.

Procedure for module version with 20 bytes of output data

Resetting the minimum and maximum values for all 3 phases.

1. Select the categories of minimum and maximum value that you want to reset in byte 2.
   - Set bit 0 for voltage and frequency.
   - Set bit 1 for current and power factor.
   - Set bit 2 for active power.
   - Set bit 3 for reactive power.
   - Set bit 4 for apparent power.

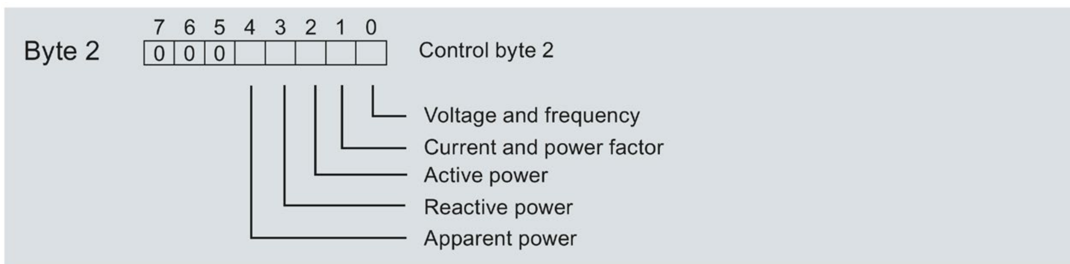

Figure 10-1 Selection of minimum and maximum value category

2. In Byte 1, set reset bit 0 for minimum values or reset bit 1 for maximum values.
   If there is an edge change of the reset bits from 0 to 1, the module resets the selected minimum or maximum values for all 3 phases that you previously selected in Byte 2.

Figure 10-2 Reset bit for minimum and maximum values

Resetting minimum and maximum values for phase-specific measurement

You can also reset the minimum and maximum values on a phase-specific basis using the output data.

Follow the procedure for "Resetting minimum and maximum values for all 3 phases" as applicable.

1. Select the categories of minimum and maximum value that you want to reset on a phase-specific basis.
   - In byte 7, set the bits for the category of minimum and maximum values in phase 1.
   - In byte 9, set the bits for the category of minimum and maximum values in phase 2.
   - In byte 11, set the bits for the category of minimum and maximum values in phase 3.
2. Set the reset bit (bit 0 and bit 1) for minimum or maximum values.
   - in byte 6 for phase 1
   - in byte 8 for phase 2
   - in byte 10 for phase 3

If there is an edge change of the phase-specific reset bits from 0 to 1, the module resets the minimum or maximum values for the given phase.

Procedure for module version with 2 bytes of output data

If you use the module version with 2 bytes of output data, you always reset **all** the minimum and maximum values simultaneously.

Set the reset bit (Bit 0 or Bit 1) in Control byte 1 from 0 to 1 through an edge change.

Figure 10-3 Resetting the minimum and maximum values at module version with 2 bytes of output data

Power quality analysis functions 11

Introduction

Power quality analysis functions are used as an aid to evaluate the quality of the supply network. In a three-phase system, many of these functions only make sense or can be executed if a functioning symmetrical three-phase supply system is available, the detection sensors of the three phases are identical in design and the nominal values current or voltage of the phases have the same values.

The AI Energy Meter HF provides you with the following power quality analysis functions in accordance with IEC 6100-4-30 for monitoring the power quality in your power network:

- Measure the neutral current
- Perform residual current analysis
- Determine active and power factor
- Carry out reactive power compensation
- Analyze fundamental values three-phase (voltage, current, power)
- Analyze the harmonics up to the 40th harmonic
- Determine the total harmonic distortion THD+N current/voltage for all three phases
- Detect voltage dip and voltage swell
- Detect overcurrent
- Detect peak value for current and voltage

The power quality analysis only returns useful results if some basic requirements are met. These include:

- Accuracy of the line frequency (50 Hz or 60 Hz) is maintained according to IEC 61557-12.
- Wiring has been carried out correctly.

Delete the results of the power quality analysis

Delete the results of the power quality analysis by setting the corresponding bits in Byte 12 of the output range (Page 199) for at least 100 ms to "1".

Deletion has the following effects:

- Deletion of the result values and status bits for
  - Peak values of the instantaneous values for voltage and current
  - Overcurrent of the current half value
  - Voltage dip and voltage swell of the voltage half-wave value
- Any pending diagnostics "External fault" is deleted.

Harmonic

Harmonics are superimposed vibrations deviating from the fundamental frequency of the supply network (50 Hz or 60 Hz) with an integer multiple of the fundamental frequency. Harmonics are generated by equipment with a non-linear current–voltage characteristic such as transformers, gas discharge lamps and power electronics devices.

Harmonic component THD (Total Harmonic Distortion)

The THD defines the ratio of the power of the harmonics to the power of the fundamental and provides information about the power quality. The value is dimensionless and is stated as a percentage [%].

The AI Energy Meter HF returns THD+N (Noise) and considers the entire current signal (DS 163) or voltage signal (DS 161). Interference in the network is not filtered out.

11.1 Power quality analysis status

Information about the power quality status can be found in the measured value "Power quality analysis qualifier" with the measured value ID 65496.

The bits 0 to 4 in byte 1 to 3 show in status "1" that information has been available since the last reset, which can be retrieved. The bits 5 to 7 in byte 1 to 3 in status "1" show that the event is currently active. If the event is not active, "0" is displayed.

The measured value "Network analysis qualifier" has the following structure:

<table>
<tr><th>Address</th><th>Content</th><th>Bit 7</th><th>Bit 6</th><th>Bit 5</th><th>Bit 4</th><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th></tr>
<tr><td>Byte 0</td><td>Power quality analysis qualifier module</td><td>Reserved</td><td>Reserved</td><td colspan="6">Status of harmonics analysis:
0_D: No data, no start
1_D … 62_D: running
63_D: Completed, data is available</td></tr>
<tr><td>Byte 1</td><td>Power quality analysis qualifier phase L1</td><td rowspan="3">Overcurrent
Event currently active</td><td rowspan="3">Voltage swell
Event currently active</td><td rowspan="3">Voltage dip
Event currently active</td><td rowspan="3">Overcurrent
Event occurred, data available</td><td rowspan="3">Peak value current
Event occurred, data available</td><td rowspan="3">Voltage peak
Event occurred, data available</td><td rowspan="3">Voltage swell
Event occurred, data available</td><td rowspan="3">Voltage dip
Event occurred, data available</td></tr>
<tr><td>Byte 2</td><td>Power quality analysis qualifier phase L2</td></tr>
<tr><td>Byte 3</td><td>Power quality analysis qualifier phase L3</td></tr>
</table>

11.2 Harmonics analysis

The AI Energy Meter HF can determine the effective values for current and voltage up to the 40th harmonic of the fundamental.

The harmonics of the voltage are stored in the data record DS 161 (Page 260).

The harmonics of the current are stored in the data record DS 163 (Page 264).

In addition, you can incorporate the results on IDs with the parameter data records DS 130/DS 131 (Page 156) in the user-defined user data and DS 135 (Page 159) in the user-defined data record DS 151 (Page 257).

The calculation of the harmonics takes several cycles. To determine whether calculation is completed, evaluate the Bits 0 to 5 in the power quality analysis data record DS 160 (Page 258) in Byte 218. If the value 63 is in the Bits 0 to 5, the calculation is completed and the measured values are available.

Note

While the calculation is in progress, you cannot read the data records DS 161 and DS 163.

Note

While the calculation is in progress, quick measured value acquisition (e.g. for controlling reactive-power compensation) is not possible.

Requirement

- The parameter "Power quality analysis function" is activated.
- The parameter "Analyse harmonics" for the corresponding phase must be released.

Voltage and current are always analyzed simultaneously for the enabled phases.

Control via data outputs

The harmonics analysis starts by setting the DQ bit 6 "Power quality analysis Start/Stop L1L2L3" in Byte 12 of the output data. The results of a previous analysis of harmonics are deleted in the process. Results of non-selected channels are "0". If channels which have not yet been analyzed are added, the data are not plausible at the start of the analysis.

If the DQ bit is reset during an ongoing analysis, the analysis stops.

11.3 Reactive power compensation

Use the power factor of the fundamental for the reactive power compensation.

When you activate the power quality analysis function, the power factor of the fundamental is available in the measured value data record DS 160 (Page 258) or in the user data.

11.4 Detection of residual current

For the residual current analysis (function "Tamper Detect" = Detection of unauthorized interventions), the total current must be determined:

Isum L1L2L3 (t) = IL1 (t) + IL2 (t) + IL3 (t)

The instantaneous residual current If is obtained by subtracting the results of the current neutral current In from the total current:

If = Isum L1L2L3 – In

Analysis starts immediately after parameter assignment. The measured value "Total current IL1+IL2+IL3-IN" (ID = 61153) returns the residual current. It is contained in DS 160, for example. You can monitor a threshold relevant for your application for a limit value (see function Limit monitoring (Page 75)).

Requirements

- "3P4W" or "3P4WI" is parameterized as the connection type.
- The same current/voltage transformers or Rogowski coils are connected to all three phases.
- The parameter "Reverse current direction" is parameterized identically for all three phases.
- The neutral current is parameterized with "Measuring".
- The residual current analysis is activated in the parameter assignment.

11.5 Active factor and power factor

The AI Energy Meter HF returns the active and power factor individually for each phase and as an aggregate.

Active factor

The active factor is defined as follows:

cos φ (active factor, signed, fundamental oscillation): cos φ = P1 / S1

φ = phase shift angle of fundamental oscillation

P1 = active power of fundamental oscillation

S1 = apparent power of fundamental oscillation

Power factor

The power factor λ = cos Φ is the ratio of active power (P) to the total apparent power (S) over the fundamental oscillation and all harmonics (total):

λ (power factor, unsigned, total): λ = cos Φ = |P| / S

11.6 Neutral current In

The module can measure or calculate the neutral current.

For measuring, you have to connect a current/voltage transformer or Rogowski coil to neutral. The behavior "measuring or calculating" can be set for each parameter. The main application of the measured value "Neutral current IN" (ID: 61149) are three-phase networks with existing 4th conductor, neutral: The neutral current usually shows incorrectly flowing currents. In an ideal three-phase network, the neutral current = 0.

An additional possible application is measuring any 4th current on this channel. Please note that in this case the measured value "Neutral current" displays this 4th current and not the actual neutral current.

Additional values in conjunction with the neutral current is set to 0.

The calculation of the neutral current and the comparison of calculated and measured neutral current (used for residual current analysis) is only possible in the operating modes "3P4W" and "3P4WI".

The determination of the neutral current is not subject to current suppression.

Parameter assignment options

If there a neutral in a connection type, the following parameters are available:

- Neutral current measurement deactivated
- Calculate the neutral current measurement
- Measure the neutral current measurement

If there is no neutral in a connection type, the following parameters are available:

- Do not use current channel
- Measure current channel

Display via channel LED

Neutral exists for connection type	calculate	measuring	Error	Channel LED
Yes	Yes	Yes	No	Green
Channel disabled	---	---	---	Off
No	No	Yes	No	Green

11.7 Monitoring the instantaneous or half-wave values

You can enable the following functions:

- Voltage swell (Page 115)
- Voltage dip (Page 117)
- Voltage peaks (Page 120)
- Current peak value (Page 126)
- Overcurrent value (Page 128)

The results are mapped in the phase-specific data records DS 147 (Page 246), DS 148 (Page 249) and DS 149 (Page 252) and in the power quality analysis data record DS 160 (Page 258).

In addition, you can incorporate the results using IDs in the measured value data record of the user-defined data record DS 151 (Page 257) and in the user data variants 1/2.

You can monitor the results for limits (Page 75) and generate hardware interrupts.

12 Phase-based measured values

Introduction

The AI Energy Meter HF makes the measured values of individual phases available.

- Through the user data variants
  - Phase-specific measurement Phase L1 with user data variants 154 ($9A_H$) and 155 ($9B_H$)
  - Phase-specific measurement Phase L2 with user data variants 156 ($9C_H$) and 157 ($9D_H$)
  - Phase-specific measurement Phase L3 with user data variants 158 ($9E_H$) and 159 ($9F_H$)
- Via measured value data records
  - Phase-specific measurement for the phases L1, L2 and L3 with data record 142
  - Phase-specific measurement for phase L1 with data record 147
  - Phase-specific measurement for phase L2 with data record 148
  - Phase-specific measurement for phase L3 with data record 149

User data variants

Through the user data variants 154 ($9A_H$) to 159 ($9F_H$) you can evaluate the following measured values for each phase of an AC / three-phase network:

- Quality information
- Current and voltage
- Active, reactive and apparent power
- Active, reactive and apparent energy
- Power factor

You can find the structure of the user data variants in appendix User data variants with 32 bytes input data / 20 bytes output data (Page 204).

Measured value data records

Through the measured value data records DS 142, DS 147, DS 148 and DS 149 you can evaluate the following measured values for each phase of an AC / three-phase network:

- Quality information
- Current and voltage
- Minimum current and minimum voltage
- Maximum current and maximum voltage
- Active, reactive and apparent power
- Minimum active, reactive and apparent power
- Maximum active, reactive and apparent power
- Active, reactive and apparent energy
- Power factor
- Minimum power factor
- Maximum power factor
- Harmonic distortion for voltage and current including minimum/maximum values
- Voltage dip
- Voltage swell
- Peak value for voltage and current
- Overcurrent value

You can find the structure of the measured value data records in appendix Measured value data record for phase-based measured values L1 (DS 147) version 1 (Page 247).

Overview of all measured value data records (Page 224)

Parameters 13

13.1 Parameters

Parameters of the AI Energy Meter HF

You will usually configure the AI Energy Meter HF with STEP 7 (TIA Portal, if necessary with HSP). In this case, STEP 7 (TIA Portal) checks the configured properties for plausibility during configuration.

You can also assign parameters to the module using a GSD file and STEP 7 or the configuration software of any provider. In this case, the module checks the validity of the configured properties only after the configuration has been downloaded. Note that some parameters depend on the selected connection type of the AI Energy Meter HF. For example in the connection type 1P2W for measurements in single-phase AC network it does not make sense to enter parameters for Phases 2 and 3. This is not checked by the system if the GSD file is used.

The effective range of the parameters that can be set using a GSD file depends on the type of bus system used:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation with PROFIBUS DP in an ET 200SP system

In addition you can change the parameterized properties via the user program in RUN mode. When you assign parameters in the user program, the "WRREC" instruction transfers the parameters to the module using data records (see appendix Configuration via parameter data records (Page 138)).

The following table summarizes all the configurable parameters with STEP 7 (GSD file).

Table 13- 1 Parameters AI Energy Meter HF (GSD file)

Parameters	Value range	Default setting	Reconfiguration in RUN
Hardware interrupt	• Disable • Enable	Disable	No
Inputs			
Diagnostics: Missing supply voltage L+	• Disable • Enable	Disable	Yes
Connection type	• Disabled • 1P2W - 1 phase, 2 conductors • 3P4W - 3 phase current measurement, 4 conductors • 3P4W1, 3 phases, 4 conductors, balanced load • 3P4W - 3 phases, 4 conductors • 3x1P2W - 3 x 1 phase, 2 conductors each • 2P3W - 2 phases, 3 conductors • 3P3W, 3 phases, 3 conductors • 3P3W1, 3 phases, 3 conductors, balanced load	3P4W - 3 phases, 4 conductors	Yes
Voltage measuring range	• 100 V • 110 V • 115 V • 120 V • 127 V • 190 V • 200 V • 208 V • 220 V • 230 V • 240 V • 277 V	230 V	Yes
Line frequency	• 50 Hz • 60 Hz	50 Hz	Yes
Energy meter gate enabled	• Disable • Enable	Disable	Yes

Parameters	Value range	Default setting	Reconfigu-ration in RUN
End value energy meter	• No end value (infinite counting) • Count periodically to 10^3 • Count periodically to 10^6 • Count periodically to 10^9 • Count periodically to 10^{12} • Count periodically to 10^{15}	No end value (infinite counting)	Yes
User data variant	See the table Overview of the user data variants	Total power L1L2L3 (W#16#FE)	Yes
Minimum and maximum value calculation	• Disable • Enable	Disable	Yes
Minimum and maximum value calculation gate	• Disable • Enable	Disable	Yes
Power quality analysis functions	• Disable • Enable	Disable	Yes
Residual current analysis	• Disable • Enable	Disable	Yes
Neutral: Current transformer secondary voltage [0.1 mV]	• 0 = Disabled • 100 ... 6000 = measuring • 65535 = calculation	250	Yes
Neutral: Current transformer primary rated current [A]	• 1 ... 16000	1000	Yes
Current transformer type for line conductors L1, L2, L3 and neu-tral conductor	• Rogowski coil • Current-voltage transformer	Rogowski coil	Yes
Voltage dip limit value in relation to nominal value voltage [0.1%]	• 10 ... 1000	100	Yes
Voltage swell limit value in rela-tion to nominal value voltage [0.1%]	• 10 ... 10000	100	Yes
Threshold overcurrent in relation to nominal value current [0.1%]	• 10 ... 60000	100	Yes
Number of cycles for voltage swell and dip analysis	• 4 ... 32767	10	Yes
Diagnostics power quality	• Disable • Enable	Disable	Yes
Diagnostics overflow current	• Disable • Enable	Disable	Yes
Diagnostics overflow voltage	• Disable • Enable	Disable	Yes

Parameters	Value range	Default setting	Reconfigu-ration in RUN
Diagnostics underflow voltage	• Disable • Enable	Disable	Yes
Diagnostics overflow cumulative values	• Disable • Enable	Disable	Yes
Detect voltage swell and dip	• Disable • Enable	Disable	Yes
Detect peak value current	• Disable • Enable	Disable	Yes
Detect peak value voltage	• Disable • Enable	Disable	Yes
Detect overcurrent	• Disable • Enable	Disable	Yes
Analyse harmonics	• Disable • Enable	Disable	Yes
Nominal value current [A]	• 0 ... 99999	1	Yes
Tolerance factor overcurrent in relation to nominal value current [0.1%]	• 10 ... 60000	100	Yes
Tolerance time overcurrent [ms]	• 0 ... 60000	40000	Yes
Low limit current measurement in relation to nominal value cur-rent [0.1%]	• 0 ... 200	10	Yes
Enable operating hours counter	• Disable • Enable	Disable	Yes
Enable gate of operating hours counter	• Disable • Enable	Disable	Yes
Current transformer secondary voltage [0.1 mV]	• 100 ... 6000	250	Yes
Current transformer primary rated current [A]	• 1 ... 16000	1000	Yes
Reverse current direction	• Disabled • Reverse current direction	Disabled	Yes
Nominal value voltage [V]	• 1 ... 999999	230 V	Yes
Tolerance factor overvolt-age/undervoltage [0.1%]	• 10 ... 500	100	Yes
Voltage transformer primary voltage [V]	• 1 ... 999999 V	230 V	Yes
Voltage transformer secondary voltage [V]	• 1 ... 500 V	230 V	Yes

Parameters	Value range	Default setting	Reconfiguration in RUN
Limits			
Number of limits	• 0 ... 16	0	Yes
Limit monitoring	• Disable • Enable	Disable	Yes
Measured variable	• Measured value ID see Measured value data records (Page 224)	None	Yes
Enable limit monitoring gate	• Disable • Enable	Disable	Yes
Hardware interrupt	• Disable • Enable	Disable	Yes
Limit	• depending on the selected measured variable	0.0000	Yes
Type	• High limit • Low limit	High limit	Yes
Hysteresis for limit monitoring [0.1%]	• 0 ... 200 [0.1%]	1%	Yes
Delay time for limit monitoring [s]	• None • 1 ... 10 s	None	Yes
User data mapping I/II			
Number of measured values	• 0 ... 64	0	Yes
Measured variable	• Measured value ID see Measured variables for connection type (Page 162)	None	Yes
Data record mapping			
Number of measured values	• 0 ... 150 • 0 ... 125 with STEP 7 (TIA Portal) V15 with HSP0253	0	Yes
Measured variable	• Measured value ID see Measured variables for connection type (Page 162)	None	Yes

13.2 Description of parameters

Hardware interrupt

Enable the hardware interrupt for the entire module here.

Inputs

Diagnostics: Missing supply voltage L+

Activate the diagnostics No supply voltage L+. If there is no voltage or too little voltage at terminal 17, the message "No supply voltage" is output and a diagnostic interrupt is triggered.

Connection type

Specify the connection type you used for the AI Energy Meter HF.

For more detailed information, refer to "Connection examples (Page 23)".

Voltage measuring range

Here you set the voltage measuring range in which the system connected to the AI Energy Meter HF works.

Line frequency

Here you set the line frequency in which the system connected to the AI Energy Meter HF works.

Enable gate energy counter

Enable the gate for the energy meter When the gate is enabled, the energy counter only counts when the corresponding output data bit (DQ bit) is set to "1".

End value energy meter

Select the end value for the periodic counting of the energy meter. You can also specify that the energy counter is to count without a full-scale value (infinite counting). The calculated energy counter values are stored retentively in the module.

User data variant

Select user data variant with which the module is to operate once it is started up.

Minimum and maximum value calculation

Enable calculation of the minimum and maximum values. The minimum and maximum value are calculated from the start of the measurement. The values determined are stored retentively in the AI Energy Meter HF together with the time stamp.

Minimum and maximum value calculation gate

Enable the gate for minimum and maximum value calculation. When the gate is enabled, the energy meter only counts when the corresponding output data bit (DQ bit) is set to "1".

Power quality analysis function

Enable the power quality analysis function for the entire module.

Residual current analysis

Enable the residual current analysis for the entire module. The residual current analysis is only available in the connection types 3P4W or 3P4WI and the concurrently activated parameter "Neutral current measurement".

Neutral current measurement

Defines whether the neutral current is measured or calculated.

This parameter does not apply to parameter assignment with GSD file.

Neutral: Current transformer secondary voltage [0.1 mV]

Enter the secondary voltage to determine the current/voltage transformer ratio. The conversion ratio is determined from the primary rated current and the secondary voltage.

The following applies to parameter assignment with GSD file:

- 0 = Neutral conductor function deactivated
- 100 ... 6000 = measure neutral current
- 65535 = calculate neutral current

Neutral: Current transformer primary rated current [A]

To determine the current/voltage transformer ratio, enter the primary rated current. The conversion ratio is determined from the primary rated current and the secondary voltage.

Current transformer type for line conductors L1, L2, L3 and neutral conductor

Select the connected current measuring transformer type.

Voltage dip limit value in relation to nominal value voltage [0.1%]

Further information can be found under Voltage dip of the voltage half-wave value (Page 117).

Voltage swell limit value in relation to nominal value voltage [0.1%]

Further information can be found under Voltage swell of the voltage half-wave value (Page 115).

Threshold overcurrent in relation to nominal value current [0.1%]

Further information can be found under Overcurrent of the current half value (Page 128).

Number of cycles for voltage swell and dip analysis

Further information can be found under Voltage swell of the voltage half-wave value (Page 115) and Voltage dip of the voltage half-wave value (Page 117).

Diagnostics power quality

Depending on the enable of the individual functions the diagnostics are triggered when a voltage swell, voltage dip or overcurrent event has occurred.

Diagnostics overflow current

The measured current is monitored after expiry of the "Tolerance time" for "Overcurrent [0.1 A] tolerance value". Exceeding the value generates the diagnostics "overflow current".

Diagnostics overflow voltage

The nominal values voltage are monitored for tolerance. An overflow triggers a diagnostic interrupt.

Diagnostics underflow voltage

The nominal values voltage are monitored for tolerance. An underflow triggers a diagnostic interrupt.

Diagnostics overflow cumulative values

A cumulative overflow in the calculated variables is displayed. The values stop at the high or low limit. A violation triggers a diagnostic interrupt.

Detect voltage swell and dip

Activates the detection of voltage swell and dip. Further information can be found under Diagnostics: Overflow/underflow (Page 113).

Detect peak value current

Activates the detection of current peak values. Further information can be found under Peak values of the instantaneous values for current (Page 126).

Detect peak value voltage

Activates the detection of voltage peak values. Further information can be found under Peak values of the instantaneous values for voltage (Page 120).

Detect overcurrent

Activates the detection of overcurrent. Further information can be found under Overcurrent of the current half value (Page 128).

Analyse harmonics

Activates harmonics analysis

Nominal value current [A]

Enter the nominal value for the current. This is the "operating point" in your application.

Tolerance factor overcurrent in relation to nominal value current [0.1%]

Further information can be found under Diagnostics: Overload (Page 122).

Tolerance time overcurrent [ms]

Further information can be found under Diagnostics: Overload (Page 122).

Low limit current measurement in relation to nominal value current [0.1%]

The configurable low limit for measuring current refers to the nominal value and is used to avoid incorrect calculations in the case of very low currents. Incorrect measurements of very low currents in particular are a cause of inaccuracies in the current transformer used. Set the low limit for the current measurement to the required value depending on your process.

Note

Tip: If you want to find the low limit for the current measurement experimentally, set it to a lower value. Then, feed in a very precise low current and determine the measurement error that can no longer be tolerated. Afterwards, set the low limit for the current measurement to the limit value you have determined.

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Neutral current
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy as well as the operating hours counters do not count any longer.

Further information can be found under Low limit for measuring current undershot (Page 124).

Enable operating hours counter

Enable the operating hours counter. The counting starts from the configurable low limit of the current measurement. The counter can be reset or pre-assigned using data record or output bit.

Enable gate of operating hours counter

Enable the gate for the operating hours counter. When the gate is activated, the operating hours counter only counts when the corresponding output data bit (DQ bit) is set to "1".

Current transformer type for line conductors L1, L2, L3 and neutral conductor

Activate the transformer type here: Current/transformer type or Rogowski coil

Current transformer secondary voltage [0.1 mV]

Enter the nominal value for the secondary voltage (100 mV bis 6000 mV) of the current/voltage transformer used or Rogowski coil. The conversion ratio is determined from the primary rated current and the secondary voltage.

Current transformer primary rated current [A]

Enter the nominal value for the primary rated current (1 A or 16000 A) of the current/voltage transformer used or Rogowski coil. The conversion ratio is determined from the primary rated current and the secondary voltage.

Reverse current direction

Setting to determine whether or not to reverse the direction of current.

In the event of inadvertent incorrect connection, this parameter can be used to correct the measured values, thus saving the hassle of rewiring. The direction of the current is only evident from the power measurement values. The current measurement value is an rms value.

Nominal value voltage [V]

Enter the nominal value for the voltage. This is the "operating point" in your application.

Tolerance factor overvoltage/undervoltage [0.1%]

Enter the tolerance factor overvoltage/undervoltage here in increments of 0.1%. You can find additional information under Diagnostics: Overflow/underflow (Page 113).

Voltage transformer primary voltage [V]

Enter the nominal value for the primary voltage of the voltage transformer used. The transformer ratio is calculated from the primary and secondary voltage.

Voltage transformer secondary voltage [V]

Enter the nominal value for the secondary voltage of the voltage transformer used. The transformer ratio is calculated from the primary and secondary voltage.

Limits

Number of limits

Enter the number of measured values that you want to monitor for limits.

Limit monitoring

Enable the monitoring of the limit for a freely definable measured value here. Limit violations are counted and the count values stored retentively.

Measured variable

Enter the measured value ID that you want to use for limit monitoring.

Enable limit monitoring gate

Enable the limit monitoring gate. When the gate is enabled, the limit monitoring is only started when the corresponding bit of the associated output user data is set to "1".

Hardware interrupt

Enable the hardware interrupt. The hardware interrupt is triggered if a high or low limit is violated. Without activation of a hardware interrupt, a limit violation is only displayed in the user data and in DS 150.

Limit

Enter the limit that is to trigger a limit violation when exceeded or fallen below. Limit violations are displayed in the user data and in DS 150.

Type

Select whether it is a high or low limit. Depending on this selection, the limit violation or hardware interrupt is triggered when a value exceeds (high limit) or falls below (low limit) the limit.

Hysteresis for limit monitoring [0.1%]

Enter the hysteresis for limit in percent.

The hysteresis band is below the high limit or above the low limit. The parameter in % refers to the configured limit. If a measured value fluctuates around the limit but does not leave the hysteresis band, a new limit violation is not triggered.

Delay time for limit monitoring [s]

Select the delay time for limit violation. The delay refers to the time that must elapse before an occurrence of a limit violation is reported. Faults can be filtered out by selection of the delay time. The deceleration time is also taken into consideration during outgoing of the limit violation.

User data mapping I/II

Number of measured values

Specify the number of measured values/variables that you want to use for the user-specific user data mapping.

Measured variable

Select the measured variable (with the measured value ID) that you want to use for the user-specific user data mapping.

Data record mapping

Number of measured values

Specify the number of measured values/variables that you want to use for the user-specific data record mapping.

Measured variable

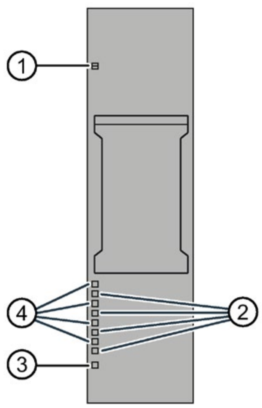
Select the measured variable (with the measured value ID) that you want to use for the user-specific data record mapping.

Interrupts/diagnostic alarms

14

14.1 Status and error display

LED display



① DIAG (green/red)
② Error (red)
③ PWR (green)
④ Status (green)

Figure 14-1 LED display

Meaning of the LED displays

The following table explains the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostic alarms (Page 110).

DIAG LED

Table 14- 1 Meaning of the DIAG LED

DIAG	Meaning
Off	Supply voltage of the ET 200SP not OK
Flashes	Module not ready for operation (no parameters assigned)
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Status LED

Table 14- 2 Meaning of the Status LED

Status	Meaning
Off	Channel disabled
On	Channel activated and no error
On	Channel enabled and error

see also Neutral current In (Page 90)

Error LED

Table 14- 3 Meaning of the Error LED

Status	Meaning
Off	Channel is OK
On	Channel is faulty

PWR LED

Table 14- 4 Meaning of the PWR LED

PWR	Meaning
Off	Line voltage missing
On	Line voltage available

14.2 Interrupts

The analog input module AI Energy Meter HF supports hardware and diagnostic interrupts.

14.2.1 Hardware interrupts

Hardware interrupts

The module generates a hardware interrupt at the following events:

- Violation of low limit 1 to 16
- Violation of high limit 1 to 16

You can find detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment of the local data double word 8 by the start information of the hardware interrupt organization block.

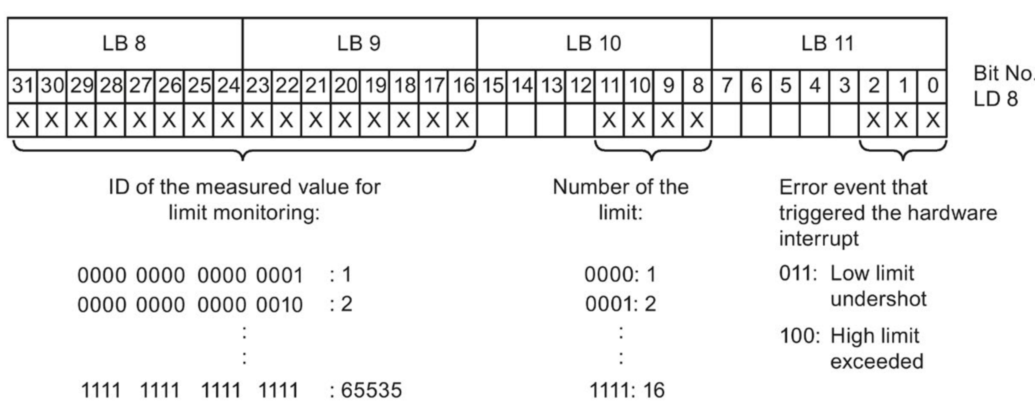


Figure 14-2 Start information of the organization block

14.2.2 Diagnostics interrupt

Diagnostic interrupt

The module generates a diagnostic error interrupt at the following events:

- Power quality
- Channel is temporarily unavailable
- Hardware interrupt lost
- Error
- Supply voltage missing
- Parameter assignment error
- Underflow voltage (tolerance for supply voltage) violated
- Overflow voltage (tolerance for supply voltage) exceeded
- Overload (voltage measured value > 424 mV or tolerance value overcurrent exceeded after the tolerance time has expired)
- Overflow of the calculated values (measured or calculated values screen exceed the representable range of values)

14.3 Diagnostic alarms

Note

Assignment channel in diagnostic message ⇔ Phase

In the diagnostic messages the channels are counted from Channel "0" on, in the AI Energy Meter HF from phase "1" on.

Note the following assignment:

- Channel "0" ⇔ Phase "1"
- Channel "1" ⇔ Phase "2"
- Channel "2" ⇔ Phase "3"

Table 14- 5 Error types

Diagnostic message	Error code	Meaning	Solution
Undervoltage	2_H	Line voltage (measuring range) is monitored for tolerance. Violation leads to voltage overflow/underflow	Observe the line voltage range
Overvoltage	3_H		
Overload	4_H	• The measured current is monitored after the "Tolerance time" for "Tolerance value overcurrent [0.1A]" has expired. Exceeding this results in overflow current. • The maximum value of the secondary voltage (424 mV) is exceeded.	Observe the current range
Error	9_H	Internal module error (diagnostic alarm on channel 0 applies to the entire module).	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Load voltage missing	11_H	Missing or insufficient line voltage at terminal 17	Check supply
External fault	$1A_H$	Voltage swell/dip and overcurrent	see: • Voltage swell of the voltage half-wave value (Page 115) • Voltage dip of the voltage half-wave value (Page 117) • Overcurrent of the current half value (Page 128)
Channel is temporarily unavailable	$1F_H$	Firmware upgrade is being performed. Channel 0 applies to the entire module. The module is currently not performing any measurements.	--
		A user calibration is being executed at the channel.	Complete the user calibration

14.4 Diagnostics response

Diagnostics response

This section describes the response of the AI Energy Meters HF when diagnostics information is reported.

Measured values in the case of diagnostics

Even in the case of diagnostics, measured values continue to be displayed as long as they can still be acquired. If measured values cannot be measured or calculated, "0" is displayed.

Low limit for current measurement undershot (zero suppression)

If the supplied current is less than the configured "Low limit for current measurement" parameter, the current measurement and all dependent variables are suppressed and set to "0".

If current falls below the low limit for the current measurement, the following measured values and derived variables of the affected phase are reset.

- Effective current value
- Active power
- Reactive power
- Apparent power
- Phase angle
- Power factor

A moving mean value is formed from the power values and they only become "0" after a corresponding time. The energy meters for active, reactive and apparent energy as well as the operating hours counters do not count any longer.

If the secondary current fed in at the current measuring channel is higher than 424 mV, the module changes to limitation and the current measurement value and all dependent variables are set to "0".

Input data to "0"

If the AI Energy Meter HF is no longer recognized by the interface module (for example, because it is defective or not plugged in), all input data are set to "0".

14.4.1 Voltage diagnostics

14.4.1.1 Diagnostics: Overflow/underflow

Introduction

You use the parameter "Tolerance factor overvoltage/undervoltage" to define a tolerance range around the set nominal value voltage at the operating point. If the effective value of the primary voltage exceeds this tolerance range, the module reports the diagnostics "overflow" or "underflow".

Calculation of tolerance value measuring voltage

The tolerance value measuring voltage is calculated with the following formula:

Tolerance value measuring voltage = "Nominal value voltage" ± ("Tolerance factor overvoltage/undervoltage [%]" × "Nominal value voltage")

The "Nominal value voltage" is the primary voltage at the operating point.

Parameter assignment

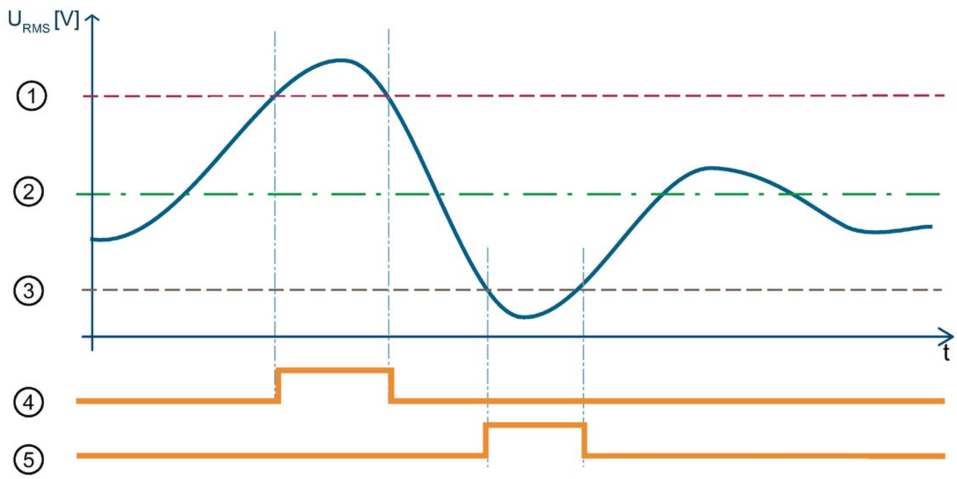
The following table shows the necessary parameters:

Table 14- 6 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics overflow	Enable
Diagnostics underflow	Enable
Nominal value voltage	1 ... 999999 V
Voltage transformer primary voltage	1 ... 999999 V
Voltage transformer secondary voltage	1 ... 500 V
Tolerance factor overflow/underflow	10 ... 50%

Example

The following figure is a schematic diagram of the principle of operation:



① Upper tolerance value measuring voltage
② Nominal voltage
③ Lower tolerance value measuring voltage
④ Diagnostics "overflow"
⑤ Diagnostics "underflow"

Figure 14-3 "Overflow/Underflow" diagnostics of the effective voltage value

The following table shows the parameter assignment for the example:

Table 14- 7 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics overflow	Enable
Diagnostics underflow	Enable
Nominal value voltage	230 V
Voltage transformer primary voltage	1000 V
Voltage transformer secondary voltage	500 V
Tolerance factor overflow/underflow	20%

In this example you define a tolerance range of ± 20%. The tolerance range corresponds to an effective value of primary voltage of ± 46 V.

In the figure the effective value of the primary voltage first exceeds the tolerance range. As long as the effective value of the primary voltage exceeds the tolerance range the module reports the diagnostics "overflow".

The effective value of the primary voltage then exceeds the tolerance range. As long as the effective value of the primary voltage exceeds the tolerance range the module reports the diagnostics "underflow".

14.4.1.2 Voltage swell of the voltage half-wave value

Introduction

Voltage swells are short-term increases in the line voltage which can occur, for example, when switching off large consumers.

With the parameter "Number of cycles for analysis" you define how many measuring cycles the voltage swell must apply at until the module reports the voltage swell. The module reports the diagnostics "Power quality". The module also sets the qualifier bit 6 for the respective phase in data record DS 160 (Page 258). If the voltage lies below the limit for voltage swell again, the module sets the diagnostics "Power quality" again and resets the qualifier bit 6 again.

The AI Energy Meter HF returns the maximum value and the duration of the voltage swell, e.g. in data record 160. The duration is determined exactly to ± 2 cycles.

In the event of voltage swell again, only the diagnostics "Power quality" is reported again and the duration, and if applicable, the maximum voltage swell value is updated.

Calculation of voltage swell limit value

The Voltage swell limit value is the value from which level of voltage the AI Energy Meter HF recognizes a voltage swell.

The "Voltage swell limit value" is calculated by the following formula:

Voltage swell limit = "Nominal value voltage" + ("Voltage swell limit [%]" × "Nominal value voltage")

The "Nominal value voltage" is the primary voltage at the operating point.

Parameter assignment

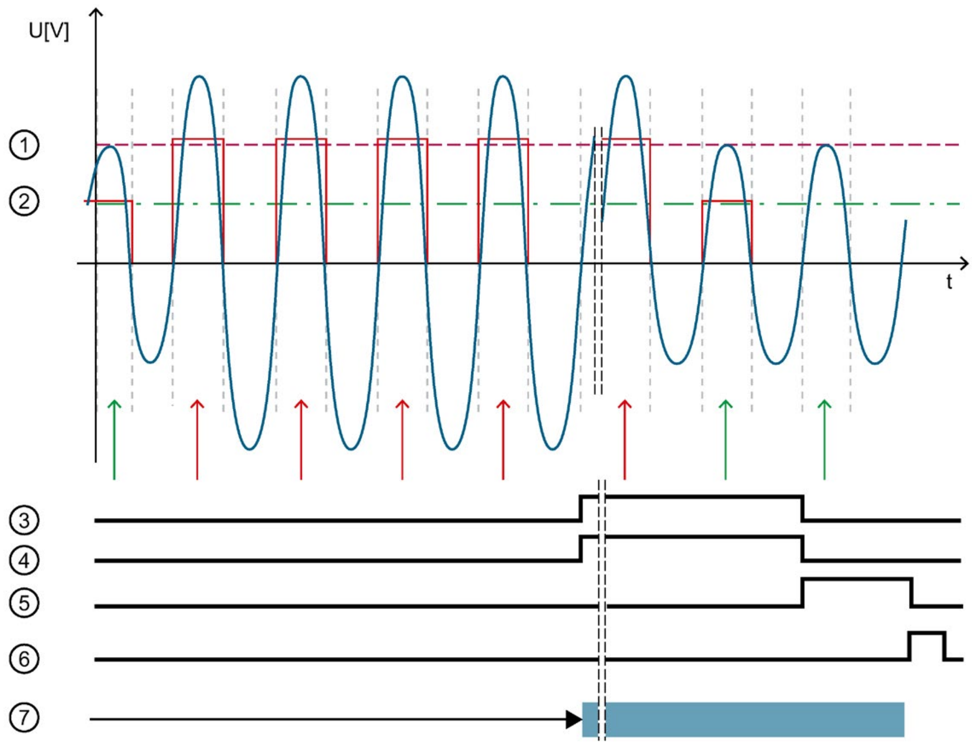
The following table shows the necessary parameters:

Table 14- 8 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4 ... 32767
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal value voltage	1 ... 999999 V
Voltage swell limit	1 ... 1000%

Example

The following figure is a schematic diagram of the principle of operation:



① Voltage swell limit
② Nominal voltage
③ Diagnostics "power quality"
④ Qualifier Bit 6
⑤ Status "Power quality voltage swell"
⑥ Bit "Reset status "power quality""
⑦ Min. voltage swell (half-wave) and duration can be read

Figure 14-4 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 9 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal value voltage	230 V
Voltage swell limit	40%

If the module detects that the "Voltage swell limit value" has been exceeded:

- The module reports the diagnostics "Power quality" from "Number of cycles for analysis" as long as there is a voltage swell.
- The module sets the qualifier bit 6 from "Number of cycles for analysis" as long as there is a voltage swell.
- After the module has reset the diagnostics "Power quality" and reset the qualifier bit again, Bit 1 is set.

As long as Bit 1 is set, the module returns the maximum value and the duration of the voltage swell, e.g. in data record 160.

You reset Bit 1 with the bit "reset status "power quality"".

14.4.1.3 Voltage dip of the voltage half-wave value

Introduction

Voltage dips are short-term decreases in the line voltage which can occur, for example, when switching on large consumers.

With the parameter "Number of cycles for analysis" you define how many measuring cycles the voltage dip must be present until the module reports the voltage dip. If the voltage lies above the "Voltage dip limit" again, the module sets the diagnostics "Power quality" and resets the qualifier bit 5 again.

The AI Energy Meter HF returns the maximum value and the duration of the voltage dip, e.g. in data record DS 160 (Page 258). The duration is determined exactly to ± 2 cycles.

In the event of voltage dip, the module reports a "Power quality" diagnostic. The module also sets the qualifier bit 5 for the respective phase in data record DS 160. In the event of voltage dip again, only the "Power quality" diagnostics is reported again and the duration, and if applicable, the minimum voltage dip value is updated.

Calculation of voltage dip limit

The voltage dip limit is the value from which level of voltage the AI Energy Meter HF detects a voltage dip.

The voltage dip limit is calculated by the following formula:

Voltage dip limit = "Nominal value voltage" - ("Voltage dip limit [%]" × "Nominal value voltage")

The "Nominal value voltage" is the primary voltage at the operating point.

Parameter assignment

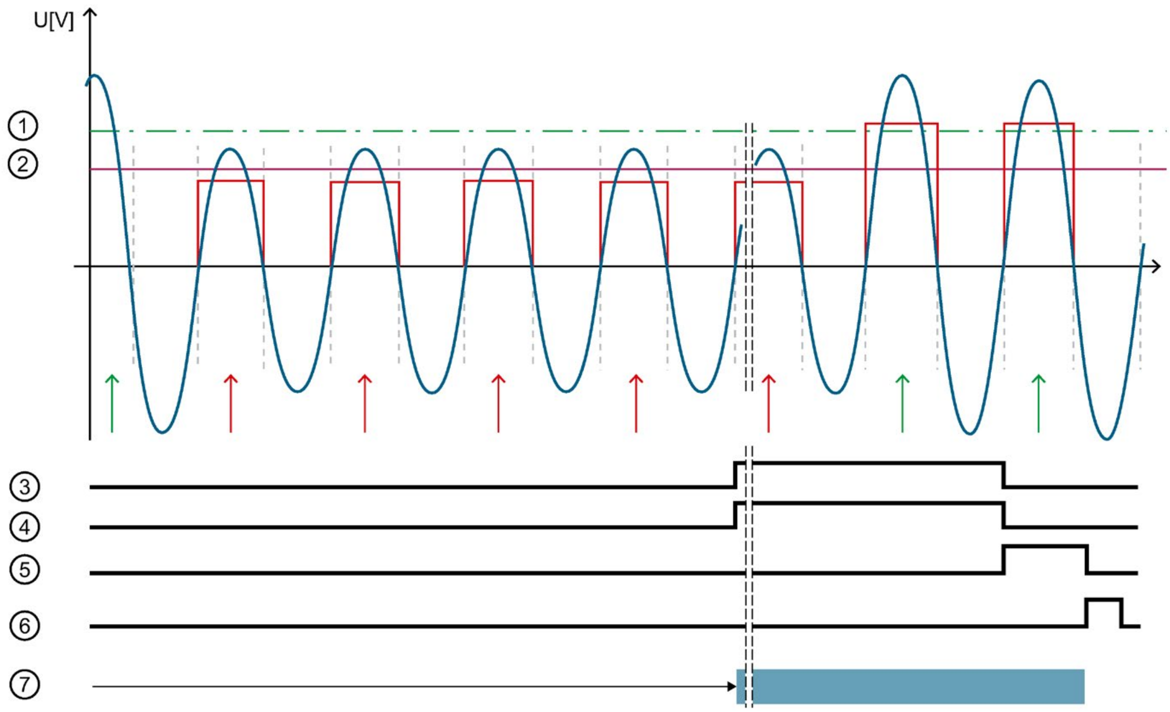
The following table shows the necessary parameters:

Table 14- 10 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4 ... 32767
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal value voltage	1 ... 999999 V
Voltage dip limit	1 ... 100%

Example

The following figure is a schematic diagram of the principle of operation:



① Nominal voltage
② Voltage dip limit
③ Diagnostics "power quality"
④ Qualifier Bit 0
⑤ Status "Power quality voltage dip"
⑥ Bit "Reset status "power quality""
⑦ Min. voltage dip (half-wave) and duration can be read

Figure 14-5 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 11 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Number of cycles for analysis	4
Diagnostics power quality	Enable
Determination of voltage swell and dip	Enable
Nominal voltage	230 V
Voltage dip limit	50%

If the module detects that the "Voltage dip limit" has been undershot:

- The module reports the diagnostics "Power quality" from "Number of cycles for analysis" as long as there is a voltage dip.
- The module sets the qualifier bit 5 from "Number of cycles for analysis" as long as there is a voltage dip.
- After the module has reset the diagnostics "Power quality" and reset the qualifier bit again, bit 0 is set.

As long as bit 0 is set, the module returns the minimum value and the duration of the voltage dip, e.g. in data record 160.

You reset Bit 0 with the bit "Reset status "power quality"".

14.4.1.4 Peak values of the instantaneous values for voltage

Introduction

The AI Energy Meter HF determines the maximum instantaneous value for the voltage for up to three phases.

The function "Detect peak value voltage" returns the largest voltage value and the associated phase. The module sets the qualifier bit 2 ("Power quality voltage peak") for the phase in question. You can read the maximum voltage value, for example, in the data record DS 160 (Page 258).

Voltage peak detection is based on the function for recording swells of the supply voltage in accordance with IEC 61000-4-30. This function is used to record the maximum voltage value in the supply network. In three-phase systems this function is only useful if the system is symmetrical and when all phases show the same voltage transformers.

Accordingly, measurement always records only the peak value over all phases. In addition to the requirements of IEC 61000-4-30, the phase on which the peak value voltage occurred is detected.

For metrological reasons, only the phase concerned that shows this maximum value can be returned. This may mean that the maximum voltage values of the other phases remain "0". With a "reset power quality analysis" the analysis starts afresh and the current results are discarded.
