## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This documentation provides you with important information on how to configure, install, wire and commission the SIMATIC ET 200AL distributed I/O system.

## Changes compared to previous version

This manual contains the following changes compared to the previous version:

- Update of the section Safety-related shutdown of ET200AL standard modules (Page 110)
- Additions to the fail-safe I/O module

## Basic knowledge required

A basic knowledge of automation technology is required to understand the documentation.

## Validity of the documentation

This documentation is valid for the SIMATIC ET 200AL distributed I/O system.

## Conventions

Please observe notes labeled as follows:

---

### Note

A note contains important information on the product described in the documentation and on the handling of the product to which particular attention should be paid.

---

## Special information

---

### Note

#### Important note for maintaining operational safety of your plant

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we inform you in personal notifications about product developments and features that are (or could be) relevant to the operation of systems from a safety perspective.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

- 

### Note

When using F-CPU's in safety mode and fail-safe modules, observe the description of the SIMATIC Industrial Software SIMATIC Safety - Configuring and Programming (<https://support.industry.siemens.com/cs/ww/de/view/54110126/en>) fail-safe system.

---

## Recycling and disposal

For ecologically sustainable recycling and disposal of your old device, contact a certificated disposal service for electronic scrap and dispose of the device in accordance with the regulations in your country.

## Additional support

- Information about Technical Support is available in section Siemens Industry Online Support (Page 5).
- The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (<https://www.siemens.com/simatic-tech-doku-portal>).
- Information about the online catalog and online order system is available in section Industry Mall (Page 6).

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

## Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

For answers and solutions concerning automation technology.

- **mySupport**

Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (<https://www.siemens.com/automation/service&support>).

## Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet.

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet  
(<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

# System overview

## 2.1 What is the SIMATIC ET 200AL distributed I/O system?

### SIMATIC ET 200AL

The SIMATIC ET 200AL distributed I/O system is a scalable and highly flexible, distributed I/O system for connecting process signals to a higher-level control system with a field bus.

### Customer benefits of the system

#### Easy to use

- Easy wiring thanks to color-coded connectors
- CAx compliant labeling of all interfaces
- Fast, convenient configuration and commissioning with STEP 7 (TIA Portal)
- Configuration customizing for future extension through integrated configuration control

#### Energy efficiency

- PROFINET as integrated function

#### Compact design

- High IO configuration limits for module widths of 30 mm or 45 mm and up to 32 modules for each ET 200AL
- High degree of protection IP65/IP67
- Adequate for temperatures from -30 °C/-25 °C to +55 °C and accelerations up to 10g

#### Flexible mounting

- Easy mounting in all mounting positions - even in small spaces
- Spatially separated mounting of the modules by means of a backplane bus designed as a cable (= ET connection)
- Flexible connection to PROFINET, PROFIBUS or integration in SIMATIC ET 200SP
- Integration of sensors and actuators through M8 and M12 connection technology

#### Communication standards

- PROFINET IO
- PROFIBUS DP
- IO-Link
- PROFI-safe

#### Powerful technology

- Module with counting function
- Fail-safe modules

Figure 2-1 ET 200AL benefits

## Area of application

The SIMATIC ET 200AL distributed I/O system is especially well suited for use in tight spaces, moving applications and for assembly and handling technology. Thanks to its scalable construction, you have the option to precisely customize its configuration to your on site needs.

The SIMATIC ET 200AL distributed I/O system features degree of protection IP65/IP67. The I/O modules are suitable for distributed use indoors on a machine or assembly line.

## Setup

The SIMATIC ET 200AL distributed I/O system is made up of the following components:

- Interface modules (PROFINET/PROFIBUS)
- Digital and analog I/O modules
- Communication module

After an interface module you can configure 2 lines (ET-Connection), each with 16 modules.

Alternatively, you can configure a line with 16 I/O modules on the SIMATIC ET 200SP distributed I/O system with BaseUnit BU-Send and the BusAdapter BA-Send 1xFC.

The ET-Connection backplane bus is designed as a cable. This allows you to create spatial distances of up to 15 m between the modules.

## 2.1 What is the SIMATIC ET 200AL distributed I/O system?

### Configuration example

The figure below shows a configuration example of the SIMATIC ET 200AL distributed I/O system with a PROFINET interface module.

Figure 2-2 Configuration example of the ET 200AL

## 2.2 What are fail-safe automation systems and fail-safe modules?

### Fail-safe automation systems

Fail-safe automation systems are mainly used in applications where failure could have consequences for the safety of people and/or the environment. Fail-safe systems are therefore intended to reduce hazards or failures that could cause physical damage. Their purpose is to ensure a tolerable level of risk.

F-systems are used to control processes and provide a safe operating state when faults are detected. Fault detection is ensured by a very high level of diagnostic coverage. When a fault is detected, appropriate actions are initiated to bring the affected application to a safe state.

F-systems offer improved fault detection and fault localization through detailed diagnostics and diagnostic messages. This is the most important difference between fail-safe systems and standard systems. The use of fail-safe systems should be considered for applications where hazards are inherent and can cause physical damage.

### Safety Integrated

Safety Integrated is the integrated safety concept for automation and drive technology from Siemens.

Proven technologies and systems from automation technology are used for safety systems. Safety Integrated includes the complete safety sequence, ranging from sensor, actuator and fail-safe modules right through to the controller, including safety-related communication via standard fieldbuses. Drives and controllers handle safety tasks in addition to their actual functions.

### Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard modules is that they have an internal two-channel design. This means the two integrated processors monitor each other, automatically test the input and output circuits, and switch the fail-safe module to a safe state in the event of a fault.

The F-CPU communicates with a fail-safe module via the safety-related PROFIsafe bus profile.

### Possible uses of ET 200AL with fail-safe modules

The use of ET 200AL with fail-safe modules makes it possible to replace conventional mounting technology in safety technology with PLC components. This also includes the replacement of switchgear for EMERGENCY STOP, safety door monitoring, ambidextrous operation, etc.

Fail-safe modules for ET 200AL are supported together with the STEP 7 Safety Advanced V17 or higher option package.

F-modules for ET 200AL can be used either with an ET 200AL PROFINET interface module (IM), a direct ET connection to an ET 200SP F-CPU or a direct ET connection to an ET 200SP IM (mixed configuration).

### Use in SIMATIC Safety F-systems

The fail-safe ET 200AL modules can be used with STEP 7 Safety Advanced from V17 with PROFINET and direct ET connection configurations together with an F-CPU.

The fail-safe modules can only be used in safety mode. Fault safe and non-fault safe modules can be combined within one ET 200AL ET connection.

### Achievable safety classes

The fail-safe modules are equipped with integrated safety functions for safety mode.

You can achieve the safety classes of the table below:

- With the appropriate parameter assignment of the safety functions in STEP 7
- With a specific combination of fail-safe and non-fail-safe I/O modules
- With a special arrangement and wiring of the sensors and actuators

Table 2- 1 Safety classes that can be achieved with ET 200AL in safety mode

| Safety class in safety mode |                          |                          |
|-----------------------------|--------------------------|--------------------------|
| According to IEC 61508      | According to ISO 13849-1 |                          |
| SIL2                        | Category 3               | (PL) Performance Level d |
| SIL3                        | Category 3               | (PL) Performance Level e |
| SIL3                        | Category 4               | (PL) Performance Level e |

#### WARNING

**The safety performance of your installation depends on the design and ongoing maintenance of the individual complete safety function.**

SIMATIC fail-safe CPUs and ET 200AL fail-safe modules have logic processing components with certified safety integrity levels, provided they are operated in accordance with classifications, specifications, and instructions.

Failure to adhere to this may cause damage or unpredictable operation, resulting in fatal or serious injury and/or property damage.

To achieve the level of safety you require, you need to select all components of your plant and construct and maintain them in accordance with accepted safety standards and practices.

## 2.3 Components

### Components of the ET 200AL distributed I/O system

The following table shows and explains the function of the most important components of the ET 200AL distributed I/O system.

Table 2- 2 Components of the ET 200AL distributed I/O system

| Components                       | Function                                                                                                                                                                                                                                                                                                                                                             | View                                                                                  |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Interface module for PROFINET IO | <ul style="list-style-type: none"> <li>The interface module connects the ET 200AL distributed I/O system with the IO controller</li> <li>Exchanges data with the I/O modules via ET-Connection</li> </ul>                                                                                                                                                            |    |
| Interface module for PROFIBUS DP | <ul style="list-style-type: none"> <li>The interface module connects the ET 200AL distributed I/O system with the DP master</li> <li>Exchanges data with the I/O modules via ET-Connection</li> </ul>                                                                                                                                                                |   |
| I/O modules                      | <ul style="list-style-type: none"> <li>The I/O modules form the interface to the process</li> <li>Recording and controlling the current process status via the connected sensors and actuators</li> </ul>                                                                                                                                                            |  |
| eCoding plug connector           | Electronic coding element with an overwriteable electronic memory for module-specific fail-safe address data (for example, the F-destination address)                                                                                                                                                                                                                |  |
| Y-cable                          | <p>Y-cable connects multiple actuators or sensors to inputs or outputs. There are two types:</p> <ul style="list-style-type: none"> <li>Y-cable: Connects inputs or outputs of the module to several actuators or sensors.</li> <li>Inverted Y-cable: Connects several fail-safe inputs or outputs of the F-module with one or more sensors and actuators</li> </ul> |  |
| Identification labels            | <ul style="list-style-type: none"> <li>The identification labels come with the module and can be machine printed</li> <li>Can be ordered separately in white or yellow for fail-safe modules</li> </ul>                                                                                                                                                              |  |

## 2.3 Components

| Components                                    | Function                                                        | View                                                                                |
|-----------------------------------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Bus cable and M8 connector for ET-Connection  | The bus cable creates the bus connection between the modules    |  |
| Power cable and M8 connector for power supply | The power cable provides power to the modules                   |  |
| Stripping tool ET-Connection                  | The stripping tool is used to strip the ET-Connection bus cable |  |

## Application planning

### 3.1 Hardware configuration

#### Mechanical maximum configuration

The following tables show the rules of the mechanical configuration. As soon as one of the following rules applies, the maximum configuration has been reached.

Table 3- 1 Maximum mechanical configuration - on ET 200AL interface module

| Properties                                          | Rule (max.)                                     |                                                 |
|-----------------------------------------------------|-------------------------------------------------|-------------------------------------------------|
|                                                     | Interface modules as of firmware version V1.0.0 | Interface modules as of firmware version V1.0.1 |
| Number of ET 200AL I/O modules in the configuration | 32                                              |                                                 |
| Number of ET-Connection outlets                     | 2                                               |                                                 |
| Number of I/O modules per ET-Connection outlet      | 16                                              |                                                 |
| Spatial extension per ET-Connection line            | 160 m                                           | 240 m                                           |
| Cable length between the modules                    | 10 m                                            | 15 m                                            |

Table 3- 2 Maximum mechanical configuration - on ET 200SP with interface module

| Properties                                          | Rule (max.)                                     |                                                 |
|-----------------------------------------------------|-------------------------------------------------|-------------------------------------------------|
|                                                     | Interface modules as of firmware version V3.0.0 | Interface modules as of firmware version V3.3.0 |
| Number of ET 200AL I/O modules in the configuration | 16                                              |                                                 |
| Number of ET-Connection outlets                     | 1                                               |                                                 |
| Spatial extension ET-Connection line                | 160 m                                           | 240 m                                           |
| Cable length between the modules                    | 10 m                                            | 15 m                                            |

Table 3- 3 Maximum mechanical configuration - on ET 200SP with CPU

| Properties                                          | Rule (max.)                             |  |
|-----------------------------------------------------|-----------------------------------------|--|
|                                                     | CPUs with firmware version as of V2.0.0 |  |
| Number of ET 200AL I/O modules in the configuration | 16                                      |  |
| Number of ET-Connection outlets                     | 1                                       |  |
| Spatial extension ET-Connection line                | 240 m                                   |  |
| Cable length between the modules                    | 15 m                                    |  |

## Electrical maximum configuration

The number of usable I/O modules of a potential group is limited by the following points:

- Power requirements of the I/O modules
- Power requirements of the components supplied via these I/O modules

The maximum infeed current of the I/O modules is 4 A with 1L+ supply voltage (non-switched) and 2L+ load voltage (switched). When the maximum infeed current has been reached, you must open a new potential group.

## Reference

You will find more information in the section Connecting cables for ET 200AL (Page 50).

## 3.2 Configuration variants with ET-Connection

### 3.2.1 ET 200AL with ET-Connection

Every ET 200AL interface module has 2 ET-Connection connections

From every ET-Connection, you have the option to set up a line with a maximum of 16 ET 200AL I/O modules.

#### ET-Connection1

The figure below shows a configuration in the IP65/IP67 environment with one ET-Connection line.

Figure 3-1 ET 200AL with ET-Connection1

## ET-Connection1 and ET-Connection2

The figure below shows a configuration in the IP65/IP67 environment with two ET-Connection lines

Figure 3-2 ET 200AL with ET-Connection1 and ET-Connection2

### 3.2.2 Hybrid configuration ET 200AL/ET 200SP with ET-Connection

#### Hybrid configuration ET 200AL and ET 200SP

You have the possibility to integrate standard and fail-safe I/O modules of the distributed I/O systems ET 200AL (IP65/IP67) into a configuration of the distributed I/O system ET 200SP (IP20). Fail-safe and non-fail-safe modules may be combined at will in the ET 200AL distributed I/O system.

The figure below shows a combination of the modules of the ET 200AL and ET 200SP distributed I/O systems.

Figure 3-3 Hybrid configuration ET 200SP and ET 200AL with ET-Connection

#### Requirement

For a hybrid configuration, you need at least the following components:

- Interface module or CPU

---

#### Note

##### Use of a F-CPU with F-modules

A fail-safe CPU must also be used when using a fail-safe module in the ET 200AL.

---

- BaseUnit BU-Send with BusAdapter BA-Send 1xFC
- ET-Connection cable pre-assembled on one side
- Power cable pre-assembled on one side

## Rules

When putting together a hybrid configuration, you must observe the following rules:

- The bus length of the ET 200SP distributed I/O system is a maximum of 1 m (excluding interface module/CPU, including BU-Send, BA-Send 1×FC and server module).
- A maximum of 16 ET 200AL I/O modules can be connected to ET-Connection.
- The maximum length of the bus cable for ET-Connection between two modules is 15 m.

## Rules

The following table shows a rough overview of the functions of the ET 200AL I/O modules in combination with the ET 200SP.

| Function              | Hybrid configuration |     |                                       |
|-----------------------|----------------------|-----|---------------------------------------|
|                       | ET 200SP             |     | ET 200AL I/O modules on ET connection |
|                       | IM                   | CPU |                                       |
| Isochronous mode      | ●                    | --  | --                                    |
| Configuration control | ●                    | ●   | ●                                     |
| Shared device         | ●                    | ●   | ●                                     |
| PROFenergy            | ● <sup>1</sup>       | --  | ● <sup>1</sup>                        |
| System redundancy S2  | ● <sup>2</sup>       | --  | ● <sup>2</sup>                        |

<sup>1)</sup> PROFenergy is not supported by fail-safe I/O module F-DI 4+F-DQ 2x24VDC/2A, 4xM12

<sup>2)</sup> With IM 155-6 PN/3 HF and IM 155-6 PN/2 HF as of V4.2

Details on the hybrid configuration are available here

(<https://support.industry.siemens.com/cs/de/en/view/100300517>).

## Procedure

Watch video sequence (<https://support.industry.siemens.com/cs/ww/en/view/95886672>)

Proceed as follows to put together a multi-tier configuration:

1. Mount the BaseUnit BU-Send directly to the right of the ET 200SP interface module or the ET 200SP CPU.
2. Then install the other BaseUnits/I/O modules for the ET 200SP distributed I/O system and the server module.
3. Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1×FC and install it on the BaseUnit BU-Send.
4. Fasten the BusAdapter BA-Send 1×FC with the BaseUnit BU-Send (1 screw with tightening torque of 0.2 Nm). Use a screwdriver with a 3 to 3.5 mm blade to do this.
5. Connect the other end of the bus cable for ET-Connection (with M8 plug) to the first ET 200AL I/O module (socket X30 ET-Connection IN).
6. Connect the supply voltage (24 V DC) to the ET 200AL I/O modules (X80 plug).

# Mounting

## 4.1 Basics

### Introduction

All the modules of the ET 200AL distributed I/O system are designed for the degree of protection IP65/IP67. This means that you can directly mount this system in your plant.

### Installation position

You can mount the ET 200AL distributed I/O system in any position.

### Minimum clearances

At ambient temperatures of 50 °C or higher, please ensure that the module is mounted at a distance of least 1 cm from an adjacent module or another device.

### Mounting rules

When mounting the modules, you do not need to following any special rules.

---

#### Note

#### Mounting of the modules

Mount the ET 200AL distributed I/O system only with disconnected supply voltages.

---

## 4.2 Mounting modules

### Introduction

The modules of the ET 200AL distributed I/O system are designed for installation on a level, firm surface.

Thanks to the axisymmetrical drill holes in the modules, you have the option to fasten the modules on an aluminum profile using tee nuts.

The following images shows the aluminum profile on which you can mount the modules.

Figure 4-1 Aluminum profile

### Required tools

For installation, you need a screwdriver or an Allen wrench.

### Required screws

The following table shows and explains the screw types required to mount the modules.

Table 4- 1 Recommended screws

| Screw type                                                              | Explanation                                                                                                   |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Socket head cap screw M4 according to DIN EN ISO 1207 / DIN EN ISO 1580 | The screw length must be at least 30 mm.<br>If you need washers, use DIN EN ISO 7089/DIN EN ISO 7090 washers. |
| Hexagon socket head cap screw M4 according to DIN EN ISO 4762           |                                                                                                               |

### Drill holes of the modules

All modules of the ET 200AL distributed I/O system feature a uniform drill pattern.

- All module housings are axisymmetrical.
- The distance between the top and bottom drill hole is identical for all modules.

### Mounting interface module and 45 mm I/O modules (front)

Watch video sequence (<https://support.industry.siemens.com/cs/ww/en/view/95886672>)

The interface modules and the 45 mm I/O modules have an attachment point on top and on the bottom.

To mount an interface module or 45 mm I/O module, follow these steps:

1. Drill 2 fastening holes with 4.5 mm diameter at a distance of 149.6 mm.
2. Fasten the interface module or the 45 mm I/O module with the screws to both fastening points (tightening torque 1.2 Nm).

The figure below shows the dimensions for fastening the IM 157-1 PN interface module and the DQ 8x24VDC/2A 8xM12 45 mm I/O module.

Figure 4-2 Dimensions for mounting interface modules and 45 mm I/O modules

### Mounting 30 mm I/O modules (front or side)

Watch video sequence (<https://support.industry.siemens.com/cs/ww/en/view/95886672>)

The 30 mm I/O modules have an attachment point on top and on the bottom. You also have the option of fastening the 30 mm I/O modules at the side. When fastening them at the side, you must use the supplied spacers.

To mount a 30 mm I/O module, follow these steps:

1. Drill 2 fastening holes with 4.5 mm diameter at a distance of 149.6 mm.
2. Use the supplied spacers for side fastening of the I/O module on the top and bottom (on one side adjacent to the fastening surface).
3. Fasten the I/O module with the screws to both fastening points (tightening torque 1.2 Nm).

The figure below shows the dimensions for fastening the 30 mm I/O modules using the example of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 I/O module.

Figure 4-3 Dimensions for mounting 30 mm I/O modules

### Fastening for cable ties

All module of the ET 200AL distributed I/O system have an integrated attachment point for cable ties. The attachment points are found on all four corners of the modules.

The figure below shows the top left attachment point for 2.5 mm wide cable ties for fastening the cables.

Figure 4-4 Top left attachment point for cable ties

# Connecting

## 5.1 Rules and regulations for operation

### Introduction

Depending on the area of application, the ET 200AL distributed I/O system, as a component of plants and systems, requires that special rules and specifications be followed.

This section gives an overview of the most important rules to be followed for integration of the ET 200AL distributed I/O system in a plant or in a system.

### Specific application

Follow the safety and accident prevention regulations applicable to specific applications, e.g. the machinery directive.

### EMERGENCY-STOP device

EMERGENCY-STOP devices according to IEC 60204 (corresponds to DIN VDE 113) must remain in effect in all operating modes of the plant or system.

### Excluding hazardous system conditions

Hazardous plant states must not occur.

Ensure that dangerous system conditions are excluded, even in the following situations:

- In the event of a voltage dip or power outage
- When the plant restarts after a voltage dip or power outage
- When the ET 200AL distributed I/O system restarts after interruption of PROFINET communication

If necessary, force the EMERGENCY OFF.

An uncontrolled or undefined startup is not permitted after the "EMERGENCY STOP" is unlocked.

### Cables and wires

Make sure that the cables used (incl. connectors) are approved for a continuous operating temperature of at least 70 °C.

### External fuses/switches

External fuses and switches must be installed so that they meet the standards for cable and device protection applicable to your application.

### Line voltage of the SELV/PELV power supply

The following section describes what you need to pay attention to with respect to the line voltage (you will find additional information in the section Information on insulation, protection class, degree of protection, and rated voltage (Page 108)):

- For stationary plants or systems without an all-pole line disconnecter, there must be a disconnecter unit (all-pole) fitted in the building installation.
- For load current supplies, the configured rated voltage range must correspond to the local line voltage.
- For all power circuits of the ET 200AL distributed I/O system, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance.

## 24 V DC supply

Below there is a description of what you need to pay attention to with 24 V DC supply:

- For buildings:  
If there is a danger due to overvoltages, you must take lightning protection measures for external lightning protection (e.g. lightning protection elements).
- With 24 V DC supply lines and signal lines:  
If there is a danger due to overvoltages, you must take lightning protection measures for internal lightning protection (e.g. lightning protection elements. You will find additional information in the Designing interference-free controllers (<https://support.industry.siemens.com/cs/ww/en/view/59193566>) function manual).
- For 24 V DC supply:  
Ensure that there is a safe (electrical) separation of low voltage (SELV/PELV) according to IEC 61010-2-201 or IEC 60950-1.  
You must secure all feeding supply voltages with a UL/IEC approved fuse 24 V DC/4 A (trigger characteristic type B or C).
- Continuous operation of fail-safe modules with more than 28.8 V DC can result in personal injury and equipment damage.

### WARNING

**Continuous operation of fail-safe modules with more than 28.8 V DC can result in personal injury and equipment damage.**

Certain transients from certain source impedances (for example according to EN 61000-4-2, 61000-4-4 and 61000-4-5), as specified in the "Electromagnetic compatibility" section, can act on this voltage without interrupting operation or causing damage.

Operate the fail-safe module within the voltage parameters specified in the technical specifications. This will avoid unacceptable temperature increases and heat damage that will cause the module to lose its functionality.

## Requirements for power supplies in the event of a power interruption

To ensure compliance with IEC 61131-2, use only power supply units/power supplies with a power failure bridging time of at least 20 ms. Observe the relevant requirement in your product standards (e.g. 30 ms for "burners" according to EN 298) with regard to possible voltage interruptions. You can find the latest information on power supply components on the Internet.

### Protection against outside electrical influences

Below is a description of what you must pay attention to in terms of protection against electrical impacts and/or faults:

- For all plants or systems in which the ET 200AL distributed I/O system is integrated, you must ensure that the equipment or system is functionally grounded to discharge electromagnetic interference.
- For supply, signal and bus cables, you must ensure that the cable routing and installation is correct.
- For signal and bus cables, you must ensure that a wire/cable breakage or a cross-wire does not lead to undefined states of the plant or system.

### Reference

Additional information can be found in the function manual Designing interference-free controllers (<https://support.industry.siemens.com/cs/ww/en/view/59193566>).

## 5.2 Additional rules and regulations for the operation of the ET 200AL with fail-safe modules

### 5.2.1 Safety extra-low-voltage (SELV, PELV) for fail-safe modules

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <b>WARNING</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>The fail-safe modules must be operated with a safe extra-low voltage (SELV, PELV).</b></p> <p>You can find additional information on safety extra-low voltage (SELV, PELV) in the data sheets of the applicable power supplies, for example.</p> <p>The fail-safe modules operate at a rated voltage of 24 V DC. The tolerance range is 20.4 V DC to 28.8 V DC.</p> <p>Within the overvoltage range from 28.8 V DC to 35 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages higher than 35 V DC, the F-modules are permanently de-energized.</p> <p>Use a power supply unit that does not exceed <math>U_m = 35</math> V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g. use of an overvoltage protector.</p> <p>All system components that can supply electrical energy in any form whatsoever must fulfill this condition.</p> <p>Each additional circuit (24 V DC) used in the system must have a safety extra-low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.</p> <p>Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safety extra-low voltage (SELV, PELV) as well. The process signal of a 24 V DC digital module must not exceed a fault voltage <math>U_m</math> in the event of a fault.</p> |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <b>WARNING</b>                                                                                                                                                                                                                                                                                                                                             |
| <p>Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.</p> <p>An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the fault voltage <math>U_m</math> to be exceeded.</p> |

### Immunity to surge voltages

To meet the product standard for burner controls (EN 298), the wiring must be equipped with external protection against coupled surge voltages caused by lightning. Further information on this can be found in the function manual Designing interference-free controllers (<https://support.industry.siemens.com/cs/ww/en/view/59193566>).

## 5.2.2 Requirements for sensors and actuators for fail-safe modules

### General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

#### WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have proof-test intervals of 20 years as defined in IEC 61508:2010 without considerable loss of safety.

The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".

To achieve the required safety class, suitably qualified sensors and actuators are necessary.

### Additional sensor requirements

General rule: To achieve SIL3/Cat. 3/PL<sub>e</sub>, a single-channel sensor is adequate. However, to achieve SIL3/Cat. 3/PL<sub>e</sub> with a single-channel sensor, the sensor itself must be SIL3/Cat. 3/PL<sub>e</sub>-capable; otherwise the sensor must be connected by two channels to achieve this safety level.

To achieve SIL3/Cat. 4/PL<sub>e</sub>, sensors must be connected by two channels.

#### WARNING

In the case of fail-safe input modules, the value "0" is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.

Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the relevant actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

## Duration requirements for sensor signals

### WARNING

Observe the following requirements for sensor signals:

- To ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- For pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

### Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in the section "Response times" of the relevant F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

## Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

Fast reacting actuators may briefly drop out or be activated during the test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

### WARNING

If the actuators switch voltages greater than 24 V DC (e.g. 230 V AC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (in accordance with IEC 60664-1).

This is generally the case for relays and contactors. Particular attention must be paid to this with semiconductor switching devices.

## Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

### 5.2.3 Crosstalk of digital input/output signals

Readback errors may occur on the F-DQ channels if the fail-safe digital output signals and fail-safe digital input signals are routed through a single cable.

**Cause: capacitive crosstalk**

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. A cross circuit/short-circuit is detected, which leads to safety-related tripping.

**Remedy:**

- Separate cables for fail-safe DQ modules and non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it.

**Cause: magnetic crosstalk**

Note that an inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

**Remedy:**

- Separate the inductive loads spatially or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

## 5.3 Operation of the ET 200AL on grounded/non-grounded infeed

### Introduction

Information is provided below on the overall configuration of an ET 200AL distributed I/O system on a grounded incoming supply (TN-S network). The specific subjects discussed are:

- Disconnecting devices, short-circuit and overload protection to IEC 60364 (corresponding to DIN VDE 0100) and IEC 60204 (corresponding to DIN VDE 0113)
- Load current supplies and load circuits
- Supply voltages of the ET 200AL distributed I/O system

### Grounded infeed

In grounded incoming supplies, the neutral conductor of the supply system is grounded. A simple ground fault between a live conductor and ground or a grounded section of the plant causes the protective devices to trip.

### Supply voltages

Provide the ET 200AL distributed I/O devices with a SELV/PELV supply voltage for 1L+. The supplied SELV/PELV load voltage for 2L+ can be switched, depending on the application.

- 1L+: Supply voltage (non-switched)
- 2L+: Load voltage (switched)

### Safe electrical separation (SELV/PELV)

Mains devices/power supply modules with secure electrical separation SELV/PELV are required for the operation of the ET 200AL distributed I/O system. These power supplies/power supply modules must comply with IEC 61010-2-201.

The wiring of SELV/PELV circuits must be separated from the wiring of non-SELV/PELV circuits. Alternatively, the insulation of all conductors must be dimensioned for the higher voltage.

|                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------|
| <b>NOTICE</b>                                                                                                    |
| <b>Operation in damp/wet environments</b>                                                                        |
| When operating in a damp/wet environment, other voltage limits apply for SELV/PELV according to IEC 61010-2-201. |

### Configuring ET 200AL with grounded reference potential

When configuring the ET 200AL distributed I/O system with grounded reference potential, occurring interference currents are discharged into functional earth. The connections must be externally connected (connection between 1M and FE).

### Configuring ET 200AL with ungrounded reference potential

When configuring the ET 200AL distributed I/O system with non-grounded reference potential, occurring interference currents are discharged via an internal RC network to functional earth (no external connection between 1M and FE).

### ET 200AL in the overall configuration

The figure below shows the ET 200AL distributed I/O system in the complete electrical configuration using the example of an interface module.

Figure 5-1 Electrical configuration

## Components and protective measures

Various components and protective measures are stipulated for setting up a complete plant. The types of components and the degree to which the protective measures are mandatory depend on the IEC regulation that applies to your plant setup.

The following table shows the components of the electrical configuration with reference to the previous figure and compares the IEC regulations.

Table 5- 1 Components of electrical configuration

|                                                              | Reference to illustration | IEC 60364 (DIN VDE 0100)                                                                                      | IEC 60204 (DIN VDE 0113)                               |
|--------------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| Disconnection element for controller, sensors, and actuators | ①                         | Main switch                                                                                                   | Disconnecter                                           |
| Short-circuit / over-load protection                         | ②                         | Single-pole protection of circuits<br>Secure all incoming supply cables with a circuit breaker (24 V DC/4 A). | Secure with one pole with a grounded secondary circuit |
| Cable protection                                             | ③                         | Protection of cables and wires against overcurrent                                                            | -                                                      |

## Insulation monitoring

In the following situations, you must provide insulation monitoring.

- When configuring the ET 200AL distributed I/O system with non-grounded reference potential
- When hazardous system conditions may occur due to errors

## 5.4 Electrical configuration of the ET 200AL

### Electrical isolation

When electrically configuring the ET 200AL distributed I/O system, there is electrical isolation between:

- Load voltage 2L+ and all other switching parts
- Communication interfaces (PROFINET/PROFIBUS) of the interface modules and all other switching parts
- ET-Connection and all other switching parts

The following images show the potential conditions of the modules of the ET 200AL distributed I/O system.

Figure 5-2 Potential conditions of the ET 200AL distributed I/O system (Part 1)

Figure 5-3 Potential conditions of the ET 200AL distributed I/O system (Part 2)

Figure 5-4 Potential conditions of the ET 200AL distributed I/O system (Part 3)

## Connection of a digital output with a digital input

### NOTICE

#### Pay attention to the potential group

When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M may then be connected, resulting in elimination of the electrical isolation between 1L+ and 2L+. The possible compensating currents can destroy the digital module.

### WARNING

#### Note potential groups for safety-related shutdown

When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can then be connected, which leads to elimination of the electrical isolation between 1L+ and 2L+. The safety-related shutdown is not permitted if the electrical isolation is eliminated.

## Cable protection

According to IEC 60364, cable protection is required, i.e. you must always secure the incoming lines externally.

You must secure all incoming supply voltages with a UL/IEC approved 24 V DC/4 A fuse (trigger characteristic type B or C).

## Power supply of the configuration

Two voltage groups are available for the distributed I/O system ET 200AL: 1L+ (supply voltage) and 2L+ (load voltage)

A second infeed may be needed to supply all the modules of a configuration with the required voltage. Renewed voltage supply of 1L+ and 2L+ can be necessary to configure different potential groups or because the voltage is not sufficient for all modules due to the voltage drop. Create a power balance for the selection of the infeed point of the voltage.

### Note

#### Turning 1L+ and 2L+ on and off

In contrast to the load voltage 2L+, the operational switching on and off of the supply voltage 1L+ results in a restart of the module.

The figure below shows a configuration with a new voltage infeed for the modules. The different potential groups have a gray background.

Figure 5-5 Wiring of the power supply

## Reference

You will find additional information on electrical configuration and the voltage drop in the section Connecting cables for ET 200AL (Page 50).

## 5.5 Connecting ET 200AL to functional earth

### Introduction

You must connect the distributed I/O system ET 200AL to functional earth (FE)

### What is functional earth?

All ET 200AL modules feature a functional earth connection. This connection is used to suppress interference sensitivity, but not for protection purposes. With the functional earth connection, you create an electrical connection directly to a point of your system or shielding. This discharges the EMC interference directly into the earth. By discharging the EMC interference, the interference safety of the entire module is increased.

The figure below shows the symbol with which the functional earth connection is identified on the ET 200AL modules.

Figure 5-6 Functional earth

### 5.5.1 Mounting ET 200AL modules on conductive substrate

#### Requirement

Conductive substrate for mounting of the module

#### Required tools

To connect to functional earth, you need the following tools:

- Screwdriver

#### Required accessories:

To connect to functional earth, you need the following accessories:

- 2 x M4 fastening screws.

## Mounting

To connect modules of the ET 200AL distributed I/O system to functional earth with a conductive mounting substrate, proceed as follows:

1. Drill two fastening holes.
2. Screw the module with the M4 fastening screws using a torque of 1.2 Nm.

---

### Note

#### Earthing with conductive mounting substrate

When you fasten a module of the ET 200AL distributed I/O system on a conductive, grounded substrate, the bottom fastening screw provides a conductive connection to the ground potential.

Ensure that there is a low-impedance connection between the module and conductive underground as well as between the conductive underground and functional earth.

---

## Reference

You will find more information on installing the modules in the section Mounting modules (Page 27).

## 5.5.2 Mounting ET 200AL modules on non-conductive substrate

### Requirement

Conductive substrate for mounting of the module

### Required tools

To connect to functional earth, you need the following tools:

- Screwdriver
- Stripping tool
- Crimp tool

### Required accessories:

To connect to functional earth on a non-conductive fastening substrate, you need the following accessories:

- 2 x M4 fastening screws.
- Cable lug suitable for M4 screws
- Grounding cable (braided copper cable) with a minimum cross section of 4 mm<sup>2</sup>

## Mounting

To connect modules of the ET 200AL distributed I/O system to functional earth, proceed as follows:

1. Drill two fastening holes.
2. Strip the grounding cable.
3. Fasten the cable lug to the grounding cable.
4. Screw the module and the cable lug with the M4 fastening screws using a torque of 1.2 Nm.

The figure below shows how to connect functional earth using the example of the IM 157-1 PN interface module.

Figure 5-7 Connecting the functional earth

---

### Note

#### Earthing with non-conductive mounting substrate

Make sure there is a low-impedance connection between the module and the functional earth.

---

## Reference

You will find more information on installing the modules in the section Mounting modules (Page 27).

## 5.6 Connecting cables for ET 200AL

### Impact of cable length on the supply voltage

When wiring your configuration, you must take into account the impact of the cable length on the supply voltage of the ET 200AL distributed I/O system.

#### CAUTION

##### Pay attention to maximum incoming currents

For each power supply (1L+, 2L+), you can feed in a maximum of 4A.

If you exceed the maximum incoming currents and do not comply with the required cable cross sections, an increased incoming current could lead to overheating of the cable insulation and the contacts. This could result in damage to the modules.

The figure below shows the voltage drop depending on the cable length for 4 current strengths, using the example of a copper cable with  $\varnothing 0.5 \text{ mm}^2$ .

Figure 5-8 Voltage drop with a cable cross-section of  $0.5 \text{ mm}^2$

To estimate the voltage drop in your ET 200AL distributed I/O system, you must add the voltage drops of the different cables. For every module used, you must add an additional voltage drop of around 0.1 V.

### Example

If you have a 7 m power supply cable with  $\varnothing 0.5 \text{ mm}^2$ , the voltage drop is around 1.5 V with a load of 3 A.

## 5.7 Wiring

### Connection

Connect all cables to the front side of the modules:

- Supply voltage and ET-Connection to the 4-pin M8 round sockets and M8 round connectors
- Signal lines to the 3-pin M8 or 4/5-pin M12 round sockets
- Fieldbus lines to the 4/5 pole M12 round sockets and M12 round connectors

---

#### Note

##### Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

---

### Requirement

Wire the modules with the supply voltage off.

### Required tools

If you are not using pre-assembled cables, you need the following tools:

- Stripping tool
- Screwdriver to wire the connection plugs
- Stripping Tool for ET-Connection

### Required accessories when connecting the supply voltage

You need the following accessories:

- Cables
  - Pre-assembled power cable, M8, 4-pin, or
  - Flexible 4-wire copper cable (wire cross section: 0.25 to 0.5 mm<sup>2</sup>)
- 4-pin M8 connection plug

### Accessories required for the connection of ET-Connection

You need the following accessories:

- ET-Connection cables
- 4-pin M8 connection plug

---

#### Note

##### ET-Connection cables

When connecting ET-Connection **use only** the offered cables.

---

### Connecting M8 plugs

To connect M8 plugs, proceed as follows:

1. Insert the connector in the appropriate round socket on the module.  
Make sure that there is proper locking between the connector and socket.
2. Tighten the connector using the knurled screw with a torque of 0.4 Nm.

The figure below shows the connection of the M8 plugs, using the example of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input / digital output module.

Figure 5-9 Connecting M8 plugs

## Connecting M12 plugs

To connect M12 plugs, proceed as follows:

1. Insert the connector in the appropriate round socket on the module.  
Make sure that there is proper locking between the connector and socket (nut and spring).
2. Tighten the connector using the knurled screw with a torque of 1 Nm.

The figure below shows the connection of the M12 plugs, using the example of the analog input module AI 4xU/I/RTD 4xM12.

Figure 5-10 Connecting M12 plugs

## Pin assignment of the sockets

The pin assignment of the sockets can be found in the manuals for the interface modules (<https://support.industry.siemens.com/cs/ww/en/ps/14246/man>) and I/O modules (<https://support.industry.siemens.com/cs/ww/en/ps/14247/man>) in the section on pin assignment and on the side surface of the module.

## Y-cable

The Y-cable allows you to connect two actuators or sensors to the inputs or outputs.

The use of a Y-cable is particularly recommended when two channels are occupied for each socket of an I/O device. The Y-cable distributes the channels to two circular connectors.

- Y-cable (6ES7194-6KA00-0XA0) for connecting 2 actuators or sensors for double connection of inputs (also fail-safe inputs) or double connection of outputs with one cable
- Y-cable (6ES7194-6KB00-0XA0) for connecting 2 sensors for double connection F-DI with one cable. Only suitable for use with the F-DI module.

You can find details about connection in the respective user manual of the product.

Figure 5-11 Y-cable

The following figure shows the wiring of the Y-cables.

## Inverted Y-cable

The inverted Y-cable enables the connection of fail-safe inputs and a fail-safe output to an I/O device (for example a Siemens SIRIUS safety position switch with interlock) with only one cable.

You can find details about connection in the respective user manual of the product.

Figure 5-12 Inverted Y-cable

The following figure shows the wiring of the Y-cables.

Figure 5-13 Y-cable 6ES7194-6KC00-0XA0

## Sealing of unused sockets

To ensure IP65 or IP67 degree of protection, seal off all unused sockets with sealing caps.

## Article numbers for accessories/spare parts.

You will find the article numbers in the Appendix in section Accessories/spare parts (Page 114).

## 5.8 ET 200AL marking

### 5.8.1 Factory markings

#### Introduction

For better orientation, the ET 200AL distributed I/O system is identified using various markings which will help you when configuring and connecting the modules.

#### Marking of the interfaces

The interfaces of the modules are factory-labeled.

The table below shows the labeling of the interfaces.

Table 5- 2 Interface labeling

| interface                                    | Labeling                             |
|----------------------------------------------|--------------------------------------|
| PROFINET IO interfaces                       | X1 P1 R and X1 P2 R                  |
| PROFIBUS DP interfaces                       | X1 DP1 and X1 DP2                    |
| I/O input and output interfaces              | X10 through X17                      |
| ET-Connection interfaces (interface modules) | X30 (ET-CON1) and X31 (ET-CON2)      |
| ET-Connection interfaces (I/O modules)       | X30 (ET-CON IN) and X31 (ET-CON OUT) |
| Power supply interfaces                      | X80 (IN) and X81 (OUT)               |

#### Note

##### Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage. Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

#### Pin assignment

The pin assignments of the various interfaces are lasered at the factory, on the side of every module.

## 5.8.2 Optional markings

### Introduction

In addition to the factory markings, there are also optional possibilities for labeling and/or identifying interfaces and modules on the ET 200AL distributed I/O system.

### Identification label

The identification labels come with each module as strips and can be machine-printed. A strip has 10 identification labels measuring 10 x 5 mm in the color RAL9016. The identification labels can be inserted into every module at the points provided. The identification labels are used for channel, module and slot labeling.

The figure below shows all points where you can use the identification labels using the example of the IO-Link Master CM 4xIO-Link 4xM12 communication module.

① Identification labels

Figure 5-14 Optional marking

### 5.8.3 Mounting identification labels

#### Introduction

This section describes how to mount or remove identification labels.

#### Required tools

You need a screwdriver with 3 mm blade width (only to remove identification labels).

#### Mounting procedure

To mount an identification label, proceed as follows:

1. Print the identification label using commercially available marking systems.
2. Press the identification label out of its holder.
3. Stick the identification labels into the cutouts provided, as shown in the figure *Optional marking* (Page 57).

Mounting the identification labels is the same for all modules.

#### Removal procedure

To remove an identification label, proceed as follows:

1. Carefully use a screwdriver to pull out the identification label.

Removing identification labels is the same for all modules.

# Configuring

## Introduction

You configure and assign parameters for the ET 200AL distributed I/O system (interface modules and I/O modules) using STEP 7 or the configuration software of another manufacturer.

## Requirements

Table 6- 1 Configuration software and requirements

| Configuration software                                                                                                                                                                                                                                     | Requirements                                                                                                                                                                                           | Installation information |

## Configuring the ET 200AL distributed I/O system

See the STEP 7 online help or the documentation of the configuration software manufacturer.

## Configuration - PROFINET maximum configuration

Each of the connections for ET-Connection occupies a slot in the configuration. The slots for ET-Connection1 and ET-Connection2 are specified statically in the PROFINET GSD file. ET-Connection1 is permanently on slot 1 and ET-Connection2 on slot 18.

The fixed slot assignment of ET-Connection1 and ET-Connection2 offers you the following advantages:

- You can expand ET-Connection1 and ET-Connection2 without a high workload
- Transparency in configuration control
- Simplification of diagnostics alarms and troubleshooting

The figure below shows the maximum configuration with modules of the ET 200AL distributed I/O system.

Figure 6-1 PROFINET maximum configuration

## Reference

You can find additional information on this topic in section Configuration control (option handling) (Page 64).

## Configuration - PROFIBUS maximum configuration

Each of the connections for ET-Connection occupies a slot in the configuration. The slot for ET-Connection1 is statically defined in the PROFIBUS GSD file. ET-Connection1 is always permanently installed in slot 1. Always place the topology module for ET-Connection2 on slot 18. You do not need to fill slots in the configuration for ET-Connection1 with dummy modules.

The fixed slot assignment of ET-Connection1 and ET-Connection2 offers you the following advantages:

- You can expand ET-Connection1 and ET-Connection2 without a high workload; for ET-Connection1 you need to remove the placeholder, the I/O module is placeable (no placeholders are needed for ET-Connection2)
- You cannot configure more modules on ET-Connection1 or ET-Connection2 than are allowed.
- Transparency in configuration control
- Simplification of diagnostics alarms and troubleshooting

The figure below shows the maximum configuration with modules of the ET 200AL distributed I/O system.

Figure 6-2 PROFIBUS maximum configuration

## Assigning the PROFIsafe addresses

The F-destination address is permanently stored in the eCoding plug connector of the fail-safe ET 200AL I/O modules.

---

### Note

When assigning the PROFIsafe addresses, the F-modules must be supplied with voltage 1L+.

---

### Note

Follow these points in conjunction with the configuration control:

Before you can use the configuration control together with F-modules, the PROFIsafe addresses must be assigned to the F-modules in the designated slots.

For this, each F-module must be plugged into the slot configured for it. The actual configuration may differ from the set configuration.

---

You can find additional information about the assignment of the PROFIsafe addresses in the manual SIMATIC Safety - Configuring and Programming (<https://support.industry.siemens.com/cs/ww/en/view/54110126>).

## Reference

You can find additional information on this topic in section Configuration control (option handling) (Page 64).

# Configuration control (option handling)

## 7.1 Configuration control

### Introduction

With configuration control (option handling), you handle various standard machine configuration levels in one project without having to change the hardware configuration or user program.

### Operating principle of configuration control

You can use configuration control to operate different standard machine configurations with a single configuration of the ET 200AL distributed I/O system.

- A station master (maximum configuration) is configured in a project. The station master comprises all modules needed for all possible equipment components of a modular standard machine.
- Provision is made in the user program of the project for various station options for the different configuration levels of the standard machine and for selection of a station option. A station option uses, for example, only some of the modules of the station master and these modules are not inserted in the configured order.
- Manufacturers of standard machines select a station option for a configuration level of the standard machine. They do not have to change the project or download the modified configuration.

You use a control data record you have programmed to notify the CPU/interface module as to which modules are missing or located on different slots in a station option as compared to the station master. If a module with the configuration control is moved to another slot, it retains its parameter assignment.

The configuration control allows you to flexibly vary the centralized/distributed configuration. As a precondition for this, the station option must be able to be derived from the station master.

The following figure shows 3 configurations of a standard machine with the corresponding station options of the ET 200AL distributed I/O system.

Figure 7-1 Various configuration levels of a standard machine with the corresponding station options of the ET 200AL distributed I/O system.

## Benefits

- Easy project handling and commissioning through use of a single STEP 7 project for all station options.
- Easy handling during maintenance, versioning and upgrades.
- Hardware savings: Only the I/O modules needed for the current station option of the machine are installed.
- Potential savings when building, commissioning and creating documentation for standard machines.

## Procedure

To set up the configuration control, follow these steps in the order given:

| Step | Procedure                              | See...                                                                                |
|------|----------------------------------------|---------------------------------------------------------------------------------------|
| 1    | Enable configuration control in STEP 7 | Section Configuring (Page 67)                                                         |
| 2    | Create control data record             | Section Creating the control data record (Page 69)                                    |
| 3    | Transfer control data record           | Section Transferring the control data record in the user program of the CPU (Page 78) |

## Library for configuration control

A library for configuration control is available for download (<https://support.industry.siemens.com/cs/ww/en/view/29430270>) on the internet. The library contains data types with the structure of the control data records for the ET 200AL distributed I/O system. You can implement your flexible automation solution economically with the help of these data types.

## 7.2 Configuring

### Requirements

Via PROFINET IO:

- Configuration software, for example STEP 7 Professional as of V13
- IM 157-1 PN
- You have assigned the interface module to an IO controller in STEP 7

Via PROFIBUS DP:

- Configuration software, for example STEP 7 Professional as of V13
- IM 157-1 DP
- You have assigned the interface module to an DP master in STEP 7
- The parameter "Operation if preset configuration does not match actual configuration" is activated.  
The parameter "Operation if preset configuration does not match actual configuration" is located in STEP 7 in the properties of the interface module under "Module parameters" > "Start-up".

---

#### Note

##### **Disabled parameter "Startup if preset configuration does not match actual configuration"**

If an I/O module is missing or an incorrect or additional I/O module is plugged in and the "Startup if preset configuration does not match actual configuration" parameter is disabled, the ET 200AL distributed I/O system does not start up.

The diagnostic "Slot x no module" or "Slot x wrong module" is generated.

If the IM 157-1 DP interface module does not start up in this status, the RUN and ERROR LEDs on the interface module flash red. The DIAG LEDs flash green on all I/O modules as well.

---

---

#### Note

Follow these points in conjunction with the configuration control:

Before you can use the configuration control together with F-modules, the PROFIsafe addresses must be assigned to the F-modules in the designated slots.

For this, each F-module must be plugged into the slot configured for it. The actual configuration may differ from the set configuration.

---

## Required steps

Enable the "Allow to reconfigure the device via the user program" parameter when configuring the interface module.

- The parameter "Enable reconfiguration of device via user program" is located in the properties of the interface module under "Module parameters" > "Configuration control".

Figure 7-2 Enabling configuration control using the IM 157-1 PN as an example

## 7.3 Creating the control data record

### 7.3.1 Introduction

#### Required steps

The following description shows as an example how you can create a control data record for the configuration control in STEP 7 (TIA Portal).

To create a control data record for the configuration control, follow these steps:

1. Create a PLC data type that contains the structure of the control data record for an ET 200AL interface module.

You can find the structure of the control data record in section Control data record for the ET 200AL distributed I/O system (Page 71)

| CTR_REC |                 |           |               |                                     |                                     |                                     |                          |                                |  |

Figure 7-3 Creating control data record 196

2. Create a global data block.

### 7.3 Creating the control data record

3. Create an array of the data type of the above created PLC data type in the data block.

The following figure shows a data block containing the control data records for an ET200AL interface module. In this example the data block contains three control data records.

| ConfDB |                  |                          |             |                                     |                                     |                                     |                          |                     |  |

Figure 7-5 Assigning slots

## Rules

Observe the following rules:

- Slot entries in the control data record outside the station master are ignored by the interface module.
- The control data record must contain the entries up to the last slot of the station option.
- Each slot of a station option may only be present once in the control data record.
- Each slot of a station option may only be assigned to one slot in the station master.
- The interface module (slot 0) is not an element of the configuration control, but instead controls this.
- The topology modules always have to exist in the data record:
  - The topology module ET-Connection 1 is always located on Slot 1.
  - The topology module ET-Connection 2 is always located on Slot 18.

### 7.3.2 Control data record for the ET 200AL distributed I/O system

#### Slot assignment

##### Note

##### Topology modules ET-Connection1 and ET-Connection2

Both topology modules ET-Connection1 and ET-Connection2 should be treated like real modules during configuration control.

Restriction: ET-Connection1 is always placed in Slot 1 and ET-Connection2 is always placed in Slot 18.

The following table shows the possible slots for the various modules for an ET 200AL interface module:

Table 7- 1 Slot assignment

| Modules                        | Possible slots | Comment                                                          |
|--------------------------------|----------------|------------------------------------------------------------------|
| Topology ET-Connection1        | 1              | The topology module ET-Connection 1 is always located on Slot 1. |
| I/O modules ET-Connection1     | 2-17           | -                                                                |
| Topology module ET-Connection2 | 18             | The topology module ET-Connection2 is always located on Slot 18. |
| I/O modules ET-Connection2     | 19-34          | -                                                                |

## Control data record

For configuration control of the ET 200AL distributed I/O system, you define a control data record 196 V2.1, which contains a slot assignment for the modules. The table below shows the structure of a control data record with explanations of the individual elements.

Table 7- 2 Configuration control: Structure of control data record 196

| Byte                                     | Element                             | Code                                                                  | Explanation                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------|-------------------------------------|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                                        | Block length                        | $4 + (\text{number of slots} \times 2)$                               | Header                                                                                                                                                                                                                                                                                                                                                                                              |

## Combination of configuration control and shared device (for PROFINET)

The configuration control function in a shared device is therefore only for the I/O modules of the IO controller to which the interface module has subscribed. I/O modules that are assigned to no controller or a different controller behave like a station without activated configuration control.

In the control data record change the slots only for those modules that are assigned to the IO-Controller.

In the control data record do not move modules to slots that are assigned to a different IO controller or no IO controller. The interface module does not check whether a control data record 196 exists for these slots. The interface module assumes a 1-to-1 assignment for these slots.

## Combination of configuration control and PROFlenergy (at PROFINET)

You can use configuration control together with PROFlenergy for the ET 200AL distributed I/O system.

Ensure that you use the slots of the used station option when creating Data record 3. Do not use the slots configured in the station master.

Example: You want to set up PROFlenergy for a DQ module of an IM 157-1 PN that works with configuration control. You have configured the DQ module to Slot 5 in the station master. You have moved the DQ module to Slot 2 in the station option. In order to set up PROFlenergy for this module use Slot 2 in Data record 3.

You can find more information about PROFlenergy in the Interface module IM 157-1 PN (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) Equipment Manual.

### 7.3.3 Feedback data record at the ET200AL distributed I/O system

#### Operating principle

The feedback data record informs you about the accuracy of the module assignment and gives you the option of detecting assignment errors in the control data record. The feedback data record is mapped via a separate data record 197 V2.0.

#### Feedback data record

The feedback data record exists only when configuration control is configured and always refers to the maximum configuration limits **without interface module**, i.e., 34 slots. Partial reading of the feedback data record is possible.

Table 7- 3 Feedback data record

| Byte | Element        | Code | Explanation                                                                                                                                                                                                                                                                                                                          |

\* Not possible if the slot is marked as not available.

**Note**

The data in the feedback data record is always mapped for all modules. In a Shared Device configuration, it is therefore irrelevant which IO controller the respective modules are assigned to.

As long as no control data record was sent, a one-to-one module assignment is assumed for the compilation of data record 197 (station master → station option).

**Error messages**

In the case of an error when reading the feedback data record, the RDREC instruction returns the following error messages via the STATUS block parameter:

Table 7- 4 Error messages

| Error code        | Meaning                                                                                                                                                                                                                                                                                                                                                       |

## 7.3.4 Example of a configuration control

### Introduction

Several options/functional variations often exist for machines designed as series products. Or you have a plant that can operate in different modes.

Combine the modules that are needed for a function. With configuration control (option handling), you have the option to switch these functions on and off or expand their configuration.

The following examples show how you can form the control data record for a station option. The station master consists of an interface module IM 157-1 PN and 15 I/O modules in this case.

### Station option with associated control data record

The configuration with the station options 2 and 4 differ from the station master as follows:

- The modules for options 1 and 3 do not exist.

## Planned configuration / station master

Figure 7-7 Example: Hardware configuration of station option 2 to 4 with the associated control data record in STEP 7

### Detailed application example

You can find a detailed application example for the configuration control in S7-1500 in here under the keyword "Application example for ET 200SP (PROFINET) and S7-1500 based on the library" on the Internet (<https://support.industry.siemens.com/cs/ww/en/view/29430270>).

## 7.4 Transferring the control data record in the user program of the CPU

### Required steps

Transfer the created control data record 196 to the interface module using the WRREC (Write data record) instruction.

### Parameters of the WRREC instruction

Below, you will find explanations of individual parameters of the WRREC instruction which you must supply with specific values in the configuration control context. You can find additional information on the WRREC instruction in the STEP 7 online help.

|        |                                                                                                                                                                                                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID     | HW identifier of the interface module.<br>If you have selected the interface module in the network view or device view, the HW identifier is available in the <b>System constants</b> tab of the Inspector window. Use the value of the system constant "<Name_of_interface_module> Head". |
| INDEX  | Data record number: 196 (decimal)                                                                                                                                                                                                                                                          |
| RECORD | Control data record to be transferred.<br>You can find the structure of the control data record in section Control data record for the ET 200AL distributed I/O system (Page 71).                                                                                                          |

### Selection of the station option in the user program

In order for the CPU to know which station option you want to operate, you must set up a possibility to select between the various control data records in the user program. You can implement the selection, for example, via an Int tag that references an array element. Note that the tag used to select the control data record must be stored in the retentive memory area. If the tag is not retentive, it will be initialized during startup of the CPU and will thus be unavailable for selection of the station option.

### Special requirements relating to the transfer of the control data record to the interface module

- If you have enabled configuration control, the ET 200AL station is not ready for operation without a control data record. As long as no valid control data record has been transferred, the I/O modules are considered as failed by the CPU and exhibit substitute value behavior. The interface module continues to exchange data.
- The control data record is stored retentively in the interface module. Note:
  - If the configuration is unchanged, you do not have to rewrite the control data record 196 during restart.
  - If you write a control data record with modified configuration, this will result in a station failure in the distributed I/O system. The original data record 196 is deleted and the new data record 196 is saved retentively. The station will then restart with the modified configuration.

### Error messages

In case of error, the WRREC instruction returns the following error messages via the STATUS block parameter:

Table 7- 5 Error messages

| Error code        | Meaning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 80B1 <sub>H</sub> | Invalid length; the length information in data record 196 is not correct.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 80B2 <sub>H</sub> | Invalid slot: The configured slot is not assigned                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 80B5 <sub>H</sub> | Configuration control parameters not assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 80B8 <sub>H</sub> | Parameter error<br>Reasons for a parameter error are: <ul style="list-style-type: none"> <li>• Incorrect block ID in the header (not equal to 196)</li> <li>• Invalid version identifier in the header</li> <li>• A reserved bit was set</li> <li>• A station master slot was assigned an invalid slot in the station option</li> <li>• Multiple slots in the station master are assigned to the same slot in the station option</li> <li>• For shared device on submodule level: violation of defined restrictions</li> </ul> |
| 80C5 <sub>H</sub> | DP slave or module not available. Indicates that a data record has not been acknowledged due to the system.                                                                                                                                                                                                                                                                                                                                                                                                                    |

If you receive the error code 80A2<sub>H</sub>, 80B2<sub>H</sub> or 80C5<sub>H</sub> when writing to control data record 196, check whether the required configuration was accepted despite the error code.

## 7.5 Behavior during operation

### Effect of discrepancy between station master and station option

For the online display and for the display in the diagnostics buffer (module OK or module faulty), the station master is always used and not the differing station option.

Example: A module outputs diagnostics data. This module is configured in slot 4 in the station master, but is inserted in slot 3 in the station option (missing module; see example in the next section). The online view (station master) shows an incorrect module in slot 4. In the real configuration, the module in slot 3 indicates an error via an LED display.

### Response to modules that are not present

If modules are entered as not present in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK.
- Direct writing access to the outputs that are not present or writing access to the process image of outputs that are not present: Remains without effect; no access error is signaled.
- Direct reading access to the inputs that are not present or reading access to the process image of inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: The output parameter STATUS of the instruction RDREC supplies the value 80A3<sub>H</sub> "General CM error".

# Commissioning

## 8.1 PROFINET IO

### 8.1.1 Commissioning ET 200AL on PROFINET IO

#### Introduction

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200AL distributed I/O system on an IO controller.

#### Requirements for the ET 200AL distributed I/O system on the PROFINET IO

##### Note

##### Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant.

Also plan the tests to include any possible foreseeable errors. This will allow you to prevent people or plants from being placed in danger during operation.

#### Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 8- 1 Requirements for the ET 200AL distributed I/O system on the PROFINET IO

| Step | Procedure                                                       | See...                                                                                                                                                                        |

#### Reference

You can find additional information on assigning the PROFINET IO parameters in the PROFINET with STEP 7 V14 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>) function manual.

### 8.1.2 Startup on PROFINET IO

#### Principle of operation

The figure below schematically shows the startup of the ET 200AL distributed I/O system on the PROFINET IO (= IO device) as a flow chart.

Figure 8-1 Startup of the ET 200AL distributed I/O system on the PROFINET IO

The figure below schematically shows the startup of an ET 200AL I/O module after an ET 200AL PROFINET interface module.

Figure 8-2 Startup of the ET 200AL I/O module

### 8.1.3 PROFlenergy

---

**Note**

PROFlenergy is not supported by fail-safe I/O module F-DI 4+F-DQ 2x24VDC/2A, 4xM12.

---

PROFlenergy (for PROFINET) makes it possible to reduce the energy consumption of the device using the PROFlenergy command during production downtime.

## 8.2 PROFIBUS DP

### 8.2.1 Commissioning ET 200AL on PROFIBUS DP

#### Introduction

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200AL distributed I/O system on a DP master.

#### Requirements for the ET 200AL distributed I/O system on a PROFIBUS DP

##### Note

##### Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant.

Also plan the tests to include any possible foreseeable errors. This helps to avoid endangering persons or equipment during operation.

#### Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 8- 2 Requirements for the ET 200AL distributed I/O system on a PROFIBUS DP

| Step | Procedure                                                                 | See...                                                                                                                                                                                                                                        |

## 8.2.2 Startup on PROFIBUS DP

### Principle of operation

The figure below schematically shows the startup of the ET 200AL distributed I/O system on the PROFIBUS DP (= DP slave) as a flow chart.

Figure 8-3 Startup of the ET 200AL distributed I/O system on PROFIBUS DP

The figure below schematically shows the startup of an ET 200AL I/O module after an ET 200AL PROFIBUS interface module as flow chart.

Figure 8-4 Startup of an ET 200AL I/O module

## 8.3 Identification and maintenance data

### 8.3.1 Reading out and entering I&M data

#### Introduction

Identification data I&M is information that is saved either as read-only (I data) or read/write (M data) on the interface module.

**Identification data (I&M0):** Manufacturer information on the module that is read-only and in some cases is also printed on the module housing, for example, article number, serial number and firmware version.

**Maintenance data (I&M1, 2, 3):** Plant-dependent information, e.g. installation location. Maintenance data is created during configuration and written to the module.

All modules of the ET 200AL distributed I/O system support identification data (I&M0 to I&M3).

The I&M identification data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a system
- Correcting errors in a system

With the I&M identification data, you have the option of clearly identifying modules online.

In STEP 7, the identification data is displayed in the "Module status - IM 157" and "Properties..." tabs (see STEP 7 online help).

#### Options for reading out I&M data

You have the following options for reading the I&M data:

- Via the user program
- Via STEP 7 or HMI devices

#### Procedure for reading I&M data by means of the user program

To read the I&M data of the interface module in the user program, use the instruction "RDREC".

#### Procedure for reading the I&M data using STEP 7

Requirement: There must be an online connection to the interface module.

1. In the project navigation, under "Distributed I/O", select the I/O device or the DP slave, e.g. "IM 157-1 PN".
2. Select: **IO device/DP slave > Online & Diagnostics > Identification & Maintenance.**

### Procedure for input of maintenance data using STEP 7

The default module name is assigned by STEP 7. You have the option to enter the following data:

- Plant designation (I&M1)
- Location identifier (I&M1)
- Installation date (I&M2)
- Additional information (I&M3)
- Signature (I&M4), only for PROFINET

To enter the data, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the interface module, for example.
2. In the properties under "General", select the "Identification & Maintenance" area and enter the data.

During the loading of the hardware configuration, the I&M data are also loaded.

### Reference

You can find additional information on I&M data of the ET 200SP (mixed configuration) in the ET 200SP distributed I/O system  
(<https://support.industry.siemens.com/cs/ww/en/view/58649293>) system manual.

### 8.3.2 Data record structure for I&M data

#### Reading I&M data records (distributed via PROFINET IO)

You can directly access specific identification data by selecting **Read data record** ("RDREC" instruction). You obtain the corresponding part of the identification data under the associated data record index.

The following table shows the principle behind the structure of data records.

Table 8- 3 Basic structure of data records with I&M identification data

| Contents                                 | Length (bytes)             | Coding (hex)                                                                                                                                                 |
|------------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Header information</b>                |                            |                                                                                                                                                              |
| BlockType                                | 2                          | I&M0: 0020 <sub>H</sub><br>I&M1: 0021 <sub>H</sub><br>I&M2: 0022 <sub>H</sub><br>I&M3: 0023 <sub>H</sub><br>I&M4: 0024 <sub>H</sub>                          |
| BlockLength                              | 2                          | I&M0: 0038 <sub>H</sub><br>I&M1: 0038 <sub>H</sub><br>I&M2: 0012 <sub>H</sub><br>I&M3: 0038 <sub>H</sub><br>I&M4: 0038 <sub>H</sub>                          |
| BlockVersionHigh                         | 1                          | 01                                                                                                                                                           |
| BlockVersionLow                          | 1                          | 00                                                                                                                                                           |
| <b>Identification data</b>               |                            |                                                                                                                                                              |
| Identification data<br>(see table below) | 54<br>54<br>16<br>54<br>54 | I&M0/Index AFF0 <sub>H</sub><br>I&M1/Index AFF1 <sub>H</sub><br>I&M2/Index AFF2 <sub>H</sub><br>I&M3/Index AFF3 <sub>H</sub><br>I&M4/Index AFF4 <sub>H</sub> |

The following table shows the structure of data records for I&M identification data.

Table 8- 4 Data record structure for I&M identification data

| Identification data                                        | Access                | Default            | Explanation                                                                             |
|------------------------------------------------------------|-----------------------|--------------------|-----------------------------------------------------------------------------------------|
| <b>Identification data 0: (data record index AFF0 hex)</b> |                       |                    |                                                                                         |
| VendorIDHigh                                               | read (1 byte)         | 00H                | This is where the name of the manufacturer is stored (42D = SIEMENS AG).                |
| VendorIDLow                                                | read (1 byte)         | 2AH                |                                                                                         |
| Order_ID                                                   | read (20 bytes)       | 6ES7157-1AB00-0AB0 | Order number of the module (e.g. of PROFINET interface module)                          |
| IM_SERIAL_NUMBER                                           | read (16 bytes)       | -                  | Serial number (device-specific)                                                         |
| IM_HARDWARE_REVISION                                       | read (2 bytes)        | 1                  | Corresponding hardware version                                                          |
| IM_SOFTWARE_REVISION                                       | read                  | Firmware version   | Provides information about the firmware version of the module                           |
| • SWRevisionPrefix                                         | (1 byte)              | V                  |                                                                                         |
| • IM_SWRevision_Functional_Enhancement                     | (1 byte)              | 00 - FFH           |                                                                                         |
| • IM_SWRevision_Bug_Fix                                    | (1 byte)              | 00 - FFH           |                                                                                         |
| • IM_SWRevision_Internal_Change                            | (1 byte)              | 00 - FFH           |                                                                                         |
| IM_REVISION_COUNTER                                        | read (2 bytes)        | 0000H              | provides information about configured changes on the module (not used)                  |
| IM_PROFILE_ID                                              | read (2 bytes)        | 0000H              | Generic device                                                                          |
| IM_PROFILE_SPECIFIC_TYPE                                   | read (2 bytes)        | 0005H              | Interface modules                                                                       |
| IM_VERSION                                                 | read                  | 0101H              | provides information about the version of the identification data (0101H = Version 1.1) |

| IM_DESCRIPTOR                                              | Read/write (54 bytes) | -                  | Enter a comment describing the module.                                                  |

### Reading I&M data records with data record 255 (distributed via PROFIBUS DP)

The modules support standardized access to identification data using DR 255 (index 65000 to 65003). For additional information on the DR 255 data structure, refer to the specifications of the Profile Guideline - Order No. 3.502.

# Maintenance

## 9.1 Replacing modules

### Replacing modules

Replacing a module is not permitted during ongoing operation.

#### **WARNING**

##### **Material damage can occur**

If you remove/insert modules with the power connected, this can lead to undefined states in your system.

Material damage to the ET 200AL distributed I/O system may occur as a result.

Only remove or replace modules when the power is disconnected.

Always comply with the required standards and safety guidelines when configuring a system.

#### **WARNING**

##### **Mixing up ET-Connection1 and ET-Connection2**

When connecting the modules, always ensure that they are properly connected.

If you mix up the lines for ET-Connection1 and ET-Connection2 when connecting the modules, this can lead to undefined states in your system.

### Behavior of ET-Connection

During ongoing operation, a module replacement may be necessary, e.g. because the module is defective. If an I/O module fails in an ET-Connection line, the line remains active up to the failed I/O module. After replacing the I/O module, the ET-Connection line starts up by itself.

## Procedure

To replace a module, proceed as follows:

1. Disconnect the supply voltage to the module to be replaced.
2. Completely remove all cables connected to the module.
3. Completely remove the fixing screws of the module
4. Replace the module.

---

### Note

#### "New" module

The removed module may only be replaced by a module of the same type.

---

5. Fasten the module with a torque of 1.2 Nm.
6. Connect all cables.
7. Turn the supply voltage on.

### WARNING

#### Pay attention to the slot number of the module

If you mix up the ET 200AL I/O modules when connecting them, this can cause personal injury and damage to the machine.

The ET 200AL distributed I/O system cannot distinguish between modules of the same type during the actual/target comparison.

We recommend that you clearly label the ET 200AL I/O modules with the slot number.

The figure below shows a recommendation for labeling the ET 200AL I/O modules with the slot number.

- ① Recommendation for labeling the slot number

Figure 9-1 Slot number

## Result

The disconnected I/O module and all downstream I/O modules start up again by themselves.

## 9.2 Firmware update

### Introduction

During operation, it can become necessary to update the firmware (e.g. for function extensions).

Firmware updates are used to update the firmware of the interface module and I/O modules.

---

#### Note

##### Temporary bus interruption

When you perform a firmware update of an ET 200AL I/O module, then the ET-Connection is temporarily interrupted due to the restart of I/O module. All downstream ET 200AL I/O modules report a pull/plug interrupt.

---

### Options for the firmware update

You have the following options to running a firmware update:

- Online via STEP 7, as of V5.5<sup>1</sup>
- Online with STEP 7, TIA Portal V13 or higher
- Embedded web server running on a SIMATIC CPU or a SIMATIC F-CPU with fail-safe modules.
- SIMATIC Automation Tool (SAT)

<sup>1</sup>) Not for use with fail-safe ET 200AL I/O modules

### Reference

You can find additional information on the procedure in the FAQs on the Internet (<https://support.industry.siemens.com/cs/ww/en/view/88778936>) and in the online help for STEP 7.

## 9.3 Resetting interface module to factory settings (PROFINET)

### Introduction

When you "Reset to factory settings", the interface module is reset to the delivery state settings. This means that all information that was saved internally on the interface module is deleted.

### Result after resetting to factory settings

The following table shows an overview of the contents of the memory objects after resetting to factory settings.

Table 9- 1 Result after resetting to factory settings

| Memory object                    | Contents                                                                              |
|----------------------------------|---------------------------------------------------------------------------------------|
| IP address                       | Deleted<br>(configurable when resetting: "Retain IP address"/<br>"Delete IP address") |
| Device name                      | Deleted                                                                               |
| MAC address                      | Is not deleted                                                                        |
| Identification data (I&M0)       | Is not deleted                                                                        |
| Maintenance data (I&M1, 2, 3, 4) | Are deleted (optional)                                                                |
| Firmware version                 | Is not deleted                                                                        |

---

#### Note

##### Failure of downstream stations is possible

Resetting an interface module to factory settings can lead to failure of downstream stations in a line.

---

#### Note

##### Substitute value behavior of I/O modules when resetting to factory settings

When "Resetting to factory settings", the I/O modules in the station take on the non-configured state, which means input data are not entered and output data are not output.

---

### Reset options

There are two ways to reset an interface module to factory settings:

- Online with STEP 7 (TIA Portal)
- Online with STEP 7, V5.5 or higher

## Requirement

You need an online connection to reset an interface module to factory settings.

### Procedure with STEP 7 (TIA Portal)

Connect the PG/PC to the PROFINET IO interface of the ET 200AL distributed I/O system.

Make sure that there is an online connection to the interface module which is to be reset to factory settings.

1. Open the online and diagnostics view of the interface module.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. Select the "Retain IP address" option button if you want to retain the IP address, or the "Reset IP address" option button if you want to delete the IP address.
4. Click the "Reset" button.
5. Click "OK" in response to the confirmation prompts.

**Result:** The interface module performs the "Reset to factory settings" while the RUN LED flashes yellow. When the RUN LED is lit yellow, the interface module has been reset to factory settings and is in the STOP operating mode. The event "Reset to factory settings" is entered in the diagnostics buffer.

### Procedure with STEP 7 V5.5 or higher

Connect the PG/PC to the PROFINET IO interface of the ET 200AL distributed I/O system.

Make sure that there is an online connection to the interface module which is to be reset to factory settings.

1. Open the SIMATIC Manager.
2. Select accessible devices.
3. Select the interface module.
4. Navigate through "Menu > Options > Edit Ethernet devices > Reset to factor settings > Reset".

**Result:** The interface module performs the "Reset to factory settings" while the RUN LED flashes yellow. When the RUN LED is lit yellow, the interface module has been reset to factory settings and is in the STOP operating mode. The event "Reset to factory settings" is entered in the diagnostics buffer.

## Reference

You will find more information on the procedure in the STEP 7 online help.

## 9.4 Reactions to errors of the F module

### Safe state (safety concept)

The basic principle behind the safety concept is the presence of a safe state for all process tags.

---

#### Note

For digital F-modules, the safe state is "0". The safe state applies to sensors and actuators.

---

### Error reactions and startup of the F-system

In the following situations, the values of the safe state must be connected to the fail-safe channel/channels instead of the process values (passivation of the fail-safe module) due to the safety function:

- When the F-system is started
- When errors are detected in the safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- When errors of the F-I/O or channel errors (e.g. wire break or discrepancy error) are detected

Detected errors are written to the diagnostic buffer of the F-CPU and reported to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. If the system is switched off and then restarted, any pending errors are detected again at startup. However, you can save errors in your safety program.

|                                                                                                    |
|----------------------------------------------------------------------------------------------------|
|  <b>WARNING</b> |
|----------------------------------------------------------------------------------------------------|

|                                                                                                |
|------------------------------------------------------------------------------------------------|
| <b>If channels are set to "disabled", there are no diagnostic or error handling reactions.</b> |
|------------------------------------------------------------------------------------------------|

|                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| For channels that are set to "disabled" in STEP 7, no diagnostic message or error handling is triggered when a channel error occurs. Not even if this channel is indirectly affected by a channel group error ("Channel activated/deactivated" parameter). |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Troubleshooting in the F-system

To correct errors in your F-system, proceed as described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

Perform the following steps:

1. Rung diagnostics and correct the error
2. Revalidate the safety function
3. Record in the service report

### Fail-safe values for F-modules

For F-modules with inputs, the F-system provides fail-safe values (0) for the safety program when passivated. The fail-safe values are used instead of the process data at the F-DI.

For F-modules with outputs, the F-system transfers the fail-safe values (0) to the fail-safe outputs during passivation. The fail-safe values are used instead of the output values of the safety program. The fail-safe outputs are de-energized. This process is performed even if the F-CPU goes to the STOP operating state.

It is not possible to set the parameters of fail-safe values.

The fail-safe values are used in the following dependencies for the channel involved or all channels of the I/O module involved:

- F-system used
- Type of error occurred
  - Error in the F-I/O
  - Channel fault
  - Communication error

### Re-integration of a fail-safe module or channel

The F-system changes from fail-safe values to process values automatically or after acknowledgment in the safety program by the user. A detailed list of errors can be found in the device manual of the F-module or in the STEP 7 online help.

Procedure after re-integration:

- For an F-module with inputs, the process data pending at the F-DI is provided again to the safety program.
- For an F-module with outputs, the output values provided by the safety program are transferred again to the F-DQs.

### Additional information on passivation and re-integration

For additional information on passivation and reintegration of F-I/O modules, refer to the SIMATIC Safety – Configuring and Programming (<https://support.industry.siemens.com/cs/ww/en/view/54110126>) manual.

### Reaction of the F-module with inputs to communication errors

F-modules with inputs react differently to communication errors than to other errors.

When a communication error is detected, the current process values at the inputs of the F-module remain set. No channels are passivated. The current process values are passivated in the F-CPU.

## 9.5 Cleaning modules

When wired, ET 200AL modules comply with degree of protection IP65/IP67 and do not require any cleaning. If you do have to clean the modules, then use a dry or damp cloth. Please take care to comply with degree of protection IP65/67 when cleaning with liquids.

# Technical specifications

## Introduction

The technical specifications of the system are found in this section:

- The standards and test values that the ET 200AL distributed I/O system complies with and fulfills.
- The test criteria according to which the ET 200AL distributed I/O system was tested.

## Technical specifications for the modules

The technical data of the individual modules can be found in the modules' manuals. If there are discrepancies between the statements in this document and the product manuals, the statements in the product manuals take priority.

## Reference

The certificates for the markings and approvals can be found on the Internet (<https://support.industry.siemens.com>).

## 10.1 Standards and authorizations

### Currently valid markings and authorizations

---

#### Note

#### Details on the components of the ET 200AL distributed I/O system

The currently valid markings and approvals are printed on the components of the ET 200AL distributed I/O system.

---

#### CE mark

The ET 200AL distributed I/O system fulfills the requirements and protection targets of the following directives and complies with the harmonized European standards (ES) which have been promulgated for programmable logic controllers in the official gazettes of the European Community:

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)

The fail-safe modules of the ET 200AL distributed I/O system meet the safety requirements and safety objectives of the following EU directives and comply with the harmonized EU standards (EN) for programmable controllers as specified in the official journals of the European Union.

- 2014/30/EU "Electromagnetic Compatibility" (EMC directive)
- 2006/42/EC "Machinery Directive and Supplementary Directive 95/16/EC"
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)

The EU Declarations of Conformity are available for the authorities in charge and are kept at the following address:

SIEMENS AG  
Digital Industries  
DI FA TI COS TT  
P.O. Box 1963  
D-92209 Amberg, Germany

These are also available for download on the Customer Support Internet pages, under the keyword "Declaration of Conformity".

## UL approval

Underwriters Laboratories Inc. in accordance with

- UL 61010-1 and UL 61010-2-201
- CSA C22.2 No. 61010-1 and CSA C22.2 No. 61010-2-201 (Process Control Equipment)

The following table shows the modules that are approved for UL50/NEMA250 Enclosure Type 4X Indoor use only, watertight.

Table 10- 1 Released modules according to UL50/NEMA250 Enclosure Type 4X, Indoor use only, watertight

## RCM Declaration of conformity for Australia/New Zealand

The ET 200AL distributed I/O system meets the requirements of EN 61000-6-4:2007 Generic standards – Emission standard for industrial environments.

### Korea Certificate KCC-REM-S49-ET200

Please note that this device corresponds to limit class A with regard to the emission of radio interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

### Marking for the Eurasian Customs Union

EAC (Eurasian Conformity)

Customs Union of Russia, Belarus and Kazakhstan

Declaration of conformity with the technical requirements of the Customs Union (TR CU)

### IEC 61131-2

The ET 200AL distributed I/O system fulfills the requirements and criteria of standard IEC 61131-2 (programmable logic controllers, Part 2: Equipment requirements and tests).

### IEC 61010-2-201

The ET 200AL distributed I/O system fulfills the requirements and criteria of standard IEC 61010-2-201.

### PROFINET standard

The interface module IM 157-1 PN based on standard IEC 61158 Type 10.

### PROFIBUS standard

The interface module IM 157-1 DP based on standard IEC 61158 Type 3.

### Marine approval

Classification societies:

- ABS (American Bureau of Shipping)
- BV (Bureau Veritas)
- CCS (China Classification Society)
- Class NK (Nippon Kaiji Kyokai)
- DNV-GL (Det Norske Veritas - Germanischer Lloyd)
- LRS (Lloyds Register of Shipping)

---

#### Note

The fail-safe module F DI 4+F DQ 2x24VDC/2A, 4xM12 of the ET 200AL distributed I/O system does not support the specified marine approvals due to the increased supply voltage requirements.

---

## IO-Link standard

The communication module CM 4xIO-Link 4xM12 based on standard IEC 61131-9.

## Industrial use

The ET 200AL distributed I/O system is suitable for use in industrial environments. It meets the following standards for this type of use:

- Requirements on interference emission EN 61000-6-4: 2007 + A1: 2011
- Requirements on immunity EN 61000-6-2: 2005

### Use in mixed areas

Under specific prerequisites you can use the ET 200AL distributed I/O system in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact the residential purpose.

If you want to use the ET 200AL distributed I/O system in mixed areas, you must ensure that its radio frequency interference emission complies with the limit classes of the EN 61000-6-3 generic standard. Suitable measures for observing these limits for use in a mixed area are, for example:

- Installation of the ET 200AL distributed I/O system in grounded control cabinets/control boxes
- Use of filters in supply cables

An additional individual acceptance test is also required.

### Use in residential areas

---

#### Note

#### ET 200AL distributed I/O system not intended for use in residential areas

The ET 200AL distributed I/O system is not intended for use in residential areas. If you are using the ET 200AL distributed I/O system in residential areas, radio and TV reception may be affected.

---

## Use in industrial burner and firing environments.

The fail-safe module F-DI 4+F-DQ 2x24VDC/2A, 4xM12 of the ET 200AL distributed I/O system meets the requirements and criteria of the following standards:

- EN 298 (Automatic burner control systems for burners and appliances burning gaseous or liquid fuels)
- EN 50156-1 (Electrical equipment for furnaces and ancillary equipment)
- EN 50156-2 (Electrical equipment for furnaces and ancillary equipment)

## Reference

The certificates for the markings and approvals can be found on the Internet under Service&Support (<https://support.industry.siemens.com/cs/ww/en/>).

## 10.2 Electromagnetic compatibility

### Definition

Electromagnetic compatibility is the ability of an electrical apparatus to function in a satisfactory manner in its electromagnetic environment without affecting this environment.

An I/O device of the ET 200AL distributed I/O system fulfills the requirements of the EMC law of the European Union. The requirement for this is that an I/O device of the ET 200AL distributed I/O system meets the specifications and guidelines for electrical configuration.

### Pulse-shaped disturbance variables

The table below shows the electromagnetic compatibility of the distributed I/O systems compared to pulse-shaped disturbance variables.

Table 10- 3 Pulse-shaped disturbance variables

| Pulse-shaped disturbance variable                                             | Tested with                                                    | Corresponds to degree of severity |
|-------------------------------------------------------------------------------|----------------------------------------------------------------|-----------------------------------|
| Electrostatic discharge according to IEC 61000-4-2.                           | Air discharge: $\pm 8$ kV                                      | 3                                 |
|                                                                               | Contact discharge: $\pm 4$ kV                                  | 2                                 |
| Burst pulses (rapid transient disturbance values) according to IEC 61000-4-4. | $\pm 2$ kV (power supply cable)                                | 3                                 |
|                                                                               | $\pm 2$ kV (PROFIBUS-/PROFINET line)                           | 4                                 |
|                                                                               | $\pm 1$ kV (signal line <30 m)                                 | 3                                 |
|                                                                               | $\pm 1$ kV (ET-Connection)                                     | 3                                 |
| High-energy surge according to IEC 61000-4-5.                                 |                                                                |                                   |
| • Asymmetrical coupling                                                       | $\pm 2$ kV (24 V DC supply cable) with protective element      | 3                                 |
|                                                                               | $\pm 0.5$ kV (24 V DC supply cable) without protective element | 1                                 |
|                                                                               | $\pm 2$ kV (PROFIBUS/PROFINET line) without protective element | 3                                 |
| • Symmetrical coupling                                                        | $\pm 1$ kV (24 V DC supply cable) with protective element      | 3                                 |
|                                                                               | $\pm 0.5$ kV (24 V DC supply cable) without protective element | 2                                 |

## Sinusoidal disturbance variables

The following tables show the electromagnetic compatibility of the distributed I/O systems to sinusoidal disturbance variables.

Table 10- 4 RF radiation

| RF radiation according to IEC 61000-4-3<br>Electromagnetic RF field, amplitude modulated |        | Corresponds to degree of severity |
|------------------------------------------------------------------------------------------|--------|-----------------------------------|
| 80 MHz to 1000 MHz                                                                       | 10 V/m | 3                                 |
| 1.4 GHz to 6 GHz                                                                         | 3 V/m  | 2                                 |
| 80% AM (1 kHz)                                                                           |        |                                   |

Table 10- 5 RF coupling (signal and supply cables)

| RF coupling according to IEC 61000-4-6. | Corresponds to degree of severity |
|-----------------------------------------|-----------------------------------|
| 0.15 MHz to 80 MHz                      | 3                                 |
| 10 V <sub>rms</sub> unmodulated         |                                   |
| 80% AM (1 kHz)                          |                                   |
| 150 Ω source impedance                  |                                   |

## Emission of radio frequency interference

The following table shows the interference emission of electromagnetic fields according to 55016: limit class A, group 1.

Table 10- 6 Interference emission of electromagnetic fields

| Frequency           | Interference emission | Measuring distance |
|---------------------|-----------------------|--------------------|
| 30 MHz to 230 MHz   | <40 dB (μV/m) Q       | 10 m               |
| 230 MHz to 1000 MHz | <47 dB (μV/m) Q       | 10 m               |
| 1 GHz to 3 GHz      | <76 dB (μV/m) P       | 3 m                |
| 3 GHz to 6 GHz      | <80 dB (μV/m) P       | 3 m                |

## 24 V supply connection

The following table shows measurement ranges for low voltage according to EN 55016.

Table 10- 7 Interference emission from the power supply

| Frequency           | Interference emission        |
|---------------------|------------------------------|
| 0.15 MHz to 0.5 MHz | 79 dB (μV) Q<br>66 dB (μV) M |
| 0.5 MHz to 30 MHz   | 73 dB (μV) Q<br>60 dB (μV) M |

## 10.3 Transport and storage conditions

### Transport and storage conditions

The modules of the ET 200AL distributed I/O system exceed the specifications regarding transport and storage conditions pursuant to IEC 61131-2. The following table shows the conditions that apply to modules transported or stored in their original packaging.

Table 10- 8 Transport and storage conditions

| Type of condition     | Permissible range                                                       |
|-----------------------|-------------------------------------------------------------------------|
| Free fall             | ≤0.3 m                                                                  |
| Temperature           | -40 °C to +70 °C                                                        |
| Temperature variation | 20 K/h                                                                  |
| Barometric pressure   | from 1140 hPa to 660 hPa<br>(corresponds to a height of 1000 to 3500 m) |
| Relative humidity     | from 5 to 95%                                                           |

## 10.4 Mechanical and climatic ambient conditions

### Operating conditions

The ET 200AL distributed I/O system is suitable for use in weather-proof, fixed locations.

- The conditions of use exceed the requirements pursuant to IEC 61131-2
  - Class OTH2

You can find the values for the operating conditions in the technical specifications of the manuals or on the Internet (<https://support.industry.siemens.com/cs/de/en/view/109742718>).

### Tests of mechanical ambient conditions

The following table shows the type and scope of the tests on mechanical ambient conditions.

Table 10- 9 Tests of mechanical ambient conditions

| Condition tested | Test standard                              | Values                                                                                                                                                                                                                                                                       |
|------------------|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vibrations       | Vibration test according to IEC 60068-2-6. | Type of oscillation: Frequency sweeps with a rate of change of 1 octave/minute.<br>5 Hz to 9.1 Hz, constant amplitude 15 mm<br>9.1 Hz to 150 Hz, constant acceleration 10g<br>Duration of oscillation: 10 frequency sweeps per axis at each of three vertically aligned axes |
| Shock            | Shock, tested according to IEC 60068-2-27  | Type of shock: Half-sine<br>Shock intensity: 30g peak value, 18 ms duration<br>Direction of shock: 3 shocks each in ± direction in each of the 3 axes vertical to one another                                                                                                |

## Climatic ambient conditions

The following table shows the type and scope of the tests on climatic ambient conditions.

Table 10- 10 Climatic ambient conditions

| Ambient conditions          | Fields of application                    | Comments                                    |
|-----------------------------|------------------------------------------|---------------------------------------------|
| Temperature                 | -25 °C to 55 °C                          | All installation positions                  |
| Temperature variation       | 10 K/h                                   | -                                           |
| Relative humidity           | From 5 to 100%                           | With condensation                           |
| Barometric pressure         | From 1140 hPa to 795 hPa                 | Corresponds to a height of - 1000 to 2000 m |
| Concentration of pollutants | ANSI/ISA-71.04 severity level G1; G2; G3 | -                                           |

The following table shows the modules with functional versions which are permitted to - 30 °C.

Table 10- 11 Extended temperature range to -30 °C

## 10.5 Details on insulation, protection class, degree of protection and rated voltage

### Insulation

The insulation is designed in compliance with the requirements of IEC 61010-2-201.

#### Note

Galvanic isolation with 707 V DC (Type Test) is tested for modules with 24 V DC supply voltage (SELV/PELV).

### Pollution class according to IEC 61010-2-201

- Protection class III

### Severity for voltage interruption

The I/O devices of the distributed I/O system ET 200AL meet the severity class PS1 for voltage interruption (5 ms).

### Pollution degree / overvoltage category pursuant to IEC 61010-2-201

- Pollution degree: 3
- Overvoltage category: II

### Degree of protection IP65 and IP67

Degree of protection IP65 and IP67 according to IEC 60529 for all modules of the ET 200AL distributed I/O system:

- 1. Code number: Dust-proof and complete protection from contact
- 2. Code number: Protection from water
  - IP65: Protection from water jets from any angle  
(The water may not have any damaging effect)
  - IP67: Protection against temporary submersion  
(The water must not enter the enclosure in harmful quantities)

### Rated voltage for operation

The following table shows the nominal voltage and the corresponding tolerance with which the ET 200AL distributed I/O system operates.

Table 10- 12 Rated voltage for operation

| Rated voltage (SELV/PELV) | Tolerance range     |
|---------------------------|---------------------|
| 24 V DC                   | 20.4 V to 28.8 V DC |

## 10.6 Safety-related symbols for IP65/IP67 modules

The following table contains an explanation of the symbols located on your IP65/67 modules, their packaging or in the accompanying documentation.

| Symbol                                                                                                                        | Meaning                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# Safety-related shutdown of ET200AL standard modules

## Introduction

The diagram below illustrates the fail-safe shutdown of ET 200AL standard modules.

In the configuration shown in the diagram below, all digital outputs that are operated with the 2L+ and 2M supply of the ET 200AL standard modules are switched to the safe OFF state. This step achieves the safety class SIL2/category 3/PLd.

## Principle of operation

The higher-level safety relay (for example: 3SK1) disconnects the 2L+ and 2M supply. This switches all digital outputs operated with the 2L+ and 2M (switched) supply to the safe state. The digital outputs connected to the 1L+ and 1M (non-switched) supply are not intended for functional switching and therefore cannot be shut down safely.

There is no interaction between the outputs supplied by 1L+ and 2L+.

You can also integrate I/O modules that are operated solely at the supply 1L+ and 1M (non-switched) in the structure of your distributed I/O system. These I/O devices must be enabled as reaction-free modules. These I/O modules are not affected by a disconnection, they pass on the supply 2L+ and 2M (switched). The following figure shows this as an example using the DI, AI and AQ modules.

## Block diagram

Figure A-1 Higher-level safety circuit with safety relay

### **! WARNING**

#### **Note potential groups for safety-related shutdown**

When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can then be connected, which leads to elimination of the electrical isolation between 1L+ and 2L+. The safety-related shutdown is not permitted if the electrical isolation is eliminated.

#### **Note**

##### **Safe electrical separation**

Maintain safe galvanic isolation for voltages higher than SELV/PELV.

#### **Note**

##### **Safety-related shutdown for the IO-Link master**

For an IO-Link master with IO-Link Port Class B, safety-related shutdown is available for the additional supply (PIN 2 and PIN 5). The other signals at the port are reaction-free.

Please note that the IO-Link device must have corresponding safety characteristics in order to use safety-oriented tripping.

## Limits of the higher-level safety circuit

The ET 200AL standard modules do not fulfill any safety functions. Safety functions are performed by the safety relay to bring the system into a safe state.

Adjust the operation inspection interval of the safety relay with relay output according to the safety class.

Take the following measures if energy that is not provided by the higher-level safety circuit is used to control the safety function.

Cover critical errors in the safety function that are not detected by the higher-level safety circuit (e.g. 3SK1) with suitable safety measures. The "diagnostics" must be performed indirectly via the controlled process.

Specifications for safety-relevant process data:

- Functionally safe
- Read via fail-safe inputs (e.g. F-DI)
- Fail-safe processing unit (e.g. F-CPU) for issuing commands
- Output through fail-safe outputs (e.g. F-DQ) to control the safety function

## Requirements on the power supply

Operation requires a SELV/PELV power supply to limit overvoltages to L+ and M (24 V). This measure prevents possible errors from the power supply side at the same time.

Select the power supply according to the requirements of the respective operating instructions for the shutdown device and for the ET 200AL system.

You can find more information on safe SELV/PELV in the data sheets of the power supplies used.

## FAQ

Read the latest information on safety-related shutdown in the FAQ (<https://support.industry.siemens.com/cs/us/en/view/39198632>).

In this FAQ, you can find the SIMATIC standard modules that are suitable for safety-related shutdown.

## Request German Technical Inspectorate report (Report no. SN89858T)

You can request copies of the German Technical Inspectorate report at the following address:

SIEMENS AG  
Digital Industries  
DI FA TI COS TT  
P.O. Box 1963  
D-92209 Amberg, Germany

## Dimension drawings

2 module widths are available with the distributed I/O system.

The figure below shows the height and width of the modules. The depth of the modules ranges from 40 mm to 46 mm. Detailed information on the dimensions of the individual modules can be found in the manuals for the Interface modules (<https://support.industry.siemens.com/cs/ww/en/ps/14246/man>) and I/O modules (<https://support.industry.siemens.com/cs/ww/en/ps/14247/man>) in the section "Dimension drawing".

| Identification labels 10 x 5 mm RAL9016, composed of 200 labels on frames, per frame 40 labels                                 | 6ES7194-2BA00-0AA0 |
| Identification labels 10 x 5 mm RAL1018, yellow, consisting of 200 labels on frames, 40 labels per frame                       | 6ES7194-2BB00-0AA0 |
| Identification labels 10 x 7 mm, yellow, consisting of 816 labels on frames, 48 labels per frame (for eCoding plug connectors) | 6ES7194-6HA00-0AA0 |
| Sealing cap M8 for modules IP67                                                                                                | 3RK1901-1PN00      |
| Sealing cap M12 for modules IP67                                                                                               | 3RX9802-0AA00      |
| Bus connection plug PROFIBUS M12, pin insert, 5 units                                                                          | 6GK1905-0EC00      |
| Stripping Tool for ET-Connection                                                                                               | 6ES7194-2KA00-0AA0 |
| Stripping Tool for PROFINET                                                                                                    | 6GK1901-1GA00      |
| Stripping Tool for PROFIBUS                                                                                                    | 6GK1905-6AA00      |
| eCoding plug connector, stores the F-destination addresses and F-source addresses for F-modules                                | 6ES7194-6KB01-0AA0 |

## Online catalog

Other article numbers for the ET 200AL distributed I/O system can be found on the Internet (<https://mall.industry.siemens.com>) in the online catalog and the online order system.

## C.2 Cables

### Cables for ET-Connection standard and PUR cable

The cables for ET-Connection are available in the following versions and lengths:

- Bus cable (4-wire), pre-assembled on both sides with 2 M8 connectors, 4-pole, shielded
  - available lengths: 0.19 m, 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Bus cable (4-wire), pre-assembled on both sides with 2 M8 connectors, angled, 4-pole, shielded
  - available lengths: 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Bus cable (4-wire), pre-assembled on one side 1x M8 connector, 4-pole, shielded
  - available lengths: 2 m, 5 m, 10 m, 15 m

The following table shows the technical properties of the bus cable ET-Connection standard.

Table C- 8 Cables for ET-Connection

| General information                              |                                                                                                                                                              |

\* = Applies to cable lengths up to 10 meters.

## Connecting cable for ET-Connection standard and PUR cable

You can use the connecting cable between two cables for ET-Connection.

Typical applications for using connecting cable for ET-Connection are:

- Combination of individual cable lengths by joining multiple pre-assembled cables for ET-Connection.
- Selective installation of disconnection points of cables for ET-Connection (for simple changing of cables and cable sections, e.g. with trailing-cable applications).

You can use a maximum of two connecting cables between the two modules.

The length of the cables for ET-Connection is limited to maximum 10 m when connecting cables are used.

The connecting cable for ET-Connection is available in the following design:

- Connecting cable for bus cable ET-Connection M8, both ends assembled with 2x M8 socket, 4-pole, shielded, length 0.2 m

The following table shows the technical properties of the connecting cable for ET-Connection standard.

Table C- 10 Connecting cables for ET-Connection

## Cables of power supply standard and PUR cable

The cables for the power supply are available in the following versions and lengths:

- Power cable (4-wire), pre-assembled on both sides with a 4-pole M8 pin connector/socket connector
  - available lengths: 0.19 m, 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Power cable (4-wire), pre-assembled on both sides with a 4-pole M8 pin connector/socket connector, angled
  - available lengths: 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Power cable (4-wire), pre-assembled on one side with 1x M8 socket connector
  - available lengths: 2 m, 5 m, 10 m, 15 m

The following table shows the technical properties of the power supply cable, standard.

Table C- 12 Cables for power supply

| General information                              |                                                                                                                                                                          |

| 3   | Ground 1M (non-switched)          | blue                                            |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | black                                           |                                                                                       |

# Glossary

## 1oo1 evaluation

Type of → sensor evaluation – in the case of the 1oo1 evaluation, there → is one sensor with a 1-channel connection to the F module.

## 1oo2 evaluation

Type of → sensor evaluation – in the case of 1oo2 evaluation , two input channels are assigned one two-channel sensor or two one-channel sensors. The input signals are compared internally for equivalence or nonequivalence.

## Access protection

Fail-safe systems must be protected against dangerous, unauthorized access. Access protection for F-systems is achieved by assigning two passwords (for the fail-safe CPU and the safety program).

## Acknowledgment time

During the acknowledgment time, the → F-I/O acknowledge the sign of life specified by the → F-CPU. The acknowledgment time is included in the calculation of the → monitoring time and → response time of the overall fail-safe system.

## Actuator

Actuators are, for example, power relays or contactors for switching on load devices or load devices themselves (e.g. directly controlled solenoid valves).

## Availability

Availability is the probability that a system is functional at a specific point in time. Availability can be increased by redundancy, e.g., by using multiple → sensors at the same measuring point.

## Bus

A common transfer route to which all devices are connected; it has two defined ends.

**Channel**

In IEC 61508 terminology, a channel is a single signal/logic path that supports a safety function. The term 'channel' is used in this sense in the definition of 1oo1 and 1oo2 above. In most cases in this manual, the term 'channel' refers to exactly one process value, which may be implemented as 1oo1 or 1oo2.

**Channel fault**

Channel-specific fault, such as a wire break or short circuit.

In channel-specific passivation, the affected channel is either automatically reintegrated or the fail-safe module must be removed and reinserted after the fault has been eliminated.

**Channel group**

The channels of a module are grouped together in a channel group. Certain parameters in STEP 7 can only be assigned to channel groups, rather than to individual channels.

**Channel number**

Channel numbers are used to uniquely identify the inputs and outputs of a module and to assign channel-specific diagnostic messages.

**Channel-specific passivation**

With this type of passivation, only the affected channel is passivated in the event of a → channel fault. In the event of a → module fault, all channels of the → fail-safe module are passivated.

**Configuration**

Systematic arrangement of individual modules (design).

**Connection plug**

Physical connection between device and cable.

**CRC**

Cyclic Redundancy Check

**CRC signature**

The validity of the process values in the safety frame, the accuracy of the assigned address references, and the safety-related parameters are validated by means of the CRC signature in the safety frame.

## **Dark period**

Dark periods occur during shutdown tests and complete bit pattern tests. The fail-safe output module switches test-related zero signals to the active output. This output is then briefly disabled (= dark period). An adequate carrier → actuator will not respond to this and will remain activated.

## **Device**

Device that can send, receive or amplify data via the bus, e.g. IO device via PROFINET IO.

## **Diagnostics**

Monitoring functions for the detection, localization, classification, display, and further evaluation of errors, faults, and alarms. They run automatically while the system is in operation. This increases the availability of systems by reducing commissioning times and downtimes.

## **Discrepancy analysis**

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is performed to determine whether the difference (for nonequivalence testing: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

The discrepancy analysis compares the two input signals of the 1oo2 sensor evaluation in the fail-safe input module.

## **Discrepancy time**

Configurable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are extended unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily since a discrepancy error is detected when, in reality, no error exists.

## **Distributed I/O system**

System with input and output modules that are configured on a distributed basis, far away from the CPU controlling them.

## **eCoding plug connector**

The eCoding plug connector stores the external addresses of F-source and F-destination of the I/O module. The eCoding plug connector simplifies module replacement.

**ET-Connection**

Backplane bus through which a connection is made. This allows bus participants to be installed several meters from each other.

**Fail-safe**

Ability of a technical system to remain in a safe state or immediately switch to another safe state when certain failures occur.

**Fail-safe modules**

ET 200AL modules with integrated safety functions that can be used for safety-related operation (safety mode).

**Fail-safe systems**

Fail-safe systems (F-systems) remain in a safe state or immediately assume another safe state as soon as particular failures occur.

**Fault reaction time**

The maximum fault reaction time of an F-system defines the interval between the occurrence of any fault and a safe reaction at all affected fail-safe outputs.

**For → F-system overall:** The maximum fault reaction time defines the interval between the occurrence of any fault in any → F-I/O and a safe response at the relevant fail-safe output.

**For digital inputs:** The maximum fault reaction time defines the interval between the occurrence of the fault and the safe reaction on the backplane bus.

**For digital outputs:** The maximum fault reaction time defines the interval between the occurrence of the fault and the safe reaction at the digital output.

**Fault tolerance time**

The fault tolerance time of a process is the time a process can be left unattended without risk to life and limb of the operating personnel, or damage to the environment.

Any type of F-system control is tolerated within this fault tolerance time, i.e. the → F-system can control its processes incorrectly or even not at all. The fault tolerance time depends on the type of process and must be determined on a case-by-case basis.

**F-CPU**

An F-CPU is a central processing unit with fail-safe capability that is permitted for use in SIMATIC Safety. A standard user program can also be run on the F-CPU.

## **F-I/O**

Collective name for fail-safe inputs and outputs available in SIMATIC S7 for integration into the SIMATIC Safety F-system. Available F-I/O modules:

- Fail-safe I/O module for ET 200eco
- Fail-safe signal modules S7-300 (F-SMs)
- Fail-safe modules for ET 200S
- Fail-safe modules for ET 200SP
- Fail-safe modules for ET 200MP
- Fail-safe modules for ET 200AL
- Fail-safe DP standard slaves
- Fail-safe PA field devices
- Fail-safe IO devices

## **Firmware update**

Upgrade of firmware for modules (interface modules, I/O modules etc.), e.g. after functional enhancements, to the newest firmware version (update).

## **F-monitoring time**

→ PROFIsafe monitoring time

## **F-Systems**

→ fail-safe systems

## **Ground**

Conductive earth whose electrical potential can be set equal to zero at any point.

All interconnected, inactive parts of a piece of equipment that cannot accept any dangerous contact voltage, even in the event of a fault.

## **Ground**

Conductive earth whose electrical potential can be set equal to zero at any point.

All interconnected, inactive parts of a piece of equipment that cannot accept any dangerous contact voltage, even in the event of a fault.

## **GSD file**

As a generic station description, this file in XML format has all the properties of a PROFINET or PROFIBUS device that are required for its configuration.

**I/O modules**

All modules that can be operated with a CPU or an interface module.

**Identification data**

Information that is saved in modules and that supports the user in checking the plant configuration and locating hardware changes.

**Interface module**

Module in the distributed I/O system. The interface module connects the distributed I/O system via a field bus with the CPU (I/O) controller and prepared the data for the/from the I/O modules.

**Module fault**

Module faults can be external faults (e.g. missing load voltage) or internal faults (e.g. processor failure). Internal faults always require module replacement.

**Monitoring time**

→ PROFIsafe monitoring time

**M-switch**

Each fail-safe digital output of ET 200AL F-modules consists of a P-switch DO-P<sub>x</sub> (current sourcing) and an M-switch DO-M<sub>x</sub> (current sinking). The load is connected between the P-switch and M-switch. The two switches are always activated so that voltage is applied to the load.

**Nonequivalent sensor**

A nonequivalent → sensor is a two-way switch that is connected to two inputs of an → F-I/O (via 2 channels) in → fail-safe systems (for → 1oo2 evaluation of sensor signals).

**Parameter assignment**

Parameter assignment is the transfer of parameters from the IO controller to the IO device.

## Passivation

If an → F-I/O module detects a fault it switches either the affected channel or all channels to a → safe state, i.e. the channels of this F-I/O module are passivated. The F-I/O module signals the detected faults to the → F-CPU.

When passivating channels at F-I/O with inputs, the → F-System provides fail-safe values for the → safety program instead of the process values pending at the fail-safe inputs.

When passivating channels at F-I/O with outputs, the F-system returns fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program.

## PELV

Protective Extra Low Voltage = protective extra-low voltage

## Performance Level

Performance Level (PL) in accordance with ISO 13849-1 or EN ISO 13849-1

## PROFINET

PROcess Field NETwork, open Industrial Ethernet standard, which continues PROFIBUS and Industrial Ethernet. A cross-manufacturer communication, automation and engineering model, defined as an automation standard by PROFIBUS International e.V.

## PROFINET IO controller

Device used to address connected I/O devices (e.g. distributed I/O systems). This means that: The IO controller exchanges input and output signals with assigned I/O devices. The IO controller often corresponds with the CPU in which the automation program is running.

## PROFINET IO device

Distributed field device that can be assigned to one or more IO controllers (e.g. distributed I/O system, valve terminals, frequency converters, switches).

## PROFINET IO

Communication concept for the realization of modular, distributed applications in the framework of PROFINET.

## PROFIsafe

Safety-oriented PROFINET I/O bus profile for communication between the → safety program and the → F-I/O module in a → fail-safe system.

**PROFIsafe address**

The PROFIsafe address (code name according to IEC 61784-3-3: 2010) is used to protect standard addressing mechanisms such as IP addresses. The PROFIsafe address consists of the F-source address and F-destination address. Every → fail-safe module therefore has two address portions, the F-source address and the F-destination address.

The PROFIsafe address must be configured in the hardware and network editor.

**PROFIsafe monitoring time**

Monitoring time for safety-related communication between the F-CPU and F-I/O

**Proof-test interval**

Period after which a component must be forced to fail-safe state, that is, it is either replaced with an unused component, or is proven faultless.

**P-switch**

→ M-switch

**Redundancy, availability-enhancing**

Multiple instances of components with the objective of maintaining component functionality in the event of hardware faults.

**Redundancy, safety-enhancing**

Multiple availability of components with the aim of exposing hardware faults based on comparison; such as → 1oo2 evaluation in → fail-safe modules.

**Reference potential**

Potential from which the voltages of the circuits involved are observed and/or measured.

**Reintegration**

After the elimination of a fault, it is necessary to ensure the reintegration (depassivation) of the → F-I/O. Reintegration (switchover from fail-safe values to process values) occurs either automatically or only after a user acknowledgment in the safety program.

In the case of a fail-safe input module, the process values pending at the fail- safe inputs are made available to the safety program again after reintegration. In the case of a fail-safe output module, the → fail-safe system transfers the output values in the safety program to the fail-safe outputs again.

**RIOforFA-Safety**

Remote IO for Factory Automation with PROFIsafe; Profile for F-I/O

### **Safe Direction (SDI)**

The SDI function (Safe Direction) monitors the direction of the motion.

### **Safe Operating Stop (SOS)**

The SOS function (Safe Operating Stop) protects from unintentional motions.

### **Safe state**

The basic principle of the safety concept in F-systems is the existence of a safe state for all process variables. For the digital F-I/O, for example, the safe state is the value "0".

### **Safety class**

Safety level (Safety Integrity Level) SIL according to IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and hardware failures.

The fail-safe modules support operation in safety mode up to safety class SIL3.

### **Safety frame**

In safety mode, data are transferred between the → F-CPU and → F-I/O in a safety frame.

### **Safety function**

A mechanism integrated in the → F-CPU and → F-I/O that enables their use in → the fail-safe system SIMATIC Safety.

According to IEC 61508:2010: A safety function is implemented by a safety system in order to maintain or force a system safe state in the event of a specific fault.

### **Safety Limited Speed (SLS)**

The SLS function (Safely Limited Speed) monitors the calculated speeds in both directions.

### **Safety mode**

Operating mode of → F-I/O that enables → safety-related communication via → safety frames.

The → fail-safe modules ET 200AL are designed for safety mode only.

### **Safety program**

Safety-related user program

**Safety-related communication**

Communication used to exchange fail-safe data.

**SELV**

Safety Extra Low Voltage = Safety extra-low voltage

**Sensor evaluation**

There are two types of sensor evaluation:

→ 1oo1 evaluation – sensor signal is read once

→ 1oo2 evaluation – sensor signal is read in twice by the same F-module and compared internally

**Sensors**

Sensors are used for the accurate detection of routes, positions, velocities, rotational speeds, masses, etc. in the form of digital and analog signals.

**Standard mode**

Operating mode of F-I/O in which standard communication is possible by means of → safety frames, but not → safety-related communication.

ET 200AL fail-safe modules are only designed for safety mode.

**TIA Portal**

Totally Integrated Automation Portal

The TIA Portal is the key to the full performance capability of Totally Integrated Automation. The software optimizes operating, machine and process sequences.

**Value status**

Binary additional information for an input signal. This additional information indicates whether or not the input signal is valid. Example: The value of the input signal is invalid if wire break has been detected or flutter monitoring has responded. In this case, exception handling is triggered in an automation function (e.g. with safe substitute value).

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This documentation provides you with important information on how to configure, install, wire and commission the IO-Link I/O modules of the SIMATIC ET 200AL distributed I/O system.

## Basic knowledge required

A basic knowledge of automation technology is required to understand the documentation.

## Validity of the documentation

This documentation applies to the IO-Link I/O modules of the SIMATIC ET 200AL distributed I/O system.

## Changes compared to the previous version

This manual contains the following changes/additions compared to the previous version:

- Supplement to section Safety-related shutdown of ET 200AL IO-Link modules (Page 61).

## Conventions

Observe the notes labeled as follows:

---

### Note

A note contains important information regarding:

- The product described in the documentation
  - The handling of the product
  - The part of the documentation to which special attention should be paid in order to avoid damage.
- 

## Recycling and disposal

For environmentally compatible recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the equipment according to the applicable regulations in your country.

## Additional support

- Information about Technical Support is available in section Siemens Industry Online Support (Page 5).
- Information about the online catalog and online order system is available in section Industry Mall (Page 5).
- The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (<http://www.siemens.com/simatic-tech-doku-portal>).

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

## Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

For answers and solutions concerning automation technology.

- **mySupport**

Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (<https://support.industry.siemens.com/cs/ww/en/>).

## Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (<https://mall.industry.siemens.com>) and in the Information and Download Center.

# ET 200AL IO-Link I/O modules Documentation Guide

# 1

The documentation for the SIMATIC ET 200AL IO-Link I/O modules is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the distributed I/O system SIMATIC ET 200AL IO-Link I/O modules.

## Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC IO-Link system.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## ET 200AL Manual Collection

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

You can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" CAx data on the Internet  
(<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA has two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SIMATIC S7-PCT

The Port Configuration Tool ("PCT") is PC-based software for the parameter assignment of Siemens IO-Link master-modules and IO-Link devices from any manufacturer.

The IO-Link devices are integrated using the standardized device description "IODD" that is available from the respective device manufacturer. S7-PCT supports the version 1.0 as well as V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link masters from STEP 7; however, it can also be started as "standalone" if the IO-Link master is not operated on a SIMATIC controller or when STEP 7 is not used.

You can find additional information on IO-Link on the Internet

(<https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html>).

# System overview

## 2.1 System overview

### Introduction

A continuous communication down to the lowest field level ensures enhanced use of the functions and performance capability of sensors and actuators. Enhanced use of sensors and actuators allows you to operate your machines and plants more productively.

No data other than the actual process value can be exchanged via the standard interfaces (digital, analog) used at the sensor/actuator level. Sensors and actuators with integrated intelligence are now used for increasingly complex functions and require a communication interface tailored to these requirements.

### Definition

IO-Link is an innovative, point-to-point communication interface for the sensor/actuator area that is specified in IEC 61131-9.

IO-Link consists of the following system components:

- IO-Link master
- IO-Link device
- Unshielded 3-wire or 5-wire standard cable
- Engineering tool for configuring and assigning parameters of IO-Link

## 2.2 What are ET 200AL IO-Link I/O modules?

### SIMATIC ET 200AL IO-Link I/O modules

SIMATIC ET 200AL IO-Link I/O modules belong to the SIMATIC ET 200AL distributed I/O system.

You can operate the IO-Link I/O modules on any IO-Link master with IP20 or IP67 degree of protection.

### Customer benefits

Figure 2-1 Benefits of the ET 200AL IO-Link

## Area of application

The SIMATIC ET 200AL distributed I/O system is especially well-suited for the following application areas:

- Where space is limited
- Moving applications
- Assembly and handling technology

Thanks to its scalable construction, you have the option to precisely customize its configuration to your on site needs.

The SIMATIC ET 200AL distributed I/O system is designed in IP65/IP67 degree of protection. The I/O modules are suited for distributed use indoors on a machine or assembly line.

You can adapt the cable routing optimally to the machine requirements. The combination of a line topology, such as PROFINET IO and ET connection, and the star topology of IO-Link make this easy to implement.

## Configuration

The IO-Link I/O modules of the SIMATIC ET 200AL distributed I/O system are operated on any IO-Link master.

A cable with M12 plug-in connection is used for the communication and power supply.

## 2.3 Components

### Components of the IO-Link I/O modules

The following table shows and explains the function of the components of the IO-Link I/O modules of the ET 200AL distributed I/O system.

Table 2- 1 Components of the IO-Link I/O modules

| Component                    | Function                                                                                                                                                                                                                 | View                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| IO-Link I/O modules          | <ul style="list-style-type: none"> <li>The I/O modules form the interface to the process</li> <li>Recording and controlling the current process status via the connected sensors and actuators</li> </ul>                |    |

| Power connecting cable M12-L | <ul style="list-style-type: none"> <li>Connection of additional load voltage</li> </ul>                                                                                                                                  |  |
| Sealing cap M8 and M12       | <ul style="list-style-type: none"> <li>Seal for unused connections</li> <li>IP degree of protection is maintained through use</li> </ul>                                                                                 |  |
| Y-cable                      | <ul style="list-style-type: none"> <li>Double connection of actuators or sensors to one socket</li> <li>IP degree of protection class is maintained when two actuators or sensors are connected to one socket</li> </ul> |  |

# Application planning

## 3.1 Hardware configuration

### Basic configuration with IO-Link I/O modules

Connect the IO-Link I/O module to an IO-Link port of the master with an M12-A coded plug.

The maximum cable length between an IO-Link device and an IO-Link master is 20 m.

Power is supplied to the IO-Link I/O modules via the IO-Link master.

You can connect one IO-Link I/O module per IO-Link port to an IO-Link master.

For I/O modules with high power demand, an M12-L power connector is available for an additional supply voltage.

You can find information on the maximum infeed current in the technical specifications of the modules in the respective equipment manuals or on the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## 3.2 Configuration of IO-Link I/O modules

Each ET 200AL IO-Link I/O module has an M12 A-coded plug for connection to an IO-Link master.

When connecting the IO-Link I/O modules to an IP65/67 IO-Link master, pay attention to the required port class (Type A or Type B). You can find the technical specifications in the respective equipment manuals or on the Internet.

### PROFINET IO

The figure shows an IO-Link configuration in combination with a PROFINET IO network. The line topology of PROFINET IO is supplemented with a star topology of IO-Link.

#### Note

#### Configuration variants

The IO-Link I/O modules can also be operated on an IO-Link master in other networks.

### Connection examples

The following figure shows a connection example using an S7-1500 IO-Link master with IP20 degree of protection.

Figure 3-1 Configuration with IP20 IO-Link master

The following figure shows a connection example on an ET 200ecoPN IO-Link master with IP65/67 degree of protection.

Figure 3-2 Configuration with IP65/67 IO-Link master

# Mounting

## 4.1 Basics

### Introduction

The IO-Link I/O modules are designed for IP65/IP67 degree of protection. This means that you can mount the modules directly in your plant.

### Mounting position

You can mount the IO-Link I/O modules in any mounting position.

### Minimum clearances

Maintain a minimum clearance of 2 cm from adjacent modules or other devices when mounting. The minimum clearance makes it easier to install the connectors.

### Mounting rules

When mounting the modules, you do not need to following any special rules.

---

#### Note

#### Mounting of the modules

Only mount the IO-Link I/O module when the supply voltages are disconnected.

---

## 4.2 Mounting modules

### Introduction

The IO-Link I/O modules are designed for mounting on a level, stable surface.

Thanks to the axisymmetrical drill holes in the modules, you have the option to fasten the modules on an aluminum profile using tee nuts.

The following images shows the aluminum profile on which you can mount the modules.

Figure 4-1 Aluminum profile

### Required tool

For installation, you need a screwdriver or an Allen wrench.

### Required screws

The following table shows and explains the screw types required to mount the modules.

Table 4- 1 Recommended screws

| Screw type                                                              | Explanation                                                                                                   |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Socket head cap screw M4 according to DIN EN ISO 1207 / DIN EN ISO 1580 | The screw length must be at least 30 mm.<br>If you need washers, use DIN EN ISO 7089/DIN EN ISO 7090 washers. |
| Hexagon socket head cap screw M4 according to DIN EN ISO 4762           |                                                                                                               |

### Drill holes of the modules

All IO-Link I/O modules have a uniform drill pattern.

- All module housings are axisymmetrical.
- The distance between the top and bottom drill hole is identical for all modules.

### Mounting 30 mm wide I/O modules (front or side)

Watch video sequence (<https://support.industry.siemens.com/cs/ww/en/view/95886672>)

The 30 mm I/O modules have a fastening point at the top and bottom. The 30 mm wide I/O modules can also be side-fastened. When fastening them at the side, you must use the supplied spacers.

Follow the steps below to mount a 30 mm wide I/O module:

1. Drill two fastening holes with 4.5 mm diameter spaced 149.6 mm apart.
2. Use the supplied spacers for side fastening of the I/O module on the top and bottom (on one side adjacent to the fastening surface).
3. Fasten the I/O module with the screws to both fastening points (tightening torque 1.2 Nm).

The figure below shows the dimensions for fastening the 30 mm wide I/O modules using the example of the IO-Link I/O module DIQ 4+DQ 4x24VDC/0.5A 8xM8.

Figure 4-2 Dimensions for mounting 30 mm wide I/O modules

### Mounting 45 mm I/O modules (front mounting)

Watch video sequence (<https://support.industry.siemens.com/cs/ww/en/view/95886672>)

The 45 mm wide I/O modules have a fastening point at the top and bottom.

Follow the steps below to mount a 45 mm wide I/O module:

1. Drill two fastening holes with 4.5 mm diameter spaced 149.6 mm apart.
2. Fasten the I/O module with the screws to both fastening points (tightening torque 1.2 Nm).

The figure below shows the dimensions for fastening using the example of the IO-Link I/O module DI 8x24VDC M12-L 8xM12.

Figure 4-3 Dimensions for mounting 45 mm I/O modules

### Fastening for cable ties

All IO-Link I/O modules have integrated fastening points for cable ties. The fastening points are found on all four corners of the modules.

The figure below shows the top left fastening point for 2.5 mm cable ties for fastening the cables.

Figure 4-4 Top left fastening point for cable ties

# Connecting

## 5.1 Rules and regulations for operation

### Introduction

Depending on the area of application, the IO-Link I/O modules, as an integral component of a system, must adhere to special rules.

This section gives an overview of the most important rules you must follow when integrating the IO-Link I/O modules in a plant or system.

### Specific application

Observe the safety and accident prevention regulations that are applicable to specific applications, for example, the Machinery Directive.

### EMERGENCY-STOP device

Emergency Stop devices according to IEC 60204-1 (corresponds to DIN VDE 0113-1) must remain effective in all operating modes of the system.

### Excluding hazardous system conditions

Hazardous operating states must not occur in any situation, but especially:

- When the system restarts after a voltage dip or power outage
- When the IO-Link I/O modules start up after interruption of the IO-Link communication

If necessary, force an EMERGENCY STOP.

An uncontrolled or undefined startup is not permitted after the "EMERGENCY STOP" is unlocked.

### Cables and wires

Note that the utilized cables (including plugs) are approved for a continuous operating temperature of 30 °C above the operation temperature of the IO-Link I/O modules.

The cables and wires used must be rated for at least the supply voltage used.

### External fuses/switches

External fuses and switches must be installed so that they meet the standards for cable and device protection applicable to your application.

## Line voltage

For the line voltage, note the following:

- For stationary plants or systems without an all-pole line disconnect, there must be a disconnect unit (all-pole) fitted in the building installation.
- For load current supplies, the configured rated voltage range must correspond to the local line voltage.
- For all electric circuits of the IO-Link I/O modules, the fluctuation/deviation of the supply voltage and load voltage from the rated value must be within the permitted tolerance.

You can find more information in the section Specifications for insulation, protection class, degree of protection and rated voltage (Page 59).

## 24 V supply

For the 24 V supply, note the following:

- For buildings:  
If there is a danger due to overvoltages, you must take lightning protection measures for external lightning protection (e.g. lightning protection elements).
- With 24 V DC supply lines and signal lines:  
If there is a danger due to overvoltages, you must take lightning protection measures for internal lightning protection (e.g. lightning protection elements. You will find additional information in the Designing interference-free controllers (<https://support.industry.siemens.com/cs/ww/en/view/59193566>) function manual).
- For 24 V DC supply:  
Ensure that there is an electrical protective separation of extra-low voltage (SELV/PELV) according to IEC 61010-2-201 or IEC 60950-1.  
1L+ is supplied via the IO-Link master. Observe the requirements of the IO-Link master used.  
2L+ is connected via port Type B or the M12-L power connector. Protect 2L+ with a UL- or IEC-approved fuse (tripping characteristic type B or C). This fuse must conform to the cable cross-section and must not exceed the maximum total current of the IO-Link I/O module. Module-specific specifications can be found in the equipment manuals and on the Internet.

---

### Note

#### Wet environment

If you use IO-Link I/O modules in a wet environment, other limits apply for SELV/PELV.

---

### Protection against outside electrical influences

Below is a description of what you must pay attention to in terms of protection against electrical impacts and/or faults:

- To protect against electromagnetic interference, connect the I/O devices to functional ground.
- Ensure correct installation and routing of the supply, signal and IO-Link cables.
- Configure the plant/system in such a way that an error does not result in undefined states.
  - Line/wire break
  - Cross-circuit in the cable

### Reference

Additional information can be found in the function manual Designing interference-free controllers (<https://support.industry.siemens.com/cs/ww/en/view/59193566>).

## 5.2 Operation of the IO-Link I/O modules on a grounded/ungrounded infeed

### Introduction

Information on the overall configuration of the IO-Link I/O modules on a grounded infeed (TN-S system) is provided below. Statements regarding the TN-S system relate to the upstream 24 V DC power supply that is connected to the TN-S system.

Together, the IO-Link I/O modules and the IO-Link master form a unit. The following items must be noted for the configuration.

- IO-Link voltage supply via IO-Link master port class A
- IO-Link voltage supply via IO-Link master port class B
- Voltage supply for modules with high power demand via the M12-L power connector

The specific subjects discussed are:

- Disconnecting devices, short-circuit and overload protection to IEC 60364 (corresponding to DIN VDE 0100) and IEC 60204 (corresponding to DIN VDE 0113)
- Load current supplies and load circuits
- Supply voltages of the IO-Link I/O modules

### Grounded infeed

In grounded incoming supplies, the neutral conductor of the supply system is grounded. A ground fault between a live conductor and ground or a grounded system component causes the protective devices to trip.

## Supply voltages

Provide the IO-Link master with an SELV/PELV 1L+ supply voltage.

The SELV/PELV 2L+ load voltage is supplied via the M12-A connector with port class B or via the M12-L power connector. The SELV/PELV 2L+ load voltage can be switched depending on the application.

- IO-Link 1L+ supply voltage (non-switched) via M12-A connector port class A.
- IO-Link 2L+ load voltage (switched) via M12-A connector port class B or M12-L power connector.

## Safe electrical isolation (SELV/PELV)

Power packs/power supply modules with safe electrical isolation SELV/PELV are required for operation of the IO-Link I/O modules. These power packs/power supply modules must comply with IEC 61010-2-201.

The wiring of SELV/PELV circuits must be separated from the wiring of non-SELV/PELV circuits. Or the insulation of all conductors must be rated for the higher voltage.

|                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------|
| <b>NOTICE</b>                                                                                                          |
| <b>Operation in damp / wet environments</b>                                                                            |
| When operating in a damp / wet environment, different voltage limits apply for SELV/PELV according to IEC 61010-2-201. |

## Configuring IO-Link I/O modules with grounded reference potential

In the configuration of IO-Link I/O modules with grounded reference potential, any interference currents that occur are discharged to functional ground. The connections must be externally connected. Establish a connection between 1M or 2M and functional ground.

## Configuring IO-Link I/O modules with ungrounded reference potential

In the configuration of IO-Link I/O modules with ungrounded reference potential, any interference currents that occur are discharged to functional ground via an internal RC network. You do not need an external connection between 1M, 2M and functional ground.

The figure below shows the overall electrical configuration using the example of an IO-Link I/O module with port class A on an IO-Link master with port class A.

[illegible]

- ① Main switch
- ② Short-circuit and overvoltage protection
- ③ Fuses for cable protection
- ④ In the configuration of the IO-Link system with ungrounded reference potential, the connection between 1M, 2M and functional ground is omitted.

Figure 5-2 Electrical configuration of an IO-Link I/O module with port class A or B on an IO-Link master with port class A.

The figure below shows the overall electrical configuration using the example of an IO-Link I/O module with port class B on an IO-Link master with port class B.

Figure 5-3 Electrical configuration of an IO-Link I/O module with port class B on an IO-Link master with port class B.

## Components and protective measures

Various components and protective measures are stipulated for setting up a complete plant. The types of components and the degree to which the protective measures are mandatory depend on the IEC regulation that applies to your plant setup.

The following table shows the components of the electrical configuration with reference to the previous figure and compares the IEC regulations.

Table 5- 1 Components of electrical configuration

|                                                              | Reference to illustration | IEC 60364 (DIN VDE 0100)                                                                                                       | IEC 60204 (DIN VDE 0113)                                         |
|--------------------------------------------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| Disconnection element for controller, sensors, and actuators | ①                         | ... Part 460: Main switch                                                                                                      | ... Part 1: Disconnectors                                        |
| Short-circuit / over-load protection                         | ②                         | ... Part 725: Single-pole protection of circuits                                                                               | ... Part 1: Single-pole protection of grounded secondary circuit |
| Cable protection                                             | ③                         | ... Part 430: Protection of cables and wires against overcurrent<br>Protect all incoming supply cables with a circuit breaker. | ... Part 1: Overcurrent protection                               |

## Insulation monitoring

You must provide insulation monitoring in the following cases:

- In the configuration of the IO-Link system with ungrounded reference potential
- When hazardous system conditions may occur due to errors

## 5.3 Electrical configuration of the IO-Link I/O modules

### Electrical isolation

In the electrical configuration of the IO-Link I/O modules, there is electrical isolation between:

- IO-Link 1L+: Non-switched supply voltage (electronics/sensor/load supply):  
Electrically isolated from 2L+ (load voltage supply)
- 2L+ port class B or M12-L power connector: Switched supply voltage (load voltage supply):  
Electrically isolated from all other circuit components  
Can be switched off without affecting the IO-Link 1L+

### Connection of a digital output with a digital input

|                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NOTICE</b>                                                                                                                                                                                                                                                                                                                                              |
| <b>Pay attention to the potential group</b><br>When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M may then be connected, resulting in elimination of the electrical isolation between 1L+ and 2L+. The possible compensating currents can destroy the digital module. |

### Cable protection

According to DIN VDE 0100, cable protection is required. Therefore, you must always protect the supply lines externally.

Protect the 24 V DC supply lines against short-circuits and overloads.

Select a protective device that meets the following criteria:

- Suitable for 24 V DC supply voltage
- Suitable for cable cross-section and type of installation
- Suitable for other conditions, such as temperature

## Power supply of the configuration

Up to two voltage groups are available for the ET 200AL distributed I/O system.

- 1L+ via IO-Link (supply voltage / non-switched)
- 2L+ via port class B or M12-L power connector (load voltage / switched)

---

### Note

#### Connecting and disconnecting of 1L+ IO-Link, 2L+ via port class B or M12-L power connector

Unlike the load voltage 2L+ via port class B or the M12-L power connector, the connection and disconnection of the supply voltage 1L+ during operation results in a module restart.

---

## 5.4 Connecting IO-Link I/O modules to functional ground

### Introduction

You must connect the IO-Link I/O modules to functional ground.

### What is functional ground?

All IO-Link I/O modules have a functional ground connection. This connection is used to suppress interference sensitivity, but not for protection purposes. With the functional ground connection, you establish an electrical connection to a point of your system or a shield. Electromagnetic interferences are discharged directly to ground via this connection. By discharging the electromagnetic interference, the interference immunity of the entire module is increased.

The figure below shows the symbol that is used to mark the functional ground connection on the IO-Link I/O modules.

Figure 5-4 Functional ground

### 5.4.1 Mounting IO-Link I/O modules on a conductive surface

#### Requirement

Conductive surface for mounting of the module

#### Required tool

To connect to functional ground, you need the following tool:

- Screwdriver or hexagon socket size 3

#### Required accessories:

To connect to functional ground, you need the following accessories:

- 2 x M4 fastening screws

#### Mounting

To connect the IO-Link I/O modules to functional ground in the case of a conductive mounting surface, proceed as follows:

1. Drill two fastening holes. The dimensions of the module can be found in the section Dimension drawings (Page 65).
2. Screw the module with the M4 fastening screws using a torque of 1.2 Nm.

---

#### Note

##### Grounding in the case of a conductive mounting surface

When you mount an IO-Link I/O module on a conductive, grounded surface, the lower fastening screw establishes a conductive connection to the ground potential.

Ensure that there is a low-impedance connection between the module and conductive surface as well as between the conductive surface and functional ground.

---

#### Reference

You will find more information on installing the modules in the section Mounting modules (Page 19).

## 5.4.2 Mounting IO-Link I/O modules on a non-conductive surface

### Requirement

Non-conductive surface for mounting of the module

### Required tool

To connect to functional ground, you need the following tool:

- Screwdriver or hexagon socket size 3
- Stripping tool
- Crimp tool

### Required accessories:

To connect to functional ground in the case of a non-conductive mounting surface, you need the following accessories:

- 2 x 4 mm fixing screws
- Cable lug, suitable for 4 mm screws
- Grounding cable (braided copper cable) with a minimum cross section of 4 mm<sup>2</sup>

## Mounting

To connect IO-Link I/O modules to functional ground, proceed as follows:

1. Drill two fastening holes.
2. Strip the grounding cable.
3. Fasten the cable lug to the grounding cable.
4. Screw the module and the cable lug with the 4 mm fastening screws using a torque of 1.2 Nm.

The figure below shows how to connect the functional ground.

Figure 5-5 Connecting the functional ground

---

### Note

#### Grounding in the case of a non-conductive mounting surface

Make sure there is a low-impedance connection between the module and functional ground.

---

## Reference

You will find more information on installing the modules in the section Mounting modules (Page 19).

## 5.5 Wiring

### Connection

Connect all cables to the front side of the modules:

- IO-Link to the 5-pole M12 connector (A-coded)
- Signal lines to the 3-pole M8 sockets or 4/5-pole M12 sockets (A-coded)
- Additional load voltage to the 5-pole M12 plug (L-coded)

### Requirement

Wire the modules with the supply voltage off.

### Required tool

If you are not using pre-assembled cables, you need the following tool:

- Stripping tool
- Screwdriver to wire the connection plugs

### Accessories required for the connection of IO-Link

You need the following accessories:

- Cables
  - Pre-assembled cable M12, 4-pole or 5-pole, or
  - Flexible 3, 4 or 5-core copper cable (core cross-section: 0.25 to 0.5 mm<sup>2</sup>)
- 5-pole M12-A coded connecting socket

### Accessories required for the connection of additional load voltage

You need the following accessories:

- Pre-assembled power cable M12-L coded, 4-pole or 5-pole
- Flexible 4-core or 5-core copper cable (core cross-section: 0.5 to 2.5 mm<sup>2</sup>)
- 4-pole or 5-pole M12-L coded socket

### Connecting M8 connectors

To connect M8 connectors, proceed as follows:

1. Insert the plug into the respective round socket on the module.  
Ensure the correct alignment between plug and socket.
2. Tighten the connector using the knurled screw with a torque of 0.4 Nm.

The figure below shows the connection of the M8 plugs, using the example of the IO-Link digital input module DI 8x24VDC 8xM8..

Figure 5-6 Connecting M8 connectors

### Connecting M12 connectors

To connect M12 connectors, proceed as follows:

1. Insert the plug into the respective round socket on the module.  
Ensure the correct alignment between plug and socket (groove and spring).
2. Tighten the connector using the knurled screw with a torque of 1 Nm.

The figure below shows the connection of the M12 plugs, using the example of the IO-Link digital input module DI 16x24VDC 8xM12..

Figure 5-7 Connecting M12 connectors

## Pin assignment of the sockets

The pin assignment of the sockets can be found in the equipment manuals of the I/O modules (<https://support.industry.siemens.com/cs/ww/en/ps/14247/man>) in the section on pin assignment and on the side surface of the module.

## Y-cable

The Y-cable allows you to connect two actuators or sensors to the inputs or outputs.

The use of a Y-cable is recommended in particular if two channels are occupied per socket of an I/O module. The Y-cable distributes the channels to two circular connectors.

The figure below shows the wiring of the Y-cable.

Figure 5-8 Wiring of the Y-cable

## Sealing of unused sockets

To ensure IP65 or IP67 degree of protection, seal off all unused sockets with sealing caps.

## Article numbers for accessories/spare parts.

You will find the article numbers in the Appendix in section Accessories/spare parts (Page 66).

## See also

Interface modules (<https://support.industry.siemens.com/cs/ww/en/ps/14246/man>)

## 5.6 Marking of IO-Link I/O modules

### 5.6.1 Factory markings

#### Introduction

For better orientation, the IO-Link I/O modules are furnished with various markings that support you when configuring and connecting the modules.

#### Marking of the interfaces

The interfaces of the modules are factory-labeled.

The table below shows the labeling of the interfaces.

Table 5- 2     Interface labeling

| interface                       | Labeling      |
|---------------------------------|---------------|
| IO-Link                         | X35 (IO-Link) |
| I/O input and output interfaces | X10 ... X17   |
| Additional power supply         | X80 (DC24V)   |

#### Pin assignment

The pin assignments of the various interfaces are lasered at the factory, on the side of every module.

## 5.6.2 Optional markings

### Introduction

In addition to the factory markings, there are also optional possibilities for labeling or marking interfaces and modules on the IO-Link I/O modules.

### Identification label

The identification labels come with each IO-Link I/O module as strips and can be machine-printed. A strip has 10 identification labels measuring 10 x 5 mm in the color RAL9016. The identification labels can be inserted into every module at the points provided. The identification labels are used for channel and module labeling.

The figure below shows all points where you can use the identification labels using the example of the IO-Link digital input module module DI 8x24VDC 8xM8.

① Identification labels

Figure 5-9 Optional marking

### 5.6.3 Mounting identification labels

#### Introduction

This section describes how to mount or remove identification labels.

#### Required tools

You need a screwdriver with 3 mm blade width (only to remove identification labels).

#### Mounting procedure

To mount an identification label, proceed as follows:

1. Print the identification label using commercially available marking systems.
2. Press the identification label out of its holder.
3. Stick the identification labels into the cutouts provided, as shown in the figure *Optional marking* (Page 41).

Mounting the identification labels is the same for all modules.

#### Removal procedure

To remove an identification label, proceed as follows:

1. Carefully use a screwdriver to pull out the identification label.

Removing identification labels is the same for all modules.

# Configuring

## 6.1 Requirements

### Introduction

Configuration and parameter assignment of the IO-Link I/O modules is carried out with:

- STEP 7 (TIA Portal)
- S7-PCT
- IO-Link configuration software of the IO-Link master manufacturer

### Requirements

Observe the software requirements of the configuration software of the utilized IO-Link master.

Table 6- 1 Hardware requirements

| Hardware       | Requirements       |
|----------------|--------------------|
| IO-Link master | As of IO-Link V1.1 |

## 6.2 IODD and Port Configuration Tool - S7-PCT

### Device description IODD

An electronic device description, the IODD file (IO Device Description), is available for each device. The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the same manner by the IO-Link configuration tools of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

## IODDfinder

The IODDfinder is a cross-vendor, central IO-Link database.

This database provides you with the latest IODDs of the device manufacturers and offers an information and download platform.

The IODD finder is available on the Internet (<https://ioddfinder.io-link.com>).

## IO-Link configuration tool

Configuration tools are required to configure the entire IO-Link system. The IO-Link configuration tools of the master manufacturers are able to read IODDs.

The main tasks of the IO-Link configuration tool include:

- Assignment of devices to the master ports
- Address assignment of the ports within the address area of the master
- Parameter assignment of the IO-Link devices

Diagnostics can also be carried out on the connected devices.

This means the IO-Link configuration tool supports the transparent representation of the IO-Link system down to field level.

Siemens provides S7-PCT for engineering of the IO-Link system.

You can find the relevant device description file, software and function manuals in SIOS.  
(<https://support.industry.siemens.com/cs/ww/en/view/109737170>)

## S7-PCT with IODD of an IO-Link I/O module

The following figure shows a section from S7-PCT with IODD of an IO-Link I/O module and the device information contained therein.

Ports | Addresses | Status | I&M | Commands

### General Master Info

Product Name: ET 200eco PN; 4 IO-L; 4xM12 V1.1

Article Number: 6ES7 148-6JD00-0AB0

Comment:

### Port Info

### Details

Vendor Name: SIEMENS AG

Vendor URL: <http://www.siemens.com/io-link>

Device Name: ET 200AL DIQ 16x24VDC/0.5A 8xM12

Description: IO-Link Digital input/output module DIQ 16x24VDC/0.5A 8xM12, Device Family SIMATIC IO Module, Release Date 2020-04-09

Article Number: 6ES7 143-5AH00-0BL0

IODD File Name: Siemens-ET200AL-DIQ16\_8xM12-20200409-IODD1.1.xml

Replaceable Device IDs:

Compatibility: The device is only compatible with the IO-Link revision 1.1.

Comment:

Figure 6-1 S7-PCT with IODD of a device and the device information contained therein

# Commissioning

## 7.1 Startup of the IO-Link I/O module

### Principle of operation

The figure below shows the startup of an IO-Link I/O module on an IO-Link Master schematically as a flow chart.

The "PWR" LED lights up green when the 2L+ voltage is applied.

Figure 7-1 Startup of an ET 200AL IO-Link I/O module

# Maintenance

## 8.1 Replacing modules

### Replacing IO-Link I/O modules

The replacement of a module is not permitted during ongoing operation.

#### **WARNING**

##### **Property damage can occur**

If you remove/insert modules while the power is connected, this can lead to undefined states in your system.

The IO-Link I/O module may be damaged as a result.

Only remove or replace modules when the power is disconnected.

Always comply with the required standards and safety guidelines when configuring a system.

If you use the restore function of the master, the master automatically provides the saved parameters to the new module after module replacement. You have the following setting options for module replacement:

- "Backup&Restore"  
You have set the master port to "Backup&Restore". The new module behaves like the replaced module because the master has saved the last parameter change using the backup function.
- "Restore"  
You have set the master port to "Restore". The new module applies the parameter settings that were saved in the master at the time of the last back-up.

## Procedure

To replace an IO-Link I/O module, follow these steps:

1. Ensure that no current is flowing via the outputs.
2. Completely disconnect all cables connected to the IO-Link I/O module.
3. Completely remove the fixing screws of the module
4. Replace the IO-Link I/O module.

---

### Note

#### "New" IO-Link I/O module

The removed IO-Link I/O module may only be replaced by a module of the same type.

---

5. Fasten the IO-Link I/O module with the screws with a torque of 1.2 Nm.
6. Connect all cables.
7. Turn the supply voltage on.

### WARNING

#### Observe the device number of the modules

If you mix up the IO-Link I/O modules when connecting them, this can cause personal injury and property damage.

We recommend that you clearly label the IO-Link I/O modules with the device number.

The figure below shows a recommendation for the marking of the IO-Link I/O modules with the device number.

- ① Recommendation for the marking of device numbers

Figure 8-1 Device number

## Result

The IO-Link I/O module that was out of service starts up again automatically. When data backup is set, the IO-Link master loads the parameter settings to the module.

## 8.2 Firmware update

### Introduction

During operation, it can become necessary to update the firmware (e.g. for function extensions).

You use a firmware update to update the module firmware.

---

**Note****STOP state during the update**

When you perform a firmware update for an IO-Link I/O module, the module goes to STOP state during the update.

---

### Requirement

To perform a FW update, you need an IO-Link master that supports the IO-Link FW update transfer mechanism.

### Option for the firmware update

You have the option of performing a firmware update online via S7-PCT.

### Reference

You will find additional information on the procedure in the "Help" > "Help topics" tab in S7-PCT. Enter "Firmware" in the search field and confirm with Enter.

## 8.3 Resetting a module

### Introduction

With "Restore Factory Setting", the IO-Link I/O module is set to the delivery condition. All information that was saved internally on the IO-Link I/O module is deleted.

### Options for resetting

You can reset the IO-Link I/O module in S7-PCT.  
You have two different possibilities for this.

- "Application Reset"
- "Restore Factory Setting"

### Result after "Application Reset"

The "Application Reset" command resets the application-specific parameters to the default values. The identification parameters of the module remain unchanged.

The command is not followed by a module restart or a communication interruption.

### Result after "Restore Factory Setting"

The "Restore Factory Setting" command causes three different actions. The actions are dependent on the data backup setting on the IO-Link master.

- "None":  
The default parameters of the IO-Link I/O module are loaded. The IO-Link I/O module performs a restart.
- "Restore":  
The saved parameters at the time of the backup are loaded. The IO-Link I/O module performs a restart.
- "Backup&Restore":  
The parameters that were in the IO-Link I/O module before the "Restore Factory Setting" command are loaded. The IO-Link I/O module performs a restart.

### Requirement

An online connection must exist to reset an IO-Link I/O device.

## Procedure using S7-PCT

Connect the PG/PC to the PROFINET IO or PROFIBUS DP interface of the IO-Link master or to your system.

Make sure that an online connection to the IO-Link I/O module exists.

1. Select an IO-Link I/O module in the project tree.
2. Select the "Parameters" tab in the work area.
3. Under "Parameters" > "Parameter Data" > "System command", click on the desired button:

- "Application Reset"
- "Restore Factory Setting"

Figure 8-2 Resetting a module

**Result:** The IO-Link I/O module is reset.

## Reference

You can find more information on the procedure in the S7-PCT online help.

## 8.4 Maintaining/cleaning the modules

### Maintenance

The IO-Link I/O modules are maintenance-free.

---

#### Note

#### Repairs

Repairs to an IO-Link I/O module may only be carried out by the manufacturer.

---

### Cleaning

When wired, the IO-Link I/O modules comply with degree of protection IP65/IP67 and do not require any cleaning.

If you want to clean the modules, use a dry or damp cloth. Please take care to comply with degree of protection IP65/67 when cleaning with liquids.

# Technical specifications

## Introduction

The technical specifications of the IO-Link I/O modules are found in this section:

- Standards and test values that the IO-Link I/O modules comply with and fulfill.
- Test criteria by which the IO-Link I/O modules have been tested

## Technical specifications for the modules

The technical data of the individual modules can be found in the modules' manuals. If there are discrepancies between the statements in this document and the product manuals, the statements in the product manuals take priority.

## See also

SIOS (<https://support.industry.siemens.com>)

## 9.1 Standards and authorizations

### Currently valid markings and authorizations

---

#### Note

#### Specifications for the components of the IO-Link I/O modules

The markings and approvals currently valid are printed on the IO-Link I/O modules.

---

### CE mark

The ET 200AL IO-Link I/O modules fulfill the requirements and protection targets of the following directives. They conform to the harmonized European standards (EN) that have been published for programmable logic controllers in the Official Journal of the European Community:

- 2014/30/EU "Electromagnetic Compatibility" (EMC directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)

The EU Declarations of Conformity are available for the authorities in charge and are kept at the following address:

SIEMENS AG  
Digital Industries  
DI FA TI COS TT  
P.O. Box 1963  
D-92209 Amberg, Germany

These files are also available for download on the Customer Support Internet pages, keyword "Declaration of Conformity".

### UL approval

Underwriters Laboratories Inc. in accordance with

- UL 61010-1 and UL 61010-2-201
- CSA C22.2 No. 61010-1 and CSA C22.2 No. 61010-2-201 (Process Control Equipment)

### RCM Declaration of conformity for Australia/New Zealand

The ET 200AL IO-Link I/O modules meet the requirements of EN 61000-6-4:2007.

### Korea Certificate KCC-REM-S49-ET200

Please note that this device corresponds to limit class A with regard to the emission of radio interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

### Marking for the Eurasian Customs Union

EAC (Eurasian Conformity)

Customs Union of Russia, Belarus and Kazakhstan

Declaration of conformity with the technical requirements of the Customs Union (TR CU)

### IEC 61010-2-201

The ET 200AL distributed I/O system fulfills the requirements and criteria of IEC 61010-2-201.

## IEC 61131-2

The ET 200AL IO-Link I/O modules fulfill the requirements and criteria of IEC 61131-2.

## IEC 61131-9

The ET 200AL IO-Link I/O modules fulfill the requirements and criteria of the IO-Link standard IEC 61131-9.

## Marine approval

Classification societies:

- ABS (American Bureau of Shipping), coming soon
- BV (Bureau Veritas),
- CCS (China Classification Society), coming soon
- Class NK (Nippon Kaiji Kyokai), coming soon
- DNV-GL (Det Norske Veritas - Germanischer Lloyd), coming soon
- LRS (Lloyds Register of Shipping), coming soon

## Industrial use

The ET 200AL IO-Link I/O modules are designed for the industrial environment. The following standards are met for this:

- Requirements for interference emission EN 61000-6-4
- Requirements for immunity EN 61000-6-2

### Use in mixed areas

Under certain circumstances, you can use the ET 200AL IO-Link I/O modules in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact the residential purpose.

If you want to use the ET 200AL IO-Link I/O modules in a mixed area, you must ensure that its radio frequency interference emissions comply with the limits of EN 61000-6-3. Suitable measures for observing these limits for use in a mixed area are, for example:

- Use of filters in supply cables

An additional individual acceptance test is also required.

### Use in residential areas

---

#### Note

#### ET 200AL IO-Link I/O modules are not intended for use in residential areas

The ET 200AL IO-Link I/O modules are not intended for use in residential areas. Using the ET 200AL IO-Link I/O modules in residential areas can affect radio and television reception.

---

## Reference

The certificates for the markings and approvals can be found on the Internet under Service&Support (<http://www.siemens.com/automation/service&support>).

## 9.2 Electromagnetic compatibility

### Definition

Electromagnetic compatibility is the ability of an electrical apparatus to function in a satisfactory manner in its electromagnetic environment without affecting this environment.

The ET 200AL IO-Link I/O modules fulfill the requirements of the EMC law of the European Single Market. The prerequisite for this is that the ET 200AL IO-Link I/O modules comply with the requirements and guidelines regarding the electrical configuration.

### Pulse-shaped disturbance variables

The following table shows the electromagnetic compatibility of the ET 200AL IO-Link I/O modules with respect to pulse-shaped disturbance variables.

Table 9- 1 Pulse-shaped disturbance variables

| Pulse-shaped disturbance variable                                             | Tested with                     | Conforms to degree of severity |
|-------------------------------------------------------------------------------|---------------------------------|--------------------------------|
| Electrostatic discharge according to IEC 61000-4-2.                           | Air discharge: $\pm 8$ kV       | 3                              |
|                                                                               | Contact discharge: $\pm 4$ kV   | 2                              |
| Burst pulses (rapid transient disturbance values) according to IEC 61000-4-4. | $\pm 2$ kV (power supply cable) | 3                              |
|                                                                               | $\pm 1$ kV (signal line <30 m)  | 3                              |

### Sinusoidal disturbance variables

The tables below show the electromagnetic compatibility of the ET 200AL IO-Link I/O modules with respect to sinusoidal disturbance variables.

Table 9- 2 RF radiation

| RF radiation according to IEC 61000-4-3<br>Electromagnetic RF field, amplitude modulated |        | Conforms to degree of severity |
|------------------------------------------------------------------------------------------|--------|--------------------------------|
| 80 ... 1000 MHz                                                                          | 10 V/m | 3                              |
| 1.4 ... 6 GHz                                                                            | 3 V/m  | 2                              |
| 80% AM (1 kHz)                                                                           |        |                                |

Table 9- 3 RF coupling (signal and supply cables)

| RF coupling according to IEC 61000-4-6. | Conforms to degree of severity |
|-----------------------------------------|--------------------------------|
| 0.15 ... 80 MHz                         | 3                              |
| 10 V <sub>rms</sub> unmodulated         |                                |
| 80% AM (1 kHz)                          |                                |
| 150 $\Omega$ source impedance           |                                |

## Emission of radio frequency interference

The table below shows the interference emission of electromagnetic fields according to EN 55011: limit class A, group 1.

Table 9- 4 Interference emission of electromagnetic fields

| Frequency        | Interference emission | Measuring distance |
|------------------|-----------------------|--------------------|
| 30 ... 230 MHz   | <40 dB (μV/m) Q       | 10 m               |
| 230 ... 1000 MHz | <47 dB (μV/m) Q       | 10 m               |
| 1 GHz ... 3 GHz  | <76 dB (μV/m) P       | 3 m                |
| 3 GHz ... 6 GHz  | <80 dB (μV/m) P       | 3 m                |

## 24 V supply connection

The following table shows measurement ranges for low voltage according to EN 55016.

Table 9- 5 Interference emission from the power supply

| Frequency        | Interference emission        |
|------------------|------------------------------|
| 0.15 ... 0.5 MHz | 89 dB (μV) Q<br>76 dB (μV) M |
| 0.5 ... 30 MHz   | 83 dB (μV) Q<br>70 dB (μV) M |

## 9.3 Transport and storage conditions

### Transport and storage conditions

The ET 200AL IO-Link I/O modules surpass the requirements of IEC 61131-2 regarding transport and storage conditions. The following table shows the conditions that apply to modules transported or stored in their original packaging.

Table 9- 6 Transport and storage conditions

| Type of condition     | Permitted range                                                     |
|-----------------------|---------------------------------------------------------------------|
| Free fall             | ≤0.3 m                                                              |
| Temperature           | -40 °C ... +70 °C                                                   |
| Temperature variation | 20 K/h                                                              |
| Barometric pressure   | 1140 ... 660 hPa<br>(corresponds to an altitude of -1000 to 3500 m) |
| Relative humidity     | 5 ... 95%                                                           |

## 9.4 Mechanical and climatic ambient conditions

### Operating conditions

The ET 200AL IO-Link I/O modules are intended for weather-proof, stationary use.

- The operating conditions surpass the requirements of IEC 61131-2:
  - Class OTH2

You can find the values for the operating conditions in the technical specifications of the equipment manuals or on the Internet

(<https://support.industry.siemens.com/cs/de/en/view/109742718>).

### Tests for mechanical ambient conditions

The following table shows the type and scope of the tests for mechanical ambient conditions.

Table 9- 7 Tests for mechanical ambient conditions

| Condition tested | Test standard                              | Values                                                                                                                                                                                                                                                                         |
|------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vibrations       | Vibration test according to IEC 60068-2-6. | Type of oscillation: Frequency sweeps with a rate of change of 1 octave/minute.<br>5 Hz ... 9.1 Hz, constant amplitude 15 mm<br>9.1 Hz ... 150 Hz, constant acceleration 5 g<br>Duration of oscillation: 10 frequency sweeps per axis at each of three vertically aligned axes |
| Shock            | Shock, tested according to IEC 60068-2-27  | Type of shock: Half-sine<br>Shock intensity: 30g peak value, 18 ms duration<br>Direction of shock: 3 shocks each in $\pm$ direction in each of the 3 axes vertical to one another                                                                                              |

### Climatic ambient conditions

The following table shows the type and scope of the tests on climatic ambient conditions.

Table 9- 8 Climatic ambient conditions

| Ambient conditions      | Fields of application                    | Comments                                         |
|-------------------------|------------------------------------------|--------------------------------------------------|
| Temperature             | -30 °C ... 55 °C                         | All installation positions                       |
| Temperature variation   | 10 K/h                                   | -                                                |
| Relative humidity       | 5 ... 100%                               | With condensation                                |
| Barometric pressure     | 1140 ... 795 hPa                         | Corresponds to an altitude of -1000 m ... 2000 m |
| Pollutant concentration | ANSI/ISA-71.04 severity level G1; G2; G3 | -                                                |

## 9.5 Details on insulation, protection class, degree of protection and rated voltage

### Insulation

The insulation is designed in compliance with the requirements of IEC 61010-2-201.

#### Note

For modules with 24 V DC supply voltage (SELV/PELV), electrical isolations are tested with 707 V DC (type test).

### Protection class according to IEC 61010-2-201

- Protection class III

### Degree of severity for direct current-supplied equipment

The IO-Link I/O devices fulfill severity class PS1.

### Pollution degree / overvoltage category according to IEC 61131

- Pollution degree 3
- Overvoltage category: II

### Degree of protection IP65 and IP67

Degree of protection IP65 and IP67 according to IEC 60529 for all ET 200AL IO-Link I/O modules:

- 1. Code number: Dust-proof and complete protection from contact
- 2. Code number: Protection from water
  - IP65: Protection from water jets from any angle  
The water must not have any damaging effect.
  - IP67: Protection against temporary immersion  
The water must not enter the enclosure in harmful quantities.

### Rated voltage for operation

The following table shows the rated voltage and the corresponding tolerance with which the ET 200AL IO-Link I/O modules operate.

Table 9- 9 Rated voltage for operation

| Rated voltage (SELV/PELV) | Tolerance range    |
|---------------------------|--------------------|
| 1L+                       | 18 ... 30 V DC     |
| 2L+                       | 20.4 ... 28.8 V DC |

## 9.6 Safety-related symbols for IP65/IP67 modules

The following table contains an explanation of the symbols located on your IP65/67 modules, their packaging or in the accompanying documentation.

| Symbol                                                                                                                        | Meaning                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                              | General warning sign <b>Caution/Notice</b><br>You must read the product documentation. # Safety-related shutdown of ET 200AL IO-Link modules

## Introduction

The following structure describes how to shut down ET 200AL IO-Link modules in a fail-safe manner.

In the configuration shown in the diagram below (e.g. with the safety shutdown device 3SK1), all digital outputs that are connected to the 2L+ and 2M supply (24 V switched) of the ET 200AL IO-Link modules are switched to the safe OFF state. This step achieves the safety class SIL2/Category 3/PL d.

## Principle of operation

The higher-level safety shutdown device (e.g. 3SK1) disconnects the supply 2L+ and 2M switched. The digital outputs of the ET 200AL IO-Link modules operated on the 2L+ and 2M (24 V switched) supply are switched to the safe state.

There are two ways to connect the 2L+ and 2M supply voltage to an IO-Link module.

- Via the IO-Link master Port Class B
- Via the M12-L plug for the supply voltage

## Block diagram

Figure A-1 Higher-level safety circuit of the outputs

### **! WARNING**

#### **Note potential groups for safety-related shutdown**

When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can be connected through this, which leads to cancellation of the electrical isolation between 1L+ and 2L+. The safety-related shutdown is not permitted if the electrical isolation is canceled.

---

**Note****Safe electrical separation**

Maintain safe galvanic isolation for voltages higher than SELV/PELV.

---

---

**Note****Selection of the IO-Link master**

If the safety-related shutdown is performed via the IO-Link master, ensure that the master has the appropriate safety characteristics.

---

---

**Note****IO-Link cable**

Use a 3-wire cable for the connection of an IO-Link master with Port Class B and an IO-Link device with Port Class A.

---

## Limits of the higher-level safety circuit

The ET 200AL IO-Link modules do not perform any safety functions. Safety functions are performed by the safety relay to bring the system into a safe state.

Adjust the operation inspection interval of the safety relay with relay output according to the safety class.

Take the following measures if energy that is not provided by the higher-level safety circuit is used to control the safety function.

Cover critical errors in the safety function that are not detected by the higher-level safety circuit (e.g. 3SK1) with suitable safety measures. The "diagnostics" must be performed indirectly via the controlled process.

Specifications for safety-relevant process data:

- Functionally safe
- Read via fail-safe inputs (e.g. F-DI)
- Fail-safe processing unit (e.g. F-CPU) for issuing commands
- Output through fail-safe outputs (e.g. F-DQ) to control the safety function

## Requirements on the power supply

Operation requires a SELV/PELV power supply to limit overvoltages to L+ and M (24 V). This measure prevents possible errors from the power supply side at the same time.

Select the power supply according to the requirements of the respective operating instructions for the shutdown device and for the ET 200AL system.

You can find more information on safe SELV/PELV in the data sheets of the power supplies used.

## FAQ

Read the latest information on safety-related shutdown in the FAQ (<https://support.industry.siemens.com/cs/us/en/view/39198632>).

In this FAQ, you can find the SIMATIC standard modules that are suitable for safety-related shutdown.

## Request German Technical Inspectorate report (Report no. SN89858T)

You can request copies of the German Technical Inspectorate report at the following address:

SIEMENS AG  
Digital Industries  
DI FA TI COS TT  
P.O. Box 1963  
D-92209 Amberg, Germany

## Dimension drawings

Two module widths are available for the IO-Link I/O modules.

The figure below shows the height and width of the modules. The depth of the modules varies between 40 mm and 45 mm. Detailed information on the dimensions of the individual modules can be found in the equipment manuals for the IO-Link I/O modules in the section "Dimension drawing".

Figure B-1 Module dimension drawings (front view)

## Online catalog

Additional article numbers for the ET 200AL IO-Link I/O modules can be found on the Internet (<https://mall.industry.siemens.com>) in the online catalog and online ordering system.

## C.2 UL-approved cables

### UL-approved cables from PHOENIX CONTACT

In combination with the named cables of the manufacturer PHOENIX CONTACT, the IO-Link I/O modules of the SIMATIC ET 200AL distributed I/O system meet the requirements for UL approval.

## UL-approved cables from Siemens

In combination with the named cables for the connection of DI/DQ of the manufacturer Siemens, the IO-Link I/O modules of the SIMATIC ET 200AL distributed I/O devices meet the requirements for UL approval.

Table C- 8 Accessories for DI/DQ connection

| Designation                                                                                                                                 | Length | Article number |

# Glossary

## C/Q

IO-Link communication signal / switching signal

## Connection plug

Physical connection between device and cable.

## Device

Device that can send, receive or amplify data via the bus, e.g. IO device via PROFINET IO.

## Diagnostics

Monitoring functions for the detection, localization, classification, display, and further evaluation of errors, faults, and alarms. They run automatically while the system is in operation. This increases the availability of systems by reducing commissioning times and downtimes.

## Distributed I/O system

System with input and output modules that are configured on a distributed basis, far away from the CPU controlling them.

## Firmware update

Upgrading the firmware of IO-Link I/O modules, for example, after function extensions, to the latest firmware version (update).

## Ground

Conductive earth whose electrical potential can be set equal to zero at any point.

All interconnected, inactive parts of a piece of equipment that cannot accept any dangerous contact voltage, even in the event of a fault.

## Ground

Conductive earth whose electrical potential can be set equal to zero at any point.

All interconnected, inactive parts of a piece of equipment that cannot accept any dangerous contact voltage, even in the event of a fault.

**Identification data**

Information that is saved in modules and that supports the user in checking the plant configuration and locating hardware changes.

**IO-Link**

Standard for communication of actuators and sensors in the lowest field level.

**IO-Link device**

Distributed field device that is connected to an IO-Link master via an IO-Link cable.

**IO-Link I/O modules**

I/O modules that are connected to an IO-Link master and operated via an IO-Link connection.

**IO-Link master**

The IO-Link master is a module that is connected to the CPU (IO controller) via a fieldbus and to IO-Link devices via IO-Link cables. It prepares the data for/from the IO-Link devices and can back up and restore the parameters.

**Parameter assignment**

Parameter assignment is the transfer of parameters from the IO-Link master to the IO-Link I/O module.

**PELV**

Protective Extra Low Voltage = Extra low voltage connected to protective ground

**PROFINET**

PROcess Field NETwork, open Industrial Ethernet standard, which continues PROFIBUS and Industrial Ethernet. A cross-manufacturer communication, automation and engineering model, defined as an automation standard by PROFIBUS International e.V.

**PROFINET IO controller**

Device used to address connected I/O devices (e.g. distributed I/O systems). This means that: The IO controller exchanges input and output signals with assigned I/O devices. The IO controller often corresponds with the CPU in which the automation program is running.

**PROFINET IO device**

Distributed field device that can be assigned to one or more IO controllers (for example, distributed I/O system, valve terminals, frequency converters, switches).

## **PROFINET IO**

Communication concept for the realization of modular, distributed applications in the framework of PROFINET.

## **Reference potential**

Potential from which the voltages of the circuits involved are observed and/or measured.

## **S7-PCT**

**S7-Port Configuration Tool** = Siemens program for configuring IO-Link devices.

## **SELV**

Safety Extra Low Voltage

## **TIA Portal**

Totally Integrated Automation Portal

The TIA Portal is the key to the full performance capability of Totally Integrated Automation. The software optimizes operating, machine and process sequences.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

|                                                                                                        |
|--------------------------------------------------------------------------------------------------------|
|  <b>DANGER</b>        |
| indicates that death or severe personal injury <b>will</b> result if proper precautions are not taken. |
|  <b>WARNING</b>       |
| indicates that death or severe personal injury <b>may</b> result if proper precautions are not taken.  |
|  <b>CAUTION</b>       |
| indicates that minor personal injury can result if proper precautions are not taken.                   |
| <b>NOTICE</b>                                                                                          |
| indicates that property damage can result if proper precautions are not taken.                         |

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <b>WARNING</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed. |

# Preface

## Purpose of the documentation

This manual supplements the system manuals ET 200SP distributed I/O system and ET 200AL distributed I/O system.

Functions that generally relate to the system are described in these system manuals.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

## Conventions

**CPU:** When the term "CPU" is used in the following, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP and ET 200AL distributed I/O systems.

**STEP 7:** In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Also observe notes marked as follows:

---

### Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

---

## Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

### General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (<http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx>).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (<https://support.industry.siemens.com/cs/us/en/view/73021864>).

### Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<http://support.automation.siemens.com/WW/view/en/84133942>).

### "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

### "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet.

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet  
(<http://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/sc/ww/en/sc/2054>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet  
(<http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet.

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet.

- ① Module type and name
- ② LED for diagnostics
- ③ Connection for ET-Connection
- ④ Article number
- ⑤ Functional version

Figure 3-2 View of the BusAdapter BA-Send 1xFC

## Properties

The module has the following technical properties:

- BusAdapter for the direct connection of ET-Connection
- Connects the interface module via ET-Connection with the ET 200AL I/O modules
- Supports all ET 200AL I/O modules

The module supports the following functions:

- Identification data I&M 0 to 3. See system manual ET 200SP Distributed I/O System (<https://support.industry.siemens.com/cs/ww/en/view/58649293>).

## Maximum configuration

- 16 ET 200AL I/O modules
- 15 m bus cable between BusAdapter BA Send and the first ET 200AL I/O module and between two ET 200AL I/O modules.
- Supported functions:

| Function              | Mixed configuration |     |                                       |

## Accessories

The following components must be ordered separately:

- Labeling strips
- Reference identification label
- Stripping tool for ET-Connection
- Bus cables for ET-Connection

## See also

You will find additional information on accessories and the other components in the system manuals ET 200AL Distributed I/O System (<http://support.automation.siemens.com/WW/view/en/89254965>) and the Accessories/Spare parts section of the ET 200SP Distributed I/O System (<https://support.industry.siemens.com/cs/ww/en/view/58649293>) system manual.

#### Additional information

You can find additional information on connecting the interface module and accessories in the *ET 200SP Distributed I/O System* system manual.

### 3.2.3 Diagnostics by means of LED display

#### LED display

The figure below shows the LED display (status and fault display) of the BusAdapter BA-Send 1xFC.

① DIAG (green/red)

Figure 3-4 LED display

#### Meaning of the LED display

The table below explains the meaning of the status and fault display.

#### DIAG LED

Table 3- 2 Status and fault display DIAG

| DIAG LED             | Meaning                                                                                                            | Remedy                                                                                                                                     |
|----------------------|--------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <div>□</div> Off     | There is no connection between the ET-Connection interface of the BusAdapter BA-Send 1xFC and the ET 200AL.        | Check whether the bus cable is interrupted.                                                                                                |
|                      | The CPU/interface module does not support the BA-Send 1xFC.                                                        | Run a firmware update.                                                                                                                     |
| <div>■</div> On      | There is a connection between the ET-Connection interface of the BusAdapter BA-Send 1xFC and the ET 200AL.         | ---                                                                                                                                        |
| <div>☀</div> Flashes | There is (at least) one diagnostics alarm of an ET-Connection device. Group error for all ET-Connection bus nodes. | Check the ET-Connection device.                                                                                                            |
|                      | Set configuration does not match the actual configuration on the ET-Connection.                                    | Check the configuration of the ET-Connection to see whether a module is missing or defective, or whether a non-configured module is wired. |

## Application planning

### Mixed configuration ET 200SP and ET 200AL with ET-Connection

You have the option of integrating the I/O modules of the ET 200AL distributed I/O system (IP65/IP67) in a configuration of the ET 200SP distributed I/O system (IP20).

The figure below shows a combination of the modules of the ET 200AL and ET 200SP distributed I/O system.

Figure 4-1 Mixed configuration ET 200SP and ET 200AL with ET-Connection

## Requirement

The following components support mixed configuration:

- Interface module
  - IM 155-6 PN HF (V3.0 or higher)
  - IM 155-6 PN/2 HF
  - IM 155-6 PN/3 HF
  - IM 155-6 PN ST (V3.1 or higher)
  - IM 155-6 DP HF (V3.0 or higher)
  - IM 155-6 MF HF
- CPU
  - CPU 1510SP-1 PN (V2.0 or higher)
  - CPU 1510SP F-1 PN (V2.0 or higher)
  - CPU 1512SP-1 PN (V2.0 or higher)
  - CPU 1512SP F-1 PN (V2.0 or higher)
  - CPU 1515SP PC
  - CPU 1515SP PC F
  - CPU 1515SP PC T
  - CPU 1515SP PC2
  - CPU 1515SP PC2 F
  - CPU 1515SP PC2 T
  - CPU 1515SP PC2 TF
- BaseUnit BU-Send with BusAdapter BA-Send 1xFC
- ET-Connection cable
- Power cable

## Rules

You must observe the following rules when assembling a mixed configuration:

- The bus length of the ET 200SP distributed I/O system must not exceed 1 m (without interface module, including BU-Send/BA-Send 1xFC and server module)
- A maximum of 16 ET 200AL I/O modules can be connected to ET-Connection
- The maximum length of the bus cable for ET-Connection between BA-Send and the first module or between two modules is 15 m

The following table shows which firmware versions of your IM or CPU support which maximum bus cable length.

| IM/CPU            | Up to 10 m     | Up to 15 m     |
|-------------------|----------------|----------------|
| IM 155-6 PN HF    | V3.0 or higher | V3.3 or higher |
| IM 155-6 PN ST    | V3.1 or higher | V3.3 or higher |
| IM 155-6 DP HF    | V3.0 or higher | --             |
| CPU 1510SP-1 PN   | V2.0 or higher |                |
| CPU 1510SP F-1 PN |                |                |
| CPU 1512SP-1 PN   |                |                |
| CPU 1512SP F-1 PN |                |                |

## Procedure

To assemble a multi-tier configuration, follow these steps:

1. Switch off the supply voltage for the ET 200SP distributed I/O system.
2. Install the BaseUnit BU-Send to the immediate right of the ET 200SP CPU/interface module. When the BaseUnit BU-Send is used next to the ET 200SP CPU, a CM DP and an Ethernet CP or a maximum of two Ethernet CPs can be inserted between the CPU and BU-Send.
3. Then mount the additional BaseUnits / I/O modules for the ET 200SP distributed I/O system and the server module.
4. Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1xFC and install it on the BaseUnit BU-Send.
5. Fasten the BusAdapter BA-Send 1xFC with the BaseUnit BU-Send (1 screw with tightening torque of 0.2 Nm). To do this, use a screwdriver with a 3 to 3.5 mm blade.
6. Connect the other end of the bus cable for ET-Connection (with M8 connector) to the first ET 200AL I/O module (X30 socket ET-Connection IN).
7. Connect the supply voltage (24 V DC) to the ET 200AL I/O modules (X80 connector).

### Note

#### Firmware update of an ET 200AL I/O module

When you run a firmware update of an ET 200AL I/O module, ET-Connection is briefly interrupted by the restart of the module. All downstream ET 200AL I/O modules report a pull/plug interrupt.

---

**Note**

Insertion of theBusAdapter BA-Send 1xFC during operation leads to a restart of the interface module.

---

# Mounting

## Introduction

For the connection of the ET 200AL I/O module via ET-Connection to the ET 200SP, you require the BaseUnit BU-Send with the BusAdapter BA-Send 1xFC.

## Requirement

- The mounting rail is mounted.
- The interface module is mounted.

## Required tools

3 to 3.5 mm screwdriver (only for dismantling the BusAdapter)

## Mounting BaseUnit BU-Send

To mount the BaseUnit BU-Send, follow these steps:

1. Mount the BaseUnit BU-Send to the right of the CPU/interface module.
2. Swivel the BaseUnit back until you hear the mounting rail release latch into place.
3. Move the BaseUnit to the left until you hear it latch into place on the CPU/interface module.

Figure 5-1 Mounting BU-Send

4. Mount the BusAdapter BA-Send 1xFC only after you have connected the bus cable for ET-Connection (see section Connecting).

## Connecting

### 6.1 Connecting BaseUnit BU-Send

#### Pin assignment

The BaseUnit BU-Send only has one slot for an expansion module. No other connections are available.

#### Schematic circuit diagram

- ① Backplane bus
- ② BA-Send 1xFC expansion module

Figure 6-1 Schematic circuit diagram BU-Send

## Introduction

You connect the ET 200AL I/O modules via the BusAdapter BA-Send 1xFC via ET-Connection.

- ① BusAdapter BA-Send 1xFC
- ② Connection element for ET-Connection bus cable

Figure 6-2 BusAdapter BA-Send 1xFC

## Required tools

Screwdriver with 3 to 3.5 mm blade

## Required accessories

Use the bus cable for ET-Connection as connecting cable between the BusAdapter BA-Send 1xFC and the ET 200AL I/O modules.

We recommend using the Stripping Tool for ET-Connection (6ES7194-2KA00-0AA0) with blade cassette green (6GK1901-1B...). This guarantees fast and safe stripping.

The bus cable is available in the following versions:

### **Bus cable for ET-Connection M8, prefabricated on one side with 1x M8 connector, 4-pole, shielded**

- Length 2 m: 6ES7194-2LH20-0AC0
- Length 5 m: 6ES7194-2LH50-0AC0
- Length 10 m: 6ES7194-2LN10-0AC0
- Length 15 m: 6ES7194-2LN15-0AC0

### **Bus cable for ET-Connection M8, PUR cable, prefabricated on one side with 1x M8 connector, 4-pole, shielded**

- Length 2 m: 6ES7194-2MH20-0AC0
- Length 5 m: 6ES7194-2MH50-0AC0
- Length 10 m: 6ES7194-2MN10-0AC0
- Length 15 m: 6ES7194-2MN15-0AC0

**Procedure**

To connect the BusAdapter BA-Send 1xFC , follow these steps:

1. Strip the sheath of the bus cable at the open end as follows:

Figure 6-3 Connecting cable

Use the Stripping Tool for ET-Connection to do this. The relevant settings are shown on the tool.

2. Pull back the locking slide of the BusAdapter BA-Send 1xFC and open the cover of the connection element.
3. Lift the cable routing up as far as it will go.
4. Insert the unstripped single cores of the bus cable (according to the imprinted color coding) into the cable routing as far as they will go and press the cable routing down as far as it will go.
5. Close the cover of the connection element and push the locking slide forward.

6. Insert and fasten the BusAdapter BA-Send 1xFC with the BaseUnit BU-Send (1 screw with tightening torque of 0.2 Nm). To do this, use a screwdriver with a 3 to 3.5 mm blade.
7. Connect the M8 connector of the bus cable to the first ET 200AL I/O module (socket X30 ET-Connection IN). For more information about wiring the ET 200AL I/O modules, refer to the system manual of the ET 200AL distributed I/O system.

- ② Bus cable for ET-Connection

Figure 6-5 BusAdapter BA-Send 1xFC mounted

# Configuring

## Introduction

The mixed configuration allows the connection of up to 16 ET 200AL I/O modules to the ET 200SP via ET-Connection. The figure below shows the configuration of the ET-Connection and the assignment of the slots.

Figure 7-1 Mixed configuration

For more information about connecting ET-Connection, supply voltages, actuators and sensors, refer to the ET 200AL system manual.

## Configuration with a CPU

In a configuration with a CPU, a maximum of 2 slots can be used immediately to the right of the CPU with CM DP module or Ethernet CP. Combinations are also possible, i.e. CM DP module and one Ethernet CP or two Ethernet CPs.

BU-Send and BA-Send should always be inserted to the immediate right of the CM/CP.

## Rules

Observe the following rules when configuring:

- With mixed configurations, the following maximum configuration is possible:
  - 31 slots for ET 200SP modules (IM 155-6 DP HF and IM 155-6 PN ST)
  - 63 slots for ET 200SP modules (IM 155-6 PN HF and CPUs)
  - 16 slots for ET 200AL I/O modules
  - 1 slot for BU-Send/BA-Send 1xFC
  - 1 slot for server module.
- The mixed configuration may contain a maximum of 31 (IM 155-6 DP HF and IM 155-6 PN ST)/63 (IM 155-6 PN HF and CPUs) ET 200SP I/O modules.
- The server module can also be mounted right next to the BU-Send/BA-Send 1xFC.
- Supported functions:

| Function              | Mixed configuration |     |                                       |
|-----------------------|---------------------|-----|---------------------------------------|
|                       | ET 200SP            |     | ET 200AL I/O modules on ET-Connection |
|                       | IM                  | CPU |                                       |
| Isochronous mode      | ●                   | --  | --                                    |
| Configuration control | ●                   | ●   | ●                                     |
| Shared device         | ●                   | ●   | ●                                     |
| PROFenergy            | ●                   | --  | ●                                     |
| System redundancy S2  | ● <sup>1</sup>      | --  | ● <sup>1</sup>                        |

<sup>1)</sup> With IM 155-6 PN/3 HF and IM 155-6 PN/2 HF V4.2 or higher

## Configuring

Observe the following points when configuring:

- BU-Send/BA-Send 1xFC and server module must be configured. There are no parameters for BU-Send/BA-Send 1xFC.
- Arrangement of the modules in the configuration:
  - Configure the BU-Send/BA-Send 1xFC modules downstream from the interface module in slot 1. Position the ET 200SP modules behind it.
  - Configure the ET 200AL I/O modules from slot 66 (PROFINET)/67 (CPU)/34 (PROFIBUS).
- The layout of the modules represents a preset configuration and is independent of the configuration control.
- The system redundancy S2 function is not available in a mixed configuration.

## Configuration example

An example of a mixed configuration is shown below:

### Hardware configuration

Figure 7-2 Mixed configuration

## Configuring configuration example

Table 7- 1 Overview

| Mixed configuration | Module                     | Slot |
|---------------------|----------------------------|------|
| ET 200SP            | IM 155-6 PN HF             | 0    |
|                     | BA-Send 1xFC               | 1    |
|                     | DI 16x24VDC ST             | 2    |
|                     | DI 16x24VDC ST             | 3    |
|                     | DI 16x24VDC ST             | 4    |
|                     | Server module              | 5    |
| ET 200AL            | DI 8x24VDC 8xM8            | 66   |
|                     | DIQ 4+DQ 4x24VDC/0.5A 8xM8 | 67   |
|                     | AI 4xU/I/RTD 4xM12         | 68   |
|                     | CM 4xIO-Link 4xM12         | 69   |

### Note

#### Configuration using PROFIBUS GSD file

When you use the PROFIBUS GSD file for the configuration, you must configure the gaps between the server module and the first ET 200AL I/O module with BU cover.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/ww/en/view/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Conventions

Please also observe notes marked as follows:

---

### Note

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## **"mySupport"**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## **"mySupport" - Documentation**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## **"mySupport" - CAx data**

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## **Application examples**

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7157-1AA00-0AB0

#### View of the module

Figure 2-1 View of the IM 157-1 DP interface module

## Properties

The module has the following technical properties:

- Connects the ET 200AL distributed I/O system with PROFIBUS DP
- 24 V DC supply voltage
- Operation as DP1 slave possible
- Direct data exchange (data exchange broadcast)
- Support for 2 ET-Connection lines
- Dimensions: 45 x 159 mm

The functions supported by the module are found in the chapter Functions (Page 12).

## Maximum configuration

The module has the following maximum configuration:

- 244 bytes input data
- 244 bytes output data
- 32 I/O modules, up to 16 I/O modules can be connected for each ET-Connection line

## Accessories

The following component is included with the module in the packaging:

- Identification labels

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for PROFIBUS
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You will find additional information on accessories and the other components in the Accessories/Spare parts section of the ET 200AL Distributed I/O System (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator control and display elements of the interface module IM 157-1 DP.

- ① RUN, ERROR, MAINT: LED displays for the current operating status and diagnostics status
- ② X1 DP1: 1st PROFIBUS interface
- ③ X1 DP2: 2nd PROFIBUS interface
- ④ Rotary coding switch for setting the PROFIBUS address
- ⑤ ET-CON1, ET-CON2: LED displays for ET-Connection
- ⑥ X80: Connector for infeed of the supply voltage (POWER input)
- ⑦ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑧ X30: Socket for ET-Connection1
- ⑨ X31: Socket for ET-Connection2
- ⑩ DP: LED displays for the current operating status of the PROFIBUS interfaces

Figure 2-2 Operator controls and display elements

## 2.3 Functions

### 2.3.1 PROFIBUS DP

#### Introduction

The interface module supports the following PROFIBUS DP functions:

- Operation as DPV0 and DPV1 slave
- Identification data I&M0 to I&M3
- Firmware update
- Configuration control by means of the user program

#### PROFIBUS DP

The PROFIBUS DP interface is used for connection to CPUs. With PROFIBUS DP you can set up extended subnets.

PROFIBUS is the network for the cell and field area in the open, manufacturer-independent communication system SIMATIC NET. Physically, PROFIBUS is an electrical network based on a shielded two-wire cable or an optical network based on a fiber optic cable.

Data transmission via PROFIBUS DP features a standardized interface (EN 50170 Vol. 2) for the transmission of process input and process output data between SIMATIC S7 and field devices (DP slaves).

The transmission behavior via PROFIBUS DP is characterized by cyclical data exchange between the DP master and the DP slaves.

#### Reference

You will find more information on PROFIBUS DP in the STEP 7 online help and in the Function Manual PROFIBUS with STEP 7 V13 (<http://support.automation.siemens.com/WW/view/en/59193579>).

## 2.3.2 Configuration control (option handling)

### Properties

Configuration control allows you to prepare your distributed I/O system for future extensions or options. Configuration control means that you can configure the planned maximum configuration of your distributed I/O system in advance and vary it later in a flexible manner by means of the user program.

### Reference

You can find more information on configuration control

- In the system manual ET 200AL Distributed I/O System (<https://support.industry.siemens.com/cs/ww/en/view/89254965>)
- On the Internet under the following link: Application collection (<https://support.industry.siemens.com/cs/ww/en/view/29430270>).
- In the STEP 7 online help.

## Wiring

### 3.1 Terminal and block diagram

The image below shows the terminal and block diagram of the IM 157-1 DP interface module.

|        |                                             |     |                                   |                  |                                 |
|--------|---------------------------------------------|-----|-----------------------------------|------------------|---------------------------------|
| ①      | Electronics                                 | 1L+ | Supply voltage 1L+ (non-switched) | RUN              | LED operating state (green)     |
| ②      | ET-Connection interface                     | 1M  | Ground 1M (non-switched)          | ERROR            | LED diagnostics status (red)    |
| ③      | Internal supply voltage                     | 2L+ | Load voltage 2L+ (switched)       | MAINT            | LED diagnostics status (yellow) |
| ④      | Rotary coding switch for PROFIBUS addresses | 2M  | Ground 2M (switched)              | DP               | PROFIBUS LED (green)            |
| X1 DP1 | 1. PROFIBUS interface                       |     |                                   | ET-CON1, ET-CON2 | ET-Connection LEDs (green)      |
| X1 DP2 | 2. PROFIBUS interface                       |     |                                   |                  |                                 |
| X80    | Infeed of supply voltages                   |     |                                   |                  |                                 |
| X81    | Loop-through of supply voltages             |     |                                   |                  |                                 |
| X30    | Infeed of the ET-Connection                 |     |                                   |                  |                                 |
| X31    | Loop-through of the ET-Connection           |     |                                   |                  |                                 |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

#### Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for PROFIBUS

The following table shows the pin assignment of the connectors and sockets for the connection of PROFIBUS.

Table 3- 1 Pin assignment for PROFIBUS

| Pin                                                                                                                                                                        | Assignment                    |                                 | Front view of the connector<br>X1 DP1                                                | Front view of the socket<br>X1 DP2                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|---------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|                                                                                                                                                                            | X1 DP1 connector<br>(feed in) | X1 DP2 Socket<br>(loop-through) |                                                                                      |                                                                                      |
| 1                                                                                                                                                                          | -                             | Supply plus P5V*                |  |  |
| 2                                                                                                                                                                          | Data cable A                  |                                 |                                                                                      |                                                                                      |
| 3                                                                                                                                                                          | Data reference potential M5*  |                                 |                                                                                      |                                                                                      |
| 4                                                                                                                                                                          | Data cable B                  |                                 |                                                                                      |                                                                                      |
| 5                                                                                                                                                                          | Functional earth FE           |                                 |                                                                                      |                                                                                      |
| Shielding                                                                                                                                                                  | Functional earth FE           |                                 |                                                                                      |                                                                                      |
| * The voltage may only be used for supplying the external terminating resistor. It is not permitted to loop-through the voltage by means of a cable to the next connector. |                               |                                 |                                                                                      |                                                                                      |

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 2 Pin assignment for ET-Connection

| Pin       | Assignment                     |                                | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets                                                             |                                                                                       |

| 3         | TXN                            | TXN                            | Blue                                                                 |                                                                                       |                                                                                       |
| 4         | RXN                            | RXN                            | Orange                                                               |                                                                                       |                                                                                       |
| Shielding | Functional earth FE            |                                | -                                                                    |                                                                                       |                                                                                       |

### Pin assignment of the connector for infeed of the supply voltage

The following table shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 3 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector                                                         |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X80 connector (power input)       |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                              |
|-----|-----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X81 Socket (power output)         |                                                      |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                       |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage. Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## 3.3 Configuring PROFIBUS DP address and terminating resistor

### Properties

Use the PROFIBUS address to specify at which address the ET 200AL distributed I/O system is addressed on the PROFIBUS DP.

The PROFIBUS DP address is configured for the ET 200AL distributed I/O system with a rotary coding switch on the front of the housing.

### Requirements

The following requirements apply:

- Each address is only assigned once on the PROFIBUS DP.
- The configured PROFIBUS DP address must match the PROFIBUS address defined in the configuration software.
- A change of the PROFIBUS DP address is only valid after POWER ON/POWER OFF on the IM 157-1 DP interface module.

### Required tools

You need the following tools to configure the PROFIBUS DP address:

- 14 mm socket wrench
- 2.5 mm screwdriver

### Setting the PROFIBUS DP address

Configurable PROFIBUS DP addresses are 1 to 99.

Proceed as follows to configure the PROFIBUS DP address:

1. Remove the two M12 sealing caps from the rotary coding switches (use 14 mm socket wrench, if needed).
2. Configure the desired PROFIBUS DP address with a screwdriver on the rotary coding switches.
  - Top rotary coding switch: Tens digit
  - Bottom rotary coding switch: Ones digit
3. Screw the two M12 sealing caps back onto the thread to protect the rotary coding switches (torque: 0.5 to 0.8 Nm).
4. Switch the supply voltage off and on again (POWER OFF/POWER ON).

The figure below shows the rotary coding switches for configuring the PROFIBUS DP address.

- ① Rotary coding switch for PROFIBUS DP (tens digit)
- ② Rotary coding switch for PROFIBUS DP address (ones digit)

Figure 3-2 Setting the PROFIBUS address

The following table shows how to set PROFIBUS address 26 as an example.

Table 3- 5      Setting of the PROFIBUS address

|                                                                                   |            |            |
|-----------------------------------------------------------------------------------|------------|------------|
|  | Tens digit | Position 2 |
|  | Ones digit | Position 6 |

### Connecting the terminating resistor for PROFIBUS DP

Terminate a PROFIBUS DP segment, on both of its ends, which means on the first and last device of the segment, with its characteristic impedance. There are two different terminating resistors available for this purpose, for sockets and for connectors.

The figure below shows typical use of a terminating resistor.

Figure 3-3      Terminating resistor

## Parameters

### 4.1 Parameters

The following table shows the parameters for the IM 157-1 DP interface module.

Table 4- 1 Parameters

| Parameters                                                          | Value range                                                               | Default <sup>2</sup> | Efficiency range |
|---------------------------------------------------------------------|---------------------------------------------------------------------------|----------------------|------------------|
| Configuration control <sup>1</sup>                                  | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul> | Disable              | ET 200AL         |
| Startup if preset configuration does not match actual configuration | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul> | Disable              | ET 200AL         |
| Diagnostics interrupt                                               | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul> | Enable               | ET 200AL         |
| Hardware interrupt                                                  | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul> | Enable               | ET 200AL         |
| Pull/plug module interrupt                                          | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul> | Enable               | ET 200AL         |

<sup>1</sup> Note that the "Startup if preset configuration does not match actual configuration" parameter is always activated when you use configuration control.

<sup>2</sup> The defaults apply to the default startup. If no other parameters are specified by the DP master, the interface module IM 157-1 DP starts up with these parameters.

### 4.2 Explanation of the parameters

#### Configuration control

You can use this parameter to enable the configuration control function in the ET 200AL distributed I/O system.

---

#### Note

##### Configuration control

The configuration control function can only be used if you set the "Startup if preset configuration does not match actual configuration" parameter to "YES".

---

**Note****Configuring the enable**

If you configure the enable, the ET 200AL distributed I/O system requires a control data record 196 from the user program in order for the ET 200AL distributed I/O system to operate the I/O modules.

---

Additional information is available in the section Configuration control (option handling).

**Startup if preset configuration does not match actual configuration****Enabled parameter**

If the preset/actual configuration differ, **a** data exchange occurs between the DP master and the ET 200AL distributed I/O system.

**Disabled parameter**

If the preset/actual configuration differ, **no** data exchange occurs between the DP master and the ET 200AL distributed I/O system.

---

**Note****More than 16 I/O modules in real configuration per ET-Connection line**

The preset/actual configuration do not match parameter is valid for 16 I/O modules per ET-Connection line.

Up to 16 I/O modules are recognized per line. Additional I/O modules are not recognized. A diagnostics alarm is not issued for these I/O modules. All I/O modules in the actual system after the 16th I/O module remain unconfigured (LED DIAG flashes green) and are not involved in the data exchange.

---

**Diagnostics interrupt**

You can use this parameter to enable or disable diagnostics interrupts.

**Hardware interrupt**

You can use this parameter to enable or disable hardware interrupts.

**Pull/plug module interrupt**

You can use this parameter to enable or disable pull/plug module interrupts.

# 5

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the IM 157-1 DP interface module.

- |   |         |          |
|---|---------|----------|
| ① | RUN     | (green)  |
| ② | ERROR   | (red)    |
| ③ | MAINT   | (yellow) |
| ④ | ET-CON1 | (green)  |
| ⑤ | ET-CON2 | (green)  |
| ⑥ | DP      | (green)  |

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 34).

### LED RUN, LED ERROR, LED MAINT

Table 5- 1 Status and error displays of the LEDs RUN, ERROR, MAINT

| LEDs                                                                                           |                                                                                                |                                                                                                | Meaning                                                                                                    | Solution                                                                                                                                                        |

| <br>On |         | A communications connection to at least one IO module at the corresponding ET-Connection is available.        | -                                                                                |

## 5.2 Interrupts

### 5.2.1 Evaluating interrupts

#### Introduction

With certain process statuses/errors, the DP slave in each case creates an interrupt block with the corresponding information in the diagnostics frame (DPV1 interrupt mechanism). Regardless of this, the diagnostic status of the DP slave is displayed in the identifier-related diagnostics, in the module status, and in the channel diagnostics.

#### Interrupts in DPV1 mode

The ET 200AL distributed I/O system supports the following interrupts:

- Diagnostics interrupts
- Hardware interrupts
- Pull/plug module interrupt

### 5.2.2 Trigger a diagnostics interrupt

For an incoming or outgoing event (for example, wire break on a channel of an I/O module), the interface module triggers a diagnostics interrupt if the I/O modules were configured accordingly and "Enable:diagnostics interrupt" is set.

The CPU interrupts user program execution and processes the diagnostics interrupt OB (OB 82). The event that triggered the interrupt is entered in the start information of the diagnostics interrupt OB.

### 5.2.3 Triggering a hardware interrupt

When a hardware interrupt occurs, the CPU interrupts execution of the user program and processes the hardware interrupt OB, for example OB 40. The event that triggered the interrupt is entered in the start information of the hardware interrupt OB.

---

#### Note

##### Diagnostics "Hardware interrupt lost" (from I/O module)

Do not use hardware interrupts for technological purposes (e.g., cyclical generation of hardware interrupts).

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

---

### 5.2.4 Triggering an insert/remove module interrupt

When an insert/remove module interrupt occurs, the CPU interrupts execution of the user program and processes the insert/remove module interrupt OB (OB 83). The event that triggered the interrupt is entered in the start information of the insert/remove OB.

The pull/plug OB (OB 83) is also triggered for all subsequent I/O modules, because the ET-Connection and/or the power supply is interrupted.

### 5.2.5 Structure of data records

#### Definition

The interrupt section of the slave diagnostics indicates the interrupt type and the event that led to an interrupt being triggered. The interrupt section comprises 62 bytes including an interrupt header.

#### Position in the diagnostics frame

The interrupt section is located after the channel diagnostics.

#### Data records

The diagnostics data of a module are located in the data records 0 and 1:

- Data record 0 contains 4 bytes of diagnostics data that describe the current status of the distributed I/O system. Data record 0 is part of the header information of the OB 82 (local data bytes 8 to 11).
- Data record 1 contains 4 bytes of diagnostics data that are also available in data record 0.

The figure below shows the structure of data record 0.

Figure 5-2 Structure of data record 0

The figure below shows the structure of data record 1.

Figure 5-3 Structure of data record 1

## Reading data records

You have the option to read out data records 0 and 1 via SFC 59 (RD\_REC) or SFB 52 (RDREC). The data length of data record 1 is up to 240 bytes. In this case, data record 1 contains up to 38 channel fault entries.

Note the figures below in this section.

## Contents

The contents of the interrupt information depend on the interrupt type:

- In the case of diagnostics interrupts, diagnostics data record 1 (up to 58 bytes) is sent as interrupt status information (starting from byte x+4).
- The length of the interrupt status information for hardware interrupts is 4 bytes.

## Structure of interrupts

The figure below shows the structure of the interrupt section for the ET 200AL distributed I/O system.

Figure 5-4 Structure of the interrupt status of the interrupt section

## Diagnostics interrupt, byte x+4 to x+7

The figure below shows the structure of the diagnostics interrupt of byte x+4 to byte x+7.

Figure 5-5 Structure of bytes x+4 to x+7 for diagnostics interrupt

**Diagnostics interrupt, starting at byte x+8**

The figure below shows the structure of the diagnostics interrupt starting at byte x+8.

Figure 5-6 Structure starting at byte x+8

**Diagnostics interrupt from the modules, starting at byte x+14**

The channel error entries start from byte x+14. A channel fault entry is 6 bytes long and can follow 8 times starting at byte x+14.

If you read the channel faults with an SFB or SFC, then 38 channel diagnostics are possible.

Figure 5-7 Structure starting from byte x+14

The following table is used to explain the channel error entries.

|                    | Description                                                                           |                                                                                                                                                                        |

| Channel error type | Explanations are available in the device manuals, in the section "Diagnostic alarms". |                                                                                                                                                                        |

### Example of a diagnostics interrupt

The figure below shows an example of a diagnostics interrupt.

Example:

I/O module AI 4xU/I/RTD reports on channel 1 the diagnostic interrupt

"High limit exceeded"

Figure 5-8 Example of a diagnostics interrupt (part 1)

Figure 5-9 Example of a diagnostics interrupt (part 2)

## Hardware interrupt of digital and analog input modules, bytes x+4 to x+7

The figure below shows the structure of a hardware interrupt.

Figure 5-10 Structure as of Byte x+4 for hardware interrupt

### Note

#### Byte x+4

You will find the event type in the device manual of the module that triggered the hardware interrupt.

## 5.3 Alarms

### 5.3.1 Diagnostics alarms

#### Actions after a diagnostics alarm in DPV1 mode

The error is entered in the channel diagnostics in the diagnostics frame:

- In DPV1 mode, diagnostics can be reported as diagnostics interrupts.
- After a diagnostics alarm, this is
  - entered in the diagnostics frame as a diagnostics interrupt block (always only one interrupt).
  - Stored in the diagnostics buffer of the CPU.
- The ERROR LED of the interface module flashes.
- OB 82 is called. If OB 82 is not available, the CPU goes into STOP mode.
- Acknowledgment of the diagnostics interrupt (a new interrupt is possible thereafter).

#### Length of the diagnostics frame

- The maximum frame length for the ET 200AL distributed I/O system with IM157-1 DP interface module (DPV1 mode) is 244 bytes.
- The minimum frame length is 6 bytes.

#### Reading out the diagnostics data

Table 5- 4 Reading the diagnostics with STEP 7

| Automation system with DP master | Application                                                                                                                       | See...                                                              |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| SIMATIC S7/M7                    | Slave diagnostics in plain text in "DP Slave Diagnostics" tab on STEP 7 interface                                                 | "Hardware diagnostics" in STEP 7 online help                        |

|                                  | "RD_REC" instruction (SFC 59)<br>Reading out data records of the S7 diagnostics data (store in the data area of the user program) | See System and Standard Functions reference manual                  |
|                                  | "RDREC" instruction (SFC 52)<br>Reading data records from the DP slave                                                            | SFB: refer to STEP 7 online help (system functions/function blocks) |
|                                  | "RALRM" instruction (SFC 54)<br>Receiving interrupts from the interrupt OBs                                                       | SFB: refer to STEP 7 online help (system functions/function blocks) |

### 5.3.2 Slave diagnostics

The figure below shows the structure of the slave diagnostics.

Figure 5-11 Structure of the slave diagnostics

#### Note

The length of the diagnostics frame varies with the IM 157-1 DP (depending on parameter assignment) between 6 and 244 bytes in DPV1 mode.

You can identify the length of the last received diagnostics frame in STEP 7 from the RET\_VAL parameter in SFC 13.

### 5.3.3 Station statuses 1 to 3

The following tables show station status 1 to 3 and provide an overview of the status of a DP slave.

#### Structure of station status 1 (byte 0)

Table 5- 5 Structure of station status 1 (byte 0)

| Bit | Meaning                                                                                                                            | Cause/Solution                                                                                                                                                                                                                                                                                                         |
|-----|------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0   | 1: The DP slave is not responding to the DP master.                                                                                | <ul style="list-style-type: none"> <li>Correct PROFIBUS address set on the DP slave?</li> <li>Bus connector connected?</li> <li>Is the DP slave connected to the voltage supply?</li> <li>RS485 repeater properly configured?</li> </ul>                                                                               |
| 1   | 1: The DP slave is not yet ready to exchange data.                                                                                 | <ul style="list-style-type: none"> <li>Wait; the DP slave is currently starting up.</li> </ul>                                                                                                                                                                                                                         |
| 2   | 1: The configuration data transferred from the DP master to the DP slave does not match the DP slave configuration.                | <ul style="list-style-type: none"> <li>Has the correct station type or the correct DP slave configuration been entered in the configuration software?</li> </ul>                                                                                                                                                       |
| 3   | 1: External diagnostics is available. (Group diagnostics display)                                                                  | <ul style="list-style-type: none"> <li>Evaluate the ID-specific diagnostics, the module status, and/or the channel diagnostics. As soon as all errors have been eliminated, bit 3 is reset. The bit is set again when there is a new diagnostics alarm in the bytes of the aforementioned diagnostics.</li> </ul>      |
| 4   | 1: The requested function is not supported by the DP slave (e.g. changing the PROFIBUS address using software).                    | <ul style="list-style-type: none"> <li>Check the configuration.</li> </ul>                                                                                                                                                                                                                                             |
| 5   | 1: The DP master cannot interpret the response of the DP slave.                                                                    | <ul style="list-style-type: none"> <li>Check the bus configuration.</li> </ul>                                                                                                                                                                                                                                         |
| 6   | 1: The DP slave type does not match the software configuration.                                                                    | <ul style="list-style-type: none"> <li>Has the correct station type been entered in the configuration software?</li> </ul>                                                                                                                                                                                             |
| 7   | 1: Parameters have been assigned to the DP slave by a different DP master (not the one that currently has access to the DP slave). | <ul style="list-style-type: none"> <li>The bit is always 1, for example, if you access the DP slave with the programming device or another DP master.</li> <li>The PROFIBUS address of the DP master that assigned parameters to the DP slave is located in the "Master PROFIBUS address" diagnostics byte.</li> </ul> |

### Structure of station status 2 (byte 1)

Table 5- 6 Structure of station status 2 (byte 1)

| Bit                                                                             | Meaning |                                                                                                                           |
|---------------------------------------------------------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------|
| 0                                                                               | 1:      | The DP slave parameters need to be reassigned.                                                                            |
| 1                                                                               | 1:      | A diagnostics alarm is pending. The DP slave will not operate until the problem is eliminated (static diagnostics alarm). |
| 2                                                                               | 1:      | The bit on the DP slave is always "1".                                                                                    |
| 3                                                                               | 1:      | The watchdog is activated for this DP slave.                                                                              |
| 4                                                                               | 1:      | The DP slave has received the control command "FREEZE". <sup>1</sup>                                                      |
| 5                                                                               | 1:      | The DP slave has received the control command "SYNC". <sup>1</sup>                                                        |
| 6                                                                               | 0:      | Bit is always "0".                                                                                                        |
| 7                                                                               | 1:      | The DP slave is disabled, that is, it has been removed from the processing in progress.                                   |
| <sup>1</sup> The bit is updated only if another diagnostics alarm also changes. |         |                                                                                                                           |

### Structure of station status 3 (byte 2)

Table 5- 7 Structure of station status 3 (byte 2)

| Bit    | Meaning |                                                                                                                                                                                                                                                         |
|--------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 to 6 | 0:      | Bits are always set to "0".                                                                                                                                                                                                                             |
| 7      | 1:      | <ul style="list-style-type: none"> <li>There are more diagnostic alarms pending than the DP slave is able to store.</li> <li>The DP master cannot enter all the diagnostics alarms sent by the DP slave in its (channel) diagnostics buffer.</li> </ul> |

#### 5.3.4 Master PROFIBUS address

The following is stored in the diagnostic byte Master PROFIBUS address:

- The PROFIBUS address of the DP master that assigned the parameters to the DP slave.
- The PROFIBUS address of the DP master that has read and write access to the DP slave.

The master PROFIBUS address is found in byte 3 of the slave diagnostics.

#### 5.3.5 Manufacturer ID

The manufacturer ID contains a code specifying the type of the DP slave.

The following table shows the structure of the manufacturer ID (bytes 4, 5).

Table 5- 8 Description of the manufacturer ID

| Byte 4          | Byte 5          | Manufacturer ID              |
|-----------------|-----------------|------------------------------|
| 81 <sub>H</sub> | A9 <sub>H</sub> | IM 157-1 DP interface module |

### 5.3.6 Identifier-related diagnostics

The identifier-related diagnostics indicates whether modules of the ET 200AL distributed I/O system have errors or not. Identifier-related diagnostics starts at byte 6 and comprises 6 bytes.

The figure below shows how the identifier-related diagnostics for the ET 200AL distributed I/O system is structured with the IM 157-1 DP interface module.

Figure 5-12 Structure of the identifier-related diagnostics

### 5.3.7 Module status

The module status indicates the status of the configured modules and provides more information on the identifier-related diagnostics with respect to the configuration. The module status begins after the identifier-related diagnostics and comprises 13 bytes.

The figure below shows how the module status for the ET 200AL distributed I/O system is structured with the IM 157-1 DP interface module.

Figure 5-13 Module status structure

### 5.3.8 Channel diagnostics

#### Function

Channel diagnostics provides information about channel errors in modules and details of the identifier-related diagnostics. Channel diagnostics begins after the module status. Channel diagnostics does not affect the module status.

The figure below shows how the channel diagnostics for the ET 200AL distributed I/O system is structured with the IM 157-1 DP interface module.

Figure 5-14 Structure of channel diagnostics

# Technical specifications

## Technical specifications of the interface module IM 157-1 DP

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet

## Dimension drawing

The figure below shows the dimension drawing of the IM 157-1 DP interface module in the front and side view.

Figure A-1 Dimension drawing

## Cycle times

The following figure shows the cycle times at ET-Connection based on the number of I/O modules.

Figure B-1 Cycle times

The cycle time is independent of the PROFIBUS transmission rate.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Changes compared to the previous version

This manual contains the following changes/additions compared to the previous version:

- Supplement to section Cycle times (Page 40)
- Adaptations in the section Technical specifications (Page 36)

## Conventions

Please also observe notes marked as follows:

---

### Note

Indicates important product information to which particular attention should be paid.

---

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

# Product overview

## 2.1 Properties

### Article number

6ES7157-1AB00-0AB0

### View of the module

Figure 2-1 View of the IM 157-1 PN interface module

### Properties

The module has the following technical properties:

- Connects the ET 200AL distributed I/O system with PROFINET IO
- 24 V DC supply voltage
- Support for 2 ET-Connection lines
- Dimensions: 45 x 159 mm

The functions supported by the module are found in the chapter Functions (Page 12).

## Maximum configuration

The module has the following maximum configuration:

- 1430 bytes input data
- 1430 bytes output data
- 32 I/O modules, up to 16 I/O modules can be connected for each ET-Connection line

---

### Note

- In the case of a shared device configuration, the sum of the I/O data of all controllers that share the device applies.
  - If more than two (max. four) controllers share the device, the maximum amount of I/O data including user data qualifier is limited to 360 bytes per controller.
- 

## Accessories

The following component is included with the module in the packaging:

- Identification labels

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for PROFINET
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You will find additional information on accessories and the other components in the Accessories/Spare parts section of the ET 200AL Distributed I/O System (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator control and display elements of the interface module IM 157-1 PN.

- ① RUN, ERROR, MAINT: LED displays for the current operating status and diagnostics status
- ② X1 P1 R: 1st PROFINET interface
- ③ X1 P2 R: 2nd PROFINET interface
- ④ ET-CON1, ET-CON2: LED displays for ET-Connection
- ⑤ X80: Connector for infeed of the supply voltage (POWER input)
- ⑥ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑦ X30: Socket for ET-Connection1
- ⑧ X31: Socket for ET-Connection2
- ⑨ P1 LINK, P2 LINK: LED displays for the current operating status of the PROFINET interfaces

Figure 2-2 Operator controls and display elements

## 2.3 Functions

### 2.3.1 PROFINET IO

#### Introduction

The interface module supports the following PROFINET IO functions:

- Integrated switch with 2 ports
- Supported Ethernet services: ping, arp, network diagnostics (SNMP)/MIB-2, LLDP
- Port diagnostics
- Deactivating of ports
- Real-time communication
- Isochronous real-time communication
- Minimum update time 250 µs
- Media redundancy (MRP)
- Media redundancy with planned duplication (MRPD)
- Device replacement with topological configuration
- Device replacement without topological configuration
- Shared Device
- Identification data I&M0 to I&M4
- Firmware update via PROFINET IO
- Reset to factory settings via PROFINET IO
- PROFIenergy
- Configuration control (option handling)
- Value status (of I/O modules)

## Requirements

The following table shows the software requirements for the use of PROFINET IO functions with the IM 157-1 PN interface module.

Table 2- 1 Software requirements for PROFINET IO functions

| PROFINET IO function                          | Configuration software                               |                                                                                                  |
|-----------------------------------------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|                                               | STEP 7 (TIA Portal) V13 or higher<br>(with GSD file) | STEP 7 V5.5 SP4 or higher<br>(with GSD file)/Software from third-party manufacturer <sup>2</sup> |
| Real-time communication                       | X                                                    | X                                                                                                |
| Isochronous real-time communication           | X                                                    | X                                                                                                |
| Device replacement without programming device | X                                                    | X                                                                                                |
| Media redundancy                              | X                                                    | X                                                                                                |
| Shared device                                 | X <sup>1</sup>                                       | X                                                                                                |

<sup>1</sup> Use a S7-1500 CPU as a controller to use a shared device with STEP 7 (TIA Portal).

<sup>2</sup> Systems of third-party manufacturers: Depending on the range of functions of the third-party system

## Real-time communication

A transmission method for PROFINET IO based on a cyclic data exchange with a provider-consumer model.

## Isochronous real-time communication

Synchronized transmission method for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth within the send clock is available for IRT data. The reserved bandwidth ensures that IRT data can be transferred at reserved synchronized intervals, without being influenced by other higher network loads (e.g., TCP/IP communication, or additional real-time communication).

A topological configuration is required for IRT.

### Note

#### IO controller as sync master with IRT communication

We recommend that you also operate the IO controller as a sync master when configuring IRT communication.

Otherwise IRT and RT configured IO devices may fail if the sync master fails.

### Device replacement without programming device

IO devices with this function can easily be replaced. You do not have to assign the device name with the PG.

The replaced IO device is assigned the device name by the IO controller and not by the programming device. The IO controller uses the configured topology and the neighboring relationships determined by the IO devices for this purpose. To do this, all devices involved must support the LLDP protocol (Link Layer Discovery Protocol). The configured target topology must match the actual topology.

IO devices which were already used in another configuration must be reset to factory settings before being reused.

### Media redundancy

Function for safeguarding communication and plant availability. Redundant transmission lines (ring topology) ensure that another communication path is made available in the event of a transmission section failure.

### Shared device

A shared device is an IO device that provides its data to up to four IO controllers.

The "Shared device" function allows the modules or submodules of an IO device to be divided up among different IO controllers. Thus allowing flexible automation concepts. You have, for example, the possibility of combining I/O modules lying near other into an IO device.

When operating as a shared device, there might be temporary delays in the update of the IO data when establishing or terminating additional communications relationships to an IO controller.

You can find additional information in the STEP 7 online help and the manual and in the function manual PROFINET with STEP 7 V14

(<http://support.automation.siemens.com/WW/view/en/49948856>).

### Cabling with fixed connection setting

If you configure a fixed connection setting for the port in STEP 7, you also have to disable "Autonegotiation/Autocrossover". By disabling "Autonegotiation/Autocrossover" you speed up establishment of the communication path.

## Replacement of an IM 157-1 PN

If you replace an interface module with an interface module that has already been used, you must reset this IO device to the delivery state with "Reset to factory settings".

You will find more information on "Resetting to factory settings" in the ET 200AL Distributed I/O System (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual in the section "Resetting interface module (PROFINET) to factory settings".

## Reference

You will find more information on the PROFINET IO functions in the PROFINET with STEP 7 V14 (<http://support.automation.siemens.com/WW/view/en/49948856>) Function Manual and in the STEP 7 online help.

## 2.3.2 PROFlenergy

### 2.3.2.1 What is PROFlenergy?

#### Introduction

PROFlenergy is a PROFINET-based data interface which makes it possible to switch off consumers in a coordinated and centrally controlled manner during break times regardless of the manufacturer or device. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

PROFINET devices are switched off with special commands in the user program of the PROFINET IO controller. Additional hardware is not needed: The PROFlenergy commands are interpreted by the PROFINET devices.

The device which provides PROFlenergy and supports the matching control data record owns the PE-Entity, the access point for these control data records. This PE-Entity represents I/O modules which do not have their own PE-Entity on the interface module. I/O modules that have their own PE-Entity are always addressed directly.

For the ET 200AL distributed I/O system, the PE-Entity is exclusively provided by the PROFINET interface module.

## Procedure

To configure PROFlenergy, follow these steps:

1. Create the parameter data record, Index 3, in STEP 7.
2. Transfer the parameter data record to the interface module with the instruction "WRREC" - SFB 53.
3. Create the user program with the FBs to control the PROFlenergy commands ("PE\_START\_END" - FB 815, "PE\_CMD" - FB 816).
4. Transfer the user program to the CPU.

## Additional information

You will find more information on the Internet (<http://www.profibus.com>) under Common Application Profile PROFlenergy; Technical Specification for PROFINET; as well as in the following documentation:

- You will find additional information on the PROFlenergy FBs ("PE\_START\_END" - FB 815, "PE\_CMD" - FB 816) in the online help for STEP 7 V5.5 SP2 and higher on System functions/system function blocks.

### 2.3.2.2 Principle of operation

#### "Pause" control and "Pause" behavior

At the beginning/end of pauses, enable/disable the pause function on the system; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules. The module then interprets the content of the PROFlenergy command and turns it off or on again. The ET 200AL interface module is the PE-Entity for the PROFlenergy-capable I/O modules of the ET 200AL distributed I/O system in this case.

Device information can be called up using additional PROFlenergy commands during the pauses. You can use these commands to transfer the "Start\_Pause" / "End\_Pause" command in good time.

---

**Note**

A complete PROFlenergy sequence consists of the commands "Start\_Pause" and "End\_Pause". Always observe this sequence during programming.

---

#### LED displays

PROFlenergy generally has no effect on the LED display. Exceptions can be found in the device manuals of the I/O modules.

#### Response to error detection

All channels whose pause mode is set to "PE\_MODE\_PROCEED" report errors as in productive operation.

The following rules apply to channels which switch to a pause mode other than "PE\_MODE\_PROCEED":

- All errors that are unrelated to the switch to "Pause" are reported.
- If error recognition is possible during "Pause", these errors continue to be reported.
- All error messages which are caused by the switch to "Pause" are suppressed.
- The following applies if error recognition is not possible during the "Pause":
  - The status of errors already pending before the "Pause" is retained.
  - Incoming and outgoing errors are reported once the "Pause" has been ended.

---

**Note**

Switching to "Pause" and out of "Pause" may cause an error to be reported.

---

## Additional information

Additional information on diagnostics can be found in the I/O module device manuals.

## Hardware interrupt

Ending a "Pause" causes hardware interrupts to be detected again.

## "Pause" behavior under certain operating conditions

A "Pause" is ended in the following cases:

Table 2- 2 Ending a "Pause"

| Ending a "Pause"                                                                                                                                                                                                                                                                                                                 | Explanation                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

| The supply voltage 1L+ of the I/O module has failed                                                                                                                                                                                                                                                                              |                                                                                                                                                           |
| The parameter settings of the I/O module were changed during operation using data record 128                                                                                                                                                                                                                                     |                                                                                                                                                           |

<sup>1</sup> The substitute value behavior was activated.

### 2.3.2.3 Parameter assignment

#### Parameter assignment

Keep the following points in mind when assigning parameters for PROFlenergy:

- Parameters for PROFlenergy are assigned with the parameter data record (version 2), index 3. The interface module distributes the PROFlenergy parameters to the I/O modules.
- The parameter assignment of an additional pause behavior is possible immediately after the start of the previous "Pause". The required state for the following pause is activated with a new "Start\_Pause" command.
- You can write the parameter assignment as often as needed.
- The interface module checks the distribution of the parameters to the I/O modules and returns the result as a return value of the write job. In the case of a negative return value, there are one or more I/O modules that have not accepted the parameter data record. In this case, the I/O modules respond according to their last PROFlenergy parameter assignment in case of an incoming "Start\_Pause" command. "Start\_Pause"/"End\_Pause" commands can be executed as planned with a positive return value.
- In case of a failure of an I/O module or station outage, you must repeat the parameter assignment using the parameter data record.
- The ET 200AL distributed I/O system supports configuration of the behavior of a "pause". If a different response is required for an additional "Pause", you will have to assign parameters again.

---

**Note**

Effect: The response (switch-off) of the I/O modules to PROFlenergy is related to the slot, which means all channels in the slot behave accordingly.

---

## Parameter data record

You specify in the parameter data record for PROFlenergy which I/O modules (slots) are controlled with the PROFlenergy commands.

The following table shows the content of the parameter data record for PROFlenergy, index 3, which you create yourself and can transfer to the interface module.

Table 2- 3 Parameter data record for PROFlenergy (version 2), index 3

| Byte | Element          |             | Code                                                                                                                                                                                                                                                                                      | Explanation                                                                         |

| 64   | Block 32         | Slot number | See Block 1                                                                                                                                                                                                                                                                               |                                                                                     |
| 65   |                  | Mode        |                                                                                                                                                                                                                                                                                           |                                                                                     |

<sup>1</sup> The specific behavior depends on the used I/O module (with a digital input module, for example, the sensor supply is turned off or the outputs are without power supply and voltage supply with an analog output module)

<sup>2</sup> An analog output module (e. g. with the output range 0 mA to 20 mA,  $\pm 20$  mA) or a digital output module issues the value "0".

## Error messages

The following table shows which error messages the feedback data record returns, if necessary:

Table 2- 4 Error messages

| Error code        | Meaning                                                                                                                                                                        |                                                                                                                                                                                                                         |

| 80E0 <sub>H</sub> | Error in header information                                                                                                                                                    | Check the data record header information                                                                                                                                                                                |
| 80E1 <sub>H</sub> | Parameter error <ul style="list-style-type: none"> <li>at least one I/O module does not support PROFlenergy</li> <li>A parameter value has been incorrectly encoded</li> </ul> | Check the content of the data record and correct the parameter assignment error before starting the "Pause". Parameter assignment errors which are not corrected can result in incorrect I/O module shut-down behavior. |

### 2.3.2.4 PROFenergy control data records

#### PROFenergy control data records

The control data record for PROFenergy, Index 80A0H, supports the following services for the IM 157-1 PN interface module:

Table 2- 5 Control data records for PROFenergy

| Service                  | Service ID | Meaning                                                                                                                                                          |
|--------------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Start pause <sup>1</sup> | 01H        | Assuming the configured Pause behavior, suppressing all associated diagnostics data                                                                              |
| End Pause                | 02H        | Leaving the pause                                                                                                                                                |
| Query Modes              | 03H        | Reads the supported modes <ul style="list-style-type: none"> <li>Request List Energy Saving Modes</li> <li>Request Get Mode (Energy Saving Mode Data)</li> </ul> |
| PEM status               | 04H        | Reading the PROFenergy status                                                                                                                                    |
| PE_Identify              | 05H        | Reading the supported PROFenergy services                                                                                                                        |

<sup>1</sup> The minimum (configurable) pause time for the ET 200AL distributed I/O system is 10 s.

## 2.3.3 Configuration control (option handling)

### Properties

Configuration control allows you to prepare your distributed I/O system for future extensions or options. Configuration control means that you can configure the planned maximum configuration of your distributed I/O system in advance and vary it later in a flexible manner by means of the user program.

### Reference

You can find more information on configuration control

- In the system manual ET 200AL Distributed I/O System (<https://support.industry.siemens.com/cs/ww/en/view/89254965>)
- On the Internet under the following link: Application collection (<https://support.industry.siemens.com/cs/ww/en/view/29430270>).
- In the STEP 7 online help.

## Wiring

### 3.1 Terminal and block diagram

The image below shows the terminal and block diagram of the IM 157-1 PN interface module.

|         |                                   |                  |                                   |
|---------|-----------------------------------|------------------|-----------------------------------|
| ①       | Switch                            | 1L+              | Supply voltage 1L+ (non-switched) |
| ②       | Electronics                       | 1M               | Ground 1M (non-switched)          |
| ③       | ET-Connection interface           | 2L+              | Load voltage 2L+ (switched)       |
| ④       | Internal supply voltage           | 2M               | Ground 2M (switched)              |
| X1 P1 R | 1. PROFINET interface             | RUN              | LED operating state (green)       |
| X1 P2 R | 2. PROFINET interface             | ERROR            | LED diagnostics status (red)      |
| X80     | Infeed of supply voltages         | MAINT            | LED diagnostics status (yellow)   |
| X81     | Loop-through of supply voltages   | P1 LINK, P2 LINK | PROFINET LEDs (green)             |
| X30     | Infeed of the ET-Connection       | ET-CON1, ET-CON2 | ET-Connection LEDs (green)        |
| X31     | Loop-through of the ET-Connection |                  |                                   |

Figure 3-1 Terminal and block diagram

# 3.2 Pin assignment

**Note**

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

## Pin assignment of the sockets for PROFINET

The following table shows the pin assignment of the two sockets for PROFINET.

Table 3- 1 Pin assignment of the PROFINET sockets

| Pin       | Assignment          |                | Front view of the sockets |         |
|-----------|---------------------|----------------|---------------------------|---------|
|           | X1 P1 R Socket      | X1 P2 R Socket | X1 P1 R                   | X1 P2 R |
| 1         | TXP                 | RXP            |                           |         |
| 2         | RXP                 | TXP            |                           |         |
| 3         | TXN                 | RXN            |                           |         |
| 4         | RXN                 | TXN            |                           |         |
| Shielding | Functional earth FE |                |                           |         |

**Note**

**Pin assignments**

If you disable "Autonegotiation" in STEP 7, you must pay attention to the different pin assignments of X1 P1 R and X1 P2 R.

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 2 Pin assignment for ET-Connection

| Pin       | Assignment                  |                             | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets                                                           |                                                                                     |
|-----------|-----------------------------|-----------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|           | X30 socket (ET-Connection1) | X31 socket (ET-Connection2) |                                                                      | X30                                                                                 | X31                                                                                 |
| 1         | RXP                         | RXP                         | Yellow                                                               |  |  |
| 2         | TXP                         | TXP                         | White                                                                |                                                                                     |                                                                                     |
| 3         | TXN                         | TXN                         | Blue                                                                 |                                                                                     |                                                                                     |
| 4         | RXN                         | RXN                         | Orange                                                               |                                                                                     |                                                                                     |
| Shielding | Functional earth FE         |                             | -                                                                    |                                                                                     |                                                                                     |

### Pin assignment of the connector for infeed of the supply voltage

The following table shows the pin assignment for infeed of the supply voltage.

Table 3- 3 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector                                                           |
|-----|-----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (power input)       |                                                      |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The following table shows the pin assignment for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 Socket (power output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

#### CAUTION

##### PROFINET IO

Modules with PROFINET interfaces may only be operated under the following condition:

All connected devices must be equipped with SELV/PELV power supplies.

## Parameters

### 4.1 Parameters

The following table shows the parameters for the IM 157-1 PN interface module.

Table 4- 1 Parameters (GSD file)

| Parameters            | Value range                                                                | Default | Efficiency range |
|-----------------------|----------------------------------------------------------------------------|---------|------------------|
| Configuration control | <ul style="list-style-type: none"><li>• Disable</li><li>• Enable</li></ul> | Disable | ET 200AL         |

### 4.2 Explanation of the parameters

#### Configuration control

You can use this parameter to enable the configuration control function in the ET 200AL distributed I/O system.

---

#### Note

If you configure the enable, the ET 200AL distributed I/O system requires a control data record 196 from the user program in order for the ET 200AL distributed I/O system to operate the I/O modules.

---

#### Reference

You will find more information in the section Configuration control (option handling) and in the STEP 7 online help.

# Interrupts, error messages, diagnostics and system alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the interface module IM 157-1 PN.

- |   |         |          |
|---|---------|----------|
| ① | RUN     | (green)  |
| ② | ERROR   | (red)    |
| ③ | MAINT   | (yellow) |
| ④ | ET-CON1 | (green)  |
| ⑤ | ET-CON2 | (green)  |
| ⑥ | P2 LINK | (green)  |
| ⑦ | P1 LINK | (green)  |

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 32).

### LED RUN, LED ERROR, LED MAINT

Table 5- 1 Status and error displays of the LEDs RUN, ERROR, MAINT

| LEDs                                                                                        |                                                                                             |                                                                                             | Meaning                                                                                                 | Solution                                                                                                                                                        |

| <br>Off |         | There are no I/O modules available at the respective ET-Connection or the modules do not have supply voltage. | Check the wiring for the ET-Connection or the supply voltage for the I/O module. |
| <br>On  |         | A communications connection to at least one IO module at the corresponding ET-Connection is available.        | -                                                                                |

## 5.2 Interrupts

### 5.2.1 Evaluating interrupts

#### Introduction

Interrupts are triggered by the IO device in case of errors. Interrupts are evaluated based on the I/O controller used.

#### Evaluating interrupts with I/O controllers

The ET 200AL distributed I/O system supports the following interrupts:

- Diagnostics interrupts
- Hardware interrupts
- Pull/plug module interrupt

In the event of an interrupt, interrupt OBs are automatically called in the CPU of the IO controller.

Information on the cause and class of the error is already available, based on the OB number and start information.

Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).

#### System diagnostics

In STEP 7 (TIA Portal), the updated system diagnostic is available for the modules of the S7-1500 automation system (IO controller CPU S7-1500) and ET 200AL (IO device). Independent of the cyclic user program, messages are made available on the display of the CPU S7-1500, the CPU web server and the HMI device.

You will find more information on systemic diagnostics in the Function Manual Diagnostics (<http://support.automation.siemens.com/WW/view/en/59192926>).

### 5.2.2 Trigger a diagnostics interrupt

For an incoming or outgoing event (for example, wire break on a channel of an I/O module), the interface module triggers a diagnostics interrupt if the parameters were assigned accordingly.

The CPU interrupts the processing of the user program and processes the diagnostics interrupt OB (OB 82). The event that triggered the interrupt is entered in the start information of the diagnostics interrupt OB.

### 5.2.3 Triggering a hardware interrupt

During a hardware interrupt, the CPU interrupts the processing of the user program and processes the hardware interrupt OB (e.g., OB 40). The event that triggered the interrupt is entered in the start information of the hardware interrupt OB.

---

**Note****Diagnostics "Hardware interrupt lost" (from I/O module)**

Avoid creating hardware interrupts cyclically.

If the hardware interrupt load is too high, hardware interrupts can get lost depending on the number of I/O modules and the communication load.

---

### 5.2.4 Triggering an insert/remove module interrupt

When an insert/remove module interrupt occurs, the CPU interrupts execution of the user program and processes the insert/remove module interrupt OB (OB 83). The event that triggered the interrupt is entered in the start information of the insert/remove OB.

The pull/plug OB (OB 83) is also triggered for all subsequent I/O modules, because the ET-Connection and/or the power supply is interrupted.

## 5.3 Alarms

### 5.3.1 Diagnostics alarms

#### Actions after a diagnostics alarm

There can be more than one diagnostic alarm at a given time. Actions initiated by diagnostics alarms:

- The ERROR LED of the interface module flashes.
- Diagnostic data is reported as diagnostics interrupts to the CPU of the IO controller and can be read via data records.
- Incoming diagnostics alarms are saved to the diagnostics buffer of the I/O controller.
- OB 82 is called. If OB 82 is not available, the I/O controller goes into STOP mode.

You can find more information on this topic in the STEP 7 online help.

#### Reading out the diagnostics data

Table 5- 4 Reading the diagnostics with STEP 7

| Automation system with IO controller | Application                                                             | See...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                      | "RALRM" instruction (SFB 54)<br>Receiving alarms from the IO device     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### Additional information on the data records for PROFINET IO

The structure of the diagnostics data records and programming examples can be found in the Programming Manual From PROFIBUS DP to PROFINET IO (<http://support.automation.siemens.com/WW/view/en/19289930>) and in the Application example (<http://support.automation.siemens.com/WW/view/en/24000238>).

## Causes of error and troubleshooting

Causes of errors and corrective measures of diagnostics alarms are described in the device manuals of the I/O modules

(<http://support.automation.siemens.com/WW/view/en/89013554>) in the section Interrupt, Error and System Messages.

## 5.3.2 Maintenance events

### Triggering of a maintenance event

The PROFINET IO interfaces of the interface module support the diagnostics concept and maintenance concept in PROFINET IO according to standard IEC 61158-6-10. The goal is the early recognition and correction of potential disruptions.

For the interface module, maintenance events signal to the user when a network component must be checked or replaced.

The CPU interrupts user program execution and processes the diagnostic block OB 82. The event that triggered the maintenance event is entered in the start information of the OB 82.

The interface module signals a maintenance event to the higher-level diagnostics system in the case of the following event:

Table 5- 5 Triggering of a maintenance event

| Maintenance alarm                                | Event                | Alarm/Meaning                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maintenance demanded</b><br>LED MAINT is lit. | Synchronization loss | <ul style="list-style-type: none"> <li>No synchronization frame received.</li> </ul> <p>No synchronization message frame was received by the sync master within the timeout period after parameter assignment or during operation.</p> <ul style="list-style-type: none"> <li>Successive synchronization frames are located outside permitted limits (jitter).</li> </ul> |

### System alarms in STEP 7 (TIA Portal)

The maintenance information is generated in STEP 7 (TIA Portal) V12 SP1 and higher with the following system alarms:

- Maintenance demanded - indicated for each port by a yellow wrench icon  in the device view or in the hardware configuration.

You can find more information on this topic in the STEP 7 online help.

### 5.3.3 Channel diagnostics

#### Function

Channel-related diagnostics provides information about channel faults in modules.

Channel faults are mapped as channel diagnostics data in IO diagnostics data records.

The data record is read with the "RDREC" instruction (SFB 52).

#### Structure of the diagnostics data records

The data records supported by the ET 200AL distributed I/O system are based on the PROFINET IO standard - Application Layer Service definition V2.2.

You can download the standard on the Internet (<http://www.profibus.com>) from home page of the PROFIBUS user organization free of charge.

#### Structure of the manufacturer-specific diagnostics data records

The structure of the diagnostics data records is differentiated by the BlockVersion. The following BlockVersion applies to the IM 157-1 PN interface modules:

Table 5- 6 Structure of the manufacturer-specific diagnostics data records

| IM 157-1 PN interface module | BlockVersion |
|------------------------------|--------------|
| 6ES7157-1AB00-0AB0           | W#16#0101    |

### 5.3.4 Invalid configuration states of ET 200AL on the PROFINET IO

#### Invalid configuration states

If the number of modules exceeds the maximum configuration limit, the extra modules are ignored by the system. No data exchange takes place.

### **5.3.5 STOP of the IO controller and recovery of the IO device**

#### **STOP of the SIMATIC IO controller**

If diagnostics from the IO device are received by the IO controller in the STOP state, these diagnostics do not result in a start of the organization blocks after startup of the IO controller. You must read the data record E00CH in OB 100 with the "RDREC" instruction.

#### **Return of the SIMATIC IO device**

If you want to read out the diagnostics of a station after the station return, you must read the data record E00CH in OB 86 with the "RDREC" instruction.

## Technical specifications

### Technical specifications of the interface module IM 157-1 PN

The following table shows the technical specifications as of 05/2021. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7157-1AB00-0AB0/td?dl=en>).

## Dimension drawing

The figure below shows the dimension drawing of the IM 157-1 PN interface module in the front and side view.

Figure A-1 Dimension drawing

## Cycle times

The figure below shows the cycle times at ET-Connection based on the number of I/O modules with a PN send clock of 0.5 ms.

Figure B-1 Cycle times

The cycle time at ET-Connection is synchronized with the PROFINET send clock. This means that the input data of the I/O modules are transmitted via ET-Connection without further delay (wait time in the interface module) via PROFINET. The output data from PROFINET is also transmitted without further delay via ET-Connection to the I/O modules. Thus, the cycle time of the ET-Connection, based on the number of I/O modules, is always a multiple of the configured PROFINET send clock.

The chart shown above shows the trend for a send clock of 0.5 ms. With larger send clocks, the gradation of the trend changes according to the send clock.

When using a larger number of IO-Link masters with a large I/O data configuration (> 32 bytes), there may be a slight increase in the cycle time at the ET-Connection.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Conventions

Please also observe notes marked as follows:

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## **"mySupport"**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## **"mySupport" - Documentation**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## **"mySupport" - CAx data**

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## **Application examples**

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7141-5BF00-0BA0

#### View of the module

Figure 2-1 View of the DI 8x24VDC 8xM8 digital input module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 8 digital inputs
- M8 sockets for connection of sensors
- 24 V DC supply voltage
- Configurable diagnostics can be set for each module
- Typical input delay of 3 ms
- Suitable for switches and proximity switches
- Dimensions 30 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

### Accessories

The following components are included in the module package:

- Identification labels
- Spacers

### Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap

### See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual.

## 2.2 Operator controls and display elements

The following figure shows the operator controls and display elements of the DI 8x24VDC 8xM8 digital input module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input signal
- ③ X80: Connector for infeed of the supply voltage (POWER input)
- ④ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑤ X30: Socket for ET-Connection IN
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

## 3.1 Terminal and block diagram

The following figure shows an example of the pin assignment of signal outputs with 2- and 3-wire connection.

|            |                                 |                 |                                      |
|------------|---------------------------------|-----------------|--------------------------------------|
| ①          | 2-wire connection               | X30             | Infeed of the ET-Connection          |
| ②          | 3-wire connection               | X31             | Loop-through of the ET-Connection    |
| ③          | DI circuit                      | 1L+             | Supply voltage 1L+ (non-switched)    |
| ④          | Microcontroller                 | 1M              | Ground 1M (non-switched)             |
| ⑤          | ET-Connection interface         | 2L+             | Load voltage 2L+ (switched)          |
| ⑥          | Internal supply voltage         | 2M              | Ground 2M (switched)                 |
| X10 to X17 | Channels 0 to 7                 | 1U <sub>s</sub> | 24 V encoder supply                  |
| X80        | Infeed of supply voltages       | DI <sub>n</sub> | Input signal                         |
| X81        | Loop-through of supply voltages | DI              | Channel status LEDs (0 to 7) (green) |
|            |                                 | DIAG            | LED diagnostic status (red/green)    |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for digital inputs

The table below shows the pin assignment of the 8 sockets for the connection of digital inputs.

Table 3- 1 Pin assignment for digital inputs

| Pin | Assignment                                                                                                                                                                                                                                                                           | Front view of the sockets                                                            |                                                                                      |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     | X10 to X17 sockets for digital inputs                                                                                                                                                                                                                                                | X10, X12, X14, X16                                                                   | X11, X13, X15, X17                                                                   |
| 1   | 24 V encoder supply 1Us<br>(derived from 1L+ non-switched)                                                                                                                                                                                                                           |  |  |
| 3   | Encoder supply ground 1M                                                                                                                                                                                                                                                             |                                                                                      |                                                                                      |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 3 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector                                                           |
|-----|-----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                      |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage. Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Parameters

The following table shows the parameters for the DI 8x24VDC 8xM8 digital input module.

Table 4- 1 Parameters

| Parameters                           | Value range                                                                | Default | Scope  |
|--------------------------------------|----------------------------------------------------------------------------|---------|--------|
| Diagnostics: Short-circuit to ground | <ul style="list-style-type: none"><li>• Disable</li><li>• Enable</li></ul> | Disable | Module |

### 4.2 Explanation of the parameters

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

## 4.3 Address space

The figure below shows the assignment of the address space for the digital input module DI 8x24VDC 8xM8 with value status (Quality Information, QI). If you are using PROFINET and the value status was enabled, the addresses for the value status are available. The value status is not available for PROFIBUS.

Assignment in the process image input (PII)

Figure 4-1 Address space

### Configuration options of the DI 8x24VDC 8xM8 digital input module

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the digital input module. Bits 0 to 7 in this byte are assigned to a channel and provide information on the validity of the digital input value.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

## Interrupts/diagnostics alarms

### 5.1 Status and error displays

#### LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC 8xM8 digital input module.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0 to 7) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 20).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On      | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

## 5.2 Interrupts

The DI 8x24VDC 8xM8 digital input module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital input module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 3 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm | Error code     | Meaning                                | Remedy                      |
|-------------------|----------------|----------------------------------------|-----------------------------|
| Short-circuit     | 1 <sub>H</sub> | Short-circuit encoder supply to ground | Eliminate the short-circuit |

# Technical specifications

## Technical specifications of the DI 8x24VDC 8xM8 digital input module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet

# PROFlenergy

## 7.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital input module is explained in the following section.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<http://support.automation.siemens.com/WW/view/en/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V13 (<http://support.automation.siemens.com/WW/view/en/49948856>).

Application examples (<http://support.automation.siemens.com/WW/view/en/41986454>) are also available on the Internet.

## 7.2 Behavior of the digital input module

### Requirement

You can use the PROFlenergy function when you use the internal encoder supply.

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

## Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                                 | Explanation                                                                                                                                                                                                                            |
|---------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0 <sub>D</sub> : PE_MODE_PROCEED     | Proceed at "pause"<br><ul style="list-style-type: none"> <li>Value status "GOOD"</li> </ul>                                                                                                                                            |
|         | 1 <sub>D</sub> : PE_MODE_SHUTDOWN    | Switch off at "pause"<br><ul style="list-style-type: none"> <li>Encoder supply U<sub>s</sub> switched off <sup>1</sup></li> <li>Pause substitute value: 0<sub>B</sub></li> <li>Value status "BAD"</li> </ul>                           |
|         | 3 <sub>D</sub> : PE_MODE_LAST_VALUE  | Last value at "pause"<br><ul style="list-style-type: none"> <li>Encoder supply U<sub>s</sub> switched off <sup>1</sup></li> <li>Pause substitute value: Last input value</li> <li>Value status "BAD"</li> </ul>                        |
|         | 4 <sub>D</sub> : PE_MODE_SUBST_VALUE | Substitute value at "pause"<br><ul style="list-style-type: none"> <li>Encoder supply U<sub>s</sub> switched off <sup>1</sup></li> <li>Pause substitute value: Configured pause substitute value</li> <li>Value status "BAD"</li> </ul> |

<sup>1</sup> As there is only one encoder supply U<sub>s</sub> for all channels, the supply can only be switched off at "pause" if no channel is configured in PE\_MODE\_PROCEED.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface

### Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### Conventions

Please also observe notes marked as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7141-5AF00-0BA0

#### View of the module

Figure 2-1 View of the DI 8x24VDC 4xM12 digital input module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 8 digital inputs
- M12 sockets for connection of sensors
- 24 V DC supply voltage
- Configurable diagnostics can be set for each module
- Typical input delay of 3 ms
- Suitable for switches and proximity switches
- Dimensions 30 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

### Accessories

The following components are included in the module package:

- Identification labels
- Spacers

### Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

### See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DI 8x24VDC 4xM12 digital input module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X13: Sockets for the input signal
- ③ X80: Connector for infeed of the supply voltage (POWER input)
- ④ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑤ X30: Socket for ET-Connection IN
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

## 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment of signal inputs with 2-wire and 3-wire connection.

|            |                                 |                 |                                      |
|------------|---------------------------------|-----------------|--------------------------------------|
| ①          | 3-wire connection               | X30             | Infeed of the ET-Connection          |
| ②          | 2-wire connection               | X31             | Loop-through of the ET-Connection    |
| ③          | 2-wire connection               | 1L+             | Supply voltage 1L+ (non-switched)    |
| ④          | DI circuit                      | 1M              | Ground 1M (non-switched)             |
| ⑤          | Microcontroller                 | 2L+             | Load voltage 2L+ (switched)          |
| ⑥          | ET-Connection interface         | 2M              | Ground 2M (switched)                 |
| ⑦          | Internal supply voltage         | 1U <sub>s</sub> | 24 V encoder supply                  |
| X10 to X13 | Channels 0 to 7                 | DI <sub>n</sub> | Input signal                         |
| X80        | Infeed of supply voltages       | DI              | Channel status LEDs (0 to 7) (green) |
| X81        | Loop-through of supply voltages | DIAG            | LED diagnostic status (red/green)    |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for digital inputs

The table below shows the pin assignment of the 4 sockets for the connection of digital inputs.

Table 3- 1 Pin assignment for digital inputs

| Pin | Assignment                                                                                                                               | Front view of the sockets                                                            |
|-----|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     | <b>X10 to X13 sockets for digital inputs</b>                                                                                             |                                                                                      |
| 1   | 24 V encoder supply 1Us<br>(derived from 1L+ non-switched)                                                                               |  |
| 2   | Input signal DI1: Connector X10<br>Input signal DI3: Connector X11<br>Input signal DI5: Connector X12<br>Input signal DI7: Connector X13 |                                                                                      |
| 3   | Encoder supply ground 1M                                                                                                                 |                                                                                      |
| 4   | Input signal DI0: Connector X10<br>Input signal DI2: Connector X11<br>Input signal DI4: Connector X12<br>Input signal DI6: Connector X13 |                                                                                      |
| 5   | Functional earth FE                                                                                                                      |                                                                                      |

### NOTICE

#### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input module to supply power to the encoder.

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 2 Pin assignment for ET-Connection

| Pin       | Assignment                    |                                | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets                                                           |                                                                                     |
|-----------|-------------------------------|--------------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Parameters

The table below shows the parameters for the DI 8x24VDC 4xM12 digital input module.

Table 4- 1 Parameters

| Parameters                           | Value range                                                                | Default | Scope  |
|--------------------------------------|----------------------------------------------------------------------------|---------|--------|
| Diagnostics: Short-circuit to ground | <ul style="list-style-type: none"><li>• Disable</li><li>• Enable</li></ul> | Disable | Module |

### 4.2 Explanation of the parameters

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

## 4.3 Address space

The figure below shows the assignment of the address space for the digital input module DI 8x24VDC 4xM12 with value status (Quality Information, QI).

The address space for the value status is allocated by the module, if the value status is configured using the PROFINET interface module.

Assignment in the process image input (PII)

Figure 4-1 Address space

### Configuration options of the DI 8x24VDC 4xM12 digital input module

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the digital input module. Bits 0 to 7 in this byte are assigned to a channel and return information about the validity of the digital input value.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

## Interrupts/diagnostic alarms

### 5.1 Status and error displays

#### LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC 4xM12 digital input module.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0 to 7) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 20).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On      | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

## 5.2 Interrupts

The DI 8x24VDC 4xM12 digital input module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital input module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 3     Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm | Error code     | Meaning                                | Remedy                      |
|-------------------|----------------|----------------------------------------|-----------------------------|
| Short-circuit     | 1 <sub>H</sub> | Short-circuit encoder supply to ground | Eliminate the short-circuit |

# Technical specifications

## 6.1 Technical specifications

### Technical specifications of the DI 8x24VDC 4xM12 digital input module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7141-5AF00-0BA0/td?dl=en>).

# PROFenergy

## 7.1 Pause function

### Introduction

PROFenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. The majority of the energy is saved by the process itself; the PROFINET device itself only contributes a few watts of saving potential. In PROFenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital input module is explained in the following section.

### Additional information

You can find additional information on working with PROFenergy in the "PROFenergy" section of the manual IM 157-1 PN interface module (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) and the "Saving energy with PROFenergy" section of function manual PROFINET with STEP 7 V13 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>).

Application examples (<https://support.industry.siemens.com/cs/ww/en/view/41986454>) are also available on the Internet.

## 7.2 Behavior of the digital input module

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                         |
|---------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0b: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                                                         |
|         | 1b: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Encoder supply Us switched off <sup>1</sup><br>• Pause substitute value: 0b<br>• Value status "BAD"                                      |
|         | 3b: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Encoder supply Us switched off <sup>1</sup><br>• Pause substitute value: Last input value<br>• Value status "BAD"                        |
|         | 4b: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Encoder supply Us switched off <sup>1</sup><br>• Pause substitute value: Configured pause substitute value<br>• Value status "BAD" |

<sup>1</sup> As there is only one encoder supply Us for all channels, the supply can only be switched off at "pause" if no channel is configured in PE\_MODE\_PROCEED.

## Dimension drawing

The figure below shows the dimension drawing of the DI 8x24VDC 4xM12 digital input module in front and side view.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface

### Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### Conventions

Please also observe notes marked as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## **"mySupport"**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## **"mySupport" - Documentation**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## **"mySupport" - CAx data**

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## **Application examples**

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7141-5AH00-0BA0

#### View of the module

Figure 2-1 View of the DI 16x24VDC 8xM12 digital input module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 16 digital inputs
- M12 sockets for connection of sensors
- 24 V DC supply voltage
- Configurable diagnostics can be set for each module
- Typical input delay of 3 ms
- Suitable for switches and proximity switches
- Dimensions 45 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

### Accessories

The following components are included in the module package:

- Identification labels

### Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

### See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system  
(<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DI 16x24VDC 8xM12 digital input module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input signal
- ③ X80: Connector for infeed of the supply voltage (POWER input)
- ④ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑤ X30: Socket for ET-Connection IN
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ LED displays 0 to 15 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

## 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment of signal inputs with 2-wire and 3-wire connection.

|            |                                 |                 |                                       |
|------------|---------------------------------|-----------------|---------------------------------------|
| ①          | 3-wire connection               | X30             | Infeed of the ET-Connection           |
| ②          | 2-wire connection               | X31             | Loop-through of the ET-Connection     |
| ③          | 2-wire connection               | 1L+             | Supply voltage 1L+ (non-switched)     |
| ④          | DI circuit                      | 1M              | Ground 1M (non-switched)              |
| ⑤          | Microcontroller                 | 2L+             | Load voltage 2L+ (switched)           |
| ⑥          | ET-Connection interface         | 2M              | Ground 2M (switched)                  |
| ⑦          | Internal supply voltage         | 1Us             | 24 V encoder supply                   |
| X10 to X17 | Channels 0 to 7                 | DI <sub>n</sub> | Input signal                          |
| X80        | Infeed of supply voltages       | DI              | Channel status LEDs (0 to 15) (green) |
| X81        | Loop-through of supply voltages | DIAG            | LED diagnostic status (red/green)     |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for digital inputs

The table below shows the pin assignment of the 8 sockets for the connection of digital inputs.

Table 3- 1 Pin assignment for digital inputs

| Pin | Assignment                                                                                                                                                                                                                                                                              | Front view of the sockets                                                            |                                                                                      |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     | X10 to X17 sockets for digital inputs                                                                                                                                                                                                                                                   | X10, X12, X14, X16                                                                   | X11, X13, X15, X17                                                                   |
| 1   | 24 V encoder supply 1Us<br>(derived from 1L+ non-switched)                                                                                                                                                                                                                              |  |  |

| 5   | Functional earth FE                                                                                                                                                                                                                                                                     |                                                                                      |                                                                                      |

### NOTICE

#### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input module to supply power to the encoder.

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 2 Pin assignment for ET-Connection

| Pin       | Assignment                    |                                | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets                                                           |                                                                                     |
|-----------|-------------------------------|--------------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 3 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector                                                           |
|-----|-----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                      |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Parameters

The table below shows the parameters for the DI 16x24VDC 8xM12 digital input module.

Table 4- 1 Parameters

| Parameters                           | Value range                                                                | Default | Scope  |
|--------------------------------------|----------------------------------------------------------------------------|---------|--------|
| Diagnostics: Short-circuit to ground | <ul style="list-style-type: none"><li>• Disable</li><li>• Enable</li></ul> | Disable | Module |

### 4.2 Explanation of the parameters

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

## 4.3 Address space

The figure below shows the assignment of the address space for the digital input module DI 16x24VDC 8xM12 with value status (Quality Information, QI).

The address space for the value status is allocated by the module, if the value status is configured using the PROFINET interface module.

Assignment in the process image input (PII)

Figure 4-1 Address space

### Configuration options of the DI 16x24VDC 8xM12 digital input module

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional two bytes are occupied in the input address space if you enable the value status for the digital input module. Bits 0 to 7 in these bytes are assigned to a channel and return information about the validity of the digital input value.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

## Interrupts/diagnostic alarms

### 5.1 Status and error displays

#### LED displays

The figure below shows the LED displays (status and error displays) of the DI 16x24VDC 8xM12 digital input module.

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 20).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On      | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

## 5.2 Interrupts

The DI 16x24VDC 8xM12 digital input module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital input module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 3 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm | Error code     | Meaning                                | Remedy                      |
|-------------------|----------------|----------------------------------------|-----------------------------|
| Short-circuit     | 1 <sub>H</sub> | Short-circuit encoder supply to ground | Eliminate the short-circuit |

# Technical specifications

## 6.1 Technical specifications

### Technical specifications of the DI 16x24VDC 8xM12 digital input module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7141-5AH00-0BA0/td?dl=en>).

# PROFlenergy

## 7.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital input module is explained in the following section.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V13 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>).

Application examples (<https://support.industry.siemens.com/cs/ww/en/view/41986454>) are also available on the Internet.

## 7.2 Behavior of the digital input module

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                         |
|---------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0b: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                                                         |
|         | 1b: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Encoder supply Us switched off <sup>1</sup><br>• Pause substitute value: 0b<br>• Value status "BAD"                                      |
|         | 3b: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Encoder supply Us switched off <sup>1</sup><br>• Pause substitute value: Last input value<br>• Value status "BAD"                        |
|         | 4b: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Encoder supply Us switched off <sup>1</sup><br>• Pause substitute value: Configured pause substitute value<br>• Value status "BAD" |

<sup>1</sup> As there is only one encoder supply Us for all channels, the supply can only be switched off at "pause" if no channel is configured in PE\_MODE\_PROCEED.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Conventions

Please also observe notes marked as follows:

---

### Note

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7143-5BF00-0BA0

#### View of the module

Figure 2-1 View of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input/digital output module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 4 digital inputs or digital outputs and 4 digital outputs, depending on parameter assignment
  - DIQ signals connected to 1L+ (non-switched)
  - DQ signals connected to 2L+ (switched)
- M8 sockets for connection of sensors and actuators
- Digital inputs:
  - 24 V DC supply voltage
  - Configurable diagnostics can be set for each module
  - Typical input delay of 3 ms
  - Suitable for switches and proximity switches
- Digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current 0.5 A per output
  - Configurable diagnostics can be set for each module
- Dimensions 30 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

### Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<http://support.automation.siemens.com/WW/view/en/89254965>) system manual.

## 2.2 Operator controls and display elements

The following figure shows the operator controls and display elements of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input/digital output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input/output signal
- ③ PWR: LED display for the load voltage 2L+
- ④ X80: Connector for infeed of the supply voltage (POWER input)
- ⑤ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑥ X30: Socket for ET-Connection IN
- ⑦ X31: Socket for ET-Connection OUT
- ⑧ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

### 3.1 Terminal and block diagram

The following figure shows an example of the pin assignment of signal inputs with 2- and 3-wire connection as well as signal outputs.

- |            |                                        |                  |                                             |
|------------|----------------------------------------|------------------|---------------------------------------------|
| ①          | Configured as output                   | X30              | Infeed of the ET-Connection                 |
| ②          | Configured as input: 2-wire connection | X31              | Loop-through of the ET-Connection           |
| ③          | Configured as input: 3-wire connection | 1L+              | Supply voltage 1L+ (non-switched)           |
| ④          | Output                                 | 1M               | Ground 1M (non-switched)                    |
| ⑤          | DI/DQ circuit                          | 2L+              | Load voltage 2L+ (switched)                 |
| ⑥          | Microcontroller                        | 2M               | Ground 2M (switched)                        |
| ⑦          | Monitoring                             | 1Us              | 24 V encoder supply                         |
| ⑧          | ET-Connection interface                | DIQ <sub>n</sub> | Input/output signal                         |
| ⑨          | Internal supply voltage                | DQ <sub>n</sub>  | Output signal                               |
| ⑩          | DQ circuit                             | DIQ              | LEDs channel status (0, 1, 2 and 3) (green) |
| X10 to X17 | Channels 0 to 7                        | DQ               | LEDs channel status (4, 5, 6 and 7) (green) |
| X80        | Infeed of supply voltages              | DIAG             | LED diagnostic status (red/green)           |
| X81        | Loop-through of supply voltages        | PWR              | LED supply voltage 2L+ (green)              |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for digital inputs/digital outputs

The tables below show the pin assignments of the 8 sockets for connection of the digital inputs/digital outputs.

Table 3- 1 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                                                                                                   | Front view of the sockets                                                            |                                                                                      |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     | X10 to X13 sockets for digital inputs/<br>digital outputs                                                                                                                                                                    | X10, X12                                                                             | X11, X13                                                                             |

### NOTICE

#### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input/digital output module to supply power to the encoder.

Table 3- 2 Pin assignment for digital outputs

| Pin | Assignment                                                                                                                                                                                       | Front view of the sockets                                                             |                                                                                       |

| <b>ET-Connection/supply voltage</b><br>Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.<br>Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module. |

## Parameters/address space

### 4.1 Parameters

The following table shows the parameters for the DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input/digital output module.

Table 4- 1 Parameters

| Parameters                            | Value range                                                                                                                 | Default   | Scope                                                                  |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----------|------------------------------------------------------------------------|
| Diagnostics: Missing load voltage 2L+ | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                               | Disable   | Module                                                                 |
| Diagnostics: Short-circuit to ground  | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                               | Disable   | Module<br>(Short-circuit of encoder supply or of the output to ground) |
| Freely assignable channel 0 ... 3     | <ul style="list-style-type: none"> <li>• DI</li> <li>• DQ</li> </ul>                                                        | DI        | Channel                                                                |
| Reaction to CPU/master STOP           | <ul style="list-style-type: none"> <li>• Shut down</li> <li>• Keep last value</li> <li>• Output substitute value</li> </ul> | Shut down | Module<br>(digital outputs)                                            |
| Substitute value channel 0 ... 7      | <ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> </ul>                                                          | 0         | Channel<br>(digital outputs)                                           |

## 4.2 Explanation of the parameters

### **Diagnostics: Missing load voltage 2L+**

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

### **Diagnostics: Short-circuit to ground**

Enabling of the diagnostics for short-circuit of the encoder supply or output to ground.

### **Freely assignable channel n**

With this parameter, you set whether the channel is to be operated as an input or output.

### **Reaction to CPU/master STOP**

With this parameter, you set the reaction of the digital outputs of the digital input/digital output module after a CPU/master STOP:

- Shut down: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

### **Substitute value channel 0 ... 7**

With this parameter, you set substitute values for the digital outputs.

## 4.3 Address space

The figure below shows the assignment of the address space for the digital input/digital output module DIQ 4+DQ 4x24VDC/0.5A 8xM8 with value status (Quality Information, QI).

The address space for the value status is allocated by the module, if the value status is configured using the PROFINET interface module.

Assignment in the process image input (PII)

Figure 4-1 Address space DIQ 4+DQ 4x24VDC/0.5A 8x8M

### Note

#### Parameter assignment of the channels

Parameters for the first four channels can be freely assigned.

For the channels 0 ... 3 that are configured as input, the corresponding values in the output data do not trigger any reaction.

For the channels 0 ... 3 that are configured as output, the input value in the process image is 0.

### Configuration options of the digital input/digital output module DIQ 4+DQ 4x24VDC/0.5A 8xM8

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional two bytes are occupied in the input address space if you enable the value status for the digital input/digital output module. The value status of the inputs is assigned to bits 0 to 3 in input byte  $x + 1$ . The value status of the outputs is assigned to bits 0 to 7 in input byte  $x + 2$ . This additional information provides information regarding the validity of the digital values or channel status.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

If the channel is configured as input, this means:

- Short-circuit to ground at sensor supply or
- Parameter error

If the channel is configured as output, this means:

- Short-circuit of output to ground or
- Parameter error or
- For channels 4 ... 7: Missing load voltage 2L+

# Interrupts/diagnostics alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the digital input/digital output module DIQ 4+DQ 4x24VDC/0.5A 8xM8.

- |   |                          |             |
|---|--------------------------|-------------|
| ① | Diagnostic status (DIAG) | (red/green) |
| ② | Channel status (0 to 7)  | (green)     |
| ③ | Load voltage 2L+ (PWR)   | (green)     |

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 23).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off      | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes  | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On       | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## 5.2 Interrupts

The DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input/digital output module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground
- Short-circuit of outputs to ground
- Load voltage 2L+ missing or too low

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital input/output module.

You can read out the diagnostics alarms, for example, from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                                                                                                                                                                                  | Error code | Meaning                                | Remedy                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------|----------------------------------------------------------------------------------------------------------|
| Short-circuit*                                                                                                                                                                                                                                                                                                                                                     | 1H         | Short-circuit encoder supply to ground | <ul style="list-style-type: none"> <li>• Eliminate the short-circuit</li> </ul>                          |
|                                                                                                                                                                                                                                                                                                                                                                    |            | Short-circuit of outputs to ground     |                                                                                                          |
| Load voltage 2L+ missing**                                                                                                                                                                                                                                                                                                                                         | 11H        | Load voltage 2L+ missing or too low    | <ul style="list-style-type: none"> <li>• Check the supply voltage</li> <li>• Check the module</li> </ul> |
| <p>* If a short-circuit of the encoder supply to ground is detected, the diagnostic alarm "Short-circuit" is always output. This alarm is output even if all channels are configured as outputs.</p> <p>** If you are using ET 200AL modules in connection with the ET 200SP distributed I/O system, the diagnostic alarm "Load voltage missing" is displayed.</p> |            |                                        |                                                                                                          |

### Note

#### Channel type

The digital input/digital output module is always signaled as a mixed module (channel type "Input/Output") in the case of diagnostic events, even if you have configured the digital input/digital output module exclusively as an output module.

## Technical specifications

### Technical specifications of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input/digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7143-5BF00-0BA0/td?dl=en>).

# PROFenergy

## 7.1 Pause function

### Introduction

PROFenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital input/digital output module is explained in the following sections.

### Additional information

You can find additional information on working with PROFenergy in the "PROFenergy" section of the manual IM 157-1 PN interface module (<http://support.automation.siemens.com/WW/view/en/89254863>) and the "Saving energy with PROFenergy" section of function manual PROFINET with STEP 7 V13 (<http://support.automation.siemens.com/WW/view/en/49948856>).

Application examples (<http://support.automation.siemens.com/WW/view/en/58235225>) are also available on the Internet.

## 7.2 DI operating mode

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                            |
|---------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0b: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                                                            |
|         | 1b: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Supply voltage $U_s$ switched off <sup>1</sup><br>• Pause substitute value: 0b<br>• Value status "BAD"                                      |
|         | 3b: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Supply voltage $U_s$ switched off <sup>1</sup><br>• Pause substitute value: Last input value<br>• Value status "BAD"                        |
|         | 4b: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Supply voltage $U_s$ switched off <sup>1</sup><br>• Pause substitute value: Configured pause substitute value<br>• Value status "BAD" |

<sup>1</sup> As there is only one encoder supply  $U_s$  for all channels, the supply can only be switched off at "pause" if all channels are configured to switch off.

## 7.3 DQ operating mode

### Display

The channel status LEDs are directly affected by the signal level at the socket.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 2 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                                       |
|---------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | Proceed at "pause" <ul style="list-style-type: none"> <li>• Value status "GOOD"</li> </ul>                                                                                        |
|         | 1D: PE_MODE_SHUTDOWN    | Switch off at "pause" <ul style="list-style-type: none"> <li>• Pause substitute value: 0B</li> <li>• Value status "BAD"</li> </ul>                                                |
|         | 3D: PE_MODE_LAST_VALUE  | Last value at "pause" <ul style="list-style-type: none"> <li>• Pause substitute value: Last output value is maintained</li> <li>• Value status "BAD"</li> </ul>                   |
|         | 4D: PE_MODE_SUBST_VALUE | Substitute value at "pause" <ul style="list-style-type: none"> <li>• Pause substitute value: Configured pause substitute value is output</li> <li>• Value status "BAD"</li> </ul> |

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface

### Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### Conventions

Please also observe notes marked as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7143-5AF00-0BA0

#### View of the module

Figure 2-1 View of the DIQ 4+DQ 4x24VDC/0.5A 4xM12 digital input/digital output module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 4 digital inputs or digital outputs and 4 digital outputs, depending on parameter assignment
  - DIQ signals connected to 1L+ (non-switched)
  - DQ signals connected to 2L+ (switched)
- M12 sockets for connection of sensors and actuators
- Digital inputs:
  - 24 V DC supply voltage
  - Configurable diagnostics can be set for each module
  - Typical input delay of 3 ms
  - Suitable for switches and proximity switches
- Digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current per output 0.5 A
  - Configurable diagnostics can be set for each module
- Dimensions 30 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

### Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DIQ 4+DQ 4x24VDC/0.5A 4xM12 digital input/digital output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X13: Sockets for the input/output signal
- ③ PWR: LED display for load voltage 2L+
- ④ X80: Connector for infeed of the supply voltage (POWER input)
- ⑤ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑥ X30: Socket for ET-Connection IN
- ⑦ X31: Socket for ET-Connection OUT
- ⑧ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

## 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment of signal inputs with 2-wire and 3-wire connection as well as signal outputs.

|            |                                        |                  |                                             |
|------------|----------------------------------------|------------------|---------------------------------------------|
| ①          | Configured as input: 3-wire connection | X30              | Infeed of the ET-Connection                 |
| ②          | Configured as output                   | X31              | Loop-through of the ET-Connection           |
| ③          | Configured as input: 2-wire connection | 1L+              | Supply voltage 1L+ (non-switched)           |
| ④          | Output                                 | 1M               | Ground 1M (non-switched)                    |
| ⑤          | DI/DQ circuit                          | 2L+              | Load voltage 2L+ (switched)                 |
| ⑥          | Microcontroller                        | 2M               | Ground 2M (switched)                        |
| ⑦          | Monitoring                             | 1U <sub>s</sub>  | 24 V encoder supply                         |
| ⑧          | ET-Connection interface                | DIQ <sub>n</sub> | Input/output signal                         |
| ⑨          | Internal supply voltage                | DQ <sub>n</sub>  | Output signal                               |
| ⑩          | DQ circuit                             | DIQ              | LEDs channel status (0, 1, 2 and 3) (green) |
| X10 to X13 | Channels 0 to 7                        | DQ               | LEDs channel status (4, 5, 6 and 7) (green) |
| X80        | Infeed of supply voltages              | DIAG             | LED diagnostic status (red/green)           |
| X81        | Loop-through of supply voltages        | PWR              | LED supply voltage 2L+ (green)              |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for digital inputs/digital outputs

The tables below show the pin assignments of the 4 sockets for connection of the digital inputs/digital outputs.

Table 3- 1 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                   | Front view of the sockets                                                            |
|-----|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     | <b>X10 and X11 - sockets for digital inputs/digital outputs</b>                                              | <b>X10, X11</b>                                                                      |
| 1   | 24 V encoder supply 1Us<br>(derived from 1L+ non-switched)                                                   |  |
| 2   | Input/output signal DIQ <sub>1</sub> : Connector X10<br>Input/output signal DIQ <sub>3</sub> : Connector X11 |                                                                                      |
| 3   | Encoder supply ground 1M                                                                                     |                                                                                      |
| 4   | Input/output signal DIQ <sub>0</sub> : Connector X10<br>Input/output signal DIQ <sub>2</sub> : Connector X11 |                                                                                      |
| 5   | Functional earth FE                                                                                          |                                                                                      |

### NOTICE

#### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input/digital output module to supply power to the encoder.

Table 3- 2 Pin assignment for digital outputs

| Pin | Assignment                                                                                     | Front view of the sockets                                                             |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector                                                           |
|-----|-----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                      |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 5 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Parameters

The table below shows the parameters for the DIQ 4+DQ 4x24VDC/0.5A 4xM12 digital input/digital output module.

Table 4- 1 Parameters

| Parameters                            | Value range                                                                                                                 | Default   | Scope                                                                  |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----------|------------------------------------------------------------------------|
| Diagnostics: Missing load voltage 2L+ | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                               | Disable   | Module                                                                 |
| Diagnostics: Short-circuit to ground  | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                               | Disable   | Module<br>(Short-circuit of encoder supply or of the output to ground) |
| Freely assignable channel 0 ... 3     | <ul style="list-style-type: none"> <li>• DI</li> <li>• DQ</li> </ul>                                                        | DI        | Channel                                                                |
| Reaction to CPU/master STOP           | <ul style="list-style-type: none"> <li>• Shut down</li> <li>• Keep last value</li> <li>• Output substitute value</li> </ul> | Shut down | Module<br>(digital outputs)                                            |
| Substitute value channel 0 ... 7      | <ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> </ul>                                                          | 0         | Channel<br>(digital outputs)                                           |

## 4.2 Explanation of the parameters

### **Diagnostics: Missing load voltage 2L+**

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

### **Diagnostics: Short-circuit to ground**

Enabling of the diagnostics for short-circuit of the encoder supply or output to ground.

### **Freely assignable channel n**

With this parameter, you set whether the channel is to be operated as an input or output.

### **Reaction to CPU/master STOP**

With this parameter, you set the reaction of the digital outputs of the digital input/digital output module after a CPU/master STOP:

- Shut down: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

### **Substitute value channel 0 ... 7**

With this parameter, you set substitute values for the digital outputs.

## 4.3 Address space

The figure below shows the assignment of the address space for the digital input/digital output module DIQ 4+DQ 4x24VDC/0.5A 4xM12 with value status (Quality Information, QI).

The address space for the value status is allocated by the module, if the value status is configured using the PROFINET interface module.

Assignment in the process image input (PII)

|      |   |   |   |   |   |   |   |   |                                 |
|------|---|---|---|---|---|---|---|---|---------------------------------|
|      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                                 |
| IB x | 0 | 0 | 0 | 0 |   |   |   |   | Input values at channels 0 to 3 |

|          |   |   |   |   |   |   |   |   |                                                 |
|----------|---|---|---|---|---|---|---|---|-------------------------------------------------|
|          | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                                                 |
| IB x + 1 | 0 | 0 | 0 | 0 |   |   |   |   | Value status (QI) for inputs at channels 0 to 3 |

|          |   |   |   |   |   |   |   |   |                                                  |
|----------|---|---|---|---|---|---|---|---|--------------------------------------------------|
|          | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                                                  |
| IB x + 2 |   |   |   |   |   |   |   |   | Value status (QI) for outputs at channels 0 to 7 |

Assignment in the process image output (PIQ)

|      |   |   |   |   |   |   |   |   |                                  |
|------|---|---|---|---|---|---|---|---|----------------------------------|
|      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                                  |
| QB x |   |   |   |   |   |   |   |   | Output values at channels 0 to 7 |

Figure 4-1 Address space

### Note

#### Parameter assignment of the channels

Parameters for the first four channels can be freely assigned.

For the channels 0 ... 3 that are configured as input, the corresponding values in the output data do not trigger any reaction.

For the channels 0 ... 3 that are configured as output, the input value in the process image is 0.

## Configuration options of the digital input/digital output module DIQ 4+DQ 4x24VDC/0.5A 4xM12

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional two bytes are occupied in the input address space if you enable the value status for the digital input/digital output module. The value status of the inputs is assigned to bits 0 to 3 in input byte  $x + 1$ . The value status of the outputs is assigned to bits 0 to 7 in input byte  $x + 2$ . This additional information provides information regarding the validity of the digital values or channel status.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

If the channel is configured as input, this means:

- Short-circuit to ground at sensor supply or
- Parameter error

If the channel is configured as output, this means:

- Short-circuit of output to ground or
- Parameter error or
- For channels 4 ... 7: Missing load voltage 2L+

# Interrupts/diagnostic alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the digital input/digital output module DIQ 4+DQ 4x24VDC/0.5A 4xM12.

- |   |                          |             |
|---|--------------------------|-------------|
| ① | Diagnostic status (DIAG) | (red/green) |
| ② | Channel status (0 to 7)  | (green)     |
| ③ | Load voltage 2L+ (PWR)   | (green)     |

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostics alarms (Page 23).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off      | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes  | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On       | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## 5.2 Interrupts

The DIQ 4+DQ 4x24VDC/0.5A 4xM12 digital input/digital output module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground
- Short-circuit of outputs to ground
- Load voltage 2L+ missing or too low

## 5.3 Diagnostics alarms

A diagnostic alarm is output for each diagnostic event and the DIAG LED flashes red on the digital input/digital output module.

You can read out the diagnostics alarms, for example, from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                                                                                                                                                                                  | Error code | Meaning                                | Remedy                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------|----------------------------------------------------------------------------------------------------------|
| Short-circuit*                                                                                                                                                                                                                                                                                                                                                     | 1H         | Short-circuit encoder supply to ground | <ul style="list-style-type: none"> <li>• Eliminate the short-circuit</li> </ul>                          |
|                                                                                                                                                                                                                                                                                                                                                                    |            | Short-circuit of outputs to ground     |                                                                                                          |
| Load voltage 2L+ missing**                                                                                                                                                                                                                                                                                                                                         | 11H        | Load voltage 2L+ missing or too low    | <ul style="list-style-type: none"> <li>• Check the supply voltage</li> <li>• Check the module</li> </ul> |
| <p>* If a short-circuit of the encoder supply to ground is detected, the diagnostic alarm "Short-circuit" is always output. This alarm is output even if all channels are configured as outputs.</p> <p>** If you are using ET 200AL modules in connection with the ET 200SP distributed I/O system, the diagnostic alarm "Load voltage missing" is displayed.</p> |            |                                        |                                                                                                          |

### Note

#### Channel type

The digital input/digital output module is always signaled as a mixed module (channel type "Input/Output") in the case of diagnostic events, even if you have configured the digital input/digital output module exclusively as an output module.

## Technical specifications

### 6.1 Technical specifications

#### Technical specifications of the DIQ 4+DQ 4x24VDC/0.5A 4xM12 digital input/digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7143-5AF00-0BA0/td?dl=en>).

# PROFlenergy

## 7.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital input/digital output module is explained in the following sections.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V13 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>).

Application examples (<https://support.industry.siemens.com/cs/ww/en/view/41986454>) are also available on the Internet.

## 7.2 DI operating mode

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                            |
|---------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0b: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                                                            |
|         | 1b: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Supply voltage $U_s$ switched off <sup>1</sup><br>• Pause substitute value: 0b<br>• Value status "BAD"                                      |
|         | 3b: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Supply voltage $U_s$ switched off <sup>1</sup><br>• Pause substitute value: Last input value<br>• Value status "BAD"                        |
|         | 4b: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Supply voltage $U_s$ switched off <sup>1</sup><br>• Pause substitute value: Configured pause substitute value<br>• Value status "BAD" |

<sup>1</sup> As there is only one encoder supply  $U_s$  for all channels, the supply can only be switched off at "pause" if all channels are configured to switch off.

## 7.3 DQ operating mode

### Display

The channel status LEDs are directly affected by the signal level at the socket.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 2 Mode parameter

| Element | Code                    | Explanation                                                                                                                  |
|---------|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                  |
|         | 1D: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Pause substitute value: 0B<br>• Value status "BAD"                                                |
|         | 3D: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Pause substitute value: Last output value is maintained<br>• Value status "BAD"                   |
|         | 4D: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Pause substitute value: Configured pause substitute value is output<br>• Value status "BAD" |

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface

### Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### Conventions

Please also observe notes marked as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## **"mySupport"**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## **"mySupport" - Documentation**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## **"mySupport" - CAx data**

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## **Application examples**

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7143-5AH00-0BA0

#### View of the module

Figure 2-1 View of the digital input/digital output module DIQ 16x24VDC/0.5A 8xM12

## Properties

The module has the following technical properties:

- 16 digital inputs or digital outputs, depending on configuration and parameter assignment
  - 8 DIQ signals connected to 1L+ (non-switched)
  - 8 DQ signals connected to 2L+ (switched)
- M12 sockets for connection of sensors and actuators
- Digital inputs:
  - 24 V DC supply voltage
  - Suitable for switches and proximity switches
  - Input delay configurable
  - Configurable diagnostics can be set for each module
- Digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current per output 0.5 A
  - Configurable diagnostics can be set for each module
- Counters:
  - Configuration method 2xCount or 4xCount with 2 or 4 counters
  - Counting frequency 2 kHz
  - Counting width 32 bits
  - Counting direction parameterizable or controllable via direction input
  - GATE function controllable via the control interface or via control input
  - Configurable diagnostics and hardware interrupts can be set for each module
  - Input delay configurable
- Dimensions 45 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

## Accessories

The following components are included in the module package:

- Identification labels

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The following figure shows the operator controls and display elements of the digital input/digital output module DIQ 16x24VDC/0.5A 8xM12.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input/output signal
- ③ PWR: LED display for load voltage 2L+
- ④ X80: Connector for infeed of the supply voltage (POWER input)
- ⑤ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑥ X30: Socket for ET-Connection IN
- ⑦ X31: Socket for ET-Connection OUT
- ⑧ LED displays 0 to 15 for the channel status

Figure 2-2 Operator controls and display elements

# Configuration modes for digital inputs/outputs

## 3.1 Overview

### Introduction

With the configuration modes for digital inputs and outputs, you can configure each channel of the module as an input or output consistent with your application.

You use the available configuration modes to specify how the channels will be used:

- **DIQ:**  
You can use each channel as an input or output through a corresponding parameter assignment.
- **DIQ with value status:**  
You can use each channel as an input or output through a corresponding parameter assignment. Additionally, the value status gives you information about the validity of the digital values and the channel status.
- **DQ16:**  
All channels (0..15) are configured as outputs.
- **DI8/DQ8:**  
Channels 0..7 are configured as inputs, and channels 8..15 are configured as outputs.
- **DIQ MIX:**  
The channels 0, 2, 4, 6, 8, 10, 12, 14 and 16 have a fixed configuration as outputs, the channels 1, 3, 5, 7, 9, 11, 13 and 15 have a fixed configuration as inputs.

---

#### Note

##### Project engineering configuration mode DIQ MIX

Note that you can only use the configuration mode DIQ MIX when configuring via GSD file and in connection with the interface modules IM 157-1 PN and IM 157-1 DP.

---

### Benefits

The address space occupied by the module is significantly reduced in the DQ16, DI8/DQ8 and DIQ MIX configuration modes compared with the DIQ configuration modes.

This reduction offers you advantages if you have already assigned the available address space of your plant for other processes.

## 3.2 Wiring

### 3.2.1 Terminal and block diagram

The figure below shows an example of the pin assignment of signal inputs with 2-wire and 3-wire connection and of signal outputs in the configuration modes for digital inputs and outputs.

|            |                                            |                  |                                     |
|------------|--------------------------------------------|------------------|-------------------------------------|
| ①          | DI/DQ circuit (1L+ non-switched)           | X81              | Loop-through of supply voltages     |
| ②          | Microcontroller                            | X30              | Infeed of the ET-Connection         |
| ③          | Monitoring                                 | X31              | Loop-through of the ET-Connection   |
| ④          | ET-Connection interface                    | 1L+              | Supply voltage 1L+ (non-switched)   |
| ⑤          | Internal supply voltage                    | 1M               | Ground 1M (non-switched)            |
| ⑥          | DI/DQ circuit (2L+ switched)               | 2L+              | Load voltage 2L+ (switched)         |
| ⑦          | Parameterized as inputs: 2-wire connection | 2M               | Ground 2M (switched)                |
| ⑧          | Parameterized as outputs                   | 1Us              | 24 V encoder supply                 |
| ⑨          | Configured as input: 3-wire connection     | 2Us              | 24 V encoder supply                 |
| ⑩          | Configured as output                       | DIQ <sub>n</sub> | Input/output signal                 |
| ⑪          | Configured as input: 2-wire connection     | DIQ              | LEDs channel status (0..15) (green) |
| X10 to X17 | Channels 0 to 15                           | DIAG             | Diagnostic status LED (red/green)   |
| X80        | Infeed of supply voltages                  | PWR              | LED supply voltage 2L+ (green)      |

Figure 3-1 Wiring and block diagram of configuration modes for digital inputs and outputs

### 3.2.2 Pin assignment

**Note**

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

**NOTICE**
**24 V encoder supply 1Us / 2Us**

Use only the 24 V encoder supplies 1Us and 2Us provided by the digital input/digital output module to supply power to the encoder.

#### Pin assignment of the sockets for digital inputs/digital outputs in the configuration modes DIQ and DIQ with value status

The tables below show the pin assignments of the 8 sockets for connection of the digital inputs/digital outputs.

Table 3- 1 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                                                                                                   | Front view of the sockets                                                             |                                                                                       |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
|     |                                                                                                                                                                                                                              | X10, X12                                                                              | X11, X13                                                                              |

### Pin assignment of the sockets for digital inputs/digital outputs in the configuration mode DQ16

The tables below show the pin assignments of the 8 sockets for connection of the digital inputs/digital outputs in the configuration mode DQ16.

In this configuration mode, socket pins 2 and 4 are always permanently assigned to output signals.

Table 3- 3 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                   | Front view of the sockets                                                             |                                                                                       |

### Pin assignment of the sockets for digital inputs/digital outputs in the configuration mode DI8/DQ8

The tables below show the pin assignments of the 8 sockets for connection of the digital inputs/digital outputs in the configuration mode DI8/DQ8.

In this configuration mode, pins 2 and 4 for the sockets X10 to X13 are always permanently assigned to the input signals, pins 2 and 4 for the sockets X14 to X17 are always permanently assigned to the output signals.

Table 3- 5 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                                                                   | Front view of the sockets                                                             |                                                                                       |

### Pin assignment of the sockets for digital inputs/digital outputs in the configuration mode DIQ MIX

The tables below show the pin assignments of the 8 sockets for connection of the digital inputs/digital outputs in the configuration mode DIQ MIX.

In this configuration mode, socket pin 2 is always permanently assigned to input signals, pin 4 is always permanently assigned to output signals.

Table 3- 7 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                   | Front view of the sockets                                                             |                                                                                       |

## Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 9 Pin assignment for ET-Connection

| Pin       | Assignment                    |                                | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets                                                             |                                                                                       |
|-----------|-------------------------------|--------------------------------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
|           | X30 socket (ET-Connection IN) | X31 socket (ET-Connection OUT) |                                                                      | X30                                                                                   | X31                                                                                   |
| 1         | TXP                           | RXP                            | Yellow                                                               |  |  |
| 2         | RXP                           | TXP                            | White                                                                |                                                                                       |                                                                                       |
| 3         | RXN                           | TXN                            | Blue                                                                 |                                                                                       |                                                                                       |
| 4         | TXN                           | RXN                            | Orange                                                               |                                                                                       |                                                                                       |
| Shielding | Functional earth FE           |                                | -                                                                    |                                                                                       |                                                                                       |

## Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 10 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the connector                                                           |
|-----|-----------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                 |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 11 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the socket                                                            |
|-----|-----------------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                 |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## 3.3 Parameters/address space

### 3.3.1 Parameters

The following table shows the parameters for the DIQ 16x24VDC/0.5A 8xM12 digital input / digital output module in the configuration modes for digital inputs and outputs.

Table 3- 12 Parameters

| Parameters                            | Value range                                                                                                                                                               | Default   | Scope                                                                  |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|------------------------------------------------------------------------|

| Substitute value channel              | <ul style="list-style-type: none"> <li>0</li> <li>1</li> </ul>                                                                                                            | 0         | Channel<br>(digital outputs)                                           |
| Input delay**                         | <ul style="list-style-type: none"> <li>0.05 ms</li> <li>0.1 ms</li> <li>0.4 ms</li> <li>0.8 ms</li> <li>1.6 ms</li> <li>3.2 ms</li> <li>12.8 ms</li> <li>20 ms</li> </ul> | 3.2 ms    | Channel<br>(Digital inputs)                                            |

\* = Can only be set in DIQ or DIQ with value status configuration mode.

\*\* = Not available in DQ16 mode. Only values starting from 1.6 ms can be configured for the input delay for channels 8..15.

### 3.3.2 Explanation of the parameters

#### Diagnostics: Missing load voltage 2L+

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics, at short-circuit of an encoder supply or of an output to ground.

#### Freely assignable channel

With this parameter, you set whether the channel is to be operated as an input or output. You can only set this parameter in the DIQ and DIQ with value status configuration modes.

#### Reaction to CPU/master STOP

With this parameter, you set the reaction of the channels configured as output of the digital input/output module after a CPU/master STOP:

- Deactivate: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

#### Substitute value channel

With this parameter, you set substitute values for the digital outputs.

#### Input delay

This parameter can be used to avoid signal faults. Changes to the signal are only detected if they are present and stable for longer than the set input delay time. You cannot set this parameter in DQ16 mode.

### 3.3.3 Address space

The DIQ 16x24VDC/0.5A 8xM12 digital input/output module occupies a different number of bytes in the process image input (PII) or process image output (PIQ), depending on which configuration mode you selected.

The following figures show you the various assignments of the address spaces.

---

#### Note

##### Parameter assignment of the channels

In the configuration modes for digital inputs and outputs, either all channels are user configurable or all channels have a fixed configuration, depending on the configuration.

For the channels that are configured as an input, the corresponding values in the output data do not trigger any reaction.

For the channels that are configured as an output, the input value in the process image is 0.

---

#### Configuration mode DIQ without value status

The figure below shows the assignment of the address space for the DIQ 16x24VDC/0.5A 8xM12 digital input / digital output module in the DIQ without value status configuration mode (Quality Information, QI).

Assignment in the process image input (PII)

Assignment in the process image output (PIQ)

Figure 3-2 Address space in DIQ without value status configuration mode

### Configuration mode DIQ with value status

The figure below shows the assignment of the address space for the digital input/digital output module DIQ 16x24VDC/0.5A 8xM12 with value status (Quality Information, QI) in the configuration method DIQ.

The address space for the value status is allocated by the module, if the value status is configured using the PROFINET interface module.

Assignment in the process image input (PII)

Assignment in the process image output (PIQ)

Figure 3-3 Address space in DIQ with value status configuration mode

### Configuration mode DQ16

In DQ16 configuration mode, the address space is reduced by the fixed parameter assignment.

Assignment in the process image output (PIQ)

Figure 3-4 Address space in DQ16 configuration mode

### Configuration mode DI8/DQ8

In DI8/DQ8 configuration mode, the address space is reduced by the fixed parameter assignment of the channels.

Assignment in the process image input (PII)

Assignment in the process image output (PIQ)

Figure 3-5 Address space in DI8/DQ8 configuration mode

### Configuration mode DIQ MIX

In DIQ MIX configuration mode, the address space is reduced by the fixed parameter assignment of the channels.

Assignment in the process image input (PII)

Assignment in the process image of the outputs (PIQ)

Figure 3-6 Address space in DIQ MIX configuration mode

## Evaluating the value status

An additional four bytes are occupied in the input address space if you enable the value status for the digital input/digital output module. The value status of the inputs is assigned to the input bytes  $x + 2$  and  $x + 3$ . The value status of the outputs is assigned to the input bytes  $x + 4$  and  $x + 5$ . This additional information provides information regarding the validity of the digital values or channel status.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

If the channel is configured as input, this means:

- Short-circuit of an encoder supply to ground, or
- Parameter error, or
- For channels 8 ... 15: Missing load voltage 2L+

If the channel is configured as output, this means:

- Short-circuit of the output to ground, or
- Parameter error, or
- For channels 8 ... 15: Missing load voltage 2L+

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic reports can be found in chapter Diagnostics alarms (Page 29).

### DIAG LED

Table 3- 13 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |

| <br>Flashes  | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On       | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 3- 14 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 3- 15 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

### 3.4.2 Interrupts

The digital input / digital output module DIQ 16x24VDC/0.5A 8xM12 in the configuration method DIQ supports diagnostic interrupts.

#### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of an encoder supply to ground, or
- Short-circuit of an output to ground
- Load voltage 2L+ missing or too low
- Parameter assignment error

### 3.4.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the LED DIAG flashes red on the digital input/digital output module.

You can read out the diagnostics alarms, for example, from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 3- 16 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                                                                                                                                                                                               | Error code | Meaning                                      | Solution                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Short circuit <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                      | 1H         | Short-circuit of an encoder supply to ground | <ul style="list-style-type: none"> <li>• Eliminate the short-circuit</li> </ul>                          |
|                                                                                                                                                                                                                                                                                                                                                                                 |            | Short-circuit of an output to ground         |                                                                                                          |
| Parameter assignment error                                                                                                                                                                                                                                                                                                                                                      | 10H        | Module parameter assignment is faulty        | Correction of the parameter assignment                                                                   |
| Load voltage 2L+ missing <sup>2</sup>                                                                                                                                                                                                                                                                                                                                           | 11H        | Load voltage 2L+ missing or too low          | <ul style="list-style-type: none"> <li>• Check the supply voltage</li> <li>• Check the module</li> </ul> |
| <sup>1</sup> = If a short-circuit of an encoder supply to ground is detected, the diagnostic alarm "Short-circuit" is always output. This alarm is output even if all channels are configured as outputs.<br><sup>2</sup> = If you are using ET 200AL modules in connection with the ET 200SP distributed I/O system, the diagnostic alarm "Load voltage missing" is displayed. |            |                                              |                                                                                                          |

#### Note

##### Channel type

The digital input/digital output module is always signaled as a mixed module (channel type "Input/Output") in the case of diagnostic events, even if you have configured the digital input/digital output module exclusively as an output or input module.

# Counting

## Counting function

Counting refers to the detection and summation of events. The respective counters of the module detect encoder signals and pulses and evaluate them accordingly, for example:

- For counting general piece goods up to a maximum limit
- For applications with recurring counting processes

You can control the counting processes with the digital inputs of the digital input / digital output module belonging to the counter. You can control the digital output belonging to the counter exactly to defined counter values via comparative results independently of the user program.

You can parameterize the behavior of the respective counter by means of the functions described below.

## Counter limits

The counter values define the range of values of the counter value than can be used. The counter limits are configurable and can be modified during runtime using the user program. The maximum adjustable count limit amounts to 2147483647 ( $2^{31}-1$ ). The maximum adjustable count limit amounts to -2147483648 ( $-2^{31}$ ).

You can continue or stop counting (automatic gate stop) on violation of a counting limit. At an overflow or underflow of the count value one event bit is respectively set in the feedback interface. The count value jumps to the respective other counting limit.

## Start value

You can configure a start value within the counter limits. The start value can be modified during runtime with the user program.

## Load value

In addition to the parameterization you can influence the counting behavior additionally via the control interface by means of the load value. Depending on the bit sequence of the load request (LD\_SLOT) contained in the control byte you can load the load value (SLOT) as a current count value, start value, comparative value or count limit.

If you re-parameterize the module, loaded values are overwritten automatically. Therefore, if necessary, carry out the adjustment of the values via the control interface again after a re-parameterization.

## Comparison value

You specify a comparison value that controls the associated count output independently of the user program.

The comparison value can be parameterized and can be changed with the user program during runtime.

## Gate control

Together with the hardware gate the software gate forms the internal gate. The module only counts when the internal gate is open.

You control the HW gate externally via the digital inputs DI<sub>4</sub> and DI<sub>6</sub>. You control the SW gate via the user program. You can activate and use the hardware gate in the 2xCount configuration method by using parameterization.

## Counting direction

The counting direction is specified either by the direction of the respective counter or via the parameter assignment of the counter.

You control the counting direction via the digital inputs DI<sub>5</sub> and DI<sub>7</sub>. You can activate and use the direction inputs in the 2xCount configuration method by using parameterization.

## Overview of configuration methods

The following table shows a list of the channel properties for the configuration methods 2xCount and 4xCount.

You can count with DI<sub>0</sub> and DI<sub>2</sub> (configuration method 2xCount) or respectively with DI<sub>0</sub>, DI<sub>2</sub>, DI<sub>4</sub> and DI<sub>6</sub> (configuration method 4xCount).

Table 4- 1 Configuration methods of the DIQ 16x24VDC/0.5A 8xM12

| Property                                  |         | Configuration method |                    |
|-------------------------------------------|---------|----------------------|--------------------|
|                                           |         | 2xCount (Page 32)    | 4xCount (Page 52)  |
| Number of counters                        |         | 2                    | 4                  |
| Counter width, max. counting frequency    |         | 32 bits, 2 kHz       | 32 bits, 2 kHz     |
| Counter inputs                            |         | Channels 0, 2        | Channel 0, 2, 4, 6 |
| Count outputs                             |         | Channel 1, 3         | Channel 1, 3, 5, 7 |
| Input for gate stop / start <sup>1</sup>  |         | Channel 4, 6         | -                  |
| Input for counting direction <sup>1</sup> |         | Channel 5, 7         | -                  |
| Number of freely parameterizable channels |         | 8                    | 8                  |
| Parameterizable input delay <sup>2</sup>  |         | 0.05 ms .. 20 ms     | 0.05 ms .. 20 ms   |
| Process data length                       | Inputs  | 14 bytes             | 26 bytes           |
|                                           | Outputs | 14 bytes             | 26 bytes           |

<sup>1</sup> = Can also be used as default digital inputs via the parameter assignment as "Digital input without function".

<sup>2</sup> = Only values as of 1.6 ms can be parameterized as the input delay for Channels 8..15.

## 4.1 Configuration method 2xCount

### 4.1.1 Wiring

#### 4.1.1.1 Terminal and block diagram

The following figure shows as an example the pin assignment of the counters in the configuration method Count (2xCount). Connection examples for allocating the freely parameterizable channels 8..15 are available in the section Configuration method DIQ, subsection Terminal and block diagram (Page 15).

|            |                                                                      |                  |                                       |
|------------|----------------------------------------------------------------------|------------------|---------------------------------------|
| ①          | DI/DQ circuit (1L+ non-switched)                                     | X81              | Loop-through of supply voltages       |
| ②          | Microcontroller                                                      | X30              | Infeed of the ET-Connection           |
| ③          | Monitoring                                                           | X31              | Loop-through of the ET-Connection     |
| ④          | ET-Connection interface                                              | 1L+              | Supply voltage 1L+ (non-switched)     |
| ⑤          | Internal supply voltage                                              | 1M               | Ground 1M (non-switched)              |
| ⑥          | DI/DQ circuit (2L+ switched)                                         | 2L+              | Load voltage 2L+ (switched)           |
| ⑦          | Counting input counter                                               | 2M               | Ground 2M (switched)                  |
| ⑧          | DQ for counters                                                      | 1Us              | 24 V encoder supply                   |
| ⑨          | Gate start/stop (level-controlled) or digital input without function | DIQ <sub>n</sub> | Input/output signal                   |
| ⑩          | Counting direction or digital input without function                 | DIQ              | Channel status LEDs (0 to 15) (green) |

### 4.1.1.2 Pin assignment

#### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for counting channels and digital inputs / outputs

The table below shows the pin assignments of the 4 sockets for the connection of the counting channels.

Table 4- 2 Pin assignment for counting channels

| Pin | Assignment                                                                                                                                                                                                                                  | Front view of the sockets                                                            |                                                                                      |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     |                                                                                                                                                                                                                                             | X10, X12                                                                             | X11, X13                                                                             |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 4- 5 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the connector                                                         |
|-----|-----------------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                 |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                     |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 4- 6 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the socket                                                              |
|-----|-----------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                 |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                       |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## 4.1.2 Parameters/address space

### 4.1.2.1 Parameters

In the configuration method 2xCount of the digital input / digital output module DIQ 16x24VDC/0.5A 8xM12 the Channels 0 to 7 are used by the counting function. The Channels 8 to 15 can be parameterized freely.

The following table shows the general parameter of the module.

Table 4- 7 General parameters

| Parameters                            | Value range                                                                                                           | Default   | Scope                                                                  |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------|-----------|------------------------------------------------------------------------|
| Diagnostics: Missing load voltage 2L+ | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>                                             | Disable   | Module                                                                 |
| Diagnostics: Short-circuit to ground  | <ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>                                             | Disable   | Module<br>(Short-circuit of encoder supply or of the output to ground) |
| Behavior at CPU/master STOP (8...15)  | <ul style="list-style-type: none"> <li>Shut down</li> <li>Keep last value</li> <li>Output substitute value</li> </ul> | Shut down | Module<br>(digital outputs)                                            |

The following table shows the parameters of Counter 0 and Counter 1.

Table 4- 8 Parameters of Counter 0 and Counter 1

| Parameter                                                 | Value range                                                                                                                                                               | Default          | Scope   |

### 4.1.2.2 Explanation of the parameters

#### General parameters

**Diagnostics: Missing load voltage 2L+**

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

**Diagnostics: Short circuit to ground**

Enabling of the diagnostics, at short-circuit of an encoder supply or of an output to ground.

**Behavior at CPU/master STOP (8...15)**

With this parameter you set the reaction of the digital outputs of after a CPU/master STOP.

Behavior DQ at freely assignable Channels 8...15:

- Deactivate: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The digital output outputs a configured substitute value.

#### Parameter counting function

**Input delay DI**

This parameter can be used to suppress signal faults. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

---

**Note****Influences the counting frequency**

When setting the input delay take into account that the counting frequency possible is automatically reduced at higher values.

In order to achieve the maximum counting frequency of 2 kHz select an input delay smaller than 0.4 ms.

---

**Counting direction**

Use this parameter to select the direction in which counting is carried out:

- Forward
- Backward.

---

**Note**

If you have parameterized DI5 or DI7 as the direction input in the respective counter, this parameter is ineffective.

---

**Edge selection**

Use this parameter to select the edge that is counted:

- At rising edge:  
The respective counter counts all the rising edges at the counter input.
- At falling edge:  
The respective counter counts all the falling edges at the counter input.

---

**Note**

If you have parameterized DI<sub>5</sub> or DI<sub>7</sub> as the direction input in the respective counter and the counting direction changes in the process, the count edge is adapted automatically (contrary edges).

---

**Behavior when a counting limit is exceeded**

With this parameter you select the behavior when the high counting limit is violated in the upward direction or the low counting limit is violated in the downward direction:

- Stop counting:  
After a counting limit is violated, the internal gate is closed. This stops the counting process. The counter value is set to the opposite counting limit. To start the counting process again, you must close and reopen the SW gate.
- Continue counting:  
After a counting limit is violated, the counter value is set to the opposite counting limit and counting continues.

**Comparison value**

With this parameter you specify the comparison value.  
The following applies:

- Low counting limit  $\leq$  Comparison value  $\leq$  High counting limit

**Start value**

With this parameter you specify the start value.  
The following applies:

- Low counting limit  $\leq$  Start value  $\leq$  High counting limit

**High counting limit**

With this parameter you specify the high counting limit.  
The following applies:

- Low counting limit  $<$  High counting limit  $\leq 2147483647 (2^{31} - 1)$

**Low counting limit**

With this parameter you specify the low counting limit.  
The following applies:

- High counting limit  $>$  Low counting limit  $\geq -2147483648 (-2^{31})$

**Behavior DQ**

With the "Behavior DQ" you select the counter values at which the count output is set. When the current count value fulfils the parameterized condition, the associated count output is set.

This means the signal state "1" is set at the count output when:

- Count value between a comparison value and the high counting limit:  
Comparison value  $\leq$  Count value  $\leq$  High counting limit

or

- Count value between a comparison value and the low counting limit:  
Low counting limit  $\leq$  Count value  $\leq$  Comparison value.

**Hardware interrupt DQ**

With this parameter you specify whether or not a hardware interrupt is generated by the event "Comparison event occurred for DQ".

**Behavior at CPU/master STOP for DQ**

With this parameter you set the reaction of the count output of a counter after a CPU/master STOP.

Behavior DQ:

- Continue: Signal state of the count output continues to be controlled by comparison conditions.
- Output substitute value: The count output outputs a configured substitute value.

**Note****Count value at CPU/Master STOP**

Independently of the selected reaction of the count output, the count value continues to change during a CPU/Master STOP depending on the input edge, counting continues.

**Substitute value DQ**

With this parameter you set the substitute value of the digital output of a counter if the setting "Output substitute value" has been selected at the parameter "Behavior at CPU/master STOP for DQ".

**Behavior DI (gate control)**

With this parameter you select whether a counting function is assigned to the digital input or whether this functions like a standard digital input:

- Gate start/stop:  
The digital input influences the internal gate of Counter 0 or Counter 1. Signal "1" at the digital input opens the HW gate for the counter. Signal "0" at the digital input closes the HW gate for the counter.
- Digital input without function:  
No counting function is assigned to the digital input. It functions like a standard digital input.

**Behavior DI (direction input)**

With this parameter you select whether a counting function is assigned to the digital input or whether this functions like a standard digital input:

- Counting direction:  
The digital input reverses the counting direction at Counter 0 or Counter 1, in order to adjust it to the process. With signal "0" at the digital input, the counter forwards. With signal "1" at the digital input, the counter counts backwards.
- Digital input without function:  
No counting function is assigned to the digital input. It functions like a standard digital input.

**Parameter freely assignable Channels 8..15**

**Freely assignable channel**

With this parameter, you set whether the channel is to be operated as an input or output.

**Input delay channel**

This parameter can be used to suppress signal interference. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

**Substitute value channel**

With this parameter, you set substitute values for the digital outputs.

**See also**

Assignment of the feedback interface (Page 44)

### 4.1.2.3 Assignment of the control interface

The user program uses the control interface to influence the behavior of the counters and the channels 8...15 of the module parameterized as an output.

The figure below shows the address assignment of the module in the process image output in the configuration method 2xCount.

At Counter 0 x stands for the output byte QB 2 in this case, at Counter 1 you add 6 bytes to this output byte.

When you assign a different start address to the digital input/digital output module, the byte sequence changes correspondingly.

Figure 4-2 Address space control interface configuration method 2xCount

**Note****Parameter assignment of the channels**

The corresponding values in the output data do not trigger any reaction for all the channels that are used as an input.

You cannot control the count outputs via the user program.

#### 4.1.2.4 Explanations on the control interface

Table 4- 10 Explanations on the control bits

| Control bit    | Explanations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLOT           | You specify the load value for the respective counter in these bytes. Through the load request LD_SLOT you load the predefined value into the counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LD_SLOT        | With this load request you control for which value of the counter the value specified in SLOT is to be loaded.<br>The counter carries out the respective action as soon as LD_SLOT changes.<br>If you have entered the load request LD_SLOT = 011 <sub>8</sub> open the SW gate, every counting process begins with the value defined in the SLOT as the start value.<br>If you have entered a different load request and open the SW gate, counting is continued with the current count value at every start of the counting process.<br>Both cases also apply at a parameterized HW gate as long as and until the SW gate is closed. |
| SW_GATE        | With this bit you open and close the SW gate of the respective counter.<br>Together with the hardware gate the software gate forms the internal gate. The module only counts when the internal gate is open.<br>0 means: Software gate closed<br>1 means: Software gate open                                                                                                                                                                                                                                                                                                                                                           |
| RES_EVENT_UFLW | With this bit you trigger the resetting of the stored event in the feedback bit EVENT_UFLW for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RES_EVENT_OFLW | With this bit you trigger the resetting of the stored event in the feedback bit EVENT_OFLW for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RES_EVENT_CMP  | With this bit you trigger the resetting of the stored event in the feedback bit EVENT_CMP for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### 4.1.2.5 Assignment of the feedback interface

##### Feedback interface

The user program receives current values and status information from the module via the feedback interface.

The figure below shows the address assignment of the module in the process image input in the configuration method 2xCount.

At Counter 0 x stands for the input byte IB 2 in this case, at Counter 1 you add 6 bytes to this output byte.

When you assign a different start address to the digital input/digital output module, the byte sequence changes correspondingly.

Figure 4-3 Address space feedback interface configuration method 2xCount

### 4.1.2.6 Explanations for the feedback interface

Table 4- 11 Explanations for the feedback bits

| Feedback bit       | Explanations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COUNT_VALUE        | This value supplies the current count value for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| STS_DQ             | This bit returns the current signal state of the count output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| STS_GATE           | <p>Together with the hardware gate the software gate forms the internal gate. This bit shows the state of the internal gate for the respective counter. The module only counts when the internal gate is open.</p> <p>0 means: Internal gate closed / counter does not count<br/>1 means: internal Tor open / counter counts</p> <p><b>Note:</b><br/>After a POWER OFF / ON or a change in the parameterization, all the values of the changed counter are transferred again to the module. In the process the internal gate of the respective counter is closed and the count value is set to the start value. Close and open the respective SW gate to restart the counting process.</p> <p><b>Note:</b><br/>When the PROFIBUS interface model is used, the CPU/Master automatically generates the "rising edge" signal after disconnection/reconnection of the communications. This continues the counting process.</p> |
| STS_SW_GATE        | <p>This bit shows the status of the software gate.</p> <p>0 means: Software gate closed<br/>1 means: Software gate open</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| LD_STS_SLOT        | This bit indicates through a status change (toggling) for the respective counter that loading of the control interface has been carried out successfully.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LD_ERROR           | <p>This bit indicates for the respective counter that an error has occurred during loading of the control interface.</p> <p>The load value was not accepted.</p> <p>One of the following conditions is fulfilled:</p> <ul style="list-style-type: none"> <li>• Low counting limit &gt; Count value</li> <li>• Low counting limit &gt; Start value</li> <li>• Low counting limit &gt; Comparison value</li> <li>• Count value &gt; High counting limit</li> <li>• Start value &gt; High counting limit</li> <li>• Comparison value &gt; High counting limit</li> <li>• Low counting limit <math>\geq</math> High counting limit</li> <li>• No valid load request in LD_SLOT</li> </ul>                                                                                                                                                                                                                                      |
| EVENT_UFLW         | <p>This bit shows for the respective counter whether an underflow (value dropped below the low count limit) has occurred.</p> <p>You reset the state by acknowledging with RES_EVENT_UFLW.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| EVENT_OFLW         | <p>This bit shows for the respective counter whether an overflow (value exceeded the high count limit) has occurred.</p> <p>You reset the state by acknowledging with RES_EVENT_OFLW.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EVENT_CMP          | <p>This bit shows for the respective counter whether a comparison event with the comparison value has occurred.</p> <p>You reset the state by acknowledging with RES_EVENT_CMP.</p> <p>The EVENT_CMP bit is not set if the count value is set to the start value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| RES_EVENT_UFLW_ACK | This bit shows for the respective counter whether the resetting of the event bit EVENT_UFLW is active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|--------------------|--------------------------------------------------------------------------------------------------------|
| RES_EVENT_OFLW_ACK | This bit shows for the respective counter whether the resetting of the event bit EVENT_OFLW is active. |
| RES_EVENT_CMP_ACK  | This bit shows for the respective counter whether the resetting of the event bit EVENT_CMP is active.  |

## Complete acknowledgment principle

Storing bits are acknowledged in accordance with the complete acknowledgment principle.

The figure below shows an example for the course of the complete acknowledgment principle at an overflow:

- ① The feedback bit EVENT\_OFLW is set as a storing event at an overflow bit.
- ② The set the control bit RES\_EVENT\_OFLW in order to initiate resetting of EVENT\_OFLW.
- ③ The feedback bit RES\_EVENT\_OFLW\_ACK is set when the resetting of EVENT\_OFLW has been recognized.
- ④ You reset the control bit RES\_EVENT\_OFLW .
- ⑤ The feedback bit RES\_EVENT\_OFLW\_ACK is reset.

Figure 4-4 Acknowledgment principle

### Note

When you have initiated the resetting of an event bit, you have to wait for the respective feedback bit. You can initiate a further reset subsequently.

### Note

An opening of the SW gate or HW gate (0-1 transition) resets all event bits.

### 4.1.3 Interrupts/diagnostic alarms

#### 4.1.3.1 Status and error displays

##### LED displays

The figure below shows the LED displays (status and error displays) of the digital input module / digital output module DIQ 16x24VDC/0.5A 8xM12.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0 to 15) (green)
- ③ Load voltage 2L+ (PWR) (green)

Figure 4-5 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic reports can be found in chapter Diagnostics alarms (Page 51).

### DIAG LED

Table 4- 12 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off      | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes  | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On       | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 4- 13 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 4- 14 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

### 4.1.3.2 Interrupts

The digital input / digital output module DIQ 16x24VDC/0.5A 8xM12 in the configuration method 2xCount supports diagnostic and hardware interrupts.

#### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of an encoder supply to ground, or
- Short-circuit of an output to ground
- Load voltage 2L+ missing or too low
- Parameter assignment error

#### Hardware interrupt

The module generates a hardware interrupt at the following event:

- Comparison event occurred for DQ

For detailed information on the error event, refer to the hardware interrupt organization block with the "RALRM" instruction (read additional interrupt info) and to the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The figure below shows the assignment to the bits of the local data double word 8.

Figure 4-6 Start information of the organization block in the configuration method 2xCount

### 4.1.3.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the LED DIAG flashes red on the digital input/digital output module.

You can read out the diagnostics alarms, for example, from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 4- 15 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                                                                                                                                                                                            | Error code | Meaning                                                                                                 | Solution                                                                                             |

### 4.2.1.2 Pin assignment

#### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for counting channels and digital inputs / outputs

The table below shows the pin assignments of the 4 sockets for the connection of the counting channels.

Table 4- 16 Pin assignment for counting channels

| Pin | Assignment                                                                                                                                                                                | Front view of the sockets                                                            |                                                                                      |

##### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input/digital output module to supply power to the encoder.

The table below shows the pin assignments of the 4 sockets for the connection of the digital inputs / digital outputs.

Table 4- 17 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                                                                                                      | Front view of the sockets                                                           |                                                                                     |

| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                     |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 4- 20 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the socket                                                              |
|-----|-----------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                 |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                       |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## 4.2.2 Parameters/address space

### 4.2.2.1 Parameters

In the configuration method 4xCount of the digital input / digital output module DIQ 16x24VDC/0.5A 8xM12 the Channels 0 to 7 are used by the counting function. The Channels 8 to 15 can be parameterized freely.

The following table shows the general parameter of the module.

Table 4- 21 General parameters

| Parameters                            | Value range                                                                                                           | Default   | Scope                                                                      |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------|-----------|----------------------------------------------------------------------------|

### 4.2.2.2 Explanation of the parameters

#### General parameters

##### **Diagnostics: Missing load voltage 2L+**

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

##### **Diagnostics: Short circuit to ground**

Enabling of the diagnostics, at short-circuit of an encoder supply or of an output to ground.

##### **Behavior at CPU/master STOP (8...15)**

With this parameter you set the reaction of the digital outputs of after a CPU/master STOP.  
Behavior DQ at freely assignable Channels 8...15:

- Deactivate: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The digital output outputs a configured substitute value.

## Parameter counting function

### Input delay DI

This parameter can be used to suppress signal faults. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

---

### Note

#### Influences the counting frequency

When setting the input delay take into account that the counting frequency possible is automatically reduced at higher values.

In order to achieve the maximum counting frequency of 2 kHz select an input delay smaller than 0.4 ms.

---

### Counting direction

Use this parameter to select the direction in which counting is carried out:

- Forward
- Backward.

### Edge selection

Use this parameter to select the edge that is counted:

- At rising edge:  
The respective counter counts all the rising edges at the counter input.
- At falling edge:  
The respective counter counts all the falling edges at the counter input.

### Behavior when a counting limit is exceeded

With this parameter you select the behavior when the high counting limit is violated in the upward direction or the low counting limit is violated in the downward direction:

- Stop counting:  
After a counting limit is violated, the internal gate is closed. This stops the counting process. The counter value is set to the opposite counting limit. To start the counting process again, you must close and reopen the SW gate.
- Continue counting:  
After a counting limit is violated, the counter value is set to the opposite counting limit and counting continues.

### Comparison value

With this parameter you specify the comparison value.

The following applies:

- $\text{Low counting limit} \leq \text{Comparison value} \leq \text{High counting limit}$

### Start value

With this parameter you specify the start value.

The following applies:

- $\text{Low counting limit} \leq \text{Start value} \leq \text{High counting limit}$

**High counting limit**

With this parameter you specify the high counting limit.

The following applies:

- Low counting limit < High counting limit  $\leq 2147483647 (2^{31} - 1)$

**Low counting limit**

With this parameter you specify the low counting limit.

The following applies:

- High counting limit > Low counting limit  $\geq -2147483648 (-2^{31})$

**Behavior DQ**

With the "Behavior DQ" you select the counter values at which the count output is set. When the current count value fulfils the parameterized condition, the associated count output is set.

This means the signal state "1" is set at the count output when:

- Count value between a comparison value and the high counting limit:  
Comparison value  $\leq$  Count value  $\leq$  High counting limit

or

- Count value between a comparison value and the low counting limit:  
Low counting limit  $\leq$  Count value  $\leq$  Comparison value.

**Hardware interrupt DQ**

With this parameter you specify whether or not a hardware interrupt is generated by the event "Comparison event occurred for DQ".

**Behavior at CPU/master STOP for DQ**

With this parameter you set the reaction of the count output of a counter after a CPU/master STOP.

Behavior DQ:

- Continue: Signal state of the count output continues to be controlled by comparison conditions.
- Output substitute value: The count output outputs a configured substitute value.

---

**Note****Count value at CPU/Master STOP**

Independently of the selected reaction of the count output, the count value continues to change during a CPU/Master STOP depending on the input edge, counting continues.

---

**Substitute value DQ**

With this parameter you set the substitute value of the digital output of a counter if the setting "Output substitute value" has been selected at the parameter "Behavior at CPU/master STOP for DQ".

**Parameter freely assignable Channels 8..15****Freely assignable channel**

With this parameter, you set whether the channel is to be operated as an input or output.

**Input delay channel**

This parameter can be used to suppress signal interference. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

**Substitute value channel**

With this parameter, you set substitute values for the digital outputs.

### 4.2.2.3 Assignment of the control interface

The user program uses the control interface to influence the behavior of the counters and the channels 8...15 of the module parameterized as an output.

The figure below shows the address assignment of the module in the process image output in the configuration method 4xCount.

At Counter 0 x stands for the output byte QB 2 in this case, at Counters 1 to 3 you add 6 bytes, 12 bytes and 18 bytes respectively to this output byte.

When you assign a different start address to the digital input/digital output module, the byte sequence changes correspondingly.

Figure 4-8 Address space control interface configuration method 4xCount

**Note****Parameter assignment of the channels**

The corresponding values in the output data do not trigger any reaction for all the channels that are used as an input.

You cannot control the count outputs via the user program.

#### 4.2.2.4 Explanations on the control interface

Table 4- 24 Explanations on the control bits

| Control bit    | Explanations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLOT           | You specify the load value for the respective counter in these bytes. Through the load request LD_SLOT you load the predefined value into the counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LD_SLOT        | With this load request you control for which value of the counter the value specified in SLOT is to be loaded.<br>The counter carries out the respective action as soon as LD_SLOT changes.<br>If you have entered the load request LD_SLOT = 011 <sub>B</sub> open the SW gate, every counting process begins with the value defined in the SLOT as the start value.<br>If you have entered a different load request and open the SW gate, counting is continued with the current count value at every start of the counting process.<br>Both cases apply as long as and until the SW gate is closed. |
| SW_GATE        | With this bit you open and close the SW gate of the respective counter. The module only counts when the software gate is open.<br>0 means: Software gate closed<br>1 means: Software gate open                                                                                                                                                                                                                                                                                                                                                                                                         |
| RES_EVENT_UFLW | With this bit you trigger the resetting of the stored event in the feedback bit EVENT_UFLW for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RES_EVENT_OFLW | With this bit you trigger the resetting of the stored event in the feedback bit EVENT_OFLW for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RES_EVENT_CMP  | With this bit you trigger the resetting of the stored event in the feedback bit EVENT_CMP for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### 4.2.2.5 Assignment of the feedback interface

##### Feedback interface

The user program receives current values and status information from the module via the feedback interface.

The figure below shows the address assignment of the module in the process image input in the configuration method 4xCount.

At Counter 0 x stands for the input byte IB 2 in this case, at Counters 1 to 3 you add 6 bytes, 12 bytes and 18 bytes respectively to this input byte.

When you assign a different start address to the digital input/digital output module, the byte sequence changes correspondingly.

## 4.2 Configuration method 4xCount

Figure 4-9 Address space feedback interface configuration method 4xCount

### 4.2.2.6 Explanations for the feedback interface

Table 4- 25 Explanations for the feedback bits

| Feedback bit       | Explanations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| COUNT_VALUE        | This value supplies the current count value for the respective counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STS_DQ             | This bit returns the current signal state of the count output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| STS_GATE           | <p>This bit shows the state of the internal gate for the respective counter. The module only counts when the internal gate is open.</p> <p>0 means: Internal gate closed / counter does not count<br/>1 means: internal Tor open / counter counts</p> <p><b>Note:</b><br/>After a POWER OFF / ON or a change in the parameterization, all the values of the changed counter are transferred again to the module. In the process the internal gate of the respective counter is closed and the count value is set to the start value. Close and open the respective SW gate to restart the counting process.</p> <p><b>Note:</b><br/>When the PROFIBUS interface model is used, the CPU/Master automatically generates the "rising edge" signal after disconnection/reconnection of the communications. This continues the counting process.</p> |
| STS_SW_GATE        | <p>This bit shows the status of the software gate.</p> <p>0 means: Software gate closed<br/>1 means: Software gate open</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| LD_STS_SLOT        | This bit indicates through a status change (toggling) for the respective counter that loading of the control interface has been carried out successfully.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LD_ERROR           | <p>This bit indicates for the respective counter that an error has occurred during loading of the control interface.</p> <p>The load value was not accepted.</p> <p>One of the following conditions is fulfilled:</p> <ul style="list-style-type: none"> <li>• Low counting limit &gt; Count value</li> <li>• Low counting limit &gt; Start value</li> <li>• Low counting limit &gt; Comparison value</li> <li>• Count value &gt; High counting limit</li> <li>• Start value &gt; High counting limit</li> <li>• Comparison value &gt; High counting limit</li> <li>• Low counting limit <math>\geq</math> High counting limit</li> <li>• No valid load request in LD_SLOT</li> </ul>                                                                                                                                                           |
| EVENT_UFLW         | <p>This bit shows for the respective counter whether an underflow (value dropped below the low count limit) has occurred.</p> <p>You reset the state by acknowledging with RES_EVENT_UFLW.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EVENT_OFLW         | <p>This bit shows for the respective counter whether an overflow (value exceeded the high count limit) has occurred.</p> <p>You reset the state by acknowledging with RES_EVENT_OFLW.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| EVENT_CMP          | <p>This bit shows for the respective counter whether a comparison event with the comparison value has occurred.</p> <p>You reset the state by acknowledging with RES_EVENT_CMP.</p> <p>The EVENT_CMP bit is not set if the count value is set to the start value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| RES_EVENT_UFLW_ACK | This bit shows for the respective counter whether the resetting of the event bit EVENT_UFLW is active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Feedback bit       | Explanations                                                                                           |
|--------------------|--------------------------------------------------------------------------------------------------------|
| RES_EVENT_OFLW_ACK | This bit shows for the respective counter whether the resetting of the event bit EVENT_OFLW is active. |
| RES_EVENT_CMP_ACK  | This bit shows for the respective counter whether the resetting of the event bit EVENT_CMP is active.  |

### Complete acknowledgment principle

Storing bits are acknowledged in accordance with the complete acknowledgment principle.

The figure below shows an example for the course of the complete acknowledgment principle at an overflow:

- ① The feedback bit EVENT\_OFLW is set as a storing event at an overflow bit.
- ② The set the control bit RES\_EVENT\_OFLW in order to initiate resetting of EVENT\_OFLW.
- ③ The feedback bit RES\_EVENT\_OFLW\_ACK is set when the resetting of EVENT\_OFLW has been recognized.
- ④ You reset the control bit RES\_EVENT\_OFLW .
- ⑤ The feedback bit RES\_EVENT\_OFLW\_ACK is reset.

Figure 4-10 Acknowledgment principle

#### Note

When you have initiated the resetting of an event bit, you have to wait for the respective feedback bit. You can initiate a further reset subsequently.

#### Note

An opening of the SW gate or HW gate (0-1 transition) resets all event bits.

## 4.2.3 Interrupts/diagnostic alarms

### 4.2.3.1 Status and error displays

#### LED displays

The figure below shows the LED displays (status and error displays) of the digital input module / digital output module DIQ 16x24VDC/0.5A 8xM12.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0 to 15) (green)
- ③ Load voltage 2L+ (PWR) (green)

Figure 4-11 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic reports can be found in chapter Diagnostics alarms (Page 70).

### DIAG LED

Table 4- 26 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off      | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes  | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On       | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 4- 27 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 4- 28 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

### 4.2.3.2 Interrupts

The digital input / digital output module DIQ 16x24VDC/0.5A 8xM12 in the configuration method 4xCount supports diagnostic and hardware interrupts.

#### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of an encoder supply to ground, or
- Short-circuit of an output to ground
- Load voltage 2L+ missing or too low
- Parameter assignment error

#### Hardware interrupt

The module generates a hardware interrupt at the following event:

- Comparison event occurred for DQ

For detailed information on the error event, refer to the hardware interrupt organization block with the "RALRM" instruction (read additional interrupt info) and to the STEP 7 online help.

The module channel that triggered the hardware interrupt is entered in the start information of the organization block. The figure below shows the assignment to the bits of the local data double word 8.

Figure 4-12 Start information of the organization block in the configuration method 4xCount

### 4.2.3.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the LED DIAG flashes red on the digital input/digital output module.

You can read out the diagnostics alarms, for example, from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 4- 29 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                                                                                                                                                                                            | Error code | Meaning                                                                                                 | Solution                                                                                             |

## 4.3 Examples of counting

In this section, you will find examples of the behavior of the counter and how you can specify this behavior. You specify the properties of the counter in the parameter assignment.

The boundary conditions apply for the following examples:

- You set the bit SW\_GATE to "1", the counting process starts.
- If you reset the bit SW\_GATE before a count limit is reached, the counting process stops. Set the bit SW\_GATE to restart the counting process. The value with which the counting process starts again depends on the content of the control interface.

These conditions only apply if you do not use a HW gate (configuration method 2xCount).

### Behavior DQ - Count value between a comparison value and the high counting limit (counting direction forward)

The following section shows the behavior of the count output with the parameter assignment "Set output DQ: Count value between a comparison value and the high counting limit".

The count output is set to "1" if the current values lies between the comparison value and the high count limit.

You can optionally enable a hardware interrupt through the parameterization. This is generated with the rising edge of the count output.

The following figure shows an example of the signal state of the count output depending on the parameterization mentioned above.

Figure 4-13 Behavior DQ and hardware interrupt

**Behavior DQ - count value between a comparison value and the low counting limit (counting direction backward)**

The following section shows the behavior of the count output with the parameter assignment "Set output DQ: Between a comparison value and the low counting limit".

The count output is set to "1" if the current values lies between the comparison value and the low count limit.

You can optionally enable a hardware interrupt through the parameterization. This is generated with the rising edge of the count output.

The following figure shows an example of the signal state of the count output depending on the parameterization mentioned above.

Figure 4-14 Behavior DQ and hardware interrupt

### Start and stop the counting process via the gate control (counting direction forward, configuration method 2xCOUNT)

The following section shows the behavior of the counter depending on the control input at the parameterization "Behavior DI: Gate control in combination with "Behavior when a counting limit is exceeded: Stop counting".

If you set the HW gate to "1" via the control input, the counting process is started. If you set the HW gate to "0", the counting process stops.

Note that the counting process also stops if you close the SW gate while the HW gate is opened.

HW gate and SW gate together form the internal gate. The module only counts when the internal gate is open.

The following figure shows an example of the behavior of the counter at gate control with the principle of stopping counting when a counting limit is exceeded.

Figure 4-15 Gate control and principle: Stop counting

### Change counting direction via count input and stop counting (configuration method 2xCOUNT)

The following section shows the behavior of the counter depending on the direction input at the parameterization "Behavior DI: Counting direction" in combination with "Behavior when a counting limit is exceeded: Stop counting".

If you have parameterized the digital input of a counter as a direction input, you can change the counting direction via corresponding signals at this input.

Irrespective of the parameterization the counter always forward if the signal state "0" is set at direction input or, respectively backward if the signal state is "1".

If you change the counting direction via a signal change at the direction input, the edge detection (rising / falling edge) is also switched over.

The following figure shows an example of the behavior of the counter at a change in the counting direction with the principle of stopping counting when a counting limit is exceeded.

Figure 4-16 Changing the counting direction and principle: Stop counting

### Behavior when a counting limit is exceeded - Stop counting (counting direction forward)

The following section describes the effects of the parameter "Behavior when a counting limit is exceeded: Stop counting" in the counting direction forward. To control the counter, the bits of the control byte of the control interface are used, see the configuration method 2xCount, section Assignment of the control interface (Page 43) and configuration method 4xCount, section Assignment of the control interface (Page 62).

You have entered the bit string 011 in the control byte of the control interface. This bit string loads the value defined in the load value (SLOT) as the start value of the counter via the load request (LD\_SLOT).

After the high counting limit is violated, counting is aborted (counting stops) and the counted value jumps to the low counting limit.

The bit STS\_GATE is reset in the feedback interface, the bit EVENT\_OFLW is set.

The following figure shows an example of the principle of stopping counting when the high count limit is exceeded, counting direction forward.

The behavior "Behavior DQ" is set to "Count value between a comparison value and the high counting limit".

Figure 4-17 Principle: Stop counting (counting direction forward)

You can find additional information on the behavior of the counter at an overflow in the section Explanations for the feedback interface (Page 46).

### Behavior when a counting limit is exceeded - Continue counting (counting direction backward)

The following section describes the effects of the parameter "Behavior when a counting limit is exceeded: Continue counting". To control the counter, the bits of the control byte of the control interface are used, see the configuration method 2xCount, section Assignment of the control interface (Page 43) and configuration method 4xCount, section Assignment of the control interface (Page 62).

After the low counting limit is underpassed, the counted value jumps to the high counting limit and counting is continued.

The bit STS\_GATE is **not** reset when a count limit is exceeded.

The following figure shows an example of the principle of stopping counting when the low count limit is exceeded, counting direction backward.

The behavior "Behavior DQ" is set to "Count value between a comparison value and the high counting limit".

Figure 4-18 Principle: Continue counting (counting direction backward)

### Reference

You will find general information on the counting function in the section Counting (Page 30).

Further information about the pin assignment, parameters, control and feedback interface, etc. is available in the sections Configuration method 2xCount (Page 32) and Configuration method 4xCount (Page 52).

## Technical specifications

### Technical specifications of the DIQ 16x24VDC/0.5A 8xM12 digital input/digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7143-5AH00-0BA0/td?dl=en>).

# PROFlenergy

## 6.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital input/digital output module with counting function is explained in the following sections.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V14 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>).

Application examples (<https://support.industry.siemens.com/cs/ww/en/view/41986454>) are also available on the Internet.

## 6.2 Behavior of the digital inputs

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 6- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                                                                                       |
|---------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | Proceed at "pause"<br><ul style="list-style-type: none"> <li>• Value status "GOOD"</li> </ul>                                                                                                                                     |
|         | 1D: PE_MODE_SHUTDOWN    | Switch off at "pause"<br><ul style="list-style-type: none"> <li>• Encoder supply Us switched off <sup>1</sup></li> <li>• Pause substitute value: 0B</li> <li>• Value status "BAD"</li> </ul>                                      |
|         | 3D: PE_MODE_LAST_VALUE  | Last value at "pause"<br><ul style="list-style-type: none"> <li>• Encoder supply Us switched off <sup>1</sup></li> <li>• Pause substitute value: Last input value</li> <li>• Value status "BAD"</li> </ul>                        |
|         | 4D: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br><ul style="list-style-type: none"> <li>• Encoder supply Us switched off <sup>1</sup></li> <li>• Pause substitute value: Configured pause substitute value</li> <li>• Value status "BAD"</li> </ul> |

<sup>1</sup> There are two encoder supplies, 1Us for Channels 0 to 7 and 2Us for Channels 8 to 15. At a "Pause" the supplies can only be switched off if no channel is configured in PE\_MODE\_PROCEED.

## 6.3 Behavior of the digital outputs

### Display

The channel status LEDs are directly affected by the signal level at the socket.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 6- 2 Mode parameter

| Element | Code                    | Explanation                                                                                                                  |
|---------|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0b: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                  |
|         | 1b: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Pause substitute value: 0b<br>• Value status "BAD"                                                |
|         | 3b: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Pause substitute value: Last output value is maintained<br>• Value status "BAD"                   |
|         | 4b: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Pause substitute value: Configured pause substitute value is output<br>• Value status "BAD" |

## 6.4 Behavior of the digital inputs of the counters

### Display

The channel status LEDs are directly influenced by the signal level at the socket.  
If the encoder supply is switched off, this causes the channel status LEDs to also switch off.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the "Short-circuit" alarms.
- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

---

#### Note

##### Channels of a counter

All the channels that belong to a counter must have the same PROFenergy behavior.  
If substitute value behavior is parameterized, this also has to be the same for all channels of a counter.

If the PROFenergy behavior is not the same for all the channels of a counter, the module rejects the PROFenergy parameterization.

Further information on the assignment of the counting channels for the configuration method 2xCount is available in the section Pin assignment (Page 33), for the configuration method 4xCount in the section Pin assignment (Page 53).

---

### Mode parameter

The following table shows the "Mode" parameter.

Table 6- 3 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                                    |
|---------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | The counter functions as in the normal count mode.<br>The count output depends on the count value.                                                                             |
|         | 1D: PE_MODE_SHUTDOWN    | The count value is no longer updated.<br>The count output is set to 0.                                                                                                         |
|         | 3D: PE_MODE_LAST_VALUE  | The count value is no longer updated (the input does not supply any edges).<br>The count output contains the last value, since the count is no longer updated.                 |
|         | 4D: PE_MODE_SUBST_VALUE | The count value is no longer updated (the input does not supply any edges).<br>The count output is set to the parameterized substitute value, irrespective of the count value. |

## Dimension drawing

The figure below shows the dimension drawing of the DIQ 16x24VDC/0.5A 8xM12 digital input/digital output module in front and side views.

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface

### Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### Conventions

Please also observe notes marked as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7142-5AF00-0BA0

#### View of the module

Figure 2-1 View of the DQ 8x24VDC/2A 8xM12 digital output module

## Properties

The module has the following technical properties:

- 8 digital outputs
  - Channels 0 to 3 connected to 1L+ (non-switched)
  - Channels 4 to 7 connected to 2L+ (switched)
- M12 sockets for connection of actuators
- Rated load voltage 24 V DC
- Suitable for solenoid valves, DC contactors, and indicator lights
- Output current per output 2 A
- Configurable diagnostics can be set for each module
- Dimensions 45 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFlenergy

## Accessories

The following components are included in the module package:

- Identification labels

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DQ 8x24VDC/2A 8xM12 digital output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the output signal
- ③ PWR: LED display for load voltage 2L+
- ④ X80: Connector for infeed of the supply voltage (POWER input)
- ⑤ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑥ X30: Socket for ET-Connection IN
- ⑦ X31: Socket for ET-Connection OUT
- ⑧ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

## Wiring

### 3.1 Terminal and block diagram

The example in the figure below shows the pin assignment of signal outputs.

|     |                                 |                 |                                      |
|-----|---------------------------------|-----------------|--------------------------------------|
| ①   | Output to 1L+                   | X10 to X17      | Channels 0 to 7                      |
| ②   | Output to 2L+                   | X30             | Infeed of the ET-Connection          |
| ③   | DQ circuit 1L+                  | X31             | Loop-through of the ET-Connection    |
| ④   | DQ circuit 2L+                  | 1L+             | Supply voltage 1L+ (non-switched)    |
| ⑤   | Microcontroller                 | 1M              | Ground 1M (non-switched)             |
| ⑥   | Monitoring                      | 2L+             | Load voltage 2L+ (switched)          |
| ⑦   | ET-Connection interface         | 2M              | Ground 2M (switched)                 |
| ⑧   | Internal supply voltage         | 1Us             | 24 V encoder supply                  |
| X80 | Infeed of supply voltages       | DQ <sub>n</sub> | Output signal                        |
| X81 | Loop-through of supply voltages | DQ              | Channel status LEDs (0 to 7) (green) |

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for digital outputs

The tables below show the pin assignments of the 8 sockets for connection of the digital outputs.

Table 3- 1 Pin assignment for digital outputs

| Pin | Assignment                                                                                                                                                                                                                                                                                   | Front view of the sockets                                                             |                                                                                       |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X10 to X17 sockets for digital outputs                                                                                                                                                                                                                                                       | X10, X12, X14, X16                                                                    | X11, X13, X15, X17                                                                    |
| 1   | Unassigned                                                                                                                                                                                                                                                                                   |                                                                                       |                                                                                       |
| 2   | Unassigned                                                                                                                                                                                                                                                                                   |                                                                                       |                                                                                       |
| 3   | X10 - X13: Ground 1M<br>X14 - X17: Ground 2M                                                                                                                                                                                                                                                 |  |  |
| 4 * | Output signal DQ0: Connector X10<br>Output signal DQ1: Connector X11<br>Output signal DQ2: Connector X12<br>Output signal DQ3: Connector X13<br>Output signal DQ4: Connector X14<br>Output signal DQ5: Connector X15<br>Output signal DQ6: Connector X16<br>Output signal DQ7: Connector X17 |                                                                                       |                                                                                       |
| 5   | Functional earth FE                                                                                                                                                                                                                                                                          |                                                                                       |                                                                                       |

\* The outputs DQ<sub>0</sub> to DQ<sub>3</sub> are connected to 1L+; the outputs DQ<sub>4</sub> to DQ<sub>7</sub> are connected to 2L+.

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 2 Pin assignment for ET-Connection

| Pin       | Assignment                    |                                | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets                                                           |                                                                                     |
|-----------|-------------------------------|--------------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|           | X30 socket (ET-Connection IN) | X31 socket (ET-Connection OUT) |                                                                      | X30                                                                                 | X31                                                                                 |
| 1         | TXP                           | RXP                            | Yellow                                                               |  |  |
| 2         | RXP                           | TXP                            | White                                                                |                                                                                     |                                                                                     |
| 3         | RXN                           | TXN                            | Blue                                                                 |                                                                                     |                                                                                     |
| 4         | TXN                           | RXN                            | Orange                                                               |                                                                                     |                                                                                     |
| Shielding | Functional earth FE           |                                | -                                                                    |                                                                                     |                                                                                     |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 3 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector                                                           |
|-----|-----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                      |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                       |

| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Parameters

The table below shows the parameters for the DQ 8x24VDC/2A 8xM12 digital output module.

Table 4- 1 Parameters

| Parameters                            | Value range                                                                                                                 | Default   | Scope                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----------|---------------------------------------------------|
| Diagnostics: Missing load voltage 2L+ | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                               | Disable   | Module                                            |
| Diagnostics: Short-circuit to ground  | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                               | Disable   | Module<br>(Short-circuit of the output to ground) |
| Reaction to CPU/master STOP           | <ul style="list-style-type: none"> <li>• Shut down</li> <li>• Keep last value</li> <li>• Output substitute value</li> </ul> | Shut down | Module                                            |
| Substitute value channel 0 ... 7      | <ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> </ul>                                                          | 0         | Channel                                           |

## 4.2 Explanation of the parameters

### Diagnostics: Missing load voltage 2L+

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

### Diagnostics: Short-circuit to ground

Enabling of the diagnostics for short-circuit of the output to ground.

### Reaction to CPU/master STOP

With this parameter, you set the reaction of the digital outputs of the module after a CPU/master STOP:

- Shut down: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

### Substitute value channel 0 ... 7

With this parameter, you set substitute values for the digital outputs.

## 4.3 Address space

The figure below shows the assignment of the address space for the digital output module DQ 8x24VDC/2A 8xM12 with value status (Quality Information, QI).

The address space for the value status is allocated by the module, if the value status is configured using the PROFINET interface module.

Assignment in the process image input (PII)

Assignment in the process image output (PIQ)

Figure 4-1 Address space

### Configuration options of the digital output module DQ 8x24VDC/2A 8xM12

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the digital output module. The value status of the outputs is assigned to bits 0 to 7 in input byte x. This additional information provides information regarding the validity of the digital values or channel status.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

This means:

- Short-circuit of output to ground or
- Parameter error or
- For channels 4 ... 7: Missing load voltage 2L+

# Interrupts/diagnostic alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the digital output module DQ 8x24VDC/2A 8xM12.

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostics alarms (Page 21).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off      | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes  | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On       | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## 5.2 Interrupts

The digital output module DQ 8x24VDC/2A 8xM12 supports diagnostics interrupts.

### Diagnostic interrupt

The digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of outputs to ground
- Load voltage 2L+ missing or too low

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital output module. You can read out the diagnostics alarms, for example, from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                      | Error code | Meaning                             | Remedy                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| Short-circuit                                                                                                                                          | 1H         | Short-circuit of outputs to ground  | <ul style="list-style-type: none"> <li>• Eliminate the short-circuit</li> </ul>                          |
| Load voltage 2L+ missing*                                                                                                                              | 11H        | Load voltage 2L+ missing or too low | <ul style="list-style-type: none"> <li>• Check the supply voltage</li> <li>• Check the module</li> </ul> |
| * If you are using ET 200AL modules in connection with the ET 200SP distributed I/O system, the diagnostics alarm "Load voltage missing" is displayed. |            |                                     |                                                                                                          |

## Technical specifications

### 6.1 Technical specifications

#### Technical specifications of the DQ 8x24VDC/2A 8xM12 digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7142-5AF00-0BA0/td?dl=en>).

| Weight, approx.                                                                                                                                                                                            | 192 g                                                                                                          |

# PROFlenergy

## 7.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the digital output module is explained in the following sections.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V13 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>).

Application examples (<https://support.industry.siemens.com/cs/ww/en/view/41986454>) are also available on the Internet.

## 7.2 Behavior of the digital output module

### Display

The channel status LEDs are directly affected by the signal level at the socket.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- During the "pause", error detection of "Short circuit" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                  |
|---------|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                                  |
|         | 1D: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Pause substitute value: 0b<br>• Value status "BAD"                                                |
|         | 3D: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Pause substitute value: Last output value is maintained<br>• Value status "BAD"                   |
|         | 4D: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Pause substitute value: Configured pause substitute value is output<br>• Value status "BAD" |

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Changes compared to previous version

Compared to the previous version, this manual contains the following adaptations in the section Technical specifications (Page 38).

## Conventions

Also observe notes marked as follows:

---

### Note

A note contains important information on the product described in the documentation and on the handling of the product to which particular attention should be paid.

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet  
(<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7144-5KD00-0BA0

#### View of the module

Figure 2-1 View of the analog input module AI 4xU/I/RTD 4xM12

## Properties

The module has the following technical properties:

- 4 analog inputs
- M12 sockets for connection of sensors
- Measurement type can be set for each channel:
  - Voltage
  - Current (2-/4-wire transducers)
  - Resistance (2-/3-wire connection)
  - Resistance thermometer (RTD) (2-/3-wire connection)
- Resolution 16-bit
- Dimensions 30 x 159 mm
- Configurable diagnostics can be set for each channel
- Hardware interrupt on limit violation can be set per channel (two high and two low limits per channel)

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

---

### Note

#### Process values during startup

As long as no parameters have been received by the I/O module, the I/O module returns the process value 7FFF<sub>H</sub>.

---

## Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<http://support.automation.siemens.com/WW/view/en/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the analog input module AI 4xU/I/RTD 4xM12.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X13: Sockets for the input signal
- ③ X80: Connector for infeed of the supply voltage (POWER input)
- ④ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑤ X30: Socket for ET-Connection IN
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ LED displays 0 to 3 for the channel status

## Wiring

### 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment for voltage measurement and current measurement.

|            |                                                         |                  |                                             |
|------------|---------------------------------------------------------|------------------|---------------------------------------------|
| ①          | Voltage measurement                                     | X30              | Infeed of the ET-Connection                 |
| ②          | Current measurement (2 DMU)                             | X31              | Loop-through of the ET-Connection           |
| ③          | Current measurement (4 DMU, with internal power supply) | 1L+              | Supply voltage 1L+ (non-switched)           |
| ④          | Current measurement (4 DMU, with external power supply) | 1M               | Ground 1M (non-switched)                    |
| ⑤          | Multiplexer                                             | 2L+              | Load voltage 2L+ (switched)                 |
| ⑥          | Analog-to-digital converter (ADC)                       | 2M               | Ground 2M (switched)                        |
| ⑦          | Microcontroller                                         | M <sub>n</sub> + | Measuring input positive, channel n         |
| ⑧          | ET-Connection interface                                 | M <sub>n</sub> - | Measuring input negative, channel n         |
| ⑨          | Internal supply voltage                                 | U <sub>v</sub>   | 24 V encoder supply                         |
| X10 to X13 | Channels 0 to 3                                         | AI               | LEDs channel status (0, 1, 2 and 3) (green) |
| X80        | Infeed of supply voltages                               | DIAG             | LED diagnostic status (red/green)           |
| X81        | Loop-through of supply voltages                         |                  |                                             |

Figure 3-1 Terminal and block diagram for voltage and current measurement

The example in the following figure shows the pin assignment for the resistance thermometer.

|            |                                   |            |                                               |
|------------|-----------------------------------|------------|-----------------------------------------------|
| ①          | RTD/R 2-wire connection           | X30        | Infeed of the ET-Connection                   |
| ②          | RTD/R 3-wire connection           | X31        | Loop-through of the ET-Connection             |
| ③          | Multiplexer                       | 1L+        | Supply voltage 1L+ (non-switched)             |
| ④          | Analog-to-digital converter (ADC) | 1M         | Ground 1M (non-switched)                      |
| ⑤          | Microcontroller                   | 2L+        | Load voltage 2L+ (switched)                   |
| ⑥          | ET-Connection interface           | 2M         | Ground 2M (switched)                          |
| ⑦          | Internal supply voltage           | Mn+        | Measuring input positive, channel n           |
| X10 to X13 | Channels 0 to 3                   | Mn-        | Measuring input negative, channel n           |
| X80        | Infeed of supply voltages         | Icn+, Icn- | Current output, current feed, RTD/R channel n |
| X81        | Loop-through of supply voltages   | AI         | LEDs channel status (0, 1, 2 and 3) (green)   |
|            |                                   | DIAG       | LED diagnostic status (red/green)             |

## 3.2 Pin assignment

### Note

#### Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for analog inputs

The tables below show the pin assignments of the four sockets for connection of the analog inputs.

Table 3- 1 Pin assignment of the sockets for analog inputs (voltage measurement)

| Pin    | Assignment                                                                                                                                                                                               | Front view of the sockets                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|        | <b>X10 to X13 - sockets for analog inputs (voltage measurement)</b>                                                                                                                                      |                                                                                      |

**NOTICE****Short-circuit from encoder supply to measuring input**

In the operating mode current measurement a short-circuit from the encoder supply to the measuring input can destroy the input channel.

Table 3- 3 Pin assignment of the sockets for analog inputs (RTD/R 2-wire connection)

| Pin    | Assignment                                                                                                                                                                                                                           | Front view of the sockets                                                           |

**NOTICE****Incorrect connection of sensors at channel**

If the measurement type current or voltage measurement is configured at the I/O module, a connected resistance thermometer could be destroyed.

**Note****Coupler plug for RTD measurement**

For RTD measurements, use a coupler plug with gold-plated contacts. Other materials can create contact resistance that can result in incorrect measured values.

**Pin assignment of the sockets for ET-Connection**

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 5 Pin assignment for ET-Connection

| Pin    | Assignment                    |                                | Assignment of the core color of the bus cable for ET-Connection | Front view of the sockets                                                             |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 7 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the socket                                                            |
|-----|-----------------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                 |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | brown                                           |  |
| 2   | Ground 2M (switched)              | white                                           |                                                                                     |
| 3   | Ground 1M (non-switched)          | blue                                            |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | black                                           |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the connector for ET-Connection and the connector for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Measurement types and measuring ranges

The table below indicates which measuring range is configurable.

Table 4- 1 Measurement type and measuring ranges

| Measurement type                                                                         | Measuring range                                 | Temperature coefficient                                                              | Resolution             |

## 4.2 Parameters

### Parameters of the analog input module AI 4xU/I/RTD 4xM12

The table below lists the parameters that can be set. The effective range of the parameters that can be set depends on the type of configuration. The following configurations are possible:

- Distributed operation on PROFINET IO
- Distributed operation with PROFIBUS DP

|                                                                                                                                                                                                                                                                                    |

## 4.2 Parameters

The table below shows the PROFINET and PROFIBUS parameters for the analog input module AI 4xU/I/RTD 4xM12 for configuration with GSD file.

Explanation of abbreviations in table below:

|        |                                          |
|--------|------------------------------------------|
| 4-DMU  | 4-wire transducer                        |
| 2-DMU  | 2-wire transducer                        |
| R-3L   | Resistance 3-wire transducer             |
| R-2L   | Resistance 2-wire transducer             |
| RTD-3L | Resistance thermometer 3-wire transducer |
| RTD-2L | Resistance thermometer 2-wire transducer |

Table 4- 2 Configurable parameters and their defaults

**Note****Unused channels**

"Deactivate" unused inputs in the parameter assignment to shorten the cycle time of the module.

A deactivated input always returns the value 7FFF<sub>H</sub>.

The table below shows the permitted value ranges for the measurement type.

Table 4- 3 Measuring ranges of the hardware interrupts

| Measure-<br>ment type     | Measuring<br>range | Low limit | High limit | Default   |            | Unit    |
|---------------------------|--------------------|-----------|------------|-----------|------------|---------|

## 4.3 Explanation of the parameters

### Temperature unit

You use this parameter to set the temperature unit with which you want to measure the temperature.

### Measurement type/measuring range channel n

You use this parameter to set the measurement type or the measuring range for acquiring the measured values.

---

#### Note

##### Unused channels

"Deactivate" unused channels in the parameter assignment to improve the cycle time of the module.

A deactivated channel always returns the value 7FFF<sub>H</sub>.

---

### Temperature coefficient (for RTD, resistance thermometer)

The temperature coefficient depends on the chemical composition of the material. In Europe, only one value is used per sensor type (default value).

The correction factor for the temperature coefficient ( $\alpha$  value) specifies how much the resistance of a certain material changes when the temperature is raised by 1 °C.

The further values facilitate sensor-specific setting of the temperature coefficient and enhance accuracy.

## Smoothing channel n

The purpose of smoothing is to filter out interferences. The greater the smoothing factor, the better the filter effect. This is technically implemented in the form of a digital filter. The smoothing can be set in 4 levels. The smoothing factor  $k$  is equal to the number of module cycles. The time constant of the smoothing filter is the product of the smoothing factor  $k$  and the cycle time of the I/O module. The greater the smoothing, the greater the time constant of the filter.

Smoothing time = number of module cycles ( $k$ ) × cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This is valid for all signal changes at the analog input.

Figure 4-1 Smoothing

## Interference frequency suppression channel n

This parameter suppresses interference for analog input modules which is caused by the frequency of the alternating voltage network in use.

The frequency of the alternating voltage network may negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

## Diagnostics: Short-circuit to ground channel n

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

## 4.3 Explanation of the parameters

**Diagnostics: Wire break channel n**

Enabling of the diagnostics if the analog input module has no current flow or the current is too weak for measurement at the correspondingly configured input.

**Note****Wire break diagnostics**

A wire break diagnostics is not possible for all measuring ranges and measurement types for analog input channels.

The table below shows the rules you must observe in the case of a wire break in the measuring ranges 1 to 5, 4 to 20 mA:

Table 4- 4 Parameters for wire break

| Parameter                                                                                                                                                                                                    | Event      | Measured value    | Explanation                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------------|----------------------------------------------|
| Wire break enabled <sup>1</sup>                                                                                                                                                                              | Wire break | 7FFF <sub>H</sub> | <b>Wire break</b> diagnostics                |
| Wire break disabled <sup>1</sup>                                                                                                                                                                             | Wire break | 8000 <sub>H</sub> | Measured value after leaving the under-range |
| Underflow enabled                                                                                                                                                                                            |            |                   | Diagnostics alarm <b>Low limit violated</b>  |
| Wire break disabled <sup>1</sup><br>Underflow disabled                                                                                                                                                       | Wire break | 8000 <sub>H</sub> | Measured value after leaving the under-range |
| <sup>1</sup> Measuring range limits for detection of wire break and measuring range undershoot: <ul style="list-style-type: none"> <li>1 V to 5 V: at 0.296 V</li> <li>4 mA to 20 mA: at 1.185 mA</li> </ul> |            |                   |                                              |

The table below shows the diagnostics that can occur for wire break with the measurement type RTD/R.

Table 4- 5 Diagnostics with RTD/R

| Diagnostics: Wire break | Diagnostics: Overflow | Diagnostics: Underflow* | Event      | Process data | Diagnostics alarm per channel |
|-------------------------|-----------------------|-------------------------|------------|--------------|-------------------------------|
| activated               | Deactivated           | Deactivated             | Wire break | 0x7FFF       | Wire break                    |
| Deactivated             | Deactivated           | Activated               | Wire break | 0x7FFF       | -                             |
| Deactivated             | Activated             | Deactivated             | Wire break | 0x7FFF       | High limit exceeded           |
| Deactivated             | Activated             | Activated               | Wire break | 0x7FFF       | High limit violated           |
| Deactivated             | Deactivated           | Deactivated             | Wire break | 0x7FFF       | -                             |

\* This column does not apply to the measurement type resistance.

**Diagnostics: Underflow channel n**

Enabling of the diagnostics when the measured value falls below the under-range.

**Diagnostics: Overflow channel n**

Enabling of the diagnostics when the measured value exceeds the overrange.

**Diagnostics: Overflow/Underflow (for PROFIBUS only)**

Enabling of the diagnostics when the measured value exceeds the overrange or falls below the underrange.

The diagnostic enable has an effect on all channels.

**Hardware interrupt high/low limit 1 or 2 channel n**

Enabling of a hardware interrupt when the high limit 1 or 2 or the low limit 1 or 2 is violated.

Requirement: An OB 4x must be assigned to the CPU/device.

Additional information on the structure of hardware interrupts is available in the section Interrupts (Page 33).

**High/low limit 1 or 2 channel n**

Specify a threshold at which a hardware interrupt is triggered when it is exceeded or undershot.

**4.4 Address space**

The figure below shows the assignment of the address space for the analog input module AI 4xU/I/RTD 4xM12 with value status (Quality Information, QI). If you are using PROFINET and the value status was enabled, the addresses for the value status are available. The value status is not available for PROFIBUS.

Assignment in the process image input (PII)

Figure 4-2 Address space

### Configuration options of analog input module AI 4xU/I/RTD 4xM12

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

If you enable the value status for the analog input module, a bit is also assigned in the input address space. Bits 0 to 3 in this byte are assigned to a channel and provide information on the validity of the analog value. The value status is independent of whether or not diagnostics was configured.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

## 5.1 Status and error displays

### LED displays

The figure below shows the LED display (status and error displays) of the analog input module AI 4xU/I/RTD 4xM12.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0, 1, 2 and 3) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 35).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                      | Meaning                                                                                                                                                                                                                                                                                                     |

## 5.2 Interrupts

Analog input module AI 4xU/I/RTD 4xM12 supports the following diagnostic and hardware interrupts.

### Diagnostic interrupt

The table below shows the events for which the analog input module returns a diagnostic interrupt, depending on the parameter assignment.

Table 5- 3 Diagnostic interrupts

| Measure-<br>ment type     | Measuring<br>range        | Diagnostics                    |            |                        |                       |                                     |
|---------------------------|---------------------------|--------------------------------|------------|------------------------|-----------------------|-------------------------------------|
|                           |                           | Short-<br>circuit to<br>ground | Wire break | Underflow <sup>1</sup> | Overflow <sup>1</sup> | Underflow/<br>Overflow <sup>2</sup> |

<sup>2</sup> Column valid for configuration with PROFIBUS GSD file

## Hardware interrupt

The analog input module generates a hardware interrupt with the following events:

- Low limit 1 violated
- High limit 1 violated
- Low limit 2 violated
- High limit 2 violated

Detailed information on the event is available in the hardware interrupt organization block with the instruction "RALRM" (Read additional interrupt information) and in the STEP 7 online help.

The start information of the organization block includes information on which channel of the analog input module triggered the hardware interrupt.

### Note

#### Violation of two limits

If two limits are violated at the same time, limit 1 is always signaled first, followed by limit 2.

The figure below shows the assignment to the bits of the local data double word 8.

Figure 5-2 Start information of the organization block

## Structure of the additional interrupt information

Table 5- 4 Structure of USI = W#16#0001

| Data block name                                                | Contents           | Comment                                                             | Bytes |
|----------------------------------------------------------------|--------------------|---------------------------------------------------------------------|-------|
| <b>USI</b><br>(User Structure Identifier)                      | W#16#0001          | Additional interrupt info for hardware interrupts of the I/O module | 2     |
| The channel that triggered the hardware interrupt follows.     |                    |                                                                     |       |
| <b>Channel</b>                                                 | B#16#00 to B#16#03 | Number of channel which triggered the event                         | 1     |
| The error event that triggered the hardware interrupt follows. |                    |                                                                     |       |
| <b>Event</b>                                                   | B#16#03            | Low limit 1 violated                                                | 1     |
|                                                                | B#16#04            | High limit 1 violated                                               |       |
|                                                                | B#16#05            | Low limit 2 violated                                                |       |
|                                                                | B#16#06            | High limit 2 violated                                               |       |

## 5.3 Diagnostics alarms

A diagnostics alarm is output for each diagnostic event and the DIAG LED flashes red on the analog input module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

The following tables set out the diagnostics alarms for the set measuring range.

Table 5- 5 Diagnostics alarms - for the measuring range: 1 V to 5 V, 2-DMU 4 mA to 20 mA and 4-DMU 4 mA to 20 mA

| Diagnostics alarm       | Error code      | Meaning                                                                                                 | Remedy                                                                                                                            |
|-------------------------|-----------------|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Short-circuit           | 1 <sub>H</sub>  | Short-circuit encoder supply to ground                                                                  | Correct interplay between module and encoder                                                                                      |
| Wire break              | 6 <sub>H</sub>  | Wire break between the module and sensor                                                                | Connect the cable                                                                                                                 |
|                         |                 | Channel not connected (open)                                                                            | <ul style="list-style-type: none"> <li>Deactivate diagnostics</li> <li>Connect the channel</li> <li>Deactivate channel</li> </ul> |
| High limit violated     | 7 <sub>H</sub>  | Value is above overrange.                                                                               | Correct interplay between module and sensor                                                                                       |
| Low limit violated      | 8 <sub>H</sub>  | Value is below underrange.                                                                              | Correct interplay between module and sensor                                                                                       |
| Error                   | 9 <sub>H</sub>  | Value is significantly above or below underrange/overrange.                                             | Correct interplay between module and sensor                                                                                       |
| Parameter error         | 10 <sub>H</sub> | Module parameter assignment is faulty                                                                   | Correct the parameter assignment                                                                                                  |
| Hardware interrupt lost | 16 <sub>H</sub> | At least one hardware interrupt could not be signaled because too many hardware interrupts are pending. | Correct the program or the process                                                                                                |

## 5.3 Diagnostics alarms

Table 5- 6 Diagnostics alarms - for the measuring range: 0 V to 10 V and 4-DMU 0 mA to 20 mA

| Diagnostics alarm       | Error code      | Meaning                                                                                                 | Remedy                                       |
|-------------------------|-----------------|---------------------------------------------------------------------------------------------------------|----------------------------------------------|
| Short-circuit           | 1 <sub>H</sub>  | Short-circuit encoder supply to ground                                                                  | Correct interplay between module and encoder |
| High limit violated     | 7 <sub>H</sub>  | Value is above overrange.                                                                               | Correct interplay between module and sensor  |
| Low limit violated      | 8 <sub>H</sub>  | Value is below underrange.                                                                              | Correct interplay between module and sensor  |
| Error                   | 9 <sub>H</sub>  | Value is significantly above or below underrange/overrange.                                             | Correct interplay between module and sensor  |
| Parameter error         | 10 <sub>H</sub> | Module parameter assignment is faulty                                                                   | Correct the parameter assignment             |
| Hardware interrupt lost | 16 <sub>H</sub> | At least one hardware interrupt could not be signaled because too many hardware interrupts are pending. | Correct the program or the process           |

Table 5- 7 Diagnostics alarms - for the measuring range: 150 Ω and 300 Ω

| Diagnostics alarm       | Error code      | Meaning                                                                                                 | Remedy                                                                                                                            |
|-------------------------|-----------------|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Wire break              | 6 <sub>H</sub>  | Impedance of encoder circuit too high                                                                   | Use a different encoder type or modify the wiring, for example, using cables with larger cross-section                            |
|                         |                 | Wire break between the module and sensor                                                                | Connect the cable                                                                                                                 |
|                         |                 | Channel not connected (open)                                                                            | <ul style="list-style-type: none"> <li>Deactivate diagnostics</li> <li>Connect the channel</li> <li>Deactivate channel</li> </ul> |
| High limit violated     | 7 <sub>H</sub>  | Value is above overrange.                                                                               | Correct interplay between module and sensor                                                                                       |
| Parameter error         | 10 <sub>H</sub> | Module parameter assignment is faulty                                                                   | Correct the parameter assignment                                                                                                  |
| Hardware interrupt lost | 16 <sub>H</sub> | At least one hardware interrupt could not be signaled because too many hardware interrupts are pending. | Correct the program or the process                                                                                                |

**Note****Measurement type resistor (3-wire terminal)**

A wire break of the M+ cable is not detected with measurement type resistor (3-wire terminal). An incorrect measuring value is output in this case.

Table 5- 8 Diagnostics alarms - for the measuring range: Pt100 and Ni100

| Diagnostics alarm       | Error code | Meaning                                                                                                 | Remedy                                                                                                                                  |
|-------------------------|------------|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Wire break              | 6H         | Impedance of encoder circuit too high                                                                   | Use a different encoder type or modify the wiring, for example, using cables with larger cross-section                                  |
|                         |            | Wire break between the module and sensor                                                                | Connect the cable                                                                                                                       |
|                         |            | Channel not connected (open)                                                                            | <ul style="list-style-type: none"> <li>• Deactivate diagnostics</li> <li>• Connect the channel</li> <li>• Deactivate channel</li> </ul> |
| High limit violated     | 7H         | Value is above overrange.                                                                               | Correct interplay between module and sensor                                                                                             |
| Low limit violated      | 8H         | Value is below underrange.                                                                              | Correct interplay between module and sensor                                                                                             |
| Parameter error         | 10H        | Module parameter assignment is faulty                                                                   | Correct the parameter assignment                                                                                                        |
| Hardware interrupt lost | 16H        | At least one hardware interrupt could not be signaled because too many hardware interrupts are pending. | Correct the program or the process                                                                                                      |

## Technical specifications

### Technical specifications of the analog input module AI 4xU/I/RTD 4xM12

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7144-5KD00-0BA0/td?dl=en>).

|                                                          |                                                            |

# PROFlenergy

## 7.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific response of the analog input module is explained in the section below.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<http://support.automation.siemens.com/WW/view/en/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V13 (<http://support.automation.siemens.com/WW/view/en/49948856>).

Application examples (<http://support.automation.siemens.com/WW/view/en/41986454>) are also available on the Internet.

## 7.2 Response of the analog input module

### Requirement

You can use the PROFenergy function when you use the internal encoder supply.

### Display

The channel status LEDs are not affected by PROFenergy.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- Encoder supply switch-off upon the start of "pause" does not result in the alarm "Wire break".
- "Wire break", "Short circuit", "High limit violated" and "Low limit violated" error detection is not possible during the "pause":
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.
- Hardware interrupts are not signaled.

## Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                                                                                               |
|---------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Changes compared to previous version

Compared to the previous version, this manual contains the following adaptations in the section Technical specifications (Page 39).

## Conventions

Also observe notes marked as follows:

---

### Note

A note contains important information on the product described in the documentation and on the handling of the product to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## **"mySupport"**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## **"mySupport" - Documentation**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## **"mySupport" - CAx data**

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## **Application examples**

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7144-5KD50-0BA0

#### View of the module

Figure 2-1 View of the analog input module AI 4xRTD/TC 4xM12

## Properties

The module has the following technical properties:

- 4 analog inputs
- M12 sockets for connection of sensors
- Measurement type can be set for each channel:
  - Voltage measurement:  $\pm 80$  mV
  - Resistance measurement: 0-150 Ohm, 0-300 Ohm (2-/3-/4-wire connection)
  - Thermal resistance measurement: Pt/Ni100, Pt/Ni1000 (2-/3-/4-wire connection)
  - Thermocouple measurement: Type B, C, E, J, K, L, N, R, S, T, U
- Connection for isolated/non-isolated thermocouples
- Resolution 16-bit
- Dimensions 30 x 159 x 40 mm
- Accuracy according to AMS2750E
- Configurable diagnostics can be set for each channel
- Hardware interrupt on limit violation can be set per channel (two high and two low limits per channel)
- Various options to compensate for the reference junction temperature

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)

---

### Note

#### Process values during startup

As long as no parameters have been received by the I/O module, the I/O module returns the process value 7FFF<sub>H</sub>.

---

## Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.industry.siemens.com/cs/ww/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator control and display elements of the analog input module AI 4xRTD/TC 4xM12.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X13: Sockets for the input signal
- ③ X80: Connector for infeed of the supply voltage (POWER input)
- ④ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑤ X30: Socket for ET-Connection IN
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ LED displays 0 to 3 for the channel status

Figure 3-1 Example of voltage and thermocouple measurement

## 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment for thermal resistance and resistance measurement.

|            |                                   |            |                                               |
|------------|-----------------------------------|------------|-----------------------------------------------|
| ①          | RTD/R 2-wire connection           | X30        | Infeed of the ET-Connection                   |
| ②          | RTD/R 3-wire connection           | X31        | Loop-through of the ET-Connection             |
| ③          | RTD/R 4-wire connection           | 1L+        | Supply voltage 1L+ (non-switched)             |
| ④          | Multiplexer                       | 1M         | Ground 1M (non-switched)                      |
| ⑤          | Analog-to-digital converter (ADC) | 2L+        | Load voltage 2L+ (switched)                   |
| ⑥          | Microcontroller                   | 2M         | Ground 2M (switched)                          |
| ⑦          | ET-Connection interface           | Mn+        | Measuring input positive, channel n           |
| ⑧          | Internal supply voltage           | Mn-        | Measuring input negative, channel n           |
| X10 to X13 | Channels 0 to 3                   | Icn+, Icn- | Current output, current feed, RTD/R channel n |
| X80        | Infeed of supply voltages         | AI         | Channel status LEDs (0, 1, 2 and 3) (green)   |
| X81        | Loop-through of supply voltages   | DIAG       | LED diagnostic status (red/green)             |

Figure 3-2 Example of resistance and thermal resistance measurement

## 3.2 Pin assignment

### Note

#### Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for analog inputs

The tables below show the pin assignments of the four sockets for connection of the analog inputs.

Table 3- 1 Pin assignment for thermocouple + voltage measurement

| Pin    | Assignment                                                                                                                                                                                               | Front view of the sockets                                                            |

**Note****Coupler plug for RTD measurement**

For RTD measurements, use a coupler plug with gold-plated contacts. Other materials can create contact resistance that can result in incorrect measured values.

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 5 Pin assignment for ET-Connection

| Pin    | Assignment                    |                                | Assignment of the core color of the bus cable for ET-Connection | Front view of the sockets                                                           |                                                                                     |
|--------|-------------------------------|--------------------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|        | X30 socket (ET-Connection IN) | X31 socket (ET-Connection OUT) |                                                                 | X30                                                                                 | X31                                                                                 |
| 1      | TXP                           | RXP                            | Yellow                                                          |  |  |
| 2      | RXP                           | TXP                            | White                                                           |                                                                                     |                                                                                     |
| 3      | RXN                           | TXN                            | Blue                                                            |                                                                                     |                                                                                     |
| 4      | TXN                           | RXN                            | Orange                                                          |                                                                                     |                                                                                     |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 6 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the connector                                                           |
|-----|-----------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                 |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                       |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                       |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 7 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the socket                                                            |
|-----|-----------------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                 |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                           |  |
| 2   | Ground 2M (switched)              | White                                           |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                            |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                           |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the connector for ET-Connection and the connector for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Measurement types and measuring ranges

The table below indicates which measuring range is configurable.

Table 4- 1 Measurement type and measuring ranges

| Measurement type                                                                                                                                                                   | Measuring range                                                                                                                                                        | Temperature coefficient                                                                                                                                    | Resolution             |

## 4.2 Parameters

### Parameters of the analog input module AI 4xRTD/TC 4xM12

Specify the module properties with the various parameters in the course of the parameter assignment of the module with STEP 7. The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Distributed mode on PROFINET IO
- Distributed mode with PROFIBUS DP
- Central operation with an ET 200SP CPU

#### NOTICE

##### Match of encoder and parameters

The default setting of the analog inputs is voltage measurement ( $\pm 80$  mV).

Make sure that the connected encoders and the selected parameters match.

### Parameters and presettings of the analog input module.

The table below shows the PROFINET IO and PROFIBUS DP parameters for the analog input module AI 4xRTD/TC 4xM12 for configuration with GSD file.

Table 4- 2 Configurable parameters and their default (GSD)

| Parameter        | Value range                                                                                                         | Default         | Effective range with configuration software e.g. STEP 7 (TIA Portal) |                      |
|------------------|---------------------------------------------------------------------------------------------------------------------|-----------------|----------------------------------------------------------------------|----------------------|
|                  |                                                                                                                     |                 | GSD file PROFINET IO                                                 | GSD file PROFIBUS DP |
| Temperature unit | <ul style="list-style-type: none"> <li>• Degrees Celsius</li> <li>• Degrees Fahrenheit</li> <li>• Kelvin</li> </ul> | Degrees Celsius | Module                                                               | Module               |

| Parameter                 | Value range                                                                                                                                                                                                                                                                                                                                       | Default                | Effective range with configuration software e.g. STEP 7 (TIA Portal) |         |

<sup>1</sup> Interference frequency suppression: Noise at 400 Hz is automatically included in the filtering at 50 Hz.

<sup>2</sup> For 2-wire connection only

### Note

#### Unused channels

"Deactivate" unused inputs in the parameter assignment to shorten the cycle time of the module.

A deactivated input always returns the value 7FFF<sub>H</sub>.

## Value ranges of the hardware interrupts

The table below shows the permitted value ranges of the hardware interrupts for the measurement type.

Table 4- 3 Value ranges of the hardware interrupts

| Measurement type | Measuring range | Low limit | High limit | Unit    |
|------------------|-----------------|-----------|------------|---------|
| Voltage          | ± 80 mV         | -94.071   | 94.068     | mV      |
|                  |                 | -32511    | 32510      | Decimal |
| Resistance       | 150 ohm         | 0.01      | 176.38     | Ω       |
|                  |                 | 2         | 32510      | Decimal |
|                  | 300 ohm         | 0.01      | 352.76     | Ω       |
|                  |                 | 1         | 32510      | Decimal |

## 4.2 Parameters

## 4.3 Explanation of the parameters

**"Fixed reference temperature" parameter for thermocouples**

The parameter "Fixed reference temperature" can only be set if you selected = "Fixed Reference Temperature" for the "Reference junction" parameter.

The following table shows the value ranges for the "reference temperature" for thermocouples.

Table 4- 4 Value ranges for the "reference temperature" for thermocouples.

| Temperature unit | Temperature |       | Decimal |      |
|------------------|-------------|-------|---------|------|
|                  | Min.        | Max   | Min.    | Max  |
| Celsius          | -145.0      | 155   | -1450   | 1550 |
| Fahrenheit       | -229.0      | 311.0 | -2290   | 3110 |
| Kelvin           | 128.2       | 327.6 | 1282    | 3276 |

## 4.3 Explanation of the parameters

**Temperature unit**

You use this parameter to set the temperature unit with which you want to measure the temperature.

**Type/range of measurement**

You use this parameter to set the measurement type or the measuring range for acquiring the measured values.

**Note****Unused channels**

"Deactivate" unused channels in the parameter assignment to improve the cycle time of the module.

A deactivated channel always returns the value 7FFF<sub>H</sub>.

**Temperature coefficient (for RTD)**

The temperature coefficient depends on the chemical composition of the material. In Europe, only one value is used per sensor type (default value).

The correction factor for the temperature coefficient ( $\alpha$  value) specifies how much the resistance of a certain material changes when the temperature is raised by 1 °C.

The further values facilitate sensor-specific setting of the temperature coefficient and enhance accuracy.

## Reference junction

If the measuring point is subjected to a different temperature than the reference junction (free ends of the thermocouple at the connection point), a thermal voltage arises between the free ends. The level of the thermal voltage depends:

- On the temperature difference between the measuring point and the free ends
- On the type of material combination of the thermocouple

Since a temperature difference is always detected with a thermocouple, the temperature of the reference junction has to be determined in order to determine the temperature of the measuring point.

The possible compensation types that can be parameterized via the parameter "reference junction" are set out in the table below.

Table 4- 5 Parameterizable compensation types for the "reference junction" parameter

| Compensation type             | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fixed reference temperature   | <p><b>Properties</b></p> <p>With this type of compensation, the reference junction temperature is stored as a fixed value.</p> <p><b>Principle of operation</b></p> <p>The reference junction temperature is specified in the "fixed reference temperature" parameter. The possible value range is displayed in the Table 4-4 Value ranges for the "reference temperature" for thermocouples. (Page 26).</p> <p>The configured reference junction temperature applies to all channels of the module that you have selected for this type of compensation.</p> <p><b>Wiring</b></p> <p>Connect the thermocouples to terminals 3 and 4 from the reference junction with copper cables. If you detect the reference junction temperature directly at the M12 connector of the AI 4xRTD/TC 4xM12, you can also connect the thermocouples directly or with compensating lines.</p>                                                           |
| Dynamic reference temperature | <p><b>Properties</b></p> <p>With this compensation, the reference junction temperature can be measured via an external module of another station.</p> <p><b>Principle of operation</b></p> <p>The reference junction temperature is transferred by means of SFB 53 by the data records 192 - 195 from the CPU to the AI 4xRTD/TC 4xM12 electronic module. Each channel that you select for this type of compensation can have its own reference junction temperature assigned to it via the user program. For more information, see section Structure of a data record for dynamic reference temperature (Page 31).</p> <p><b>Wiring</b></p> <p>Connect the thermocouples to Terminals 3 and 4 from the reference junction with copper cables. If you detect the reference junction temperature directly at the M12 connector of the AI 4xRTD/TC 4xM12, you can also connect the thermocouples directly or with compensating lines.</p> |

## 4.3 Explanation of the parameters

| Compensation type           | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal reference junction | <p><b>Properties</b></p> <p>With this compensation type, the reference junction temperature is determined with an internal temperature sensor that is integrated in the AI 4xRTD/TC 4xM12 electronic module.</p> <p>Note: Take the reaction time to changes of the ambient temperature into account.</p> <p><b>Principle of operation</b></p> <p>The reference junction temperature is detected through an internal temperature sensor.</p> <p>All channels of the AI 4xRTD/TC 4xM12 that you select for this type of compensation receive the same reference junction temperature.</p> <p><b>Wiring</b></p> <p>Connect the thermocouples directly or with compensating lines to the AI 4xRTD/TC 4xM12.</p>                                                                |
| No compensation             | <p><b>Properties</b></p> <p>With this compensation type, the reference junction temperature of the thermocouples is measured outside the AI 4xRTD/TC 4xM12 electronic module. You can, for example, connect a compensating box to the thermocouple for this purpose.</p> <p><b>Principle of operation</b></p> <p>The temperature of the reference junction for this type of compensation is specified as 0 °C.</p> <p>This can be achieved by using a compensating box. A separate compensating box is required for each thermocouple.</p> <p><b>Wiring</b></p> <p>Connect the compensating box with the AI 4xRTD/TC 4xM12 with copper cables.</p> <p>Note: Thermocouples of Type B do not require a compensating box up to a reference junction temperature of 50 °C.</p> |

## Smoothing

The purpose of smoothing is to filter out interferences. The greater the smoothing factor, the better the filter effect. This is technically implemented in the form of a digital filter. The smoothing can be set in 4 levels. The smoothing factor  $k$  is equal to the number of module cycles. The time constant of the smoothing filter is the product of the smoothing factor  $k$  and the cycle time of the I/O module. The greater the smoothing, the greater the time constant of the filter.

Smoothing time = number of module cycles ( $k$ )  $\times$  cycle time of the module.

The following figure shows how many module cycles it takes for the smoothed analog value to approach 100%, depending on the configured smoothing. This is valid for all signal changes at the analog input.

Figure 4-1 Smoothing

## Interference frequency suppression

This parameter suppresses interference for analog input modules which is caused by the frequency of the alternating voltage network in use.

The frequency of the alternating voltage network may negatively affect the measured value, in particular when measuring in the low voltage range and with thermocouples. With this parameter, the user specifies the line frequency that is predominant in the plant.

## Diagnostics: Reference junction

Enabling of the reference junction diagnostics if the reference temperature of the reference junction needs to be determined for the TC channel being operated.

## 4.3 Explanation of the parameters

**Diagnostics: Wire break**

Enabling of the diagnostics if the analog input module has no current flow or the current is too weak for measurement at the correspondingly configured input.

**Note****Wire break diagnostics**

With analog input channels, wire break diagnostics is not possible for the measurement type voltage  $\pm 80$  mV.

The following table shows the diagnostics that may occur on wire break.

Table 4- 6 Diagnostics with RTD/R

| Diagnostics: Wire break | Diagnostics: Overflow | Diagnostics underflow | Event      | Process data | Diagnostics alarm per channel |
|-------------------------|-----------------------|-----------------------|------------|--------------|-------------------------------|
| Enabled                 | Disabled              | Disabled              | Wire break | 0x7FFF       | Wire break                    |
| Disabled                | Disabled              | Enabled               | Wire break | 0x7FFF       | -                             |
| Disabled                | Enabled               | Disabled              | Wire break | 0x7FFF       | High limit violated           |
| Disabled                | Enabled               | Enabled               | Wire break | 0x7FFF       | High limit violated           |
| Disabled                | Disabled              | Disabled              | Wire break | 0x7FFF       | -                             |

**Diagnostics: Overflow/Underflow (for PROFIBUS only)**

Enabling of the diagnostics when the measured value exceeds the overrange or falls below the underrange.

**Diagnostics: Underflow**

Enabling of the diagnostics when the measured value falls below the underrange.

**Diagnostics: Overflow**

Enabling of the diagnostics when the measured value exceeds the overrange.

**Conductor resistance**

Parameters for the measurement types resistor and thermal resistor (2-wire connection).

The parameter is used to compensate the conductor resistance without interfering with the sensor wiring.

**Hardware interrupt high/low limit 1 or 2**

Enabling of a hardware interrupt when the high limit 1 or 2 or the low limit 1 or 2 is violated.

Requirement: An OB 4x must be assigned to the CPU/device.

Additional information on the structure of hardware interrupts is available in the section Interrupts (Page 36).

**High/low limit 1 or 2**

Specify a threshold at which a hardware interrupt is triggered when it is exceeded or undershot.

**See also**

Parameters (Page 20)

**4.4 Structure of a data record for dynamic reference temperature**

The **WRREC** instruction is used to transfer the reference junction temperature via data record 192 to data record 195 to the module.

The description of the WRREC instruction can be found in the online help from STEP 7.

If you have set the "Dynamic reference temperature" value for the "Reference junction" parameter, the module expects a new data record at least every 5 minutes. If the module does not receive a new data record within this time, it generates the "Reference channel error" diagnostics message.

**Assignment of data record and channel**

The assignment of the channels is:

- Data record 192 for channel 0
- Data record 193 for channel 1
- Data record 194 for channel 2
- Data record 195 for channel 3

### Structure of data record 192 for dynamic reference temperature

The following figure shows you an example of the structure of data record 192 for channel 0. The structure for data records 193 to 195 is identical.

Figure 4-2 Structure of data record 192

### Valid values for fixed temperature compensation

The selectable values must lie within the permitted value range. The resolution of the valid values for temperature compensation is a tenth of a degree

Table 4- 7 Valid values for temperature compensation via data record

| Temperature unit      | Decimal          | Hexadecimal     |
|-----------------------|------------------|-----------------|
| Celsius (default)     | -1450 ... 1550   | FA56H ... 60EH  |
| Fahrenheit (default)  | -2290 ... 3110   | F70EH ... C26H  |
| Kelvin (default)      | 1282 ... 3276    | 502H ... CCH    |
| Celsius (climatic)    | -14500 ... 15500 | C75CH ... 3C8CH |
| Fahrenheit (climatic) | -22900 ... 31100 | A68CH ... 797CH |
| Kelvin (climatic)     | 12820 ... 32760  | 3214H ... 7FF8H |

#### Note

Thanks to the flexible content of the data records DS 192 - DS 195, you can use a separate reference junction for each channel. The channels can also be combined via the user program in such a way that they use the same reference junction. To this end, you need to specify the same temperature value in the data records for all channels operating with the same reference function temperature.

### Additional information

You can find more information on compensation of the reference junction temperature via data record in the function manual SIMATIC analog value processing (<https://support.industry.siemens.com/cs/ww/en/view/67989094>).

# Interrupts/diagnostics alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED display (status and error displays) of the AI 4xRTD/TC 4xM12 analog input module.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0, 1, 2 and 3) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 38).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                                                                                                                             |

## 5.2 Interrupts

The AI 4xRTD/TC 4xM12 analog input module supports diagnostic and hardware interrupts.

### Diagnostic interrupt

The table below shows the events for which the analog input module returns a diagnostic interrupt, depending on the parameter assignment.

Table 5- 3 Diagnostic interrupts

| Measure-<br>ment type | Diagnostics   |                        |                       |       |                                         |                               |                               |
|-----------------------|---------------|------------------------|-----------------------|-------|-----------------------------------------|-------------------------------|-------------------------------|
|                       | Wire<br>break | High limit<br>violated | Low limit<br>violated | Error | Parame-<br>ter as-<br>signment<br>error | Reference<br>channel<br>error | Hardware<br>interrupt<br>lost |
| Voltage               | -             | x                      | x                     | x     | x                                       | -                             | x                             |
| Resistance            | x             | x                      | -                     | x     | x                                       | -                             | x                             |
| Thermal<br>resistor   | x             | x                      | x                     | x     | x                                       | -                             | x                             |
| Thermocou-<br>ple     | x             | x                      | x                     | x     | x                                       | x                             | x                             |

### Hardware interrupt

The analog input module generates a hardware interrupt with the following events:

- Low limit 1 violated
- High limit 1 violated
- Low limit 2 violated
- High limit 2 violated

Detailed information on the event is available in the hardware interrupt organization block with the instruction "RALRM" (Read additional interrupt information) and in the STEP 7 online help.

The start information of the organization block includes information on which channel of the analog input module triggered the hardware interrupt.

---

#### Note

##### High limit violation of 2 limits

If two limits are violated at the same time, limit 1 is always signaled first, followed by limit 2.

---

The figure below shows the assignment to the bits of the local data double word 8.

Figure 5-2 Start information of the organization block

## Structure of the additional interrupt information

Table 5- 4 Structure of the additional interrupt information

| Data block name                                                | Contents              | Comment                                                             | Bytes |
|----------------------------------------------------------------|-----------------------|---------------------------------------------------------------------|-------|
| <b>USI</b><br>(User Structure Identifier)                      | W#16#0001             | Additional interrupt info for hardware interrupts of the I/O module | 2     |
| The channel that triggered the hardware interrupt follows.     |                       |                                                                     |       |
| <b>Channel</b>                                                 | B#16#00 to<br>B#16#03 | Number of channel which triggered the event                         | 1     |
| The error event that triggered the hardware interrupt follows. |                       |                                                                     |       |
| <b>Event</b>                                                   | B#16#03               | Low limit 1 violated                                                | 1     |
|                                                                | B#16#04               | High limit 1 violated                                               |       |
|                                                                | B#16#05               | Low limit 2 violated                                                |       |
|                                                                | B#16#06               | High limit 2 violated                                               |       |

## 5.3 Diagnostics alarms

A diagnostics alarm is output for each diagnostics event. The DIAG LED flashes red on the analog output module. The diagnostics alarms are listed in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

The following tables set out the diagnostics alarms for the set measuring range.

Table 5- 5 Diagnostics alarms, their meaning and remedies

| Diagnostics alarm                | Error code | Meaning                                                                                                                                                | Remedy                                                                                                                        |
|----------------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Wire break                       | 6H         | Wire break between the module and sensor                                                                                                               | Connect the cable                                                                                                             |
|                                  |            | Channel not connected (open)                                                                                                                           | <ul style="list-style-type: none"> <li>Deactivate diagnostics</li> <li>Connect channel</li> <li>Deactivate channel</li> </ul> |
| High limit violated <sup>1</sup> | 7H         | Value is above overrange.                                                                                                                              | Correct interplay between module and sensor                                                                                   |
|                                  |            | Wire break <sup>2</sup>                                                                                                                                | See wire break                                                                                                                |
| Low limit violated <sup>1</sup>  | 8H         | Value is below underrange.                                                                                                                             | Correct interplay between module and sensor                                                                                   |
| Error                            | 9H         | Value is significantly above or below underrange/overrange.                                                                                            | Correct interplay between module and sensor                                                                                   |
| Parameter error                  | 10H        | <ul style="list-style-type: none"> <li>The module cannot evaluate parameters for the channel</li> <li>Module parameter assignment is faulty</li> </ul> | Correct the parameter assignment (wire break diagnostics set only with the permitted measuring ranges).                       |
| Reference channel error          | 15H        | Data record 192 ... 195 was not correctly cyclically received within 5 min                                                                             | Write data record 192 ... 195                                                                                                 |
| Hardware interrupt lost          | 16H        | At least one hardware interrupt was not signaled because too many hardware interrupts are pending.                                                     | Correct the program or the process                                                                                            |

<sup>1</sup> = The alarm depends on the configured measuring range.

<sup>2</sup> = For resistor and thermal resistor measuring ranges with deactivated diagnostics for "wire break", this is reported by the "Violation of high limit" diagnostic.

## Dimension drawing

### A.1 Dimension drawing

The figure below shows the dimension drawing of the AI 4xRTD/TC 4xM12 analog input module in the front and side view.

Figure A-1 Dimension drawing

## Representation of analog values

### B.1 Representation of analog values in voltage measuring range

The table below lists the decimal and hexadecimal values (codes) of the voltage measuring range.

Table B- 1 Voltage measuring range  $\pm 80$  mV

| Values |      | Voltage measuring range | Range         |
|--------|------|-------------------------|---------------|
| Dec.   | Hex. | $\pm 80$ mV             |               |
| 32767  | 7FFF | > 94.1 mV               | Overflow      |
| 32511  | 7EFF | 94.1 mV                 | Overrange     |
| 27649  | 6C01 |                         |               |
| 27648  | 6C00 | 80 mV                   | Nominal range |
| 20736  | 5100 | 60 mV                   |               |
| 1      | 1    | 2.89 $\mu$ V            |               |
| 0      | 0    | 0 mV                    |               |
| -1     | FFFF | -2.89 $\mu$ V           |               |
| -20736 | AF00 | -60 mV                  |               |
| -27648 | 9400 | -80 mV                  |               |
| -27649 | 93FF |                         | Underrange    |
| -32512 | 8100 | -94.1 mV                |               |
| -32768 | 8000 | < -94.1 mV              | Underflow     |

## B.2 Representation of analog values for resistance-based sensors

### Resistance-based sensor

The following tables list the decimal and hexadecimal values (codes) of the resistance-based sensor.

Table B- 2 Resistance-based sensor of 150  $\Omega$  and 300  $\Omega$

| Values |      | Resistance-based sensor range |                  | Range         |
|--------|------|-------------------------------|------------------|---------------|
| Dec.   | Hex. | 150 $\Omega$                  | 300 $\Omega$     |               |
| 32767  | 7FFF | >176.38 $\Omega$              | >352.77 $\Omega$ | Overflow      |
| 32511  | 7EFF | 176.38 $\Omega$               | 352.77 $\Omega$  | Overrange     |
| 27649  | 6C01 |                               |                  |               |
| 27648  | 6C00 | 150 $\Omega$                  | 300 $\Omega$     | Nominal range |
| 20736  | 5100 | 112.5 $\Omega$                | 225 $\Omega$     |               |
| 1      | 1    | 5.43 m $\Omega$               | 10.85 m $\Omega$ |               |
| 0      | 0    | 0 $\Omega$                    | 0 $\Omega$       |               |

#### Note

##### Negative value for 2-wire connection

A negative value is possible in these constellations:

- Configured conductor compensation > sum of conductor resistance and resistance
- Short-circuit on the input and configured conductor compensation

With a negative value the value 7FFF<sub>H</sub> is generated. The diagnostic message "Violation of high limit" is signaled for the channel in question.

## B.3 Representation of analog values for thermal resistors

The tables below list the decimal and hexadecimal values (codes) of the thermal resistors.

Table B- 3 Thermal resistor Pt 100, Pt 1000 Standard

| Pt x00<br>Standard<br>in °C<br>(1 digit =<br>0.1°C) | Values |      | Pt x00<br>Standard<br>in °F<br>(1 digit =<br>0.1 °F) | Values |      | Pt x00<br>Standard<br>in K<br>(1 digit =<br>0.1 K) | Values |      | Range         |

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

|                                                                                                        |
|--------------------------------------------------------------------------------------------------------|
|  <b>DANGER</b>        |
| indicates that death or severe personal injury <b>will</b> result if proper precautions are not taken. |
|  <b>WARNING</b>       |
| indicates that death or severe personal injury <b>may</b> result if proper precautions are not taken.  |
|  <b>CAUTION</b>       |
| indicates that minor personal injury can result if proper precautions are not taken.                   |
| <b>NOTICE</b>                                                                                          |
| indicates that property damage can result if proper precautions are not taken.                         |

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <b>WARNING</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed. |

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface

### Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### Changes compared to the previous version

Compared to the previous version, this manual contains the following adaptations in the section Technical specifications (Page 26).

### Conventions

Please also observe notes marked as follows:

---

#### Note

A note contains important information on the product described in the documentation and on the handling of the product to which particular attention should be paid.

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## **"mySupport"**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## **"mySupport" - Documentation**

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/My/ww/en/documentation>).

## **"mySupport" - CAx data**

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet  
(<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## **Application examples**

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7145-5ND00-0BA0

#### View of the module

Figure 2-1 View of the analog output module AQ 4xU/I 4xM12

## Properties

The module has the following technical properties:

- 4 analog outputs
- M12 sockets for connection of actuators
- Voltage output can be set for each channel
- Current output can be set for each channel
- Resolution: 16-bit
- Dimensions 30 x 159 mm
- Configurable diagnostics can be set for each channel

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)
- PROFIenergy

## Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.industry.siemens.com/cs/us/en/view/89254965>) system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the AQ 4xUI/ 4xM12 analog output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X13: Sockets for the output signal
- ③ X80: Connector for infeed of the supply voltage (POWER input)
- ④ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑤ X30: Socket for ET-Connection IN
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ LED displays 0 to 3 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

## 3.1 Terminal and block diagram

The example in the following figure shows the pin assignment for voltage and current output of the analog output module AQ 4xU/I 4xM12.

|            |                                             |                                    |                                             |
|------------|---------------------------------------------|------------------------------------|---------------------------------------------|
| ①          | Voltage/current output as 2-wire connection | X31                                | Loop-through of the ET-Connection           |
| ②          | Voltage/current output as 4-wire connection | 1L+                                | Supply voltage 1L+ (non-switched)           |
| ③          | Output driver                               | 1M                                 | Ground 1M (non-switched)                    |
| ④          | Digital-to-analog converter (DAC)           | 2L+                                | Load voltage 2L+ (switched)                 |
| ⑤          | Microcontroller                             | 2M                                 | Ground 2M (switched)                        |
| ⑥          | ET-Connection interface                     | 1U <sub>A</sub>                    | 24 V actuator supply                        |
| ⑦          | Internal supply voltage                     | QV <sub>n</sub> /QI <sub>n</sub> + | Voltage/current output positive, channel n  |
| X10 to X13 | Channels 0 to 3                             | QV <sub>n</sub> /QI <sub>n</sub> - | Voltage/current output negative, channel n  |
| X80        | Infeed of supply voltages                   | AQ                                 | Channel status LEDs (0, 1, 2 and 3) (green) |
| X81        | Loop-through of supply voltages             | DIAG                               | Diagnostic status LED (red/green)           |
| X30        | Infeed of the ET-Connection                 |                                    |                                             |

Figure 3-1 Terminal and block diagram for voltage and current output

## 3.2 Pin assignment

### Note

#### Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for analog outputs

The tables below show the pin assignments of the 4 sockets for connection of the analog outputs.

Table 3- 1 Pin assignment of the sockets for analog outputs (voltage output)

| Pin    | Assignment                                                                                                                                                                                                                                    | Front view of the sockets                                                            |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|        | X10 to X13 - sockets for analog outputs (voltage output)                                                                                                                                                                                      |                                                                                      |

| 1      | TXP                           | RXP                            | yellow                                                          |  |  |
| 2      | RXP                           | TXP                            | white                                                           |                                                                                       |                                                                                       |
| 3      | RXN                           | TXN                            | blue                                                            |                                                                                       |                                                                                       |
| 4      | TXN                           | RXN                            | orange                                                          |                                                                                       |                                                                                       |
| Shield | Functional earth FE           |                                | -                                                               |                                                                                       |                                                                                       |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the connector                                                         |
|-----|-----------------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X80 connector (POWER input)       |                                                 |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | brown                                           |  |
| 2   | Ground 2M (switched)              | white                                           |                                                                                     |
| 3   | Ground 1M (non-switched)          | blue                                            |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | black                                           |                                                                                     |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 5 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the core color of the power cable | Front view of the socket                                                              |
|-----|-----------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                 |                                                                                       |
| 1   | Supply voltage 1L+ (non-switched) | brown                                           |  |
| 2   | Ground 2M (switched)              | white                                           |                                                                                       |
| 3   | Ground 1M (non-switched)          | blue                                            |                                                                                       |
| 4   | Load voltage 2L+ (switched)       | black                                           |                                                                                       |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the connector for ET-Connection and the connector for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Output ranges

The table below indicates which output types and ranges are configurable.

#### Output type and output ranges

Table 4- 1 Output type and output ranges

| Output type | Output range                                |
|-------------|---------------------------------------------|
| Disabled    | -                                           |
| Voltage     | +/- 10 V<br>0 V to 10 V<br>1 V to 5 V       |
| Current     | +/- 20 mA<br>0 mA to 20 mA<br>4 mA to 20 mA |

The tables of the output ranges, overflow, overrange, etc. are provided in the appendix Representation of analog values (Page 33).

## 4.2 Parameters

### Parameters of the AQ 4xU/I 4xM12 analog output module

The table below lists the parameters that can be set. The effective range of the parameters that can be set depends on the type of configuration. The following configurations are possible:

- Distributed operation on PROFINET IO
- Distributed operation with PROFIBUS DP

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults

| Parameters                                                 | Value range                                                                                                                                                                                                                                                                    | Default                     | GSD file<br>PROFINET IO | GSD file<br>PROFIBUS DP |

| Diagnostics: Overflow                                      | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>                                                                                                                                                                                                  | Disable                     | Channel                 | Module                  |

| Parameters                  | Value range                                                                                                           | Default   | GSD file<br>PROFINET IO | GSD file<br>PROFIBUS DP |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|-----------|-------------------------|-------------------------|
| Reaction to CPU/master STOP | <ul style="list-style-type: none"> <li>Shut down</li> <li>Keep last value</li> <li>Output substitute value</li> </ul> | Shut down | Channel                 | Module                  |
| Substitute value            | See section Explanation of the parameters (Page 20)                                                                   | 0         | Channel                 | Channel                 |

\* = With configuration via PROFIBUS GSD file, the two short-circuit diagnostics ("Diagnostics: Actuator supply short circuit to ground" and "Diagnostics: Short circuit to ground" for voltage outputs) are activated or deactivated using a module-wide parameter "Diagnostics: Short circuit to ground". They cannot be adjusted independently of one another.

### Short-circuit detection

The diagnostics for short circuit to ground can be configured for the voltage output type. Short-circuit detection cannot be guaranteed for small output values (between 0.1 V and +0.1 V).

### Wire break detection

The diagnostics for wire break can be configured for the current output type. Wire break detection cannot be guaranteed for small output values (between -0.2 mA and +0.2 mA).

## 4.3 Explanation of the parameters

### Output type/range channel n

With this parameter, you set the output type or output range for the channel to control the actuator.

---

#### Note

##### Unused channels

"Deactivate" unused channels in the parameter assignment to improve the power consumption of the module.

A deactivated channel always returns the value "no voltage or current".

---

### Diagnostics: Actuator supply short circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

### Diagnostics: Short circuit to ground

Enabling of the diagnostics if a short-circuit of the output to ground occurs.

### Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

### Diagnostics: Underflow

Enabling of the diagnostics when the output value violates the underrange, falls below the minimum output value or reaches the underflow.

### Diagnostics: Overflow

Enabling of the diagnostics when the output value exceeds the overrange.

### Reaction to CPU/master STOP

Adjusts the reaction of the module after a CPU/master STOP.

- Shut down: The analog output is de-energized.
- Keep last value: The last value of the analog output remains activated.
- Output substitute value: The channel outputs a configured substitute value.

## Substitute value

With this parameter, you set substitute values for the analog outputs.

The table below shows the permitted value ranges for the substitute values:

Table 4- 3 Permissible substitute values for the output ranges

| Output type | Output range  | Valid substitute value |
|-------------|---------------|------------------------|
| Current     | ±10 V         | -32512 to 32511        |
|             | 0 V to 10 V   | 0..32511               |
|             | 1 V to 5 V    | -6912 to 32511         |
| Voltage     | ±20 mA        | -29031..29030          |
|             | 0 mA to 20 mA | 0..29030               |
|             | 4 mA to 20 mA | -692 to 29376          |

## 4.4 Address space

The following figure shows the assignment of the address space for the AQ 4xU/I 4xM12 analog output module with value status (Quality Information (QI)).

The address space for the value status is occupied by the module if the value status is configured using the PROFINET interface module.

Assignment in the process image output (PIQ)

|        |   |   |   |   |   |   |   |   | Connec-<br>tors | Pin assignment |          | Channe |
|--------|---|---|---|---|---|---|---|---|-----------------|----------------|----------|--------|
|        |   |   |   |   |   |   |   |   |                 | U              | I        |        |
|        | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                 |                |          |        |
| QB x   |   |   |   |   |   |   |   |   | X10             | Pin 2, 4       | Pin 2, 4 | 0      |

Figure 4-1 Address space

### Configuration options of the AQ 4xU/I 4xM12 analog output module

You have the following configuration options:

- Configuration 1: without value status
- Configuration 2: with value status

### Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the analog output module. Bits 0 to 3 in this byte are assigned to a channel and return information about the validity of the analog values or the channel status.

Bit = 1: No error on channel.

Bit = 0: Error on channel.

# Interrupts/diagnostics alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED display (status and error displays) of the AQ 4xU/I 4xM12 analog output module.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0, 1, 2 and 3) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 25).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                                                                                                                                                                     |

## 5.2 Interrupts

The AQ 4xU/I 4xM12 analog output module supports diagnostics interrupts.

### Diagnostic interrupt

The module generates a diagnostic interrupt at the following events:

- Short-circuit of the actuator supply
- Short-circuit (voltage)
- Wire break (current)
- High limit violated
- Low limit violated
- Parameter assignment error

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the analog output module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

The following tables show the diagnostics alarms for all measuring ranges.

Table 5- 3 Diagnostics alarms

| Diagnostics alarm          | Error code      | Meaning                                                                                                                                     | Solution                                                                                                                                |
|----------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Short circuit to ground    | 1 <sub>H</sub>  | <ul style="list-style-type: none"> <li>• Short-circuit of actuator supply to ground</li> <li>• Short-circuit of output to ground</li> </ul> | Correct the process wiring                                                                                                              |
| Wire break                 | 6 <sub>H</sub>  | Actuator circuit impedance too high                                                                                                         | Use a different actuator type or modify the wiring, e.g. use cables with larger cross-section                                           |
|                            |                 | Wire break between the module and sensor                                                                                                    | Connect the cable                                                                                                                       |

| High limit violated        | 7 <sub>H</sub>  | The output value set by the user program violates the valid rated range/overrange.                                                          | Correct the output value                                                                                                                |
| Low limit violated         | 8 <sub>H</sub>  | The output value set by the user program violates the valid rated range/underrange.                                                         | Correct the output value                                                                                                                |
| Parameter assignment error | 10 <sub>H</sub> | Module parameter assignment is faulty                                                                                                       | Correct the parameter assignment                                                                                                        |

## Technical specifications

### Technical specifications of the AQ 4xU/I 4xM12 analog output module

The following table shows the technical specifications as of the issue date. You will find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7145-5ND00-0BA0/td?dl=en>).

# PROFlenergy

## 7.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific response of the analog output module is explained in the section below.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<https://support.industry.siemens.com/cs/ww/en/view/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V14 (<https://support.industry.siemens.com/cs/ww/en/view/49948856>).

Application examples (<https://support.industry.siemens.com/cs/ww/en/view/41986454>) are also available on the Internet.

## 7.2 Response of analog output module

### Display

The channel status LEDs are not affected by PROFlenergy.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following conditions apply to all channels which switch to the pause mode "PE\_MODE\_SHUTDOWN":

- "Wire break" and "Short circuit" error detection is **not** possible during the pause:
  - Alarms for errors already pending before the "pause" are retained.
  - Incoming and outgoing errors are reported once the "pause" has ended.

The following applies for all channels which switch to a different pause mode:

- "Wire break" and "Short circuit" error recognition is possible during the pause. These errors are reported.
- The selection of an incorrect pause substitute value which does not correspond to the output range may result in the message "High limit violated" or "Low limit violated". The pause substitute output value effective at the channel is limited to the high or low control limit for the output range.

### Mode parameter

The following table shows the "Mode" parameter.

Table 7- 1 Mode parameter

| Element | Code                    | Explanation                                                                                                              |
|---------|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0b: PE_MODE_PROCEED     | Proceed at "pause"<br>• Value status "GOOD"                                                                              |
|         | 1b: PE_MODE_SHUTDOWN    | Switch off at "pause"<br>• Actuator supply U <sub>A</sub> switched off<br>• Outputs de-energized<br>• Value status "BAD" |
|         | 3b: PE_MODE_LAST_VALUE  | Last value at "pause"<br>• Pause substitute value: Last output value:<br>• Value status "BAD"                            |
|         | 4b: PE_MODE_SUBST_VALUE | Substitute value at "pause"<br>• Pause substitute value: Configured pause substitute value<br>• Value status "BAD"       |

<sup>1</sup> As there is only one actuator supply U<sub>A</sub> for all channels, the supply can only be switched off during a "pause" if all channel parameters have been set to switch off.

## Dimension drawing

The figure below shows the dimension drawing of the AQ 4xU/I 4xM12 analog output module in front and side view.

Figure A-1 Dimension drawing

## Representation of analog values

This appendix shows the analog values for all output ranges supported by the AQ 4xU/I 4xM12 analog output module.

### Measured value resolution

The digitized analog value is the same for all output values at the same nominal range. Analog values are output as fixed point numbers in two's complement.

Table B- 1 Resolution of the analog values

| Resolution in bits including sign | Values  |                | Analog value       |               |
|-----------------------------------|---------|----------------|--------------------|---------------|
|                                   | Decimal | Hexadecimal    | High byte          | Low byte      |
| 16                                | 1       | 1 <sub>H</sub> | Sign 0 0 0 0 0 0 0 | 0 0 0 0 0 0 1 |

### B.1 Representation of analog values in the voltage output ranges

The tables below list the decimal and hexadecimal values (codes) of the possible voltage output ranges.

Table B- 2 Voltage output range +/-10 V

| Values    |        |      | Voltage output range | Range                |
|-----------|--------|------|----------------------|----------------------|
|           | Dec.   | Hex. | ±10 V                |                      |
| 118.5149% | 32767  | 7FFF | 11.76 V              | Maximum output value |
|           | 32512  | 7F00 |                      |                      |
| 117.589%  | 32511  | 7EFF | 11.76 V              | Overrange            |
|           | 27649  | 6C01 |                      |                      |
| 100%      | 27648  | 6C00 | 10 V                 | Nominal range        |
| 75%       | 20736  | 5100 | 7.5 V                |                      |
| 0.003617% | 1      | 1    | 361.7 µV             |                      |
| 0%        | 0      | 0    | 0 V                  |                      |
|           | -1     | FFFF | -361.7 µV            |                      |
| -75%      | -20736 | AF00 | -7.5 V               |                      |
| -100%     | -27648 | 9400 | -10 V                |                      |
|           | -27649 | 93FF |                      | Underrange           |
| -117.593% | -32512 | 8100 | -11.76 V             |                      |
|           | -32513 | 80FF | -11.76               | Minimum output value |
| -118.519% | -32768 | 8000 |                      |                      |

## B.1 Representation of analog values in the voltage output ranges

Table B- 3 Voltage output range 0 V to 10 V

| Values    |        |      | Voltage output range | Range                |
|-----------|--------|------|----------------------|----------------------|
|           | Dec.   | Hex. | 0 V to 10 V          |                      |
| 118.519%  | 32767  | 7FFF | 11.76 V              | Maximum output value |
|           | 32512  | 7F00 |                      |                      |
| 117.589%  | 32511  | 7EFF | 11.76 V              | Overrange            |
|           | 27649  | 6C01 |                      |                      |
| 100%      | 27648  | 6C00 | 10 V                 | Nominal range        |
| 75%       | 20736  | 5100 | 7.5 V                |                      |
| 0.003617% | 1      | 1    | 361.7 $\mu$ V        |                      |
| 0%        | 0      | 0    | 0 V                  |                      |
|           | -1     | FFFF | 0 V                  | Minimum output value |
| -118.519% | -32768 | 8000 |                      |                      |

Table B- 4 Voltage output range 1 to 5 V

| Values    |        |      | Voltage output range | Range                |
|-----------|--------|------|----------------------|----------------------|
|           | Dec.   | Hex. | 1 V to 5 V           |                      |
| 118.519%  | 32767  | 7FFF | 5.70 V               | Maximum output value |
|           | 32512  | 7F00 |                      |                      |
| 117.589%  | 32511  | 7EFF | 5.70 V               | Overrange            |
|           | 27649  | 6C01 |                      |                      |

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) system manual. Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

## Conventions

Please also observe notes marked as follows:

---

### Note

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (<https://www.siemens.com/industrialsecurity>).

# Documentation guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<http://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.

You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (<http://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (<http://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/sc/ww/en/sc/2054>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool>).

## SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

General function overview:

- Network browsing and creation of a table showing the accessible devices in the network
- Flashing of device LEDs or HMI display to locate a device
- Downloading of addresses (IP, subnet, gateway) to a device
- Downloading the PROFINET name (station name) to a device
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your PG/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- Performing a CPU memory reset
- Resetting devices to factory settings
- Downloading a firmware update to a device

You can find the SIMATIC Automation Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/98161300>).

## PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the system network during commissioning. PRONETA features two core functions:

- The topology overview independently scans the PROFINET network and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (<https://www.siemens.com/sinetplan>).

## Product overview

### 2.1 Properties

#### Article number

6ES7147-5JD00-0BA0

#### View of the module

Figure 2-1 View of the CM 4xIO-Link 4xM12 communication module

## Properties

The module has the following technical properties:

- IO-Link Master according to IO-Link specification V1.1
- 4 ports, type class B
- 4 M12 connectors
- SIO mode (standard IO mode)
- Supported data transmission rates:
  - COM1 (4.8 kBd)
  - COM2 (38.4 kBd)
  - COM3 (230.4 kBd)
- Configuration limits:
  - Max. 33 bytes of input data and 32 bytes of output data per port
  - Max. 132 bytes of input data and 128 bytes of output data per module
- Automatic backup of device parameters during replacement of the IO-Link device (only for V1.1 devices)
- Suitable for connection of IO-Link devices with 3-wire and 5-wire connection
- Configurable diagnostics can be set for each channel
- Dimensions 30 x 159 mm

The module supports the following functions:

Table 2- 1 Version dependencies of the module functions

| Function                                            | Firmware version of the module |
|-----------------------------------------------------|--------------------------------|
| Firmware update                                     | V1.0 or higher                 |
| Identification and maintenance data (I&M)           | V1.0 or higher                 |
| PROFenergy                                          | V1.0 or higher                 |
| IO-Link port configuration with S7-PCT (as of V3.2) | V1.0 or higher                 |
| IO-Link port configuration without S7-PCT           | V1.1 or higher                 |
| Master backup with "IO_LINK_MASTER" function block  | V1.1 or higher                 |
| Port Qualifier Information (PQI)                    | V1.1 or higher                 |
| Support of I/O data per module > 32 bytes           | V1.2 or higher                 |

## Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<http://support.automation.siemens.com/WW/view/en/89254965>) system manual.

## 2.2 Operator controls and display elements

The following figure shows the operator controls and display elements of the CM 4xIO-Link 4xM12 communication module.

- ① DIAG: LED display for mode and diagnostic status
- ② C1 to C4: LED displays for port status
- ③ Q1 to Q4: LED displays for channel status in SIO mode
- ④ X10 to X13: Sockets for device connection
- ⑤ PWR: LED display for the load voltage 2L+
- ⑥ X80: Connector for infeed of the supply voltage (POWER input)
- ⑦ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑧ X30: Socket for ET-Connection IN
- ⑨ X31: Socket for ET-Connection OUT

Figure 2-2 Operator controls and display elements

## 2.3 Functions

IO-Link is a point-to-point connection between an IO-Link master and an IO-Link device. On the IO-Link master, you can use IO-Link devices as well as conventional sensors/actuators with unshielded standard cables using proven 3-wire technology. IO-Link is backward compatible to conventional digital sensors or actuators. Switching status channel and data channel are in proven 24 V DC technology.

### Reference

For more information on the IO-Link system, please see the IO-Link system (<http://support.automation.siemens.com/WW/view/en/65949252>) function manual.

## 2.4 Reset communication module to factory settings

### Effects of resetting to the factory settings

Use the "Reset to factory settings" function to restore the parameter assignments of your CM 4xIO-Link 4xM12 communication module made with S7-PCT to the factory state.

After a "Reset to factory settings", the parameters of the CM 4xIO-Link 4xM12 communication module are assigned as follows:

- The ports are in DI mode
- The ports are mapped to the relative addresses 0.0 ... 0.3
- The PortQualifier is disabled
- The I&M data 1 ... 3 are deleted

---

### Note

The device parameters are deleted and the factory state is restored.

You should reset a removed CM 4xIO-Link 4xM12 communication module to the factory settings before you place it in storage.

---

### Procedure

To perform a "Reset to factory settings", proceed as described in the S7-PCT online help.

# Wiring

## 3.1 Terminal and block diagram

The following figure shows an example of the pin assignment for Port Class A (Type A) and Port Class B (Type b).

|            |                                 |      |                                   |
|------------|---------------------------------|------|-----------------------------------|
| ①          | SIO input                       | X31  | Loop-through of the ET-Connection |
| ②          | SIO output                      | 1L+  | Supply voltage 1L+ (non-switched) |
| ③          | Port Class A (Type A)           | 1M   | Ground 1M (non-switched)          |
| ④          | Port Class B (Type B)           | 2L+  | Load voltage 2L+ (switched)       |
| ⑤          | IO-Link device                  | 2M   | Ground 2M (switched)              |
| ⑥          | IO-Link switching               | 1Us  | 24 V encoder supply               |
| ⑦          | Microcontroller                 | 2Us  | 24 V actuator supply              |
| ⑧          | Monitoring                      | 1M   | Ground for encoder supply         |
| ⑨          | ET-Connection interface         | 2M   | Ground for actuator supply        |
| ⑩          | Internal supply voltage         | C/Q  | Port n                            |
| X10 to X13 | Channels 0 to 3                 | Cn   | LEDs channel status (green)       |
| X80        | Infeed of supply voltages       | Qn   | LED status in SIO mode (green)    |
| X81        | Loop-through of supply voltages | DIAG | LED diagnostic status (red/green) |
| X30        | Infeed of the ET-Connection     | PWR  | LED supply voltage 2L+ (green)    |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the IO-Link sockets

### Note

#### Port Class B

The pin assignment of the IO-Link interface corresponds to the IO-Link specification as per Port Class B. Port Class B is specially suited for the connection of actuators with additional supply (e.g. valve terminals).

To connect devices with Port Class A (e.g. sensors) to the communication module CM 4xIO-Link 4xM12, a 3-wire connection cable should be used (Port Class A compatibility).

The table below shows the pin assignments of the 4 sockets for the connection of IO-Link.

Table 3- 1 Pin assignment of the IO-Link

| Pin                                                                                                  | Assignment                                                                                                               | Front view of the sockets                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                      | X10 to X13 - sockets for IO-Link                                                                                         |                                                                                                                                                                                                                                        |
| 1                                                                                                    | 24 V encoder supply 1Us (from 1L+)                                                                                       | <p>Port Class A (Type A)*</p>  <p>Port Class B (Type B)</p>  |
| 2                                                                                                    | 24 V actuator supply 2U <sub>A</sub> (from 2L+)                                                                          |                                                                                                                                                                                                                                        |
| 3                                                                                                    | Encoder supply ground 1M                                                                                                 |                                                                                                                                                                                                                                        |
| 4                                                                                                    | Port 1 (C/Q): Connector X10<br>Port 2 (C/Q): Connector X11<br>Port 3 (C/Q): Connector X12<br>Port 4 (C/Q): Connector X13 |                                                                                                                                                                                                                                        |
| 5                                                                                                    | Ground for actuator supply 2M                                                                                            |                                                                                                                                                                                                                                        |
| * If you use the sockets for IO-Link as Port Class A, you may not place any signals on pins 2 and 5. |                                                                                                                          |                                                                                                                                                                                                                                        |

The M12 connectors are designed according to IO-Link specification as port type Class B. Pins 2 and 5 contain an additional power supply.

Reaction-free connection of devices with different port types (Class A and Class B) is possible using a 3-wire connecting cable (assignment of pins 1, 3 and 4).

#### NOTICE

#### 24 V encoder supply 1Us

For the supply of devices, only use the 24 V 1Us encoder supply provided by the communication device.

### Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 3- 2 Pin assignment for ET-Connection

| Pin    | Assignment                    |                                | Assignment of the wire color of the bus line cable for ET-Connection | Front view of the sockets |     |
|--------|-------------------------------|--------------------------------|----------------------------------------------------------------------|---------------------------|-----|
|        | X30 socket (ET-Connection IN) | X31 socket (ET-Connection OUT) |                                                                      | X30                       | X31 |
| 1      | TXP                           | RXP                            | Yellow                                                               |                           |     |
| 2      | RXP                           | TXP                            | White                                                                |                           |     |
| 3      | RXN                           | TXN                            | Blue                                                                 |                           |     |
| 4      | TXN                           | RXN                            | Orange                                                               |                           |     |
| Shield | Functional earth FE           |                                | -                                                                    |                           |     |

### Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage.

Table 3- 3 Pin assignment of the supply voltage connector

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the connector |
|-----|-----------------------------------|------------------------------------------------------|-----------------------------|
|     | X80 connector (POWER input)       |                                                      |                             |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |                             |
| 2   | Ground 2M (switched)              | White                                                |                             |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                             |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                             |

### Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage.

Table 3- 4 Pin assignment of the supply voltage socket

| Pin | Assignment                        | Assignment of the wire color of the power line cable | Front view of the socket                                                            |
|-----|-----------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X81 socket (POWER output)         |                                                      |                                                                                     |
| 1   | Supply voltage 1L+ (non-switched) | Brown                                                |  |
| 2   | Ground 2M (switched)              | White                                                |                                                                                     |
| 3   | Ground 1M (non-switched)          | Blue                                                 |                                                                                     |
| 4   | Load voltage 2L+ (switched)       | Black                                                |                                                                                     |

#### NOTICE

##### ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

Mixing up the connector for ET-Connection and the connector for the supply voltage can destroy the module.

## Parameters/address space

### 4.1 Parameters

#### Parameters

The following table shows the general parameters for the communication module CM 4xIO-Link 4xM12.

Table 4- 1 General parameters

| Parameters                         | Range of values                                                               | Default | Scope   |
|------------------------------------|-------------------------------------------------------------------------------|---------|---------|
| <b>Diagnostics</b>                 |                                                                               |         |         |
| Diagnostics: No supply voltage 2L+ | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Disable | Module  |
| Diagnostics port 1                 | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Disable | Channel |
| Diagnostics port 2                 | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Disable | Channel |
| Diagnostics port 3                 | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Disable | Channel |
| Diagnostics port 4                 | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Disable | Channel |
| <b>Configuration</b>               |                                                                               |         |         |
| Input / output type                | See table in section Explanation of the parameters (Page 23)                  | 32I/32O | Module  |
| Port configuration without S7-PCT  | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Disable | Module  |
| Port Qualifier Information (PQI)   | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> | Enable  | Module  |

## 4.1 Parameters

The following table shows the port parameters for the communication module CM 4xIO-Link 4xM12 with firmware version V1.1.

Table 4- 2 Port parameters

| Parameters                         | Range of values                                                                                                                                                                                                                                               | Default                                      |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Port configuration</b>          |                                                                                                                                                                                                                                                               |                                              |
| Operating mode                     | <ul style="list-style-type: none"> <li>IO-Link autostart</li> <li>IO-Link manual</li> <li>DI</li> <li>DQ</li> <li>Disabled</li> </ul>                                                                                                                         | IO-Link autostart                            |
| Length of input data (without PQI) | Depending on the total length of the module*                                                                                                                                                                                                                  | Depending on the total length of the module* |
| Length of output data              | Depending on the total length of the module*                                                                                                                                                                                                                  | Depending on the total length of the module* |
| Vendor ID**                        | Vendor ID of the connected IO-Link device                                                                                                                                                                                                                     | 0                                            |
| Device ID**                        | Device ID of the connected IO-Link device                                                                                                                                                                                                                     | 0                                            |
| Testing accuracy / data storage**  | <ul style="list-style-type: none"> <li>Same type (V1.0) without Backup&amp;Restore</li> <li>Type compatible (V1.1) without Backup&amp;Restore</li> <li>Type compatible (V1.1) with Backup&amp;Restore</li> <li>Type compatible (V1.1) with Restore</li> </ul> | Type compatible (V1.1) with Backup&Restore   |

\* Make sure that you do not exceed the maximum possible length of the input or output data for all ports that you selected.

Example:

You selected the 64I/64O configuration. You have assigned 16 bytes of input data to the first port. You can still assign a total of 48 bytes of input data for the remaining three ports.

\*\* Only in effect when "IO-Link manual" port mode is used.

## 4.2 Explanation of the parameters

### Diagnostics: No supply voltage 2L+

Enabling of the diagnostics for no or insufficient supply voltage 2L+.

### Diagnostics port

This parameter enables the diagnostics for the selected port.

The diagnostics possible depends on the IO-Link device in use. Additional information about the diagnostic interrupts can be found in the description of the utilized IO-Link device.

### Input / output type

This parameter sets the maximum length of the input and output data of the module.

### Port configuration without S7-PCT

This parameter releases the port configuration without S7-PCT for the module.

### Port Qualifier Information

This parameter releases the Port Qualifier Information (PQI).

The PQI provides information on the device status of the port and IO-Link.

## Operating mode

This parameter determines the mode in which the selected port should be operated. You can select from the following options:

- IO-Link autostart
- IO-Link manual
- DI
- DQ
- Disabled

### IO-Link autostart

The connected IO-Link device starts automatically (Plug&Play functionality). The IO-Link device is immediately ready for operation.

### IO-Link manual

The connected IO-Link device is **not** started automatically.

You must store the Vendor ID and Device ID of the connected IO-Link device in STEP 7. In addition, you can select the inspection severity for data storage:

- Identical type (V1.0) without Backup&Restore
- Type-compatible (V1.1) without Backup&Restore
- Type-compatible (V1.1) with Backup&Restore
- Type-compatible (V1.1) with Restore

You can find the Vendor ID and Device ID on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109748852>).

### DI

The port is operating as a standard digital input.

### DQ

The port is operating as a standard digital output.

### Disabled

The port is disabled.

## Configuration options of the communication module CM 4xIO-Link 4xM12

The CM 4xIO-Link 4xM12 communication module supports a variable address space for I/O data.

The following table provides an overview of the configuration options for the supported address spaces for I/O data:

Table 4- 3 Configuration options of the communication module CM 4xIO-Link 4xM12

| Module configuration/<br>supporting address space for I/O<br>data | IO-Link Master<br>with Firmware<br>V1.0 | IO-Link Master<br>with Firmware<br>V1.1 | IO-Link master<br>with firmware<br>V1.2 |
|-------------------------------------------------------------------|-----------------------------------------|-----------------------------------------|-----------------------------------------|
| 1-byte input/1-byte output                                        | X                                       |                                         |                                         |
| 2-byte inputs/2-byte outputs                                      | X                                       |                                         |                                         |
| 4-byte inputs/4-byte outputs                                      | X                                       | X*                                      | X*                                      |
| 8-byte inputs/0-byte outputs                                      |                                         | X                                       | X                                       |
| 8-byte inputs/8-byte outputs                                      | X                                       | X                                       | X                                       |
| 12-byte inputs/8-byte outputs                                     |                                         | X                                       | X                                       |
| 16-byte inputs/16-byte outputs                                    | X                                       | X                                       | X                                       |
| 20-byte inputs/16-byte outputs                                    |                                         | X                                       | X                                       |
| 32-byte inputs/32-byte outputs                                    | X                                       | X                                       | X                                       |
| 36-byte inputs/32-byte outputs                                    |                                         |                                         | X                                       |
| 48-byte inputs/48-byte outputs                                    |                                         |                                         | X                                       |
| 52-byte inputs/48-byte outputs                                    |                                         |                                         | X                                       |
| 64-byte inputs/64-byte outputs                                    |                                         |                                         | X                                       |
| 68-byte inputs/64-byte outputs                                    |                                         |                                         | X                                       |
| 80-byte inputs/80-byte outputs                                    |                                         |                                         | X                                       |
| 84-byte inputs/80-byte outputs                                    |                                         |                                         | X                                       |
| 96-byte inputs/96-byte outputs                                    |                                         |                                         | X                                       |
| 100-byte inputs/96-byte outputs                                   |                                         |                                         | X                                       |
| 112-byte inputs/112-byte outputs                                  |                                         |                                         | X                                       |
| 116-byte inputs/112-byte outputs                                  |                                         |                                         | X                                       |
| 128-byte inputs/128-byte outputs                                  |                                         |                                         | X                                       |
| 132-byte inputs/128-byte outputs                                  |                                         |                                         | X                                       |

\* No PortQualifierInformation is transferred with this configuration.

## Port configuration

You can use a CM 4xIO-Link 4xM12 communication module as of firmware version V1.1 to commission the IO-Link ports of the IO-Link master or the connected IO-Link devices in two different ways:

- Port configuration without S7-PCT
- Port configuration with S7-PCT

## Port configuration without S7-PCT

### Requirement

You have enabled the check box "Port configuration without S7-PCT" for the configuration of the IO-Link master in STEP 7.

### Procedure

You configure the IO-Link master directly in STEP 7:

- Enabling of the diagnostics
- Configuration of the I/O data lengths per port
- Enabling of the Port Qualifier Information (PQI)
- Port mode:
  - Operation in "IO-Link autostart" mode (default)
  - Operation in "IO-Link manual" mode
  - Operated as DI
  - Operated as DQ
  - Disabled

## Port configuration with S7-PCT

### Requirement

You deselected the "Port configuration without S7-PCT" check box in the configuration of the IO-Link master in STEP 7.

### Procedure

You configure the port configuration of the IO-Link master using the port configuration tool S7-PCT as of V3.2.

## Port Qualifier Information (PQI)

You can enable the Port Qualifier Information (PQI) for your IO-Link master as of firmware version V1.1.

---

### Note

#### Port Qualifier Information (PQI)

If you have enabled the Port Qualifier Information (PQI), this information is always sent with the size of 1 byte together with the input data of the IO-Link device.

---

The following figure show the structure of the PQI byte.  
You enable a parameter by setting the corresponding bit to "1".

## Port Qualifier Information (PQI)

\* The PQI byte is always located after the last input byte of the port.

Figure 4-1 Structure of the PQI byte

## Reference

For more information, please refer to the IO-Link system  
(<http://support.automation.siemens.com/WW/view/en/65949252>) function manual.

## Diagnostics alarms

### 5.1 Status and error displays

#### LED displays

The following figure shows the LED display of the CM 4xIO-Link 4xM12 communication module.

- |   |                                   |             |
|---|-----------------------------------|-------------|
| ① | Diagnostics (DIAG)                | (green/red) |
| ② | Port status / IO-Link status (Cn) | (green)     |
| ③ | Load voltage 2L+ (PWR)            | (green)     |
| ④ | Channel status in SIO mode (Qn)   | (green)     |

Figure 5-1 LED displays

#### Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 32).

## DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                                                                                                                                                                                       |
| <br>Flashes | <ul style="list-style-type: none"> <li>Module parameters not assigned (after switching on the supply voltage 1L+)</li> <li>Loading firmware (while the firmware update is being performed, all LEDs retain their current status)</li> <li>No connection to the ET-Connection and/or the fieldbus</li> </ul> |
| <br>On      | Module parameters assigned and no module diagnostics                                                                                                                                                                                                                                                        |
| <br>Flashes | Module parameters assigned and module diagnostics                                                                                                                                                                                                                                                           |

## LEDs Cn

Valid for IO-Link port in IO-Link mode.

Table 5- 2 Status displays of the C1, C2, C3, and C4 LEDs

| C1, C2, C3, or C4 LED                                                                          | Meaning                                                                                     |
|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <br>Off     | Port disabled or in SIO mode                                                                |
| <br>Flashes | Port in IO-Link mode, device not connected or port not connected with the configured device |
| <br>On      | Port in IO-Link mode, device not connected                                                  |

## PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## LEDs Qn

Valid for IO-Link port in SIO mode.

Table 5- 4 Status displays of the Q1, Q2, Q3, and Q4 LEDs

| Q1, Q2, Q3, and Q4 LEDs                                                                  | Meaning                                                        |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <br>Off | Process signal = 0 in SIO mode, deactivated or in IO-Link mode |
| <br>On  | Process signal = 1 in SIO mode                                 |

## 5.2 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the communication module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 5 Error types

| Diagnostics alarm          | Error code      | Meaning (IO-Link error code)                                                                                                                                                                                                                                                                                                                                                                                                                                         | IO-Link master | IO-Link device |
|----------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|----------------|
| Short-circuit              | 1 <sub>H</sub>  | • Short-circuit at the process cables on the IO-Link device (1804 <sub>H</sub> )                                                                                                                                                                                                                                                                                                                                                                                     | X              |                |

## Technical specifications

### Technical specifications of the CM 4xIO-Link 4xM12 communication module

The following table shows the technical specifications as of 03/2021. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/ww/en/pv/6ES7147-5JD00-0BA0/td?dl=en>).

# Replacing modules

## What do you need to know when replacing modules?

When you replace the communication module CM 4xIO-Link 4xM12, you must transfer the IO-Link parameter settings (master/device) again. You can transfer the IO-Link configuration using S7-PCT or save it with the Master Backup function.

## Master Backup

The "IO\_LINK\_MASTER" function block is used to read all relevant IO-Link device and IO-Link master parameters. These can be stored retentively at a central location, such as in a data block in the IO controller.

The status of the IO-Link devices or IO-Link ports stored in the IO-Link master can be restored with the "IO\_LINK\_MASTER" function block.

As a result, the IO-Link ports and the IO-Link master are configured with the values stored in the master backup.

A typical application is the restoration of parameters after replacement of the IO-Link master.

---

### Note

#### Availability

Note that the Master Backup function is available only for IO-Link devices that are specified for the IO-Link Standard as of V1.1.

---

You will find information on the Master Backup and Master Restore functions in section "Master backup" of chapter "Integration into the automation system" of the IO-Link System (<https://support.industry.siemens.com/cs/ww/en/view/65949252>) function manual.

## Reference

You will find additional information on replacing modules in the system manual ET 200AL distributed I/O system (<http://support.automation.siemens.com/WW/view/en/89254965>) in the "Module" section.

You will find additional information on replacing IO-Link masters in the S7-PCT online help.

# PROFlenergy

## 8.1 Pause function

### Introduction

PROFlenergy is a PROFINET-based data interface for switching off consumers centrally and in a coordinated manner during pause times regardless of the manufacturer or device type. This has the aim that the process is only provided with the energy that is absolutely required. In so doing, the majority of the energy savings come from the process itself; the PROFINET device contributes only a few watts to the possible savings. In PROFlenergy, this operating state is referred to as a "pause".

### Start and end of a pause

You enable and disable the pause function of the system at the beginning and end of pauses, respectively; the IO controller then sends the PROFlenergy command "Start\_Pause" or "End\_Pause" to the modules.

Use the "Start\_Pause" command to start a pause.

Use the "End\_Pause" command to end a pause.

The following conditions will also cause a pause to be ended:

- Reconfiguration in RUN
- Controller failure
- Firmware update
- Station stop
- Restart of the interface module through:
  - POWER OFF/POWER ON of an interface module
  - POWER OFF/POWER ON of an I/O module
  - Termination of ET-Connection1 or ET-Connection2

The specific behavior of the communication module is explained in the following sections.

### Additional information

You can find additional information on working with PROFlenergy in the "PROFlenergy" section of the manual IM 157-1 PN interface module (<http://support.automation.siemens.com/WW/view/en/89254863>) and the "Saving energy with PROFlenergy" section of function manual PROFINET with STEP 7 V13 (<http://support.automation.siemens.com/WW/view/en/49948856>).

Application examples (<http://support.automation.siemens.com/WW/view/en/41986454>) are also available on the Internet.

## 8.2 DI operating mode

### Display

If no external supply voltage is connected, switching off supply voltages 1U<sub>s</sub> and 2U<sub>A</sub> also leads to switching off the associated channel status LED Q<sub>n</sub>.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- During the "pause", error detection of "Load voltage 2L+" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 8- 1 Mode parameter

| Element | Code                                 | Explanation                                                                                                                                                                                                                              |
|---------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0 <sub>D</sub> : PE_MODE_PROCEED     | Proceed at "pause" <ul style="list-style-type: none"> <li>• Value status "GOOD"</li> </ul>                                                                                                                                               |
|         | 1 <sub>D</sub> : PE_MODE_SHUTDOWN    | Switch off at "pause" <ul style="list-style-type: none"> <li>• Supply voltages 1U<sub>s</sub> and 2U<sub>A</sub> off</li> <li>• Pause substitute value: 0<sub>B</sub></li> <li>• Value status "BAD"</li> </ul>                           |
|         | 3 <sub>D</sub> : PE_MODE_LAST_VALUE  | Last value at "pause" <ul style="list-style-type: none"> <li>• Supply voltages 1U<sub>s</sub> and 2U<sub>A</sub> off</li> <li>• Pause substitute value: Last input value</li> <li>• Value status "BAD"</li> </ul>                        |
|         | 4 <sub>D</sub> : PE_MODE_SUBST_VALUE | Substitute value at "pause" <ul style="list-style-type: none"> <li>• Supply voltages 1U<sub>s</sub> and 2U<sub>A</sub> off</li> <li>• Pause substitute value: Configured pause substitute value</li> <li>• Value status "BAD"</li> </ul> |

---

**Note****Supply voltages 1U<sub>s</sub> and 2U<sub>A</sub>**

Supply voltages 1U<sub>s</sub> and 2U<sub>A</sub> can only be switched off separately for each module.

If all channels require switching off during the pause, all supply voltages are switched off if no channel is assigned in PE\_MODE\_PROCEED.

---

## 8.3 DQ operating mode

### Display

The channel status LEDs Qn show the output value.

### Response to error detection

All channels that are in pause mode on "PE\_MODE\_PROCEED" report their diagnostic status as in productive mode.

The following applies for all channels which switch to a different pause mode:

- During the "pause", error detection of "Load voltage 2L+ missing" is not possible:
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 8- 2 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                                                                    |
|---------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | Proceed at "pause" <ul style="list-style-type: none"> <li>• Value status "GOOD"</li> </ul>                                                                                                                     |
|         | 1D: PE_MODE_SHUTDOWN    | Switch off at "pause" <ul style="list-style-type: none"> <li>• Supply voltages 1U<sub>s</sub> and 2U<sub>A</sub> off</li> <li>• Pause substitute value: 0<sub>B</sub></li> <li>• Value status "BAD"</li> </ul> |
|         | 3D: PE_MODE_LAST_VALUE  | Last value at "pause" <ul style="list-style-type: none"> <li>• Pause substitute value: Last output value is maintained</li> <li>• Value status "BAD"</li> </ul>                                                |
|         | 4D: PE_MODE_SUBST_VALUE | Substitute value at "pause" <ul style="list-style-type: none"> <li>• Pause substitute value: Configured pause substitute value is output</li> <li>• Value status "BAD"</li> </ul>                              |

---

**Note****Supply voltages 1U<sub>S</sub> and 2U<sub>A</sub>**

Supply voltages 1U<sub>S</sub> and 2U<sub>A</sub> can only be switched off separately for each module.

If all channels require switching off in the pause, the supply voltages are switched off.

---

## 8.4 IO-Link operating mode

### Display

Switching off the supply voltage 1Us also switches off the associated port status LED Cn.

### Response to error detection

All channels which are set to "PE\_MODE\_PROCEED" and "PE\_MODE\_LAST\_VALUE" in pause mode report errors as in productive operation.

The following conditions apply to all channels (ports) which switch to a different pause mode ("PE\_MODE\_SHUTDOWN" and "PE\_MODE\_SUBST\_VALUE"):

- Switching off the supply voltage  $U_{Sn}$  (port) upon starting the "pause" does not lead to generation of the alarms "Wire break" and "Short circuit".
- Error detection is not possible during the "pause" (no IO-Link device communication):
  - Alarms for errors already pending before the "pause" are retained.
  - After the "pause" is over, the error status is updated and incoming/outgoing errors are reported correspondingly.

### Mode parameter

The following table shows the "Mode" parameter.

Table 8-3 Mode parameter

| Element | Code                    | Explanation                                                                                                                                                                                             |
|---------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | 0D: PE_MODE_PROCEED     | Proceed at "pause" <ul style="list-style-type: none"> <li>• Value status "GOOD"</li> </ul>                                                                                                              |
|         | 1D: PE_MODE_SHUTDOWN    | Switch off at "pause" <ul style="list-style-type: none"> <li>• Supply voltages 1Us and 2UA off<sup>1</sup></li> <li>• Pause substitute value (input): 0B</li> <li>• Value status "BAD"</li> </ul>       |
|         | 3D: PE_MODE_LAST_VALUE  | Last value at "pause" <ul style="list-style-type: none"> <li>• Pause substitute value: Last input value</li> <li>• Value status "BAD"</li> </ul>                                                        |
|         | 4D: PE_MODE_SUBST_VALUE | Substitute value at "pause" <ul style="list-style-type: none"> <li>• Supply voltages 1Us and 2UA off<sup>1</sup></li> <li>• Pause substitute value (input): 0B</li> <li>• Value status "BAD"</li> </ul> |

<sup>1</sup> Supply voltage 1Us of the assigned port is switched off. Result: The IO-Link device is no longer supplied with voltage.

---

**Note****Supply voltages 1U<sub>S</sub> and 2U<sub>A</sub>**

Supply voltages 1U<sub>S</sub> and 2U<sub>A</sub> can only be switched off separately for each module.

If all channels require switching off in the pause, the supply voltages are switched off.

---

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface IO-Link module AL

### Purpose of the documentation

This manual supplements the system manual ET 200AL IO-Link (<https://support.automation.siemens.com/WW/view/en/109773203>). Functions that generally relate to the distributed I/O system ET 200AL IO-Link I/O modules are described there.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200AL IO-Link I/O modules.

### Changes compared to the previous version

This manual contains the following changes compared to the previous version:

- Supplements in the section Parameters (Page 14).

### Conventions

Also observe notes labeled as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL IO-Link I/O modules Documentation Guide

# 1

The documentation for the SIMATIC ET 200AL IO-Link I/O modules is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the distributed I/O system SIMATIC ET 200AL IO-Link I/O modules.

## Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC IO-Link system.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## ET 200AL Manual Collection

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

You can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA has two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SIMATIC S7-PCT

The Port Configuration Tool ("PCT") is PC-based software for the parameter assignment of Siemens IO-Link master-modules and IO-Link devices from any manufacturer.

The IO-Link devices are integrated using the standardized device description "IODD" that is available from the respective device manufacturer. S7-PCT supports the version 1.0 as well as V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link masters from STEP 7; however, it can also be started as "standalone" if the IO-Link master is not operated on a SIMATIC controller or when STEP 7 is not used.

You can find additional information on IO-Link on the Internet

(<https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html>).

## Product overview

### 2.1 Properties

#### Article number

6ES7141-5BF00-0BL0

#### View of the module

Figure 2-1 View of the DI 8x24VDC 8xM8 IO-Link digital input module

## Properties

The module has the following technical properties:

- 8 digital inputs
- M8 sockets for connection of sensors
- 24 V DC supply voltage
- Configurable diagnostics can be set for each module
- Typical input delay of 3 ms
- Suitable for switches and proximity switches
- Dimensions 30 x 159 mm

Interface for IO-Link and power supply:

- M12 connector A-coded
- IO-Link Port Class A (Type A)
- Supply of module electronics and sensor supply

The module supports the following functions:

- Firmware update
- IO-Link profile: General profile

## Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- M8 sealing cap

## See also

You can find more information on accessories in the system manual IO-Link IO modules Hotspot text ET 200AL distributed I/O system in the section Accessories/spare parts.

## See also

ET 200AL system manual (<https://support.automation.siemens.com/WW/view/en/109773203>)

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DI 8x24VDC 8xM8 IO-Link digital input module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input signal
- ③ X35: IO-Link interface
- ④ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

## 3.1 Terminal and block diagram

The following figure shows an example of the pin assignment of signal outputs with 2- and 3-wire connection.

|            |                         |      |                                      |
|------------|-------------------------|------|--------------------------------------|
| ①          | 2-wire connection       | 1L+  | Supply voltage 1L+ (non-switched)    |
| ②          | 3-wire connection       | 1M   | Ground 1M (non-switched)             |
| ③          | DI circuit              | 1Us  | 24 V encoder supply                  |
| ④          | Microcontroller         | DIn  | Input signal                         |
| ⑤          | Internal supply voltage | DI   | Channel status LEDs (0 to 7) (green) |
| X10 to X17 | Channels 0 to 7         | DIAG | LED diagnostic status (red/green)    |
| X35        | IO-Link interface       |      |                                      |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Pin assignment of the sockets for digital inputs

The table below shows the pin assignment of the 8 sockets for the connection of digital inputs.

Table 3- 1 Pin assignment for digital inputs

| Pin | Assignment                                                                                                                                                                                           | Front view of the sockets                                                           |                                                                                     |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X10 to X17 sockets for digital inputs                                                                                                                                                                | X10, X12, X14, X16                                                                  | X11, X13, X15, X17                                                                  |
| 1   | 24 V encoder supply 1Us<br>(derived from 1L+ non-switched)                                                                                                                                           |  |  |
| 3   | Encoder supply ground 1M                                                                                                                                                                             |                                                                                     |                                                                                     |
| 4   | Input signal DI0: X10<br>Input signal DI1: X11<br>Input signal DI2: X12<br>Input signal DI3: X13<br>Input signal DI4: X14<br>Input signal DI5: X15<br>Input signal DI6: X16<br>Input signal DI7: X17 |                                                                                     |                                                                                     |

#### NOTICE

##### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input module to supply power to the encoder.

### Pin assignment of the IO-Link connector

The following table shows the pin assignment of the connector for the IO-Link connection. The IO-Link interface corresponds to the specification according to port Class A.

Table 3- 2 Pin assignment of the IO-Link interface

| Pin | Assignment                              | Front view of the connector (Port Class A)                                            |
|-----|-----------------------------------------|---------------------------------------------------------------------------------------|
|     | X35                                     |                                                                                       |
| 1   | 1L+                                     |  |
| 2   | Unassigned                              |                                                                                       |
| 3   | Ground 1M                               |                                                                                       |
| 4   | Switching and communication cable (C/Q) |                                                                                       |
| 5   | Unassigned                              |                                                                                       |

---

**Note**

Note that the module can only be supplied with a protective low voltage according to the standard SELV/PELV.

---

## Parameters/address space

### 4.1 Parameters

The following table shows the parameters for the DI 8x24VDC 8xM8 IO-Link digital input module.

Table 4- 1 Parameters

| Parameters                           | Value range |          |          | Default | Scope  | ISDU index (decimal) | ISDU subindex (decimal) |
|--------------------------------------|-------------|----------|----------|---------|--------|----------------------|-------------------------|
|                                      | Value       | Dec<br>· | Hex<br>· |         |        |                      |                         |
| Diagnostics: Short-circuit to ground | Disable     | 0        | 0        | Disable | Module | 131                  | 1                       |
|                                      | Enable      | 255      | FF       |         |        |                      |                         |

### 4.2 Explanation of the parameters

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

### 4.3 Address space

The figure below shows the assignment of the address space for the DI 8x24VDC 8xM8 IO-Link digital input module.

Assignment in the process image input (PII)

Figure 4-1 Address space IO-Link DI 8x24VDC 8xM8

## 4.4 IODD parameters

### Device description IODD

An electronic device description is available for the DI 8x24VDC 8xM8 IO-Link digital input module, the IODD file (IO Device Description). The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the identical manner by the IO-Link Configuration Tool of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

### IODDfinder

The IODDfinder is a cross-vendor, central IO-Link database.

This database provides you with the latest IODDs of the device manufacturers and offers an information and download platform.

The IODDfinder is available on the Internet (<https://ioddfinder.io-link.com>).

# Interrupts/diagnostics alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the DI 8x24VDC 8xM8 IO-Link digital input module.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0 to 7) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 18).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                 |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                                   |
| <br>Flashes | <ul style="list-style-type: none"> <li>No data exchange with the IO-Link Master, for example, due to wire break</li> <li>Firmware is loading</li> </ul> |
| <br>On      | Module is currently exchanging data with the IO-Link master and no module diagnostics                                                                   |
| <br>Flashes | Module is currently exchanging data with the IO-Link master and module diagnostics                                                                      |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

## 5.2 Interrupts

The DI 8x24VDC 8xM8 IO-Link digital input module supports diagnostic interrupts.

### Diagnostic interrupt

The IO-Link digital input module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital input module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 3      Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm | Error code | Meaning                                      | Remedy                                                                      |
|-------------------|------------|----------------------------------------------|-----------------------------------------------------------------------------|
| Short-circuit     | 0x7710     | Short-circuit of an encoder supply to ground | <ul style="list-style-type: none"><li>Eliminate the short-circuit</li></ul> |

---

### Note

#### Short-circuit at the sensor supply

A short-circuit at the sensor supply can cause wire break diagnostics of the IO-Link Master. The behavior depends on the technical specifications of the IO-Link Master used.

---

## Technical specifications

### Technical specifications of the DI 8x24VDC 8xM8 IO-Link digital input module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/de/en/pv/6ES7141-5BF00-0BLO/td?dl=de>).

|                                                                            |                                                                                       |
|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Article number</b>                                                      | <b>6ES7141-5BF00-0BLO</b>                                                             |

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface IO-Link module AL

### Purpose of the documentation

This manual supplements the system manual ET 200AL IO-Link (<https://support.automation.siemens.com/WW/view/en/109773203>). Functions that generally relate to the distributed I/O system ET 200AL IO-Link I/O modules are described in this manual.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200AL IO-Link I/O modules.

### Changes compared to the previous version

This manual contains the following changes compared to the previous version:

- Supplements in the section Parameters (Page 15)

### Conventions

Also observe notes labeled as follows:

---

#### Note

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL IO-Link I/O modules Documentation Guide

# 1

The documentation for the SIMATIC ET 200AL IO-Link I/O modules is arranged into three areas.  
This arrangement enables you to access the specific content you require.

## Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the distributed I/O system SIMATIC ET 200AL IO-Link I/O modules.

## Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC IO-Link system.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## ET 200AL Manual Collection

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

You can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA has two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SIMATIC S7-PCT

The Port Configuration Tool ("PCT") is PC-based software for the parameter assignment of Siemens IO-Link master-modules and IO-Link devices from any manufacturer.

The IO-Link devices are integrated using the standardized device description "IODD" that is available from the respective device manufacturer. S7-PCT supports the version 1.0 as well as V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link masters from STEP 7; however, it can also be started as "standalone" if the IO-Link master is not operated on a SIMATIC controller or when STEP 7 is not used.

You can find additional information on IO-Link on the Internet

(<https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html>).

## Product overview

### 2.1 Properties

#### Article number

6ES7141-5AH00-0BLO

#### View of the module

Figure 2-1 View of the DI 16x24VDC 8xM12 IO-Link digital input module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 16 digital inputs
- M12 sockets for connection of sensors
- 24 V DC supply voltage
- Configurable diagnostics can be set for each module
- Typical input delay of 3 ms
- Suitable for switches and proximity switches
- Dimensions 45 x 159 mm

Interface for IO-Link and power supply:

- M12 connector A-coded
- IO-Link Port Class A
- Supply of the module electronics
- Encoder supply

The module supports the following functions:

- Firmware update
- IO-Link profile: General profile

### Accessories

The following components are included in the module package:

- Identification labels

### Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- M12 sealing cap

### See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.automation.siemens.com/WW/view/en/109773203>) IO-Link I/O modules system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DI 16x24VDC 8xM12 IO-Link digital input module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input signal
- ③ X35: IO-Link interface
- ④ LED displays 0 to 15 for the channel status

Figure 2-2 Operator controls and display elements

## 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment of signal inputs with 2-wire and 3-wire connection.

|            |                         |                 |                                       |
|------------|-------------------------|-----------------|---------------------------------------|
| ①          | 3-wire connection       | 1L+             | Supply voltage 1L+ (non-switched)     |
| ②          | 2-wire connection       | 1M              | Ground 1M (non-switched)              |
| ③          | 2-wire connection       | 1Us             | 24 V encoder supply                   |
| ④          | DI circuit              | DI <sub>n</sub> | Input signal                          |
| ⑤          | Microcontroller         | DI              | Channel status LEDs (0 to 15) (green) |
| ⑥          | Internal supply voltage | DIAG            | Diagnostic status LED (red/green)     |
| X10 to X17 | Channels 0 to 7         |                 |                                       |
| X35        | IO-Link interface       |                 |                                       |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Pin assignment of the sockets for digital inputs

The table below shows the pin assignment of the 8 sockets for the connection of digital inputs.

Table 3- 1 Pin assignment for digital inputs

| Pin | Assignment                                                                                                                                                                                                                                                                              | Front view of the sockets                                                           |                                                                                     |

#### NOTICE

##### 24 V encoder supply 1Us

Use only the 24 V encoder supply 1Us provided by the digital input module to supply power to the encoder.

### Pin assignment of the IO-Link connector

The following table shows the pin assignment of the connector for the IO-Link connection. The IO-Link interface corresponds to the specification according to Port Class A.

Table 3- 2 Pin assignment of the IO-Link interface

| Pin | Assignment                              | Front view of the connector (Port Class A)                                          |
|-----|-----------------------------------------|-------------------------------------------------------------------------------------|
|     | X35                                     |                                                                                     |
| 1   | 1L+                                     |  |
| 2   | Unassigned                              |                                                                                     |
| 3   | Ground 1M                               |                                                                                     |
| 4   | Switching and communication cable (C/Q) |                                                                                     |
| 5   | Unassigned                              |                                                                                     |

#### Note

Note that the module can only be supplied with a protective low voltage according to the standard SELV/PELV.

## Parameters/address space

### 4.1 Parameters

The following table shows the parameters for the DI 16x24VDC 8xM12 IO-Link digital input module.

Table 4- 1 Parameters

| Parameters                           | Value range |     |     | Default | Scope  | ISDU index<br>(hexadecimal) | ISDU subindex<br>(hexadecimal) |
|--------------------------------------|-------------|-----|-----|---------|--------|-----------------------------|--------------------------------|
|                                      | Value       | Dec | Hex |         |        |                             |                                |
| Diagnostics: Short-circuit to ground | Disable     | 0   | 0   | Disable | Module | 131                         | 1                              |
|                                      | Enable      | 255 | FF  |         |        |                             |                                |

### 4.2 Explanation of the parameters

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the encoder supply to ground occurs.

### 4.3 Address space

The figure below shows the assignment of the address space for the DI 16x24VDC 8xM12 IO-Link digital input module.

Assignment in the process image input (PII)

Figure 4-1 Address space IO-Link DI 16x24VDC 8xM12

## 4.4 IODD parameters

### Device description IODD

An electronic device description is available for the DI 16x24VDC 8xM12 IO-Link digital input module, the IODD file (IO Device Description). The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the same manner by the IO-Link Configuration Tool of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

### IODDfinder

The IODDfinder is a cross-vendor, central IO-Link database.

This database provides you with the latest IODDs of the device manufacturers and offers an information and download platform.

The IODDfinder is available on the Internet (<https://ioddfinder.io-link.com>).

# Interrupts/diagnostic alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the DI 16x24VDC 8xM12 IO-Link digital input module.

- ① Diagnostic status (DIAG) (red/green)
- ② Channel status (0 to 15) (green)

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 19).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                   |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                     |
| <br>Flashes | <ul style="list-style-type: none"> <li>No data exchange with the IO-Link master (e.g. wire break)</li> <li>Firmware is loading</li> </ul> |
| <br>On      | Module is currently exchanging data with the IO-Link master and no module diagnostics                                                     |
| <br>Flashes | Module is currently exchanging data with the IO-Link master and module diagnostics                                                        |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

## 5.2 Interrupts

The DI 16x24VDC 8xM12 IO-Link digital input module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the LED DIAG flashes red on the digital input module. You can read out the diagnostics alarms, for example, from the status of the IO-Link master. You can evaluate the error codes with the user program.

Table 5- 3 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm | Error code | Meaning                                      | Remedy                      |
|-------------------|------------|----------------------------------------------|-----------------------------|
| Short-circuit     | 0x7710     | Short-circuit of an encoder supply to ground | Eliminate the short-circuit |

---

### Note

#### Short-circuit at the sensor supply

A short-circuit at the sensor supply can cause wire break diagnostics of the IO-Link Master. The behavior depends on the technical specifications of the IO-Link Master used.

---

## Technical specifications

### Technical specifications of the DI 16x24VDC 8xM12 IO-Link digital input module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/de/en/pv/6ES7141-5AH00-0BL0/td?dl=en>).

|                                                                            |                                                                                       |

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

|                                                                                                        |
|--------------------------------------------------------------------------------------------------------|
|  <b>DANGER</b>        |
| indicates that death or severe personal injury <b>will</b> result if proper precautions are not taken. |
|  <b>WARNING</b>       |
| indicates that death or severe personal injury <b>may</b> result if proper precautions are not taken.  |
|  <b>CAUTION</b>       |
| indicates that minor personal injury can result if proper precautions are not taken.                   |
| <b>NOTICE</b>                                                                                          |
| indicates that property damage can result if proper precautions are not taken.                         |

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Preface

## Preface IO-Link module AL

### Purpose of the documentation

This manual supplements the system manual ET 200AL IO-Link (<https://support.automation.siemens.com/WW/view/en/109773203>). Functions that generally relate to the distributed I/O system ET 200AL IO-Link I/O modules are described there.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200AL IO-Link I/O modules.

### Changes compared to the previous version

This manual contains the following changes compared to the previous version:

- Supplements in the section Parameters (Page 15).
- Update of the section Technical specifications (Page 20)

### Conventions

Also observe notes labeled as follows:

---

**Note**

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL IO-Link I/O modules Documentation Guide

# 1

The documentation for the SIMATIC ET 200AL IO-Link I/O modules is arranged into three areas.  
This arrangement enables you to access the specific content you require.

## Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the distributed I/O system SIMATIC ET 200AL IO-Link I/O modules.

## Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC IO-Link system.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## ET 200AL Manual Collection

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

You can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" CAx data on the Internet  
(<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA has two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SIMATIC S7-PCT

The Port Configuration Tool ("PCT") is PC-based software for the parameter assignment of Siemens IO-Link master-modules and IO-Link devices from any manufacturer.

The IO-Link devices are integrated using the standardized device description "IODD" that is available from the respective device manufacturer. S7-PCT supports the version 1.0 as well as V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link masters from STEP 7; however, it can also be started as "standalone" if the IO-Link master is not operated on a SIMATIC controller or when STEP 7 is not used.

You can find additional information on IO-Link on the Internet

(<https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html>).

## Product overview

### 2.1 Properties

#### Article number

6ES7142-5AF00-0BL0

#### View of the module

Figure 2-1 View of the DQ 8x24VDC/2A 8xM12 IO-Link digital output module

## 2.1 Properties

### Properties

The module has the following technical properties:

- 8 digital outputs
  - Channels 0 to 7 connected to 2L+ (switched)
- M12 sockets for connection of actuators
- Rated load voltage 24 V DC
- Suitable for solenoid valves, DC contactors, and indicator lights
- Output current per output 2 A
- Configurable diagnostics can be set for each module
- Dimensions 45 x 159 mm
- Interface for supply 2L+

Interface for IO-Link and power supply:

- M12 connector A-coded
- IO-Link Port Class A
- Supply of module electronics

Load voltage supply of output

- M12 connector L-coded

The module supports the following functions:

- Firmware update
- IO-Link profile: General profile

### Accessories

The following components are included in the module package:

- Identification labels

### Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- M12 sealing cap

### See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.automation.siemens.com/WW/view/en/109773203>) IO-Link I/O modules system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the IO-Link DQ 8x24VDC/2A 8xM12 digital output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the output signal
- ③ PWR: LED display for load voltage 2L+
- ④ X80: Connector for infeed of the supply voltage (POWER input)
- ⑤ X35: IO-Link interface
- ⑥ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

## Wiring

### 3.1 Terminal and block diagram

The example in the figure below shows the pin assignment of signal outputs.

|            |                                            |                 |                                      |
|------------|--------------------------------------------|-----------------|--------------------------------------|
| ①          | Output to 2L+                              | 1L+             | Supply voltage 1L+ (non-switched)    |
| ②          | DQ circuit                                 | 1M              | Ground 1M (non-switched)             |
| ③          | Microcontroller                            | 2L+             | Load voltage 2L+ (switched)          |
| ④          | Monitoring                                 | 2M              | Ground 2M (switched)                 |
| ⑤          | Internal supply voltage                    | DQ <sub>n</sub> | Output signal                        |
| X10 to X17 | Channels 0 to 7                            | DQ              | Channel status LEDs (0 to 7) (green) |
| X35        | IO-Link interface                          | DIAG            | Diagnostic status LED (red/green)    |
| X80        | Connector for infeed of supply voltage 2L+ | PWR             | Supply voltage LED 2L+ (green)       |

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Pin assignment of the sockets for digital outputs

The table below shows the pin assignment of the 8 sockets for the connection of the digital outputs.

Table 3- 1 Pin assignment for digital outputs

| Pin | Assignment                                                                                                                                                                                                                                                                                   | Front view of the sockets                                                           |                                                                                     |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X10 to X17 sockets for digital outputs                                                                                                                                                                                                                                                       | X10, X12, X14, X16                                                                  | X11, X13, X15, X17                                                                  |
| 1   | Unassigned                                                                                                                                                                                                                                                                                   |                                                                                     |                                                                                     |
| 2   | Unassigned                                                                                                                                                                                                                                                                                   |                                                                                     |                                                                                     |

### Pin assignment of the connector for infeed of the supply voltage 2L+

The table below shows the pin assignment of the connector for infeed of the supply voltage 2L+.

Table 3- 2 Pin assignment of the supply voltage connector

| Pin | Assignment | Front view of the connector                                                           |
|-----|------------|---------------------------------------------------------------------------------------|
|     | X80        |                                                                                       |
| 1   | Unassigned |  |
| 2   | Ground 2M  |                                                                                       |
| 3   | Unassigned |                                                                                       |
| 4   | 2L+        |                                                                                       |

### Pin assignment of the connector for IO-Link

The following table shows the pin assignment of the connector for IO-Link. The IO-Link interface corresponds to the specification according to port Class A.

Table 3- 3 Pin assignment of the IO-Link interface

| Pin | Assignment                              | Front view of the connector (Port Class A)                                          |
|-----|-----------------------------------------|-------------------------------------------------------------------------------------|
|     | X35                                     |                                                                                     |
| 1   | 1L+                                     |  |
| 2   | Unassigned                              |                                                                                     |
| 3   | Ground 1M                               |                                                                                     |
| 4   | Switching and communication cable (C/Q) |                                                                                     |
| 5   | Unassigned                              |                                                                                     |

#### Note

Note that the module can only be supplied with a protective low voltage according to the standard SELV/PELV.

## Parameters/address space

### 4.1 Parameters

The following table shows the parameters for the DQ 8x24VDC/2A 8xM12 IO-Link digital output module.

Table 4- 1 Parameters

| Parameters                            | Value range             |     |     | Default  | Scope                                         | ISDU index (decimal) | ISDU subindex (decimal) |
|---------------------------------------|-------------------------|-----|-----|----------|-----------------------------------------------|----------------------|-------------------------|
|                                       | Value                   | Dec | Hex |          |                                               |                      |                         |
| Diagnostics: Missing load voltage 2L+ | Disable                 | 0   | 0   | Disable  | Module                                        | 131                  | 1                       |
|                                       | Enable                  | 255 | FF  |          |                                               |                      |                         |
| Diagnostics: Short-circuit to ground  | Disable                 | 0   | 0   | Disable  | Module (Short-circuit of an output to ground) | 131                  | 2                       |
|                                       | Enable                  | 255 | FF  |          |                                               |                      |                         |
| Reaction to CPU/master STOP           | Shutdown                | 0   | 0   | Shutdown | Module                                        | 131                  | 3                       |
|                                       | Keep last value         | 2   | 2   |          |                                               |                      |                         |
|                                       | Output substitute value | 3   | 3   |          |                                               |                      |                         |
| Substitute value channel              | 0                       | 0   | 0   | 0        | Channel                                       | 131                  | 4 ... 11                |
|                                       | 1                       | 255 | FF  |          |                                               |                      |                         |

### 4.2 Explanation of the parameters

#### Diagnostics: Missing load voltage 2L+

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

#### Diagnostics: Short-circuit to ground

Enabling of the diagnostics for short-circuit of the output to ground.

#### Reaction to CPU/master STOP

With this parameter, you set the reaction of the digital outputs of the module after a CPU/master STOP:

- Shut down: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

#### Substitute value channel

With this parameter, you set substitute values for the digital outputs.

## 4.3 Address space

The figure below shows the assignment of the address space for the DQ 8x24VDC/2A 8xM12 IO-Link digital output module.

Assignment in the process image output (PIQ)

Figure 4-1 Address space IO-Link DQ 8x24VDC/2A 8xM12

## 4.4 IODD parameters

### Device description IODD

An electronic device description is available for the DQ 8x24VDC/2A 8xM12 IO-Link digital output module, the IODD file (IO Device Description). The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the same manner by the IO-Link Configuration Tool of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

### IODDfinder

The IODDfinder is a cross-vendor, central IO-Link database.

This database provides you with the latest IODDs of the device manufacturers and offers an information and download platform.

The IODDfinder is available on the Internet (<https://ioddfinder.io-link.com>).

# Interrupts/diagnostic alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the DQ 8x24VDC/2A 8xM12 IO-Link digital output module.

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostics alarms (Page 19).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                   |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                     |
| <br>Flashes | <ul style="list-style-type: none"> <li>No data exchange with the IO-Link Master (e.g. wire break)</li> <li>Firmware is loading</li> </ul> |
| <br>On      | Module is currently exchanging data with the IO-Link master and no module diagnostics                                                     |
| <br>Flashes | Module is currently exchanging data with the IO-Link master and module diagnostics                                                        |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## 5.2 Interrupts

The DQ 8x24VDC/2A 8xM12 IO-Link digital output module supports diagnostic interrupts.

### Diagnostic interrupt

The digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of outputs to ground
- Load voltage 2L+ missing or too low

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the LED DIAG flashes red on the digital output module. You can read out the diagnostics alarms, for example, from the status of the IO-Link master. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm        | Error code | Meaning                              | Remedy                                                                                                |
|--------------------------|------------|--------------------------------------|-------------------------------------------------------------------------------------------------------|
| Short-circuit            | 0x7711     | Short-circuit of an output to ground | Eliminate the short-circuit                                                                           |
| Load voltage 2L+ missing | 0x5112     | Load voltage 2L+ missing or too low  | <ul style="list-style-type: none"><li>• Check the supply voltage</li><li>• Check the module</li></ul> |

## Technical specifications

### Technical specifications of the DQ 8x24VDC/2A 8xM12 IO-Link digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet

(<https://support.industry.siemens.com/cs/de/en/pv/6ES7142-5AF00-0BL0/td?dl=en>).

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the system manual ET 200AL IO-Link (<https://support.automation.siemens.com/WW/view/en/109773203>). Functions that generally relate to the distributed I/O system ET 200AL IO-Link I/O modules are described there.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200AL IO-Link I/O modules.

## Changes compared to the previous version

This manual contains the following changes compared to the previous version:

- Supplements in the section Parameters (Page 15).
- Update of the section Technical specifications (Page 22)

## Conventions

Also observe notes labeled as follows:

---

### Note

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL IO-Link I/O modules Documentation Guide

# 1

The documentation for the SIMATIC ET 200AL IO-Link I/O modules is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the distributed I/O system SIMATIC ET 200AL IO-Link I/O modules.

## Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC IO-Link system.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## ET 200AL Manual Collection

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

You can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" CAx data on the Internet (<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA has two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SIMATIC S7-PCT

The Port Configuration Tool ("PCT") is PC-based software for the parameter assignment of Siemens IO-Link master-modules and IO-Link devices from any manufacturer.

The IO-Link devices are integrated using the standardized device description "IODD" that is available from the respective device manufacturer. S7-PCT supports the version 1.0 as well as V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link masters from STEP 7; however, it can also be started as "standalone" if the IO-Link master is not operated on a SIMATIC controller or when STEP 7 is not used.

You can find additional information on IO-Link on the Internet

(<https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html>).

## Product overview

### 2.1 Properties

#### Article number

6ES7143-5BF00-0BL0

#### View of the module

Figure 2-1 View of the DIQ 4+DQ 4x24VDC/0,5A 8xM8 IO-Link digital input/digital output module

## Properties

The module has the following technical properties:

- 4 digital inputs or digital outputs and 4 digital outputs, depending on parameter assignment
  - DIQ signals connected to 2L+ (switched)
  - DQ signals connected to 2L+ (switched)
- M8 sockets for connection of sensors and actuators
- Digital inputs:
  - 24 V DC supply voltage
  - Configurable diagnostics can be set for each module
  - Typical input delay of 3 ms
  - Suitable for switches and proximity switches
- Digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current 0.5 A per output
  - Configurable diagnostics can be set for each module
- Dimensions 30 x 159 mm
- Interface for IO-Link and power supply:
  - M12 connector A-coded
  - IO-Link Port Class B
  - Supply of the module electronics
  - Encoder supply and load voltage supply of output

The module supports the following functions:

- Firmware update
- IO-Link profile: General profile

## Accessories

The following components are included in the module package:

- Identification labels
- Spacers

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- M8 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system

(<https://support.automation.siemens.com/WW/view/en/109773203>) IO-Link I/O modules system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DIQ 4+DQ 4x24VDC/0,5A 8xM8 IO-Link digital input/digital output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input/output signal
- ③ PWR: LED display for load voltage 2L+
- ④ X35: IO-Link interface
- ⑤ LED displays 0 to 7 for the channel status

Figure 2-2 Operator controls and display elements

## Wiring

### 3.1 Terminal and block diagram

The following figure shows an example of the pin assignment of signal inputs with 2- and 3-wire connection as well as signal outputs.

|            |                                        |                  |                                             |
|------------|----------------------------------------|------------------|---------------------------------------------|
| ①          | Configured as output                   | 1L+              | Supply voltage 1L+ (non-switched)           |
| ②          | Configured as input: 2-wire connection | 1M               | Ground 1M (non-switched)                    |
| ③          | Configured as input: 3-wire connection | 2L+              | Load voltage 2L+ (switched)                 |
| ④          | Output                                 | 2M               | Ground 2M (switched)                        |
| ⑤          | DI/DQ circuit (2L+ switched)           | 2Us              | 24 V encoder supply                         |
| ⑥          | Microcontroller                        | DIQ <sub>n</sub> | Input/output signal                         |
| ⑦          | Monitoring                             | DQ <sub>n</sub>  | Output signal                               |
| ⑧          | Internal supply voltage                | DIQ              | LEDs channel status (0, 1, 2 and 3) (green) |
| ⑨          | DQ circuit (2L+ switched)              | DQ               | LEDs channel status (4, 5, 6 and 7) (green) |
| X10 to X17 | Channels 0 to 7                        | DIAG             | LED diagnostic status (red/green)           |
| X35        | IO-Link interface                      | PWR              | LED supply voltage 2L+ (green)              |

## 3.2 Pin assignment

### Pin assignment of the sockets for digital inputs/digital outputs

The tables below show the pin assignments of the 8 sockets for connection of the digital inputs/digital outputs.

Table 3- 1 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                       | Front view of the sockets                                                           |                                                                                     |
|-----|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X10 to X13 - sockets for digital inputs / outputs                                                                                | X10, X12                                                                            | X11, X13                                                                            |
| 1   | 24 V encoder supply 2Us<br>(derived from 2L+ switched)                                                                           |  |  |
| 3   | Ground 2M                                                                                                                        |                                                                                     |                                                                                     |
| 4   | Input/output signal DIQ0: X10<br>Input/output signal DIQ1: X11<br>Input/output signal DIQ2: X12<br>Input/output signal DIQ3: X13 |                                                                                     |                                                                                     |

#### NOTICE

#### 24 V encoder supply 2Us

Use only the 24 V encoder supply 2Us provided by the digital input/digital output module to supply power to the encoder.

Table 3- 2 Pin assignment for digital outputs

| Pin | Assignment                                                                                           | Front view of the sockets                                                             |                                                                                       |

### Pin assignment of the IO-Link connector

The following table shows the pin assignment of the connector for the IO-Link connection. The IO-Link interface corresponds to the specification according to Port Class B.

Table 3- 3 Pin assignment of the IO-Link interface

| Pin | Assignment                              | Front view of the connector (Port Class B)                                          |
|-----|-----------------------------------------|-------------------------------------------------------------------------------------|
|     | X35                                     |                                                                                     |
| 1   | 1L+                                     |  |
| 2   | 2L+                                     |                                                                                     |
| 3   | Ground 1M                               |                                                                                     |
| 4   | Switching and communication cable (C/Q) |                                                                                     |
| 5   | Ground 2M                               |                                                                                     |

#### Note

Note that the module can only be supplied with a protective low voltage according to the standard SELV/PELV.

## Parameters/address space

### 4.1 Parameters

The following table shows the parameters for the DIQ 4+DQ 4x24VDC/0,5A 8xM8 IO-Link digital input / digital output module.

Table 4- 1 Parameters

| Parameters                            | Value range             |          |          | Default  | Scope                                                                  | ISDU index (decimal) | ISDU sub-index (decimal) |
|---------------------------------------|-------------------------|----------|----------|----------|------------------------------------------------------------------------|----------------------|--------------------------|
|                                       | Value                   | Dec<br>. | Hex<br>. |          |                                                                        |                      |                          |
| Diagnostics: Missing load voltage 2L+ | Disable                 | 0        | 0        | Disable  | Module                                                                 | 131                  | 1                        |
|                                       | Enable                  | 255      | FF       |          |                                                                        |                      |                          |
| Diagnostics: Short-circuit to ground  | Disable                 | 0        | 0        | Disable  | Module<br>(Short-circuit of encoder supply or of the output to ground) | 131                  | 2                        |
|                                       | Enable                  | 255      | FF       |          |                                                                        |                      |                          |

## 4.2 Explanation of the parameters

### **Diagnostics: Missing load voltage 2L+**

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

### **Diagnostics: Short-circuit to ground**

Enabling of the diagnostics for short-circuit of the encoder supply or output to ground.

### **Freely assignable channel n**

With this parameter, you set whether the channel is to be operated as an input or output.

### **Reaction to CPU/master STOP**

With this parameter, you set the reaction of the digital outputs of the digital input/digital output module after a CPU/master STOP:

- Shut down: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

### **Substitute value channel**

With this parameter, you set substitute values for the digital outputs.

## 4.3 Address space

The figure below shows the assignment of the address space for the IO-Link DIQ 4+DQ 4x24VDC/0,5A 8xM8.

Assignment in the process image input (PII)

|      |   |   |   |   |   |   |   |   |                                 |
|------|---|---|---|---|---|---|---|---|---------------------------------|
|      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                                 |
| IB x | 0 | 0 | 0 | 0 |   |   |   |   | Input values at channels 0 to 3 |

Assignment in the process image output (PIQ)

|      |   |   |   |   |   |   |   |   |                                  |
|------|---|---|---|---|---|---|---|---|----------------------------------|
|      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |                                  |
| QB x |   |   |   |   |   |   |   |   | Output values at channels 0 to 7 |

Figure 4-1 Address space IO-Link DIQ 4+DQ 4x24VDC/0,5A 8xM8

---

### Note

#### Parameter assignment of the channels

Parameters for the first four channels can be freely assigned.

For the channels 0 ... 3 that are configured as input, the corresponding values in the output data do not trigger any reaction.

For the channels 0 ... 3 that are configured as output, the input value in the process image is 0.

---

## 4.4 IODD parameters

### Device description IODD

An electronic device description is available for the DIQ 4+DQ 4x24VDC/0.5A 8xM8 IO-Link digital input / digital output module, the IODD file (IO Device Description). The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the same manner by the IO-Link Configuration Tool of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

### IODDfinder

The IODDfinder is a cross-vendor, central IO-Link database.

This database provides you with the latest IODDs of the device manufacturers and offers an information and download platform.

The IODDfinder is available on the Internet (<https://ioddfinder.io-link.com>).

# Interrupts/diagnostics alarms

## 5.1 Status and error displays

### LED displays

The figure below shows the LED displays (status and error displays) of the DIQ 4+DQ 4x24VDC/0,5A 8xM8 IO-Link digital input / digital output module.

- |   |                          |             |
|---|--------------------------|-------------|
| ① | Diagnostic status (DIAG) | (red/green) |
| ② | Channel status (0 to 7)  | (green)     |
| ③ | Load voltage 2L+ (PWR)   | (green)     |

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in the section Diagnostics alarms (Page 21).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                                 |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                                   |
| <br>Flashes | <ul style="list-style-type: none"> <li>No data exchange with the IO-Link Master, for example, due to wire break</li> <li>Firmware is loading</li> </ul> |
| <br>On      | Module is currently exchanging data with the IO-Link master and no module diagnostics                                                                   |
| <br>Flashes | Module is currently exchanging data with the IO-Link master and module diagnostics                                                                      |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning                           |
|--------------------------------------------------------------------------------------------|-----------------------------------|
| <br>Off | Process signal = 0 or deactivated |
| <br>On  | Process signal = 1                |

### PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## 5.2 Interrupts

The DIQ 4+DQ 4x24VDC/0,5A 8xM8 IO-Link digital input / digital output module supports diagnostic interrupts.

### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of encoder supply to ground
- Short-circuit of outputs to ground
- Load voltage 2L+ missing or too low

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the DIAG LED flashes red on the digital input/output module.

You can read out the diagnostics alarms, for example, from the port status of the IO-Link master. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                          | Error code | Meaning                                      | Remedy                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Short-circuit <sup>1</sup>                                                                                                                                                                                 | 0x7710     | Short-circuit of an encoder supply to ground | <ul style="list-style-type: none"> <li>• Eliminate the short-circuit</li> </ul>                          |
|                                                                                                                                                                                                            | 0x7711     | Short-circuit of an output to ground         |                                                                                                          |
| Load voltage 2L+ missing                                                                                                                                                                                   | 0x5112     | Load voltage 2L+ missing or too low          | <ul style="list-style-type: none"> <li>• Check the supply voltage</li> <li>• Check the module</li> </ul> |
| <sup>1</sup> = If a short-circuit of the encoder supply to ground is detected, the diagnostic alarm "Short-circuit" is always output. This alarm is output even if all channels are configured as outputs. |            |                                              |                                                                                                          |

## Technical specifications

### Technical specifications of the DIQ 4+DQ 4x24VDC/0,5A 8xM8 IO-Link digital input / digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/de/en/pv/6ES7143-5BF00-0BL0/td?dl=de>).

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Preface IO-Link module AL

### Purpose of the documentation

This manual supplements the system manual ET 200AL IO-Link (<https://support.automation.siemens.com/WW/view/en/109773203>). Functions that generally relate to the distributed I/O system ET 200AL IO-Link I/O modules are described there.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200AL IO-Link I/O modules.

### Changes compared to the previous version

This manual contains the following changes compared to the previous version:

- Supplements in the section Parameters (Page 15).
- Update of the section Technical specifications (Page 21)

### Conventions

Also observe notes labeled as follows:

---

**Note**

Indicates important product information to which particular attention should be paid.

---

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# ET 200AL IO-Link I/O modules Documentation Guide

# 1

The documentation for the SIMATIC ET 200AL IO-Link I/O modules is arranged into three areas.

This arrangement enables you to access the specific content you require.

## Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the distributed I/O system SIMATIC ET 200AL IO-Link I/O modules.

## Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC IO-Link system.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## ET 200AL Manual Collection

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (<https://support.automation.siemens.com/WW/view/en/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (<https://support.industry.siemens.com/My/ww/en>).

## "mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/My/ww/en/documentation>).

## "mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

You can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" CAx data on the Internet  
(<https://support.industry.siemens.com/my/ww/en/CAxOnline>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/ps/ae>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/109767888>).

## PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA has two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet

(<https://support.industry.siemens.com/cs/ww/en/view/67460624>).

## SIMATIC S7-PCT

The Port Configuration Tool ("PCT") is PC-based software for the parameter assignment of Siemens IO-Link master-modules and IO-Link devices from any manufacturer.

The IO-Link devices are integrated using the standardized device description "IODD" that is available from the respective device manufacturer. S7-PCT supports the version 1.0 as well as V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link masters from STEP 7; however, it can also be started as "standalone" if the IO-Link master is not operated on a SIMATIC controller or when STEP 7 is not used.

You can find additional information on IO-Link on the Internet

(<https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html>).

## Product overview

### 2.1 Properties

#### Article number

6ES7143-5AH00-0BL0

#### View of the module

Figure 2-1 View of the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module

## Properties

The module has the following technical properties:

- 16 digital inputs or digital outputs, depending on configuration and parameter assignment
  - 16 DIQ signals connected to 2L+ (switched)
- M12 sockets for connection of sensors and actuators
- Digital inputs:
  - 24 V DC supply voltage
  - Suitable for switches and proximity switches
  - Typical input delay of 3 ms
  - Configurable diagnostics can be set for each module
- Digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current per output 0.5 A
  - Configurable diagnostics can be set for each module
- Dimensions 45 x 159 mm
- Interface for IO-Link and power supply:
  - M12 connector A-coded
  - Supply of the module electronics
  - IO-Link Port Class B
  - Encoder supply and load voltage supply of output

The module supports the following functions:

- Firmware update
- IO-Link profile: General profile

## Accessories

The following components are included in the module package:

- Identification labels

## Other components

The following component can be ordered as spare part:

- Identification labels

The following components can be ordered as accessories:

- Connectors
- Cables
- M12 sealing cap

## See also

You can find more information on accessories in the Accessories/spare parts section of the ET 200AL distributed I/O system (<https://support.industry.siemens.com/cs/us/en/view/89254965>) IO-Link I/O modules system manual.

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module.

- ① DIAG: LED display for the diagnostic status
- ② X10 to X17: Sockets for the input/output signal
- ③ PWR: LED display for load voltage 2L+
- ④ X35: IO-Link interface
- ⑤ LED displays 0 to 15 for the channel status

Figure 2-2 Operator controls and display elements

# Wiring

## 3.1 Terminal and block diagram

The figure below shows an example of the pin assignment of signal inputs with 2-wire and 3-wire connection and of signal outputs in the configuration modes for digital inputs and outputs.

|            |                                         |                  |                                     |
|------------|-----------------------------------------|------------------|-------------------------------------|
| ①          | Configured as inputs: 2-wire connection | 1L+              | Supply voltage 1L+ (non-switched)   |
| ②          | Configured as outputs                   | 1M               | Ground 1M (non-switched)            |
| ③          | Configured as input: 3-wire connection  | 2L+              | Load voltage 2L+ (switched)         |
| ④          | Configured as output                    | 2M               | Ground 2M (switched)                |
| ⑤          | Configured as input: 2-wire connection  | 2Us              | 24 V encoder supply                 |
| ⑥          | DI/DQ circuit (2L+ switched)            | DIQ <sub>n</sub> | Input/output signal                 |
| ⑦          | Microcontroller                         | DIQ              | LEDs channel status (0..15) (green) |
| ⑧          | Monitoring                              | DIAG             | Diagnostic status LED (red/green)   |
| ⑨          | Internal supply voltage                 | PWR              | LED supply voltage 2L+ (green)      |
| X10 to X17 | Channels 0 to 15                        |                  |                                     |
| X35        | IO-Link interface                       |                  |                                     |

## 3.2 Pin assignment

### Pin assignment of the sockets for digital inputs/digital outputs

The table below shows the pin assignments of the 8 sockets for the connection of the digital inputs/digital outputs.

Table 3- 1 Pin assignment for digital inputs/digital outputs

| Pin | Assignment                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Front view of the sockets                                                           |                                                                                     |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|     | X10 to X17 - sockets for digital inputs/outputs                                                                                                                                                                                                                                                                                                                                                                                                                 | X10, X12, X14, X16                                                                  | X11, X13, X15, X17                                                                  |
| 1   | 24 V encoder supply 2Us<br>(derived from 2L+ switched)                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |

### Pin assignment of the connector for IO-Link

The following table shows the pin assignment of the connector for the IO-Link.

Table 3- 2 Pin assignment of the IO-Link interface

| Pin | Assignment                              | Front view of the connector (Port Class B)                                            |
|-----|-----------------------------------------|---------------------------------------------------------------------------------------|
|     | X35                                     |                                                                                       |
| 1   | 1L+                                     |  |
| 2   | 2L+                                     |                                                                                       |
| 3   | Ground 1M                               |                                                                                       |
| 4   | Switching and communication cable (C/Q) |                                                                                       |
| 5   | Ground 2M                               |                                                                                       |

#### Note

Note that the module can only be supplied with a protective low voltage according to the standard SELV/PELV.

## Parameters/address space

### 4.1 Parameters

The table below shows the parameters for the IO-Link digital input/digital output module DIQ 16x24VDC/0,5A 8xM12.

Table 4- 1 Parameters

| Parameters                            | Value range             |          |          | Default   | Scope                                                                  | ISDU index (decimal) | ISDU sub-index (decimal) |
|---------------------------------------|-------------------------|----------|----------|-----------|------------------------------------------------------------------------|----------------------|--------------------------|
|                                       | Value                   | Dec<br>. | Hex<br>. |           |                                                                        |                      |                          |
| Diagnostics: Missing load voltage 2L+ | Disable                 | 0        | 0        | Disable   | Module                                                                 | 131                  | 1                        |
|                                       | Enable                  | 255      | FF       |           |                                                                        |                      |                          |
| Diagnostics: Short-circuit to ground  | Disable                 | 0        | 0        | Disable   | Module<br>(Short-circuit of encoder supply or of the output to ground) | 131                  | 2                        |
|                                       | Enable                  | 255      | FF       |           |                                                                        |                      |                          |

## 4.2 Explanation of the parameters

### **Diagnostics: Missing load voltage 2L+**

Enabling of the diagnostics for missing or insufficient load voltage 2L+.

### **Diagnostics: Short-circuit to ground**

Enabling of the diagnostics, at short-circuit of an encoder supply or of an output to ground.

### **Freely assignable channel**

With this parameter, you set whether the channel is to be operated as an input or output.

### **Reaction to CPU/master STOP**

With this parameter, you set the reaction of the channels configured as output of the digital input/output module after a CPU/master STOP:

- Deactivate: The digital output is de-energized.
- Keep last value: The last value of the digital output remains activated.
- Output substitute value: The module outputs a configured substitute value.

### **Substitute value channel**

With this parameter, you set substitute values for the digital outputs.

## 4.3 Address space

The figure below shows the assignment of the address space for the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module.

Assignment in the process image input (PII)

Assignment in the process image output (PIQ)

Figure 4-1 Address space IO-Link DIQ 16x24VDC/0,5A 8xM12

## 4.4 IODD parameters

### Device description IODD

An electronic device description is available for the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module, the IODD file (IO Device Description). The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the same manner by the IO-Link Configuration Tool of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

### IODDfinder

The IODDfinder is a cross-vendor, central IO-Link database.

This database provides you with the latest IODDs of the device manufacturers and offers an information and download platform.

The IODDfinder is available on the Internet (<https://ioddfinder.io-link.com>).

## Interrupts/diagnostic alarms

### 5.1 Status and error displays

#### LED displays

The figure below shows the LED displays (status and error displays) of the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module.

- |   |                          |             |
|---|--------------------------|-------------|
| ① | Diagnostic status (DIAG) | (red/green) |
| ② | Channel status (0 to 15) | (green)     |
| ③ | Load voltage 2L+ (PWR)   | (green)     |

Figure 5-1 LED displays

## Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic reports can be found in chapter Diagnostics alarms (Page 20).

### DIAG LED

Table 5- 1 Error display of the DIAG LED

| DIAG LED                                                                                     | Meaning                                                                                                                                   |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Off     | No supply voltage 1L+                                                                                                                     |
| <br>Flashes | <ul style="list-style-type: none"> <li>No data exchange with the IO-Link Master (e.g. wire break)</li> <li>Firmware is loading</li> </ul> |
| <br>On      | Module is currently exchanging data with the IO-Link master and no module diagnostics                                                     |
| <br>Flashes | Module is currently exchanging data with the IO-Link master and module diagnostics                                                        |

### LED channel status

Table 5- 2 LED channel status display

| LED channel status                                                                         | Meaning            |
|--------------------------------------------------------------------------------------------|--------------------|
| <br>Off | Process signal = 0 |
| <br>On  | Process signal = 1 |

### PWR LED

Table 5- 3 Status display of the PWR LED

| PWR LED                                                                                    | Meaning                                |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>Off | Load voltage 2L+ is missing or too low |
| <br>On  | Load voltage 2L+ present               |

## 5.2 Interrupts

Diagnostic interrupts of the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module.

### Diagnostic interrupt

The digital input/digital output module generates a diagnostic interrupt at the following events:

- Short-circuit of an encoder supply to ground, or
- Short-circuit of an output to ground
- Load voltage 2L+ missing or too low

## 5.3 Diagnostics alarms

For each diagnostic event, a diagnostics alarm is issued and the LED DIAG flashes red on the digital input/digital output module.

You can read out the diagnostics alarms, for example, from the status of the IO-Link master. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meanings and corrective measures

| Diagnostics alarm                                                                                                                                                                                                                                                                                                                                                               | Error code | Meaning                                      | Solution                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Short circuit <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                      | 0x7710     | Short-circuit of an encoder supply to ground | <ul style="list-style-type: none"> <li>• Eliminate the short-circuit</li> </ul>                          |
|                                                                                                                                                                                                                                                                                                                                                                                 | 0x7711     | Short-circuit of an output to ground         |                                                                                                          |
| Load voltage 2L+ missing <sup>2</sup>                                                                                                                                                                                                                                                                                                                                           | 0x5112     | Load voltage 2L+ missing or too low          | <ul style="list-style-type: none"> <li>• Check the supply voltage</li> <li>• Check the module</li> </ul> |
| <sup>1</sup> = If a short-circuit of an encoder supply to ground is detected, the diagnostic alarm "Short-circuit" is always output. This alarm is output even if all channels are configured as outputs.<br><sup>2</sup> = If you are using ET 200AL modules in connection with the ET 200SP distributed I/O system, the diagnostic alarm "Load voltage missing" is displayed. |            |                                              |                                                                                                          |

## Technical specifications

### Technical specifications of the DIQ 16x24VDC/0,5A 8xM12 IO-Link digital input/digital output module

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (<https://support.industry.siemens.com/cs/de/en/pv/6ES7143-5AH00-0BL0/td?dl=en>).

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Preface

## Purpose of the documentation

This manual supplements the *ET 200AL distributed I/O system system manual* (<https://support.industry.siemens.com/cs/ww/en/view/89254965>). Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

### WARNING

**The *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* in the current version is the authoritative source for functional safety-related information concerning configuring and programming.**

Siemens identifies the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* as the authoritative and/or original source in the case of discrepancies between the manuals.

All warnings in the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* have to be observed. You can find the current version of the manual on the Internet (<https://support.industry.siemens.com/cs/ww/en/view/54110126>).

## Conventions

Please observe notes marked as follows:

---

### Note

Indicates important product information to which particular attention should be paid.

## Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (<https://www.siemens.com/industrialsecurity>).

# Documentation guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

## Basic information

The *System Manual* and *Getting Started* describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

## Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

## General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (<https://support.industry.siemens.com/cs/ww/en/view/109742667>).

## Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/view/95242965>).

## "mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAX data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet  
(<https://support.industry.siemens.com/cs/ww/en/my>).

## Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet  
(<https://support.industry.siemens.com/sc/ww/en/sc/2054>).

## TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet  
(<https://support.industry.siemens.com/cs/us/en/view/109767888>).

## Safety technology support

Siemens provides the following online comprehensive support for your use of safety technology:

- Safety Evaluation Tool - assists you in determining required safety levels
- Functional Examples - guides you in your safety applications
- Siemens training (SITRAIN) classes - offers training in safety standards and products
- SIMATIC STEP 7 Safety Advance F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times Excel file (RT\_calculator) - assists you in calculating your maximum system response time

You can find the Safety Evaluation Tool on the Internet (<http://www.siemens.com/safety-evaluation-tool>).

You can find Functional Examples on the Internet (<http://www.siemens.com/safety-functional-examples>).

You can find SITRAIN classes on the Internet (<http://www.siemens.com/sitrain-safetyintegrated>).

You can find the RT\_calculator on the Internet (<http://support.automation.siemens.com/WW/view/en/49368678/133100>).

## Product overview

### 2.1 Properties

#### Article Number

6ES7146-5FF00-0BA0

#### View of the Module

Figure 2-1 View of the F-DI 4+F-DQ 2x24VDC/2A, 4xM12 Fail-Safe I/O module

## Properties

The module has the following technical properties:

- Four fail-safe digital inputs and two fail-safe digital outputs (M12 sockets for connection of sensors and actuators)
- One eCoding connection (M12 socket for eCoding plug)
- Two power ports, infeed and loop-through, which contain both logic and input power (1L+) and output power (2L+) (M8 module supply voltage ports)
- Two ET-Connection communication ports (M8 sockets)
- Fail-safe digital inputs:
  - 24 V DC rated
  - Two short-circuit proof sensor supplies
  - External sensor supply possible
  - Configurable diagnostics can be set for each channel
  - Configurable input delay
  - Suitable for switches and 3/4-wire proximity switches
- Fail-safe digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current per output 2.0 A
  - Configurable diagnostics can be set for each channel
- Dimensions 45 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)

The module has the following maximum achievable safety class in safety mode:

| Maximum achievable safety class in safety mode | 1-channel input | 2-channel input | Output channel |
|------------------------------------------------|-----------------|-----------------|----------------|
| Performance level according to EN ISO 13849-1  | Cat. 3, PL d    | Cat. 4, PL e    | Cat. 4, PL e   |
| SIL according to IEC 61508                     | SIL 2           | SIL 3           | SIL 3          |

## Accessories

The following components are included in the module package:

- Identification labels (Yellow)
- eCoding plug (Used to store the application's PROFI-safe addresses)

## Other components

The following components can be ordered as a spare part:

- Identification labels (Yellow)
- eCoding plug

The following components can be ordered as accessories:

- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

## See also

You can find more information on accessories in "Accessories/spare parts" in the *ET 200AL distributed I/O system* system manual (<https://support.industry.siemens.com/cs/ww/en/view/89254965>).

## 2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the F-DI 4/F-DQ 2 Fail-Safe module:

- ① DIAG: LED display for the diagnostic status
- ② LED displays for the channel status
- ③ X40: eCoding plug connection
- ④ PWR: LED display for load voltage 2L+
- ⑤ X81: Socket for loop-through of the supply voltage (POWER output)
- ⑥ X31: Socket for ET-Connection OUT
- ⑦ X30: Socket for ET-Connection IN
- ⑧ X80: Connector for infeed of the supply voltage (POWER input)
- ⑨ X10 to X16: Sockets for the input/output signals

Figure 2-2 Operator controls and display elements

## 2.3 Fail-safe digital inputs

The digital inputs of the F-DI 4/F-DQ 2 Fail-Safe module are rated for connection to 24 V DC sensors/switches and 3/4-wire proximity switches (for example, BEROs: Siemens line of no-touch sensors) and have an EN 61131-2 type 1 input rating.

The fail-safe module has two 0.5 A sensor supply outputs that can power external sensors (inputs). All 1oo1 and 1oo2 application modes, except the "1oo2, 2 channel 3-wire nonequivalent" application mode, use the  $V_{S1}$  sensor supply to provide power for channels 0 and 1, and the  $V_{S2}$  sensor supply to provide power for channels 2 and 3. The "1oo2, 2 channel 3-wire nonequivalent" application mode uses the  $V_{S1}$  sensor supply to provide power for all four inputs and does not use the  $V_{S2}$  sensor supply.

### Inputs and test circuit

The fail-safe digital inputs consist of four input channels (F-DI x.0 to x.3). You can configure these channels as four one-out-of-one (1oo1) inputs (SIL 2/Cat. 3/PL d), two one-out-of-two (1oo2) inputs (SIL 3/Cat. 3 or Cat. 4/PL e), or combinations of 1oo1 and 1oo2 inputs.

| Connections | Input channel pairs |
|-------------|---------------------|
| X10         | 0 and 2             |
| X12         | 1 and 3             |

The fail-safe digital inputs use two microcontrollers to implement the safety function. One microcontroller monitors inputs 0 and 1, and the other microcontroller monitors inputs 2 and 3. The corresponding channels (0, 2) and (1, 3) form a 1oo2 channel group. The lower numbered channel of the group is called the primary input and the other channel is called the secondary input. The first of the two inputs in the channel group conveys the signal in a 1oo2 configuration. For example, if you wire F-DI 0.0 and F-DI 0.2 in a 1oo2 configuration and configure STEP 7 to use 1oo2 sensor evaluation, the signal state is reported at only the F-DI 0.0 input when you close or open the circuit for both.

When you configure a channel group as 1oo2, the two microcontrollers must sense the same input change within a configured time. Otherwise, the two microcontrollers detect a discrepancy error.

You can enable short-circuit testing if you use a sensor supply output to provide power to a sensor. The short-circuit test checks for shorts to 24 V DC by periodically pulsing the sensor output off and verifying that the associated input is off.

This short-circuit test also checks for shorts to the other circuit in "1oo2, 2 channel equivalent" and "1oo2, 2 channel 4-wire nonequivalent" application modes because the test pulses the two sensor outputs off at different times.

The microcontrollers provide internal test pulses to each other's process input circuits to verify that sensing electronics are responsive to both "1" and "0" inputs.

<https://support.industry.siemens.com/cs/us/en/view/89254965>

**2.4 Fail-safe digital outputs**

The digital outputs of the F-DI 4/F-DQ 2 Fail-Safe module are for use in fail-safe applications and are suitable for various actuators such as the following:

- Solenoid valves
- DC contactors
- Indicator lights

The two digital outputs each have P- and M-switches that are rated to connect 24 V DC actuators with up to a 2.0 A rating. The two digital outputs use the load voltage 2L+ with a maximum current of 4.0 A. This means that the total current usage by the two digital outputs cannot exceed 3.96 A because the 2L+ supply uses about 40 mA.

**Outputs**

The fail-safe digital outputs consist of two output channels (F-DQ x.0 to x.1). You can use each output for SIL 3 applications.

| Connections | Output channel |
|-------------|----------------|
| X14         | 0              |
| X16         | 1              |

Each output consists of two switches:

- A P-switch connects 24 V DC positive (L+) to the load.
- An M-switch connects the load to M or 24 V DC return.

Both switches must be ON for current to flow to the load.

The fail-safe digital outputs use two microcontrollers to implement the safety function. One microcontroller controls the P-switch while the other microcontroller controls the M-switch. Status of the P-switch is fed back to the other microcontroller (the one that controls the M-switch). Likewise, status of the M-switch is fed back to the other microcontroller (the one that controls the P-switch). The microcontrollers use the feedback to verify that the output switches are operating properly and in the commanded state.

You must configure a "Maximum readback time" that specifies the allowed delay for the output voltage to respond to the switch change.

The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. Your configured "Maximum readback time" also sets the duration of the "OFF" test pulse. You must configure a "Maximum readback time switch on test" which sets the duration of the "ON" test pulse. Choose these durations short enough to not affect your load.

## 2.4 Fail-safe digital outputs

The module can detect a broken wire or missing load when the output PV is OFF. If the broken wire diagnostic is enabled, then the load must be wired in the PM configuration or a broken wire diagnostic will occur (see applications 1, 3 or 4 in section 5.2 Digital output applications (Page 51)).

## Wiring

** WARNING**

**You can come into contact with live electrical wires connected to the main power supply.**

Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.

Shut off the supply and load voltage before you wire the fail-safe module.

### 3.1 Terminal and block diagram

The following figure shows an example of the pin assignment of signal inputs with 4-wire connection as well as signal outputs:

Figure 3-1 Terminal and block diagram

## 3.2 Pin assignment

### Note

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

### Pin assignment of the sockets for fail-safe digital inputs/outputs

The tables below show the pin assignments of the four sockets for connection of the fail-safe digital inputs/outputs:

Table 3- 1 Pin assignment for fail-safe digital input sockets

| Pin | Assignment                                                         | Front view of the sockets                                                            |
|-----|--------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|     | X10 and X12 - sockets for fail-safe digital inputs                 | X10, X12                                                                             |

## Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage:

Table 3- 5 Pin assignment of the supply voltage socket

| Pin | Assignment                | Assignment of the wire color of the power line cable | Front view of the socket                                                              |
|-----|---------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------|
|     | X81 socket (POWER output) |                                                      |                                                                                       |
| 1   | Supply voltage 1L+        | Brown                                                |  |
| 2   | Ground 2M                 | White                                                |                                                                                       |
| 3   | Ground 1M                 | Blue                                                 |                                                                                       |
| 4   | Load voltage 2L+          | Black                                                |                                                                                       |

**Note****ET-Connection/supply voltage**

Installing a supply voltage cable in an ET-connection socket or an ET-connection cable in the supply voltage loop-through socket can destroy the module.

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

### 3.3 Connecting the M12 eCoding plug

The eCoding plug (6ES7194-6KB01-0AA0) stores the PROFIsafe addresses that you assign to the F-DI 4/F-DQ 2 Fail-Safe module:

| eCoding Plug<br>(side view)                                                        | F-DI 4/F-DQ 2 with eCoding Plug Attached<br>(front view)                           | F-DI 4/F-DQ 2 with eCoding Plug Attached<br>(side view)                             |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|  |  |  |

The eCoding plug stores the following information:

- PROFIsafe source address
- PROFIsafe destination address
- Address validity information

The eCoding plug occupies the X40 M12 socket, utilizing a B-coded plug. You use the eCoding plug to facilitate module replacement.

The eCoding plug stores assigned PROFIsafe source and destination addresses. The "Assign PROFIsafe address option" is selected in STEP 7 during the F-DI 4/F-DQ 2 Fail-Safe module set-up. The module checks the PROFIsafe addresses stored in the eCoding plug against the PROFIsafe reference addresses provided to the module during start-up parameterization.

Protection mechanisms prevent you from damaging the eCoding plug or an I/O channel due to attempted plugging of the eCoding plug into an I/O M12 socket or plugging of an I/O M12 cable into the X40 socket.

### 3.3 Connecting the M12 eCoding plug

Install the eCoding plug into the M12 socket at X40 with a torque of 1 Nm. Do not overtighten the eCoding plug as it could damage the threading.

#### **WARNING**

**If you remove/insert the eCoding plug with the power connected, this can lead to undefined states in your system.**

Death or serious personal injury and damage to the fail-safe module and associated machines/equipment may result if proper precautions are not taken.

Only remove or replace the eCoding plug when the power is disconnected. Always comply with the required standards and safety guidelines when configuring a system.

---

#### **Note**

When replacing the F-DI 4/F-DQ 2 Fail-Safe module, transfer the eCoding plug of the failed module to the replacement module to retain the PROFIsafe addresses stored in the eCoding plug. Otherwise, use STEP 7 to configure the PROFIsafe address in the replacement module. Ensure that the eCoding plug is not accidentally inserted in a module other than the intended F-DI 4/F-DQ 2 Fail-Safe module.

---

## Parameters/address space

All connected fail-safe I/O must have their operating properties configured by the STEP 7 Safety configuration software. You have the responsibility to ensure that no unconfigured modules are connected in a fail-safe automation system.

### F-Parameters

You must assign the PROFIsafe addresses (F-destination address together with F-source address) to the F-module before you put it into operation as follows:

- You define the F-source address using the "Central F-source addresses" parameter in the F-CPU.
- An F-destination address unique throughout the project's hardware configuration is automatically assigned for each F-module. You can manually change the F-destination addresses assigned in the hardware configuration.

You can find further information on F-parameters such as the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address), F-parameter signature (with or without addresses) and the F-I/O DB in the *SIMATIC, Industrial Software, SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* on the Internet (<https://support.industry.siemens.com/cs/ww/en/view/54110126>).

## 4.1 Configuring module I/O properties

To configure fail-safe module I/O properties, follow these steps:

1. Select the image of a fail-safe I/O device (on the Device view or Device overview) and view the module's "Properties" tab.
2. On the "Properties" view, select the "General" tab.
3. Select a property category in the left-side property tree and then set values in the right-side property fields.
4. A successful compile and download of your hardware configuration to one of the following CPUs automatically puts your new configuration settings in the I/O modules:
  - ET 200pro F
  - ET 200SP F
  - S7-1200 F
  - S7-1500 F
  - Prior generation S7-300 F and S7-400 F

## 4.2 Parameters

The following table shows the parameters for the F-DI 4/F-DQ 2 Fail-Safe module:

| Channel                                   | Value range                                                                                                                                                                               | Default                                | Parameter re-assignment in RUN | Scope   |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|--------------------------------|---------|
| <b>F-parameters</b>                       |                                                                                                                                                                                           |                                        |                                |         |
| Manual assignment of F-monitoring time    | <ul style="list-style-type: none"> <li>disable</li> <li>enable</li> </ul>                                                                                                                 | disable                                | no                             | Module  |
| F-monitoring time                         | 1 to 65535 ms                                                                                                                                                                             | 150 ms                                 | no                             | Module  |
| F-source address                          | 1 to 65534                                                                                                                                                                                | 1 (always disabled)                    | no                             | Module  |
| F-destination address                     | 1 to 65534                                                                                                                                                                                | 65534 (always enabled)                 | no                             | Module  |

## 4.3 Explanation of parameters

### 4.3.1 F-parameters

Information on F-parameters is available in the *SIMATIC Safety – Configuring and Programming* manual (<https://support.industry.siemens.com/cs/us/en/view/54110126>).

#### Behavior after channel fault

Use this parameter to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

## Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

### Use in S7-300/400 F-CPUs

This parameter is always set to "Adjustable" when you use the fail-safe module in S7- 300/400 F-CPUs. You make the required setting in the F-I/O DB of the fail-safe module.

### Use in ET 200pro, ET 200SP and S7-1200/1500 F-CPUs

When using the fail-safe module in ET 200pro, ET 200SP and S7-1200/1500 F-CPUs, you set this parameter in the STEP 7 dialog of the fail-safe module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

## 4.3.2 DI parameters

### Short-circuit test

You can enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with a power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit test switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Duration of short-circuit test".

If a short-circuit is detected, the fault is reported to the F-CPU and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input to another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, nonequivalent) which also detects the cross circuits using discrepancy.

### 4.3 Explanation of parameters

During the execution time (duration of short-circuit test + startup time of sensor after the short-circuit test) of the short-circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

#### Discrepancy time variation with short-circuit test

If your process input changes near when a short-circuit test is in progress, a discrepancy is detected in less time than your configured discrepancy time.

Elements of discrepancy time variations are defined as follows:

- **Tdisc** = configured discrepancy time
- **Tsct** = configured short circuit test duration
- **Tfilter** = configured input filter time
- **Tda** = actual discrepancy time, time between process signal changes that can be detected as a fault

The range of detected discrepancy time is as follows:

- If **Tfilter** < **Tsct**:  $\{Tdisc - (Tfilter + Tsct)\} \leq Tda \leq Tdisc$
- If **Tfilter** ≥ **Tsct**:  $\{Tdisc - (2 \times Tsct)\} \leq Tda \leq Tdisc$

Your configured discrepancy time should account for this variation to avoid unexpected passivations.

#### Interval for short-circuit test

You can specify how often the short-circuit test is executed (Interval) when the "Short-circuit test" check box is selected. The interval defines the period of time between two consecutive sensor supply OFF test pulses.

This value is the time between the OFF pulses of the sensor supply.

---

#### Note

The interval between pulses must be a minimum of eight times the duration of a pulse.

---

Short-circuit testing is performed on  $V_{s1}$  and  $V_{s2}$  independently, allowing module circuitry to detect shorts between the two sensor supplies as follows:

$V_{Sn}$   $V_{S1}$  or  $V_{S2}$  sensor supplies (V DC)

$T_{int}$  Short-circuit test interval (time period) between the OFF pulses of the sensor supply (ms)

$T_{dur}$  Short-circuit test OFF pulse time duration (ms)

### Duration of short-circuit test

You can specify the duration of the test pulse applied to the sensor supply when the "Short-circuit test" check box is selected.

This value is the time that the power supply remains off during the test. The short-circuit test OFF pulse must be long enough for the external sensors and wiring to respond and present a "0" to the inputs.

### Sensor evaluation

You can assign whether "channel n" input operates individually (1oo1) or is paired with its companion channel "n+2" input (1oo2).

Defines signal evaluation and wiring definitions. These selections correspond with the various application mode wiring examples.

**1oo1 evaluation:** One sensor is connected to the module on a single channel.

**1oo2 evaluation:** Two input channels are occupied by either:

- **2 channel equivalent** (with equivalent signals): One two-channel equivalent sensor or two single-channel equivalent sensors are connected to the two channels, in a channel pair.
- **2 channel - 3 wire nonequivalent:** One two-channel nonequivalent sensor is connected to the two channels, in a channel pair.
- **2 channel - 4 wire nonequivalent** One two-channel nonequivalent sensor or two single-channel nonequivalent sensors are connected to the two channels, in a channel pair.

If 1oo2 is selected, you must assign the discrepancy properties.

Refer to "Digital input applications (Page 39)" for illustrations of connection modes.

### 4.3 Explanation of parameters

When you select the channel group as 1oo2, STEP 7 (TIA Portal) enables the parameters in the first channel of the group and completely disables the parameters in the second channel of the group. The second channel derives its parameter values from the first channel's parameter values. When you select the channel group as 1oo1, STEP 7 (TIA Portal) enables all of the parameters in both channels.

---

**Note****Safety program access to 1oo2 input data**

For 1oo2 evaluation, two paired input channels (for example, F-DI 0 and F-DI 2) are connected to one or two sensors. The F-DI performs the discrepancy analysis and sends the result to the safety program, at the input address of the low-numbered channel of the pair (F-DI 0, in the example).

---

### Discrepancy behavior

A 1oo2 input configuration allows a logical difference between the two signals, without error, for the configured discrepancy time. You assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

---

**Note****Sensor-actuator response time is increased when you add more input discrepancy time**

The discrepancy time adds directly to the maximum response time of a 1oo2 evaluation if the two signals do not agree in logical state. If you select the "Supply value 0" option, then the F-DI does not delay a transition from "1" to "0" but can delay the transition from "0" to "1". If you select the "Supply last valid value" option, then the F-DI can delay both transitions from "1" to "0" and "0" to "1". The discrepancy time is influenced by sensor specifications, installation tolerances, and wiring. For best response time, select the smallest discrepancy time that provides reliable normal operation. Refer to "Response times (Page 83)" for further information.

---

### Discrepancy time

The two signals in a 1oo2 input configuration will not change exactly at the same time, due to differences in sensors, contacts, and wiring. You can configure a maximum expected duration for a mismatch between signals during transition.

### Reintegration after discrepancy error

You can assign whether a zero state must be detected on both 1oo2 inputs before a previously declared discrepancy can be cleared.

#### **"Test 0-signal necessary"**

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels for a duration of at least 100 ms.

If you are using nonequivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, nonequivalent", a 0-signal must be present again at the low order channel of the channel pair.

#### **"Test 0-signal not necessary"**

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists between the two relevant input channels.

### **Activated**

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel. Whenever you disable all output channels, you do not have to power 2L+ and 2L+ undervoltage reporting is suspended.

### **Input filters**

The module filters the digital inputs to remove contact bounce and short duration noise. This parameter assigns the duration of the filter time.

### **Channel failure acknowledge**

Controls whether the channel is automatically reintegrated after a fault clears or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults (Page 61)" for the reintegration procedure.

---

#### **Note**

The configuration of the "F-Parameters": "Reintegration after channel fault" parameter can determine your ability to modify the "Channel failure acknowledge" parameter's selection.

---

### **Sensor supply**

You can assign whether to supply 24 V DC power to sensors from the module's integrated sensor supply (internal) or from an external power supply (external).

Short-circuit tests are not performed for any channel where external power is selected.

### 4.3.3 DQ parameters

#### Maximum test period

You can assign the time interval between bit pattern tests for F-DQ DC output faults to a value of either 100 seconds or 1000 seconds.

Functional bit pattern tests are applied to the output switches. These tests detect faulted P- or M- output switches and wiring faults. Short circuits to other signals or power rails can be detected. Open circuits between the wiring terminals and the load are not detected.

If an error is detected on a channel, the test interval is shortened to 60 seconds. If an error is no longer detected on any output channel, the configured test interval is used again.

A persistent fault is reported to the fail-safe CPU and the affected channels are passivated.

#### Wire break

You can enable or disable wire break testing. Wire break is only detected when the channel is in the OFF state (process value is "0").

#### Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel.

---

#### Note

Whenever you disable all output channels, you do not have to power 2L+ and 2L+ undervoltage reporting is suspended.

---

#### Channel failure acknowledge

Controls whether the channel is automatically reintegrated after a fault clears or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults (Page 61)" for the reintegration procedure.

---

#### Note

The configuration of the "F-Parameters": "Reintegration after channel fault" parameter can determine your ability to modify the "Channel failure acknowledge" parameter's selection.

---

## Maximum readback time

The maximum readback time is a user-configured parameter that assigns the maximum time allowed for an output to reach the new state (ON or OFF) due to a process value change without generating an error. Also, this is the maximum width of a diagnostic test pulse applied during the bit pattern test to verify that an output can be turned OFF while it is in the ON state. The time of the OFF pulse should be as long as possible, but short enough so that the actuator cannot react.

The "Maximum readback time" parameter allows you to set the maximum time for verification that the channel's output switch states are as expected after a process value change.

If the expected output switch states (as reported by P-readback and M-readback signals) are not reached upon expiration of the "Maximum readback time", the output channel is passivated.

No new process values are switched to the output channels while a test pattern is applied to the outputs. This means that a higher "Maximum readback time" increases the response time of the F-module.

### WARNING

#### Short-circuit (cross-circuit) detection may not be possible for high frequency signals

Through the configured "Maximum readback time", short-circuits (cross-circuits) to a signal with a frequency greater than  $1/(2 \times \text{configured "Maximum readback time"})$  Hz cannot be detected (50:50 sampling ratio).

You must take this into consideration for your application and respective requirements of your product standards.

Short-circuits (cross-circuits) to an output of the same module are recognized regardless of the frequency of the output channel.

You can adjust the maximum readback time to change the frequency of the signal that can be detected.
